Modify an EC2 Fleet

You can modify an EC2 Fleet that is in the `submitted` or `active` state. When you modify a fleet, it enters the `modifying` state.

You can only modify an EC2 Fleet that is of type `maintain`. You cannot modify an EC2 Fleet of type `request` or `instant`.

You can modify the following parameters of an EC2 Fleet:

- `target-capacity-specification` – Increase or decrease the target capacity for `TotalTargetCapacity`, `OnDemandTargetCapacity`, and `SpotTargetCapacity`.
- `excess-capacity-termination-policy` – Whether running instances should be terminated if the total target capacity of the EC2 Fleet is decreased below the current size of the fleet. Valid values are `no-termination` and `termination`.

When you increase the target capacity, the EC2 Fleet launches the additional instances according to the instance purchasing option specified for `DefaultTargetCapacityType`, which are either On-Demand Instances or Spot Instances.

If the `DefaultTargetCapacityType` is `spot`, the EC2 Fleet launches the additional Spot Instances according to its allocation strategy. If the allocation strategy is `lowest-price`, the fleet launches the instances from the lowest-priced Spot capacity pool in the request. If the allocation strategy is `diversified`, the fleet distributes the instances across the pools in the request.

When you decrease the target capacity, the EC2 Fleet deletes any open requests that exceed the new target capacity. You can request that the fleet terminate instances until the size of the fleet reaches the new target capacity. If the allocation strategy is `lowest-price`, the fleet terminates the instances with the highest price per unit. If the allocation strategy is `diversified`, the fleet terminates instances across the pools. Alternatively, you can request that EC2 Fleet keep the fleet at its current size, but not replace any Spot Instances that are interrupted or any instances that you terminate manually.

When an EC2 Fleet terminates a Spot Instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

To modify an EC2 Fleet (AWS CLI)

Use the [modify-fleet](#) command to update the target capacity of the specified EC2 Fleet.

```
aws ec2 modify-fleet \
--fleet-id fleet-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
--target-capacity-specification TotalTargetCapacity=20
```

If you are decreasing the target capacity but want to keep the fleet at its current size, you can modify the previous command as follows.

```
aws ec2 modify-fleet \
--fleet-id fleet-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
--target-capacity-specification TotalTargetCapacity=10 \
--excess-capacity-termination-policy no-termination
```

Delete an EC2 Fleet

If you no longer require an EC2 Fleet, you can delete it. After you delete a fleet, it launches no new instances.

When you delete an EC2 Fleet, you must specify if you want to also terminate its instances. If you specify that the instances must be terminated when the fleet is deleted, it enters the `deleted_terminating` state. Otherwise, it enters the `deleted_running` state, and the instances continue to run until they are interrupted or you terminate them manually.

Restrictions

- You can delete up to 25 instant fleets in a single request. If you exceed this number, no instant fleets are deleted and an error is returned. There is no restriction on the number of fleets of type `maintain` or `request` that can be deleted in a single request.
- Up to 1000 instances can be terminated in a single request to delete instant fleets.

To delete an EC2 Fleet and terminate its instances (AWS CLI)

Use the [delete-fleets](#) command and the `--terminate-instances` parameter to delete the specified EC2 Fleet and terminate the instances.

```
aws ec2 delete-fleets \
--fleet-ids fleet-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
--terminate-instances
```

The following is example output.

```
{  
    "UnsuccessfulFleetDeletions": [],  
    "SuccessfulFleetDeletions": [  
        {  
            "CurrentFleetState": "deleted_terminating",  
            "PreviousFleetState": "active",  
            "FleetId": "fleet-73fbcd2ce-aa30-494c-8788-1cee4EXAMPLE"  
        }  
    ]  
}
```

To delete an EC2 Fleet without terminating the instances (AWS CLI)

You can modify the previous command using the `--no-terminate-instances` parameter to delete the specified EC2 Fleet without terminating the instances.

Note

`--no-terminate-instances` is not supported for instant fleets.

```
aws ec2 delete-fleets \  
  --fleet-ids fleet-73fbcd2ce-aa30-494c-8788-1cee4EXAMPLE \  
  --no-terminate-instances
```

The following is example output.

```
{  
    "UnsuccessfulFleetDeletions": [],  
    "SuccessfulFleetDeletions": [  
        {  
            "CurrentFleetState": "deleted_running",  
            "PreviousFleetState": "active",  
            "FleetId": "fleet-4b8aaae8-dfb5-436d-a4c6-3dafa4c6b7dcEXAMPLE"  
        }  
    ]  
}
```

Troubleshoot when a fleet fails to delete

If an EC2 Fleet fails to delete, `UnsuccessfulFleetDeletions` in the output returns the ID of the EC2 Fleet, an error code, and an error message.

The error codes are:

- `ExceededInstantFleetNumForDeletion`
- `fleetIdDoesNotExist`
- `fleetIdMalformed`
- `fleetNotInDeletableState`
- `NoTerminateInstancesNotSupported`
- `UnauthorizedOperation`
- `unexpectedError`

Troubleshooting `ExceededInstantFleetNumForDeletion`

If you try to delete more than 25 instant fleets in a single request, the `ExceededInstantFleetNumForDeletion` error is returned. The following is example output for this error.

```
{
    "UnsuccessfulFleetDeletions": [
        {
            "FleetId": "fleet-5d130460-0c26-bfd9-2c32-0100a098f625",
            "Error": {
                "Message": "Can't delete more than 25 instant fleets in a single request.",
                "Code": "ExceededInstantFleetNumForDeletion"
            }
        },
        {
            "FleetId": "fleet-9a941b23-0286-5bf4-2430-03a029a07e31",
            "Error": {
                "Message": "Can't delete more than 25 instant fleets in a single request.",
                "Code": "ExceededInstantFleetNumForDeletion"
            }
        },
        .
        .
        .
        ],
        "SuccessfulFleetDeletions": []
    }
}
```

Troubleshoot NoTerminateInstancesNotSupported

If you specify that the instances in an instant fleet must not be terminated when you delete the fleet, the `NoTerminateInstancesNotSupported` error is returned. `--no-terminate-instances` is not supported for instant fleets. The following is example output for this error.

```
{
    "UnsuccessfulFleetDeletions": [
        {
            "FleetId": "fleet-5d130460-0c26-bfd9-2c32-0100a098f625",
            "Error": {
                "Message": "NoTerminateInstances option is not supported for instant fleet",
                "Code": "NoTerminateInstancesNotSupported"
            }
        }
    ],
    "SuccessfulFleetDeletions": []
}
```

Troubleshoot UnauthorizedOperation

If you do not have permission to terminate instances, you get the `UnauthorizedOperation` error when deleting a fleet that must terminate its instances. The following is the error response.

```
<Response><Errors><Error><Code>UnauthorizedOperation</Code><Message>You are not authorized to perform this operation. Encoded authorization failure message: VvuncIxj7Z_CPGNYXWqnuFV-YjByeAU66Q9752NtQ-I3-qnDLWs6JLFdKnSMMiq5s6cGqjjPteDpsnGHzzzHasFHOaRYJpaDVravoW25azn6KNkUQQ1FwhJyujt2dtNCdduJfrqcFYAj1EiRMkfDht7N63SKlwBHTurzDK6A560Y2nDSUiMmABly9UNTqazJ9SNes5NxKMqZaqKtjRbk02Rzu5V2vn9Vm6fm2aMVHbY9JhLvGypLcMujtJ76H9ytg2zRVPiU5v2s-UgZ7h0p2yth6ysUdh10Ng6dBYu8_y_HtEI54invCj4CoK0qawqzMNe6rcmCQHvtCxtXsbkgyaEbcwmrm2m01-EMhekLFZeJLrDtYOOpYcEl4_nWFX1wtQDCnNNCmxnJZAoJvb3VMDYpDTsxjQv1PxODZuqWHs23YXWVywzgnLtHeRf2o41UhGBw17mXsS07k7XAfdPMP_Pt9vrHtQiILor5VVTsjsPWg7edj__1rsnXhwPSu8gI48ZLRGrPQqFq0RmKO_QIE8N8s6NWzCK4yoX-9gDcheurOGpkprPIC9YPGMLK9</Message></Error></Errors><RequestID>89b1215c-7814-40ae-a8db-41761f43f2b0</RequestID></Response>
```

To resolve the error, you must add the `ec2:TerminateInstances` action to the IAM policy, as shown in the following example.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "DeleteFleetsAndTerminateInstances",  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DeleteFleets"  
                "ec2:TerminateInstances"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

Spot Fleet

A Spot Fleet is set of Spot Instances and optionally On-Demand Instances that is launched based on criteria that you specify. The Spot Fleet selects the Spot capacity pools that meet your needs and launches Spot Instances to meet the target capacity for the fleet. By default, Spot Fleets are set to *Maintain* target capacity by launching replacement instances after Spot Instances in the fleet are terminated. You can submit a Spot Fleet as a one-time *request*, which does not persist after the instances have been terminated. You can include On-Demand Instance requests in a Spot Fleet request.

Topics

- [Spot Fleet request types \(p. 839\)](#)
- [Spot Fleet configuration strategies \(p. 839\)](#)
- [Work with Spot Fleets \(p. 865\)](#)
- [CloudWatch metrics for Spot Fleet \(p. 884\)](#)
- [Automatic scaling for Spot Fleet \(p. 886\)](#)

Spot Fleet request types

There are two types of Spot Fleet requests:

`request`

If you configure the request type as `request`, Spot Fleet places an asynchronous one-time request for your desired capacity. Thereafter, if capacity is diminished because of Spot interruptions, the fleet does not attempt to replenish Spot Instances, nor does it submit requests in alternative Spot capacity pools if capacity is unavailable.

`maintain`

If you configure the request type as `maintain`, Spot Fleet places an asynchronous request for your desired capacity, and maintains capacity by automatically replenishing any interrupted Spot Instances.

To specify the type of request in the Amazon EC2 console, do the following when creating a Spot Fleet request:

- To create a Spot Fleet of type `request`, clear the **Maintain target capacity** check box.
- To create a Spot Fleet of type `maintain`, select the **Maintain target capacity** check box.

For more information, see [Create a Spot Fleet request using defined parameters \(console\) \(p. 872\)](#).

Both types of requests benefit from an allocation strategy. For more information, see [Allocation strategy for Spot Instances \(p. 840\)](#).

Spot Fleet configuration strategies

A *Spot Fleet* is a collection, or fleet, of Spot Instances, and optionally On-Demand Instances.

The Spot Fleet attempts to launch the number of Spot Instances and On-Demand Instances to meet the target capacity that you specified in the Spot Fleet request. The request for Spot Instances is fulfilled if there is available capacity and the maximum price you specified in the request exceeds the current Spot price. The Spot Fleet also attempts to maintain its target capacity fleet if your Spot Instances are interrupted.

You can also set a maximum amount per hour that you're willing to pay for your fleet, and Spot Fleet launches instances until it reaches the maximum amount. When the maximum amount you're willing to pay is reached, the fleet stops launching instances even if it hasn't met the target capacity.

A *Spot capacity pool* is a set of unused EC2 instances with the same instance type (for example, `m5.large`), operating system, Availability Zone, and network platform. When you make a Spot Fleet request, you can include multiple launch specifications, that vary by instance type, AMI, Availability Zone, or subnet. The Spot Fleet selects the Spot capacity pools that are used to fulfill the request, based on the launch specifications included in your Spot Fleet request, and the configuration of the Spot Fleet request. The Spot Instances come from the selected pools.

- [Spot Fleet instance weighting \(p. 864\)](#)

Plan a Spot Fleet request

Before you create a Spot Fleet request, review [Spot Best Practices](#). Use these best practices when you plan your Spot Fleet request so that you can provision the type of instances you want at the lowest possible price. We also recommend that you do the following:

- Determine whether you want to create a Spot Fleet that submits a one-time request for the desired target capacity, or one that maintains a target capacity over time.
- Determine the instance types that meet your application requirements.
- Determine the target capacity for your Spot Fleet request. You can set the target capacity in instances or in custom units. For more information, see [Spot Fleet instance weighting \(p. 864\)](#).
- Determine what portion of the Spot Fleet target capacity must be On-Demand capacity. You can specify 0 for On-Demand capacity.
- Determine your price per unit, if you are using instance weighting. To calculate the price per unit, divide the price per instance hour by the number of units (or weight) that this instance represents. If you are not using instance weighting, the default price per unit is the price per instance hour.
- Review the possible options for your Spot Fleet request. For more information, see the [request-spot-fleet](#) command in the *AWS CLI Command Reference*. For additional examples, see [Spot Fleet example configurations \(p. 930\)](#).

Allocation strategy for Spot Instances

The allocation strategy for the Spot Instances in your Spot Fleet determines how it fulfills your Spot Fleet request from the possible Spot capacity pools represented by its launch specifications. The following are the allocation strategies that you can specify in your Spot Fleet request:

`lowestPrice`

The Spot Instances come from the pool with the lowest price. This is the default strategy.

`diversified`

The Spot Instances are distributed across all pools.

capacityOptimized

The Spot Instances come from the pools with optimal capacity for the number of instances that are launching. You can optionally set a priority for each instance type in your fleet using `capacityOptimizedPrioritized`. Spot Fleet optimizes for capacity first, but honors instance type priorities on a best-effort basis.

With Spot Instances, pricing changes slowly over time based on long-term trends in supply and demand, but capacity fluctuates in real time. The `capacityOptimized` strategy automatically launches Spot Instances into the most available pools by looking at real-time capacity data and predicting which are the most available. This works well for workloads such as big data and analytics, image and media rendering, machine learning, and high performance computing that may have a higher cost of interruption associated with restarting work and checkpointing. By offering the possibility of fewer interruptions, the `capacityOptimized` strategy can lower the overall cost of your workload.

Alternatively, you can use the `capacityOptimizedPrioritized` allocation strategy with a `priority` parameter to order instance types from highest to lowest priority. You can set the same priority for different instance types. Spot Fleet will optimize for capacity first, but will honor instance type priorities on a best-effort basis (for example, if honoring the priorities will not significantly affect Spot Fleet's ability to provision optimal capacity). This is a good option for workloads where the possibility of disruption must be minimized and the preference for certain instance types matters. Using priorities is supported only if your fleet uses a launch template. Note that when you set the priority for `capacityOptimizedPrioritized`, the same priority is also applied to your On-Demand Instances if the On-Demand `AllocationStrategy` is set to `prioritized`.

InstancePoolsToUseCount

The Spot Instances are distributed across the number of Spot pools that you specify. This parameter is valid only when used in combination with `lowestPrice`.

Maintain target capacity

After Spot Instances are terminated due to a change in the Spot price or available capacity of a Spot capacity pool, a Spot Fleet of type `maintain` launches replacement Spot Instances. If the allocation strategy is `lowestPrice`, the fleet launches replacement instances in the pool where the Spot price is currently the lowest. If the allocation strategy is `diversified`, the fleet distributes the replacement Spot Instances across the remaining pools. If the allocation strategy is `lowestPrice` in combination with `InstancePoolsToUseCount`, the fleet selects the Spot pools with the lowest price and launches Spot Instances across the number of Spot pools that you specify.

Choose an appropriate allocation strategy

You can optimize your Spot Fleets based on your use case.

If your fleet runs workloads that may have a higher cost of interruption associated with restarting work and checkpointing, then use the `capacityOptimized` strategy. This strategy offers the possibility of fewer interruptions, which can lower the overall cost of your workload. This is the recommended strategy. Use the `capacityOptimizedPrioritized` strategy for workloads where the possibility of disruption must be minimized and the preference for certain instance types matters.

If your fleet is small or runs for a short time, the probability that your Spot Instances may be interrupted is low, even with all the instances in a single Spot capacity pool. Therefore, the `lowestPrice` strategy is likely to meet your needs while providing the lowest cost.

If your fleet is large or runs for a long time, you can improve the availability of your fleet by distributing the Spot Instances across multiple pools. For example, if your Spot Fleet request specifies 10 pools and a target capacity of 100 instances, the fleet launches 10 Spot Instances in each pool. If the Spot price for one pool exceeds your maximum price for this pool, only 10% of your fleet is affected. Using this strategy also makes your fleet less sensitive to increases in the Spot price in any one pool over time. With

the diversified strategy, the Spot Fleet does not launch Spot Instances into any pools with a Spot price that is equal to or higher than the [On-Demand price](#).

To create a cheap and diversified fleet, use the `lowestPrice` strategy in combination with `InstancePoolsToUseCount`. You can use a low or high number of Spot pools across which to allocate your Spot Instances. For example, if you run batch processing, we recommend specifying a low number of Spot pools (for example, `InstancePoolsToUseCount=2`) to ensure that your queue always has compute capacity while maximizing savings. If you run a web service, we recommend specifying a high number of Spot pools (for example, `InstancePoolsToUseCount=10`) to minimize the impact if a Spot capacity pool becomes temporarily unavailable.

Configure Spot Fleet for cost optimization

To optimize the costs for your use of Spot Instances, specify the `lowestPrice` allocation strategy so that Spot Fleet automatically deploys the least expensive combination of instance types and Availability Zones based on the current Spot price.

For On-Demand Instance target capacity, Spot Fleet always selects the least expensive instance type based on the public On-Demand price, while continuing to follow the allocation strategy (either `lowestPrice`, `capacityOptimized`, or `diversified`) for Spot Instances.

Configure Spot Fleet for cost optimization and diversification

To create a fleet of Spot Instances that is both cheap and diversified, use the `lowestPrice` allocation strategy in combination with `InstancePoolsToUseCount`. Spot Fleet automatically deploys the cheapest combination of instance types and Availability Zones based on the current Spot price across the number of Spot pools that you specify. This combination can be used to avoid the most expensive Spot Instances.

For example, if your target capacity is 10 Spot Instances, and you specify 2 Spot capacity pools (for `InstancePoolsToUseCount`), Spot Fleet will draw on the two cheapest pools to fulfill your Spot capacity.

Note that Spot Fleet attempts to draw Spot Instances from the number of pools that you specify on a best effort basis. If a pool runs out of Spot capacity before fulfilling your target capacity, Spot Fleet will continue to fulfill your request by drawing from the next cheapest pool. To ensure that your target capacity is met, you might receive Spot Instances from more than the number of pools that you specified. Similarly, if most of the pools have no Spot capacity, you might receive your full target capacity from fewer than the number of pools that you specified.

Configure Spot Fleet for capacity optimization

To launch Spot Instances into the most-available Spot capacity pools, use the `capacityOptimized` allocation strategy. For an example configuration, see [Example 9: Launch Spot Instances in a capacity-optimized fleet \(p. 939\)](#).

You can also express your pool priorities by using the `capacityOptimizedPrioritized` allocation strategy and then setting the order of instance types to use from highest to lowest priority. Using priorities is supported only if your fleet uses a launch template. Note that when you set priorities for `capacityOptimizedPrioritized`, the same priorities are also applied to your On-Demand Instances if the `OnDemandAllocationStrategy` is set to `prioritized`. For an example configuration, see [Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities \(p. 940\)](#).

Attribute-based instance type selection for Spot Fleet

When you create a Spot Fleet, you must specify one or more instance types for configuring the On-Demand Instances and Spot Instances in the fleet. As an alternative to manually specifying the instance types, you can specify the attributes that an instance must have, and Amazon EC2 will identify all the instance types with those attributes. This is known as *attribute-based instance type selection*. For

example, you can specify the minimum and maximum number of vCPUs required for your instances, and Spot Fleet will launch the instances using any available instance types that meet those vCPU requirements.

Attribute-based instance type selection is ideal for workloads and frameworks that can be flexible about what instance types they use, such as when running containers or web fleets, processing big data, and implementing continuous integration and deployment (CI/CD) tooling.

Benefits

Attribute-based instance type selection has the following benefits:

- With so many instance types available, finding the right instance types for your workload can be time consuming. When you specify instance attributes, the instance types will automatically have the required attributes for your workload.
- To manually specify multiple instance types for a Spot Fleet, you must create a separate launch template override for each instance type. But with attribute-based instance type selection, to provide multiple instance types, you need only specify the instance attributes in the launch template or in a launch template override.
- When you specify instance attributes rather than instance types, your fleet can use newer generation instance types as they're released, "future proofing" the fleet's configuration.
- When you specify instance attributes rather than instance types, Spot Fleet can select from a wide range of instance types for launching Spot Instances, which adheres to the [Spot best practice of instance type flexibility \(p. 443\)](#).

Topics

- [How attribute-based instance type selection works \(p. 843\)](#)
- [Considerations \(p. 845\)](#)
- [Create a Spot Fleet with attribute-based instance type selection \(p. 845\)](#)
- [Examples of configurations that are valid and not valid \(p. 851\)](#)
- [Preview instance types with specified attributes \(p. 857\)](#)

How attribute-based instance type selection works

To use attribute-based instance type selection in your fleet configuration, you replace the list of instance types with a list of instance attributes that your instances require. Spot Fleet will launch instances on any available instance types that have the specified instance attributes.

Topics

- [Types of instance attributes \(p. 843\)](#)
- [Where to configure attribute-based instance type selection \(p. 843\)](#)
- [How Spot Fleet uses attribute-based instance type selection when provisioning a fleet \(p. 844\)](#)
- [Price protection \(p. 844\)](#)

Types of instance attributes

There are several instance attributes that you can specify to express your compute requirements. For a description of each attribute and the default values, see [InstanceRequirements](#) in the *Amazon EC2 API Reference*.

Where to configure attribute-based instance type selection

Depending on whether you use the console or the AWS CLI, you can specify the instance attributes for attribute-based instance type selection as follows:

In the console, you can specify the instance attributes in one or both of the following fleet configuration components:

- In a launch template, and reference the launch template in the fleet request
- In the fleet request

In the AWS CLI, you can specify the instance attributes in one or all of the following fleet configuration components:

- In a launch template, and reference the launch template in the fleet request
- In a launch template override

If you want a mix of instances that use different AMIs, you can specify instance attributes in multiple launch template overrides. For example, different instance types can use x86 and Arm-based processors.

- In a launch specification

How Spot Fleet uses attribute-based instance type selection when provisioning a fleet

Spot Fleet provisions a fleet in the following way:

- Spot Fleet identifies the instance types that have the specified attributes.
- Spot Fleet uses price protection to determine which instance types to exclude.
- Spot Fleet determines the capacity pools from which it will consider launching the instances based on the AWS Regions or Availability Zones that have matching instance types.
- Spot Fleet applies the specified allocation strategy to determine from which capacity pools to launch the instances.

Note that attribute-based instance type selection does not pick the capacity pools from which to provision the fleet; that's the job of the allocation strategies. There might be a large number of instance types with the specified attributes, and some of them might be expensive. The default allocation strategy of `lowest-price` for Spot and On-Demand guarantees that Spot Fleet will launch instances from the least expensive capacity pools.

If you specify an allocation strategy, Spot Fleet will launch instances according to the specified allocation strategy.

- For Spot Instances, attribute-based instance type selection supports the `capacity-optimized` and `lowest-price` allocation strategies.
- For On-Demand Instances, attribute-based instance type selection supports the `lowest-price` allocation strategy.
- If there is no capacity for the instance types with the specified instance attributes, no instances can be launched, and the fleet returns an error.

Price protection

Price protection is a feature that prevents your Spot Fleet from using instance types that you would consider too expensive even if they happen to fit the attributes that you specified. When you create a fleet with attribute-based instance type selection, price protection is enabled by default, with separate thresholds for On-Demand Instances and Spot Instances. When Amazon EC2 selects instance types with your attributes, it excludes instance types priced above your threshold. The thresholds represent the maximum you'll pay, expressed as a percentage above the least expensive M, C, or R instance type with your specified attributes.

If you don't specify a threshold, the following thresholds are used by default:

- For On-Demand Instances, the price protection threshold is set at 20 percent.
- For Spot Instances, the price protection threshold is set at 100 percent.

To specify the price protection threshold

While creating the Spot Fleet, configure the fleet for attribute-based instance type selection, and then do the following:

- Console

To specify the On-Demand Instance price protection threshold, under **Additional instance attribute**, choose **On-demand price protection**, and then choose **Add attribute**. For **On-Demand price protection percentage**, enter the price protection threshold as a percentage.

To specify the Spot Instance price protection threshold, under **Additional instance attribute**, choose **Spot price protection**, and then choose **Add attribute**. For **Spot price protection percentage**, enter the price protection threshold as a percentage.

- AWS CLI

To specify the On-Demand Instance price protection threshold, in the JSON configuration file, in the `InstanceRequirements` structure, for `OnDemandMaxPricePercentageOverLowestPrice`, enter the price protection threshold as a percentage.

To specify the Spot Instance price protection threshold, in the JSON configuration file, in the `InstanceRequirements` structure, for `SpotMaxPricePercentageOverLowestPrice`, enter the price protection threshold as a percentage.

For more information about creating the fleet, see [Create a Spot Fleet with attribute-based instance type selection \(p. 845\)](#).

Note

When creating the Spot Fleet, if you set **Total target capacity** type to **vCPUs or Memory (MiB)** (console) or `TargetCapacityUnitType` to `vcpu` or `memory-mib` (AWS CLI), the price protection threshold is applied based on the per-vCPU or per-memory price instead of the per-instance price.

Considerations

- You can specify either instance types or instance attributes in a Spot Fleet, but not both at the same time.

When using the CLI, the launch template overrides will override the launch template. For example, if the launch template contains an instance type and the launch template override contains instance attributes, the instances that are identified by the instance attributes will override the instance type in the launch template.

- When using the CLI, when you specify instance attributes as overrides, you can't also specify weights or priorities.
- You can specify a maximum of three `InstanceRequirements` structures in a request configuration.

Create a Spot Fleet with attribute-based instance type selection

You can configure a fleet to use attribute-based instance type selection by using the Amazon EC2 console or the AWS CLI.

Topics

- [Create a Spot Fleet using the console \(p. 846\)](#)

- [Create a Spot Fleet using the AWS CLI \(p. 846\)](#)

Create a Spot Fleet using the console

To configure a Spot Fleet for attribute-based instance type selection (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**, and then choose **Request Spot Instances**.
3. Follow the steps to create a Spot Fleet. For more information, see [Create a Spot Fleet request using defined parameters \(console\) \(p. 872\)](#).

While creating the Spot Fleet, configure the fleet for attribute-based instance type selection as follows:

- a. For **Instance type requirements**, choose **Specify instance attributes that match your compute requirements**.
- b. For **vCPUs**, enter the desired minimum and maximum number of vCPUs. To specify no limit, select **No minimum**, **No maximum**, or both.
- c. For **Memory (GiB)**, enter the desired minimum and maximum amount of memory. To specify no limit, select **No minimum**, **No maximum**, or both.
- d. (Optional) For **Additional instance attributes**, you can optionally specify one or more attributes to express your compute requirements in more detail. Each additional attribute adds further constraints to your request.
- e. (Optional) Expand **Preview matching instance types** to view the instance types that have your specified attributes.

Create a Spot Fleet using the AWS CLI

To create a Spot Fleet (AWS CLI)

- Use the [request-spot-fleet](#) (AWS CLI) command to create a Spot Fleet. Specify the fleet configuration in a JSON file.

```
aws ec2 request-spot-fleet \
  --region us-east-1 \
  --cli-input-json file://file_name.json
```

The following JSON file contains all of the parameters that can be specified when configuring a Spot Fleet. The parameters for attribute-based instance type selection are located in the `InstanceRequirements` structure. For a description of each attribute and the default values, see [InstanceRequirements](#) in the *Amazon EC2 API Reference*.

Note

When `InstanceRequirements` is included in the fleet configuration, `InstanceType` and `WeightedCapacity` must be excluded; they cannot determine the fleet configuration at the same time as instance attributes.

Examples of configurations that are valid and not valid

If you use the AWS CLI to create a Spot Fleet, you must make sure that your fleet configuration is valid. The following examples show configurations that are valid and not valid.

Configurations are considered not valid when they contain the following:

- A single `Overrides` structure with both `InstanceRequirements` and `InstanceType`
- Two `Overrides` structures, one with `InstanceRequirements` and the other with `InstanceType`
- Two `InstanceRequirements` structures with overlapping attribute values within the same `LaunchTemplateSpecification`

Example configurations

- [Valid configuration: Single launch template with overrides \(p. 851\)](#)
- [Valid configuration: Single launch template with multiple `InstanceRequirements` \(p. 852\)](#)
- [Valid configuration: Two launch templates, each with overrides \(p. 853\)](#)
- [Configuration not valid: Overrides contain `InstanceRequirements` and `InstanceType` \(p. 854\)](#)
- [Configuration not valid: Two `Overrides` contain `InstanceRequirements` and `InstanceType` \(p. 855\)](#)
- [Valid configuration: Only `InstanceRequirements` specified, no overlapping attribute values \(p. 856\)](#)
- [Configuration not valid: Overlapping attribute values \(p. 857\)](#)

Valid configuration: Single launch template with overrides

The following configuration is valid. It contains one launch template and one `Overrides` structure containing one `InstanceRequirements` structure. A text explanation of the example configuration follows.

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "lowestPrice",  
        "ExcessCapacityTerminationPolicy": "default",  
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",  
        "LaunchTemplateConfigs": [  
            {  
                "LaunchTemplateSpecification": {  
                    "LaunchTemplateName": "My-launch-template",  
                    "Version": "1"  
                },  
                "Overrides": [  
                    {  
                        "InstanceRequirements": {  
                            "VCpuCount": {  
                                "Min": 2,  
                                "Max": 8  
                            },  
                            "MemoryMiB": {  
                                "Min": 0,  
                                "Max": 10240  
                            },  
                            "MemoryGiBPerVCpu": {  
                                "Max": 10000  
                            },  
                            "RequireHibernateSupport": true  
                        }  
                    }  
                ]  
            }  
        ],  
        "TargetCapacity": 5000,  
        "OnDemandTargetCapacity": 0,  
        "TargetCapacityUnitType": "vcpu"  
    }  
}
```

InstanceRequirements

To use attribute-based instance selection, you must include the `InstanceRequirements` structure in your fleet configuration, and specify the desired attributes for the instances in the fleet.

In the preceding example, the following instance attributes are specified:

- `VCpuCount` – The instance types must have a minimum of 2 and a maximum of 8 vCPUs.
- `MemoryMiB` – The instance types must have a maximum of 10240 MiB of memory. A minimum of 0 indicates no minimum limit.
- `MemoryGiBPerVCpu` – The instance types must have a maximum of 10,000 GiB of memory per vCPU. The `Min` parameter is optional. By omitting it, you indicate no minimum limit.

TargetCapacityUnitType

The `TargetCapacityUnitType` parameter specifies the unit for the target capacity. In the example, the target capacity is 5000 and the target capacity unit type is `vcpu`, which together specify a desired target capacity of 5,000 vCPUs. Spot Fleet will launch enough instances so that the total number of vCPUs in the fleet is 5,000 vCPUs.

Valid configuration: Single launch template with multiple InstanceRequirements

The following configuration is valid. It contains one launch template and one `Overrides` structure containing two `InstanceRequirements` structures. The attributes specified

in `InstanceRequirements` are valid because the values do not overlap—the first `InstanceRequirements` structure specifies a `vCpuCount` of 0-2 vCPUs, while the second `InstanceRequirements` structure specifies 4-8 vCPUs.

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "lowestPrice",  
        "ExcessCapacityTerminationPolicy": "default",  
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",  
        "LaunchTemplateConfigs": [  
            {  
                "LaunchTemplateSpecification": {  
                    "LaunchTemplateName": "MyLaunchTemplate",  
                    "Version": "1"  
                },  
                "Overrides": [  
                    {  
                        "InstanceRequirements": {  
                            "vCpuCount": {  
                                "Min": 0,  
                                "Max": 2  
                            },  
                            "MemoryMiB": {  
                                "Min": 0  
                            }  
                        }  
                    },  
                    {  
                        "InstanceRequirements": {  
                            "vCpuCount": {  
                                "Min": 4,  
                                "Max": 8  
                            },  
                            "MemoryMiB": {  
                                "Min": 0  
                            }  
                        }  
                    }  
                ]  
            }  
        ],  
        "TargetCapacity": 1,  
        "OnDemandTargetCapacity": 0,  
        "Type": "maintain"  
    }  
}
```

Valid configuration: Two launch templates, each with overrides

The following configuration is valid. It contains two launch templates, each with one `Overrides` structure containing one `InstanceRequirements` structure. This configuration is useful for `arm` and `x86` architecture support in the same fleet.

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "lowestPrice",  
        "ExcessCapacityTerminationPolicy": "default",  
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",  
        "LaunchTemplateConfigs": [  
            {  
                "LaunchTemplateSpecification": {  
                    "LaunchTemplateName": "armLaunchTemplate",  
                    "Version": "1"  
                },  
                "Overrides": [  
                    {  
                        "InstanceRequirements": {  
                            "vCpuCount": {  
                                "Min": 0,  
                                "Max": 2  
                            },  
                            "MemoryMiB": {  
                                "Min": 0  
                            }  
                        }  
                    },  
                    {  
                        "InstanceRequirements": {  
                            "vCpuCount": {  
                                "Min": 4,  
                                "Max": 8  
                            },  
                            "MemoryMiB": {  
                                "Min": 0  
                            }  
                        }  
                    }  
                ]  
            }  
        ]  
    }  
}
```

```
        },
        "Overrides": [
        {
            "InstanceRequirements": {
                "VCpuCount": {
                    "Min": 0,
                    "Max": 2
                },
                "MemoryMiB": {
                    "Min": 0
                }
            }
        },
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "x86LaunchTemplate",
                "Version": "1"
            },
            "Overrides": [
            {
                "InstanceRequirements": {
                    "VCpuCount": {
                        "Min": 0,
                        "Max": 2
                    },
                    "MemoryMiB": {
                        "Min": 0
                    }
                }
            }
        ]
    }
],
"TargetCapacity": 1,
"OnDemandTargetCapacity": 0,
"Type": "maintain"
}
}
```

Configuration not valid: Overrides contain InstanceRequirements and InstanceType

The following configuration is not valid. The Overrides structure contains both InstanceRequirements and InstanceType. For the Overrides, you can specify either InstanceRequirements or InstanceType, but not both.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "lowestPrice",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",
        "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "MyLaunchTemplate",
                "Version": "1"
            },
            "Overrides": [
            {
                "InstanceRequirements": {
                    "VCpuCount": {
                        "Min": 0,
                        "Max": 2
                    },
                    "MemoryMiB": {
                        "Min": 0
                    }
                }
            }
        ]
    }
},
"Type": "onDemand"
}
```

```
        "Min": 0
    }
}
{
    "InstanceType": "m5.large"
}
]
}
],
"TargetCapacity": 1,
"OnDemandTargetCapacity": 0,
"Type": "maintain"
}
}
```

Configuration not valid: Two Overrides contain InstanceRequirements and InstanceType

The following configuration is not valid. The Overrides structures contain both InstanceRequirements and InstanceType. You can specify either InstanceRequirements or InstanceType, but not both, even if they're in different Overrides structures.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "lowestPrice",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                    {
                        "InstanceRequirements": {
                            "VCpuCount": {
                                "Min": 0,
                                "Max": 2
                            },
                            "MemoryMiB": {
                                "Min": 0
                            }
                        }
                    }
                ]
            },
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyOtherLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                    {
                        "InstanceType": "m5.large"
                    }
                ]
            }
        ],
        "TargetCapacity": 1,
        "OnDemandTargetCapacity": 0,
        "Type": "maintain"
    }
}
```

```
}
```

Valid configuration: Only InstanceRequirements specified, no overlapping attribute values

The following configuration is valid. It contains two `LaunchTemplateSpecification` structures, each with a launch template and an `Overrides` structure containing an `InstanceRequirements` structure. The attributes specified in `InstanceRequirements` are valid because the values do not overlap—the first `InstanceRequirements` structure specifies a `VCpuCount` of 0-2 vCPUs, while the second `InstanceRequirements` structure specifies 4-8 vCPUs.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "lowestPrice",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                    {
                        "InstanceRequirements": {
                            "VCpuCount": {
                                "Min": 0,
                                "Max": 2
                            },
                            "MemoryMiB": {
                                "Min": 0
                            }
                        }
                    }
                ]
            },
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyOtherLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                    {
                        "InstanceRequirements": {
                            "VCpuCount": {
                                "Min": 4,
                                "Max": 8
                            },
                            "MemoryMiB": {
                                "Min": 0
                            }
                        }
                    }
                ]
            }
        ],
        "TargetCapacity": 1,
        "OnDemandTargetCapacity": 0,
        "Type": "maintain"
    }
}
```

Configuration not valid: Overlapping attribute values

The following configuration is not valid. The two `InstanceRequirements` structures each contain `"VCpuCount": {"Min": 0, "Max": 2}`. The values for these attributes overlap, which will result in duplicate capacity pools.

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "lowestPrice",  
        "ExcessCapacityTerminationPolicy": "default",  
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",  
        "LaunchTemplateConfigs": [  
            {  
                "LaunchTemplateSpecification": {  
                    "LaunchTemplateName": "MyLaunchTemplate",  
                    "Version": "1"  
                },  
                "Overrides": [  
                    {  
                        "InstanceRequirements": {  
                            "VCpuCount": {  
                                "Min": 0,  
                                "Max": 2  
                            },  
                            "MemoryMiB": {  
                                "Min": 0  
                            }  
                        },  
                        {  
                            "InstanceRequirements": {  
                                "VCpuCount": {  
                                    "Min": 0,  
                                    "Max": 2  
                                },  
                                "MemoryMiB": {  
                                    "Min": 0  
                                }  
                            }  
                        }  
                    ]  
                ]  
            },  
            "TargetCapacity": 1,  
            "OnDemandTargetCapacity": 0,  
            "Type": "maintain"  
        ]  
    }  
}
```

Preview instance types with specified attributes

You can use the [get-instance-types-from-instance-requirements](#) AWS CLI command to preview the instance types that match the attributes that you specify. This is especially useful for working out what attributes to specify in your request configuration without launching any instances. Note that the command does not consider available capacity.

To preview a list of instance types by specifying attributes using the AWS CLI

1. (Optional) To generate all of the possible attributes that can be specified, use the [get-instance-types-from-instance-requirements](#) command and the `--generate-cli-skeleton` parameter. You can optionally direct the output to a file to save it by using `input > attributes.json`.

```
aws ec2 get-instance-types-from-instance-requirements \
--region us-east-1 \
--generate-cli-skeleton input > attributes.json
```

Expected output

```
{
    "DryRun": true,
    "ArchitectureTypes": [
        "x86_64_mac"
    ],
    "VirtualizationTypes": [
        "paravirtual"
    ],
    "InstanceRequirements": {
        "VCpuCount": {
            "Min": 0,
            "Max": 0
        },
        "MemoryMiB": {
            "Min": 0,
            "Max": 0
        },
        "CpuManufacturers": [

        ],
        "AcceleratorTotalMemoryMiB": {
            "Min": 0,
            "Max": 0
        }
    },
    "MaxResults": 0,
    "NextToken": ""
}
```

2. Create a JSON configuration file using the output from the previous step, and configure it as follows:

Note

You must provide values for `ArchitectureTypes`, `VirtualizationTypes`, `VCpuCount`, and `MemoryMiB`. You can omit the other attributes; when omitted, the default values are used.

For a description of each attribute and their default values, see [get-instance-types-from-instance-requirements](#) in the *Amazon EC2 Command Line Reference*.

- a. For `ArchitectureTypes`, specify one or more types of processor architecture.
 - b. For `VirtualizationTypes`, specify one or more types of virtualization.
 - c. For `VCpuCount`, specify the minimum and maximum number of vCPUs. To specify no minimum limit, for `Min`, specify 0. To specify no maximum limit, omit the `Max` parameter.
 - d. For `MemoryMiB`, specify the minimum and maximum amount of memory in MiB. To specify no minimum limit, for `Min`, specify 0. To specify no maximum limit, omit the `Max` parameter.
 - e. You can optionally specify one or more of the other attributes to further constrain the list of instance types that are returned.
3. To preview the instance types that have the attributes that you specified in the JSON file, use the [get-instance-types-from-instance-requirements](#) command, and specify the name and path to your JSON file by using the `--cli-input-json` parameter. You can optionally format the output to appear in a table format.

```
aws ec2 get-instance-types-from-instance-requirements \
--cli-input-json file://attributes.json \
--output table
```

Example **attributes.json** file

In this example, the required attributes are included in the JSON file. They are `ArchitectureTypes`, `VirtualizationTypes`, `VCpuCount`, and `MemoryMiB`. In addition, the optional `InstanceGenerations` attribute is also included. Note that for `MemoryMiB`, the `Max` value can be omitted to indicate that there is no limit.

```
{
    "ArchitectureTypes": [
        "x86_64"
    ],
    "VirtualizationTypes": [
        "hvm"
    ],
    "InstanceRequirements": {
        "VCpuCount": {
```

```
        "Min": 4,
        "Max": 6
    },
    "MemoryMiB": {
        "Min": 2048
    },
    "InstanceGenerations": [
        "current"
    ]
}
}
```

Example output

```
-----
|GetInstanceTypesFromInstanceRequirements|
+-----+
||      InstanceTypes      ||
|+-----+|
||      InstanceType      ||
|+-----+|
||  c4.xlarge           ||
||  c5.xlarge            ||
||  c5a.xlarge           ||
||  c5ad.xlarge          ||
||  c5d.xlarge           ||
||  c5n.xlarge           ||
||  d2.xlarge            ||
...
...
```

4. After identifying instance types that meet your needs, make note of the instance attributes that you used so that you can use them when configuring your fleet request.

On-Demand in Spot Fleet

To ensure that you always have instance capacity, you can include a request for On-Demand capacity in your Spot Fleet request. In your Spot Fleet request, you specify your desired target capacity and how much of that capacity must be On-Demand. The balance comprises Spot capacity, which is launched if there is available Amazon EC2 capacity and availability. For example, if in your Spot Fleet request you specify target capacity as 10 and On-Demand capacity as 8, Amazon EC2 launches 8 capacity units as On-Demand, and 2 capacity units ($10-8=2$) as Spot.

Prioritize instance types for On-Demand capacity

When Spot Fleet attempts to fulfill your On-Demand capacity, it defaults to launching the lowest-priced instance type first. If `OnDemandAllocationStrategy` is set to `prioritized`, Spot Fleet uses priority to determine which instance type to use first in fulfilling On-Demand capacity. The priority is assigned to the launch template override, and the highest priority is launched first.

For example, you have configured three launch template overrides, each with a different instance type: `c3.large`, `c4.large`, and `c5.large`. The On-Demand price for `c5.large` is less than for `c4.large`. `c3.large` is the cheapest. If you do not use priority to determine the order, the fleet fulfills On-Demand capacity by starting with `c3.large`, and then `c5.large`. Because you often have unused Reserved Instances for `c4.large`, you can set the launch template override priority so that the order is `c4.large`, `c3.large`, and then `c5.large`.

Capacity Rebalancing

You can configure Spot Fleet to launch a replacement Spot Instance when Amazon EC2 emits a rebalance recommendation to notify you that a Spot Instance is at an elevated risk of interruption. Capacity Rebalancing helps you maintain workload availability by proactively augmenting your fleet with a new Spot Instance before a running instance is interrupted by Amazon EC2. For more information, see [EC2 instance rebalance recommendations \(p. 472\)](#).

To configure Spot Fleet to launch a replacement Spot Instance, you can use the Amazon EC2 console or the AWS CLI.

- Amazon EC2 console: You must select the **Capacity rebalance** check box when you create the Spot Fleet. For more information, see step 6.d. in [Create a Spot Fleet request using defined parameters \(console\) \(p. 872\)](#).
- AWS CLI: Use the `request-spot-fleet` command and the relevant parameters in the `SpotMaintenanceStrategies` structure. For more information, see the [example launch configuration \(p. 938\)](#).

Limitations

- Capacity Rebalancing is available only for fleets of type `maintain`.
- When the fleet is running, you can't modify the Capacity Rebalancing setting. To change the Capacity Rebalancing setting, you must delete the fleet and create a new fleet.

Configuration options

The `ReplacementStrategy` for Spot Fleet supports the following two values:

`launch-before-terminate`

Spot Fleet terminates the Spot Instances that receive a rebalance notification after new replacement Spot Instances are launched. When you specify `launch-before-terminate`, you must also specify a value for `termination-delay`. After the new replacement instances are launched, Spot Fleet waits for the duration of the `termination-delay`, and then terminates the old instances. For `termination-delay`, the minimum is 120 seconds (2 minutes), and the maximum is 7200 seconds (2 hours).

We recommend that you use `launch-before-terminate` only if you can predict how long your instance shutdown procedures will take to complete. This will ensure that the old instances are terminated only after the shutdown procedures are completed. Note that Amazon EC2 can interrupt the old instances with a two-minute warning before the `termination-delay`.

We strongly recommend against using the `lowestPrice` allocation strategy in combination with `launch-before-terminate` to avoid having replacement Spot Instances that are also at an elevated risk of interruption.

`launch`

Spot Fleet launches replacement Spot Instances when a rebalance notification is emitted for existing Spot Instances. Spot Fleet does not terminate the instances that receive a rebalance notification. You can terminate the old instances, or you can leave them running. You are charged for all instances while they are running.

Considerations

If you configure a Spot Fleet for Capacity Rebalancing, consider the following:

Spot Fleet can launch new replacement Spot Instances until fulfilled capacity is double target capacity

When a Spot Fleet is configured for Capacity Rebalancing, the fleet attempts to launch a new replacement Spot Instance for every Spot Instance that receives a rebalance recommendation. After a Spot Instance receives a rebalance recommendation, it is no longer counted as part of the fulfilled capacity. Depending on the replacement strategy, Spot Fleet either terminates the instance after a preconfigured termination delay, or leaves it running. This gives you the opportunity to perform [rebalancing actions \(p. 472\)](#) on the instance.

If your fleet reaches double its target capacity, it stops launching new replacement instances even if the replacement instances themselves receive a rebalance recommendation.

For example, you create a Spot Fleet with a target capacity of 100 Spot Instances. All of the Spot Instances receive a rebalance recommendation, which causes Spot Fleet to launch 100 replacement Spot Instances. This raises the number of fulfilled Spot Instances to 200, which is double the target capacity. Some of the replacement instances receive a rebalance recommendation, but no more replacement instances are launched because the fleet cannot exceed double its target capacity.

Note that you are charged for all of the instances while they are running.

We recommend that you configure Spot Fleet to terminate Spot Instances that receive a rebalance recommendation

If you configure your Spot Fleet for Capacity Rebalancing, we recommend that you choose `launch-before-terminate` with an appropriate termination delay only if you can predict how long your instance shutdown procedures will take to complete. This will ensure that the old instances are terminated only after the shutdown procedures are completed.

If you choose to terminate the instances that are recommended for rebalance yourself, we recommend that you monitor the rebalance recommendation signal that is received by the Spot Instances in the fleet. By monitoring the signal, you can quickly perform [rebalancing actions \(p. 472\)](#) on the affected instances before Amazon EC2 interrupts them, and then you can manually terminate them. If you do not terminate the instances, you continue paying for them while they are running. Spot Fleet does not automatically terminate the instances that receive a rebalance recommendation.

You can set up notifications using Amazon EventBridge or instance metadata. For more information, see [Monitor rebalance recommendation signals \(p. 473\)](#).

Spot Fleet does not count instances that receive a rebalance recommendation when calculating fulfilled capacity during scale in or out

If your Spot Fleet is configured for Capacity Rebalancing, and you change the target capacity to either scale in or scale out, the fleet does not count the instances that are marked for rebalance as part of the fulfilled capacity, as follows:

- Scale in – If you decrease your desired target capacity, the fleet terminates instances that are not marked for rebalance until the desired capacity is reached. The instances that are marked for rebalance are not counted towards the fulfilled capacity.

For example, you create a Spot Fleet with a target capacity of 100 Spot Instances. 10 instances receive a rebalance recommendation, so the fleet launches 10 new replacement instances, resulting in a fulfilled capacity of 110 instances. You then reduce the target capacity to 50 (scale in), but the fulfilled capacity is actually 60 instances because the 10 instances that are marked for rebalance are not terminated by the fleet. You need to manually terminate these instances, or you can leave them running.

- Scale out – If you increase your desired target capacity, the fleet launches new instances until the desired capacity is reached. The instances that are marked for rebalance are not counted towards the fulfilled capacity.

For example, you create a Spot Fleet with a target capacity of 100 Spot Instances. 10 instances receive a rebalance recommendation, so the fleet launches 10 new replacement instances, resulting in a fulfilled capacity of 110 instances. You then increase the target capacity to 200 (scale out), but the fulfilled capacity is actually 210 instances because the 10 instances that are marked for rebalance are not counted by the fleet as part of the target capacity. You need to manually terminate these instances, or you can leave them running.

Provide as many Spot capacity pools in the request as possible

Configure your Spot Fleet to use multiple instance types and Availability Zones. This provides the flexibility to launch Spot Instances in various Spot capacity pools. For more information, see [Be flexible about instance types and Availability Zones \(p. 443\)](#).

Avoid an elevated risk of interruption of replacement Spot Instances

Your replacement Spot Instances may be at an elevated risk of interruption if you use the lowest-price allocation strategy. This is because Amazon EC2 will always launch instances in the lowest-priced pool that has available capacity at that moment, even if your replacement Spot Instances are likely to be interrupted soon after being launched. To avoid an elevated risk of interruption, we strongly recommend against using the lowest-price allocation strategy, and instead recommend the capacity-optimized or capacity-optimized-prioritized allocation strategy. These strategies ensure that replacement Spot Instances are launched in the most optimal Spot capacity pools, and are therefore less likely to be interrupted in the near future. For more information, see [Use the capacity optimized allocation strategy \(p. 443\)](#).

Spot price overrides

Each Spot Fleet request can include a global maximum price, or use the default (the On-Demand price). Spot Fleet uses this as the default maximum price for each of its launch specifications.

You can optionally specify a maximum price in one or more launch specifications. This price is specific to the launch specification. If a launch specification includes a specific price, the Spot Fleet uses this maximum price, overriding the global maximum price. Any other launch specifications that do not include a specific maximum price still use the global maximum price.

Control spending

Spot Fleet stops launching instances when it has either reached the target capacity or the maximum amount you're willing to pay. To control the amount you pay per hour for your fleet, you can specify the `SpotMaxTotalPrice` for Spot Instances and the `OnDemandMaxTotalPrice` for On-Demand Instances. When the maximum total price is reached, Spot Fleet stops launching instances even if it hasn't met the target capacity.

The following examples show two different scenarios. In the first, Spot Fleet stops launching instances when it has met the target capacity. In the second, Spot Fleet stops launching instances when it has reached the maximum amount you're willing to pay.

Example: Stop launching instances when target capacity is reached

Given a request for `m4.1large` On-Demand Instances, where:

- On-Demand Price: \$0.10 per hour
- `OnDemandTargetCapacity`: 10
- `OnDemandMaxTotalPrice`: \$1.50

Spot Fleet launches 10 On-Demand Instances because the total of \$1.00 (10 instances x \$0.10) does not exceed the `OnDemandMaxTotalPrice` of \$1.50.

Example: Stop launching instances when maximum total price is reached

Given a request for `m4.large` On-Demand Instances, where:

- On-Demand Price: \$0.10 per hour
- `OnDemandTargetCapacity: 10`
- `OnDemandMaxTotalPrice: $0.80`

If Spot Fleet launches the On-Demand target capacity (10 On-Demand Instances), the total cost per hour would be \$1.00. This is more than the amount (\$0.80) specified for `OnDemandMaxTotalPrice`. To prevent spending more than you're willing to pay, Spot Fleet launches only 8 On-Demand Instances (below the On-Demand target capacity) because launching more would exceed the `OnDemandMaxTotalPrice`.

Spot Fleet instance weighting

When you request a fleet of Spot Instances, you can define the capacity units that each instance type would contribute to your application's performance, and adjust your maximum price for each Spot capacity pool accordingly using *instance weighting*.

By default, the price that you specify is *per instance hour*. When you use the instance weighting feature, the price that you specify is *per unit hour*. You can calculate your price per unit hour by dividing your price for an instance type by the number of units that it represents. Spot Fleet calculates the number of Spot Instances to launch by dividing the target capacity by the instance weight. If the result isn't an integer, the Spot Fleet rounds it up to the next integer, so that the size of your fleet is not below its target capacity. Spot Fleet can select any pool that you specify in your launch specification, even if the capacity of the instances launched exceeds the requested target capacity.

The following tables provide examples of calculations to determine the price per unit for a Spot Fleet request with a target capacity of 10.

Instance type	Instance weight	Price per instance hour	Price per unit hour	Number of instances launched
<code>r3.xlarge</code>	2	\$0.05	.025 (.05 divided by 2)	5 (10 divided by 2)

Instance type	Instance weight	Price per instance hour	Price per unit hour	Number of instances launched
<code>r3.8xlarge</code>	8	\$0.10	.0125 (.10 divided by 8)	2 (10 divided by 8, result rounded up)

Use Spot Fleet instance weighting as follows to provision the target capacity that you want in the pools with the lowest price per unit at the time of fulfillment:

1. Set the target capacity for your Spot Fleet either in instances (the default) or in the units of your choice, such as virtual CPUs, memory, storage, or throughput.
2. Set the price per unit.

3. For each launch configuration, specify the weight, which is the number of units that the instance type represents toward the target capacity.

Instance weighting example

Consider a Spot Fleet request with the following configuration:

- A target capacity of 24
- A launch specification with an instance type `r3.2xlarge` and a weight of 6
- A launch specification with an instance type `c3.xlarge` and a weight of 5

The weights represent the number of units that instance type represents toward the target capacity. If the first launch specification provides the lowest price per unit (price for `r3.2xlarge` per instance hour divided by 6), the Spot Fleet would launch four of these instances (24 divided by 6).

If the second launch specification provides the lowest price per unit (price for `c3.xlarge` per instance hour divided by 5), the Spot Fleet would launch five of these instances (24 divided by 5, result rounded up).

Instance weighting and allocation strategy

Consider a Spot Fleet request with the following configuration:

- A target capacity of 30
- A launch specification with an instance type `c3.2xlarge` and a weight of 8
- A launch specification with an instance type `m3.xlarge` and a weight of 8
- A launch specification with an instance type `r3.xlarge` and a weight of 8

The Spot Fleet would launch four instances (30 divided by 8, result rounded up). With the `lowestPrice` strategy, all four instances come from the pool that provides the lowest price per unit. With the diversified strategy, the Spot Fleet launches one instance in each of the three pools, and the fourth instance in whichever pool provides the lowest price per unit.

Work with Spot Fleets

To start using a Spot Fleet, you create a Spot Fleet request that includes the target capacity, an optional On-Demand portion, one or more launch specifications for the instances, and the maximum price that you are willing to pay. The fleet request must include a launch specification that defines the information that the fleet needs to launch an instance, such as an AMI, instance type, subnet or Availability Zone, and one or more security groups.

If your fleet includes Spot Instances, Amazon EC2 can attempt to maintain your fleet target capacity as Spot prices change.

It is not possible to modify the target capacity of a one-time request after it's been submitted. To change the target capacity, cancel the request and submit a new one.

A Spot Fleet request remains active until it expires or you cancel it. When you cancel a fleet request, you can specify whether canceling the request terminates the Spot Instances in that fleet.

Contents

- [Spot Fleet request states \(p. 866\)](#)
- [Spot Fleet health checks \(p. 866\)](#)
- [Spot Fleet permissions \(p. 867\)](#)
- [Create a Spot Fleet request \(p. 872\)](#)

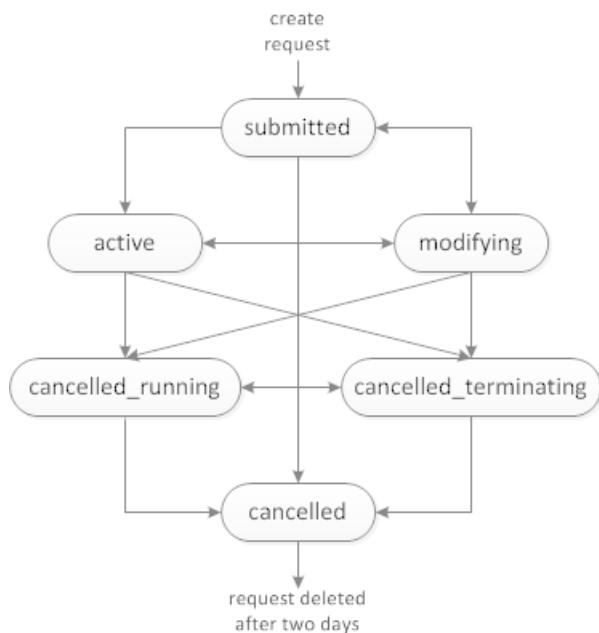

- Tag a Spot Fleet (p. 875)
 - Describe your Spot Fleet (p. 882)
 - Modify a Spot Fleet request (p. 882)
 - Cancel a Spot Fleet request (p. 883)

Spot Fleet request states

A Spot Fleet request can be in one of the following states:

- submitted – The Spot Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances.
 - active – The Spot Fleet has been validated and Amazon EC2 is attempting to maintain the target number of running Spot Instances. The request remains in this state until it is modified or canceled.
 - modifying – The Spot Fleet request is being modified. The request remains in this state until the modification is fully processed or the Spot Fleet is canceled. A one-time request cannot be modified, and this state does not apply to such Spot requests.
 - cancelled_running – The Spot Fleet is canceled and does not launch additional Spot Instances. Its existing Spot Instances continue to run until they are interrupted or terminated. The request remains in this state until all instances are interrupted or terminated.
 - cancelled_terminating – The Spot Fleet is canceled and its Spot Instances are terminating. The request remains in this state until all instances are terminated.
 - cancelled – The Spot Fleet is canceled and has no running Spot Instances. The Spot Fleet request is deleted two days after its instances were terminated.

The following illustration represents the transitions between the request states. If you exceed your Spot Fleet limits, the request is canceled immediately.

Spot Fleet health checks

Spot Fleet checks the health status of the Spot Instances in the fleet every two minutes. The health status of an instance is either healthy or unhealthy.

Spot Fleet determines the health status of an instance by using the status checks provided by Amazon EC2. An instance is determined as **unhealthy** when the status of either the instance status check or the system status check is impaired for three consecutive health checks. For more information, see [Status checks for your instances \(p. 945\)](#).

You can configure your fleet to replace unhealthy Spot Instances. After enabling health check replacement, a Spot Instance is replaced when it is reported as **unhealthy**. The fleet could go below its target capacity for up to a few minutes while an unhealthy Spot Instance is being replaced.

Requirements

- Health check replacement is supported only for Spot Fleets that maintain a target capacity (fleets of type **maintain**), not for one-time Spot Fleets (fleets of type **request**).
- Health check replacement is supported only for Spot Instances. This feature is not supported for On-Demand Instances.
- You can configure your Spot Fleet to replace unhealthy instances only when you create it.
- IAM users can use health check replacement only if they have permission to call the `ec2:DescribeInstanceStatus` action.

Console

To configure a Spot Fleet to replace unhealthy Spot Instances using the console

1. Follow the steps for creating a Spot Fleet. For more information, see [Create a Spot Fleet request using defined parameters \(console\) \(p. 872\)](#).
2. To configure the fleet to replace unhealthy Spot Instances, for **Health check**, choose **Replace unhealthy instances**. To enable this option, you must first choose **Maintain target capacity**.

AWS CLI

To configure a Spot Fleet to replace unhealthy Spot Instances using the AWS CLI

1. Follow the steps for creating a Spot Fleet. For more information, see [Create a Spot Fleet using the AWS CLI \(p. 875\)](#).
2. To configure the fleet to replace unhealthy Spot Instances, for `ReplaceUnhealthyInstances`, enter `true`.

Spot Fleet permissions

If your IAM users will create or manage a Spot Fleet, you need to grant them the required permissions.

If you use the Amazon EC2 console to create a Spot Fleet, it creates two service-linked roles named `AWSServiceRoleForEC2SpotFleet` and `AWSServiceRoleForEC2Spot`, and a role named `aws-ec2-spot-fleet-tagging-role` that grant the Spot Fleet the permissions to request, launch, terminate, and tag resources on your behalf. If you use the AWS CLI or an API, you must ensure that these roles exist.

Use the following instructions to grant the required permissions and create the roles.

Permissions and roles

- [Grant permission to IAM users for Spot Fleet \(p. 868\)](#)
- [Service-linked role for Spot Fleet \(p. 869\)](#)
- [Service-linked role for Spot Instances \(p. 871\)](#)

- [IAM role for tagging a Spot Fleet \(p. 871\)](#)

Grant permission to IAM users for Spot Fleet

If your IAM users will create or manage a Spot Fleet, be sure to grant them the required permissions as follows.

To grant an IAM user permissions for Spot Fleet

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Policies, Create policy**.
3. On the **Create policy** page, choose **JSON**, and replace the text with the following.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances",  
                "ec2:CreateTags",  
                "ec2:RequestSpotFleet",  
                "ec2:ModifySpotFleetRequest",  
                "ec2:CancelSpotFleetRequests",  
                "ec2:DescribeSpotFleetRequests",  
                "ec2:DescribeSpotFleetInstances",  
                "ec2:DescribeSpotFleetRequestHistory"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": "iam:PassRole",  
            "Resource": "arn:aws:iam::*:role/aws-ec2-spot-fleet-tagging-role"  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "iam>CreateServiceLinkedRole",  
                "iam>ListRoles",  
                "iam>ListInstanceProfiles"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

The preceding example policy grants an IAM user the permissions required for most Spot Fleet use cases. To limit the user to specific API actions, specify only those API actions instead.

Required EC2 and IAM APIs

The following APIs must be included in the policy:

- `ec2:RunInstances` – Required to launch instances in a Spot Fleet
- `ec2:CreateTags` – Required to tag the Spot Fleet request, instances, or volumes
- `iam:PassRole` – Required to specify the Spot Fleet role
- `iam>CreateServiceLinkedRole` – Required to create the service-linked role
- `iam>ListRoles` – Required to enumerate existing IAM roles

- `iam>ListInstanceProfiles` – Required to enumerate existing instance profiles

Important

If you specify a role for the IAM instance profile in the launch specification or launch template, you must grant the IAM user the permission to pass the role to the service. To do this, in the IAM policy include "arn:aws:iam::*:role/*IamInstanceProfile-role*" as a resource for the `iam:PassRole` action. For more information, see [Granting a user permissions to pass a role to an AWS service](#) in the *IAM User Guide*.

Spot Fleet APIs

Add the following Spot Fleet API actions to your policy, as needed:

- `ec2:RequestSpotFleet`
- `ec2:ModifySpotFleetRequest`
- `ec2:CancelSpotFleetRequests`
- `ec2:DescribeSpotFleetRequests`
- `ec2:DescribeSpotFleetInstances`
- `ec2:DescribeSpotFleetRequestHistory`

Optional IAM APIs

(Optional) To enable an IAM user to create roles or instance profiles using the IAM console, you must add the following actions to the policy:

- `iam:AddRoleToInstanceProfile`
 - `iam:AttachRolePolicy`
 - `iam>CreateInstanceProfile`
 - `iam>CreateRole`
 - `iam:GetRole`
 - `iam>ListPolicies`
4. Choose **Review policy**.
 5. On the **Review policy** page, enter a policy name and description, and choose **Create policy**.
 6. In the navigation pane, choose **Users** and select the user.
 7. Choose **Permissions, Add permissions**.
 8. Choose **Attach existing policies directly**. Select the policy that you created earlier and choose **Next: Review**.
 9. Choose **Add permissions**.

Service-linked role for Spot Fleet

Amazon EC2 uses service-linked roles for the permissions that it requires to call other AWS services on your behalf. A service-linked role is a unique type of IAM role that is linked directly to an AWS service. Service-linked roles provide a secure way to delegate permissions to AWS services because only the linked service can assume a service-linked role. For more information, see [Using Service-Linked Roles](#) in the *IAM User Guide*.

Amazon EC2 uses the service-linked role named **AWSServiceRoleForEC2SpotFleet** to launch and manage instances on your behalf.

Important

If you specify an [encrypted AMI \(p. 203\)](#) or an [encrypted Amazon EBS snapshot \(p. 1542\)](#) in your Spot Fleet, you must grant the **AWSServiceRoleForEC2SpotFleet** role permission to use the CMK so that Amazon EC2 can launch instances on your behalf. For more information, see [Grant access to CMKs for use with encrypted AMIs and EBS snapshots \(p. 871\)](#).

Permissions granted by AWSServiceRoleForEC2SpotFleet

Amazon EC2 uses **AWSServiceRoleForEC2SpotFleet** to complete the following actions:

- `ec2:RequestSpotInstances` - Request Spot Instances
- `ec2:RunInstances` - Launch instances
- `ec2:TerminateInstances` - Terminate instances
- `ec2:DescribeImages` - Describe Amazon Machine Images (AMIs) for the instances
- `ec2:DescribeInstanceStatus` - Describe the status of the instances
- `ec2:DescribeSubnets` - Describe the subnets for the instances
- `ec2:CreateTags` - Add tags to the Spot Fleet request, instances, and volumes
- `elasticloadbalancing:RegisterInstancesWithLoadBalancer` - Add the specified instances to the specified load balancer
- `elasticloadbalancing:RegisterTargets` - Register the specified targets with the specified target group

Create the service-linked role

Under most circumstances, you don't need to manually create a service-linked role. Amazon EC2 creates the **AWSServiceRoleForEC2SpotFleet** service-linked role the first time you create a Spot Fleet using the console.

If you had an active Spot Fleet request before October 2017, when Amazon EC2 began supporting this service-linked role, Amazon EC2 created the **AWSServiceRoleForEC2SpotFleet** role in your AWS account. For more information, see [A new role appeared in my AWS account](#) in the *IAM User Guide*.

If you use the AWS CLI or an API to create a Spot Fleet, you must first ensure that this role exists.

To create AWSServiceRoleForEC2SpotFleet using the console

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Roles**.
3. Choose **Create role**.
4. For **Select type of trusted entity**, choose **AWS service**.
5. Under **Choose a use case, Or select a service to view its use cases**, choose **EC2**.
6. Under **Select your use case**, choose **EC2 - Spot Fleet**.
7. Choose **Next: Permissions**.
8. On the next page, choose **Next: Tags**.
9. On the next page, choose **Next: Review**.
10. On the **Review**, choose **Create role**.

To create AWSServiceRoleForEC2SpotFleet using the AWS CLI

Use the [create-service-linked-role](#) command as follows.

```
aws iam create-service-linked-role --aws-service-name spotfleet.amazonaws.com
```

If you no longer need to use Spot Fleet, we recommend that you delete the **AWSServiceRoleForEC2SpotFleet** role. After this role is deleted from your account, Amazon EC2 will create the role again if you request a Spot Fleet using the console. For more information, see [Deleting a Service-Linked Role](#) in the *IAM User Guide*.

Grant access to CMKs for use with encrypted AMIs and EBS snapshots

If you specify an [encrypted AMI \(p. 203\)](#) or an [encrypted Amazon EBS snapshot \(p. 1542\)](#) in your Spot Fleet request and you use a customer managed customer master key (CMK) for encryption, you must grant the **AWSServiceRoleForEC2SpotFleet** role permission to use the CMK so that Amazon EC2 can launch instances on your behalf. To do this, you must add a grant to the CMK, as shown in the following procedure.

When providing permissions, grants are an alternative to key policies. For more information, see [Using Grants](#) and [Using Key Policies in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

To grant the **AWSServiceRoleForEC2SpotFleet** role permissions to use the CMK

- Use the [create-grant](#) command to add a grant to the CMK and to specify the principal (the **AWSServiceRoleForEC2SpotFleet** service-linked role) that is given permission to perform the operations that the grant permits. The CMK is specified by the `key-id` parameter and the ARN of the CMK. The principal is specified by the `grantee-principal` parameter and the ARN of the **AWSServiceRoleForEC2SpotFleet** service-linked role.

```
aws kms create-grant \
  --region us-east-1 \
  --key-id arn:aws:kms:us-
east-1:444455556666:key/1234abcd-12ab-34cd-56ef-1234567890ab \
  --grantee-principal arn:aws:iam::111122223333:role/AWSServiceRoleForEC2SpotFleet \
  --operations "Decrypt" "Encrypt" "GenerateDataKey"
  "GenerateDataKeyWithoutPlaintext" "CreateGrant" "DescribeKey" "ReEncryptFrom"
  "ReEncryptTo"
```

Service-linked role for Spot Instances

Amazon EC2 uses the service-linked role named **AWSServiceRoleForEC2Spot** to launch and manage Spot Instances on your behalf. For more information, see [Service-linked role for Spot Instance requests \(p. 451\)](#).

IAM role for tagging a Spot Fleet

The `aws-ec2-spot-fleet-tagging-role` IAM role grants the Spot Fleet permission to tag the Spot Fleet request, instances, and volumes. For more information, see [Tag a Spot Fleet \(p. 875\)](#).

Important

If you choose to tag instances in the fleet and you choose to maintain target capacity (the Spot Fleet request is of type `maintain`), the differences in permissions of the IAM user and the `IamFleetRole` might lead to inconsistent tagging behavior of instances in the fleet. If the `IamFleetRole` does not include the `CreateTags` permission, some of the instances launched by the fleet might not be tagged. While we are working to fix this inconsistency, to ensure that all instances launched by the fleet are tagged, we recommend that you use the `aws-ec2-spot-fleet-tagging-role` role for the `IamFleetRole`. Alternatively, to use an existing role, attach the `AmazonEC2SpotFleetTaggingRole` AWS Managed Policy to the existing role. Otherwise, you need to manually add the `CreateTags` permission to your existing policy.

To create the IAM role for tagging a Spot Fleet

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.

2. In the navigation pane, choose **Roles**.
3. Choose **Create roles**.
4. On the **Select type of trusted entity** page, choose **AWS service**.
5. Under **Choose a use case, Or select a service to view its use cases**, choose **EC2**.
6. Under **Select your use case**, choose **EC2 - Spot Fleet Tagging**.
7. Choose **Next: Permissions**.
8. On the next page, choose **Next: Tags**.
9. On the next page, choose **Next: Review**.
10. On the **Review** page, enter a name for the role (for example, **aws-ec2-spot-fleet-tagging-role**) and choose **Create role**.

Create a Spot Fleet request

Using the AWS Management Console, quickly create a Spot Fleet request by choosing only your application or task need and minimum compute specs. Amazon EC2 configures a fleet that best meets your needs and follows Spot best practice. For more information, see [Quickly create a Spot Fleet request \(console\) \(p. 872\)](#). Otherwise, you can modify any of the default settings. For more information, see [Create a Spot Fleet request using defined parameters \(console\) \(p. 872\)](#) and [Create a Spot Fleet using the AWS CLI \(p. 875\)](#).

Options for creating a Spot Fleet

- [Quickly create a Spot Fleet request \(console\) \(p. 872\)](#)
- [Create a Spot Fleet request using defined parameters \(console\) \(p. 872\)](#)
- [Create a Spot Fleet using the AWS CLI \(p. 875\)](#)

Quickly create a Spot Fleet request (console)

Follow these steps to quickly create a Spot Fleet request.

To create a Spot Fleet request using the recommended settings (console)

1. Open the Spot console at <https://console.aws.amazon.com/ec2spot>.
2. If you are new to Spot, you see a welcome page; choose **Get started**. Otherwise, choose **Request Spot Instances**.
3. Under **Launch parameters**, choose **Manually configure launch parameters**.
4. For **AMI**, choose an AMI.
5. Under **Target capacity**, for **Total target capacity**, specify the number of units to request. For the type of unit, you can choose **Instances**, **vCPUs**, or **Memory (MiB)**.
6. For **Your fleet request at a glance**, review your fleet configuration, and choose **Launch**.

Create a Spot Fleet request using defined parameters (console)

You can create a Spot Fleet by using parameters that you define.

To create a Spot Fleet request using defined parameters (console)

1. Open the Spot console at <https://console.aws.amazon.com/ec2spot>.
2. If you are new to Spot, you see a welcome page; choose **Get started**. Otherwise, choose **Request Spot Instances**.
3. For **Launch parameters**, do the following:

- a. To define the launch parameters in the Spot console, choose **Manually configure launch parameters**.
- b. For **AMI**, choose one of the basic AMIs provided by AWS, or choose **Search for AMI** to use an AMI from our user community, the AWS Marketplace, or one of your own.
- c. (Optional) For **Key pair name**, choose an existing key pair or create a new one.

[Existing key pair] Choose the key pair.

[New key pair] Choose **Create new key pair** to go the **Key Pairs** page. When you are done, return to the **Spot Requests** page and refresh the list.

- d. (Optional) Expand **Additional launch parameters**, and do the following:
 - i. (Optional) To enable Amazon EBS optimization, for **EBS-optimized**, select **Launch EBS-optimized instances**.
 - ii. (Optional) To add temporary block-level storage for your instances, for **Instance store**, choose **Attach at launch**.
 - iii. (Optional) To add storage, choose **Add new volume**, and specify additional instance store volumes or Amazon EBS volumes, depending on the instance type.
 - iv. (Optional) By default, basic monitoring is enabled for your instances. To enable detailed monitoring, for **Monitoring**, select **Enable CloudWatch detailed monitoring**.
 - v. (Optional) To run a Dedicated Spot Instance, for **Tenancy**, choose **Dedicated - run a dedicated instance**.
 - vi. (Optional) For **Security groups**, choose one or more security groups or create a new one.

[Existing security group] Choose one or more security groups.

[New security group] Choose **Create new security group** to go the **Security Groups** page. When you are done, return to the **Spot Requests** and refresh the list.

- vii. (Optional) To make your instances reachable from the internet, for **Auto-assign IPv4 Public IP**, choose **Enable**.
- viii. (Optional) To launch your Spot Instances with an IAM role, for **IAM instance profile**, choose the role.
- ix. (Optional) To run a start-up script, copy it to **User data**.
- x. (Optional) To add a tag, choose **Create tag** and enter the key and value for the tag, and choose **Create**. Repeat for each tag.

For each tag, to tag the instances and the Spot Fleet request with the same tag, ensure that both **Instances** and **Fleet** are selected. To tag only the instances launched by the fleet, clear **Fleet**. To tag only the Spot Fleet request, clear **Instances**.

4. For **Additional request details**, do the following:

- a. Review the additional request details. To make changes, clear **Apply defaults**.
- b. (Optional) For **IAM fleet role**, you can use the default role or choose a different role. To use the default role after changing the role, choose **Use default role**.
- c. (Optional) For **Maximum price**, you can use the default maximum price (the On-Demand price) or specify the maximum price you are willing to pay. If your maximum price is lower than the Spot price for the instance types that you selected, your Spot Instances are not launched.
- d. (Optional) To create a request that is valid only during a specific time period, edit **Request valid from** and **Request valid until**.
- e. (Optional) By default, we terminate your Spot Instances when the Spot Fleet request expires. To keep them running after your request expires, clear **Terminate the instances when the request expires**.

- f. (Optional) To register your Spot Instances with a load balancer, choose **Receive traffic from one or more load balancers** and choose one or more Classic Load Balancers or target groups.
5. For **Minimum compute unit**, choose the minimum hardware specifications (vCPUs, memory, and storage) that you need for your application or task, either **as specs** or **as an instance type**.
 - For **as specs**, specify the required number of vCPUs and amount of memory.
 - For **as an instance type**, accept the default instance type, or choose **Change instance type** to choose a different instance type.
6. For **Target capacity**, do the following:
 - a. For **Total target capacity**, specify the number of units to request. For the type of unit, you can choose **Instances**, **vCPUs**, or **Memory (MiB)**. To specify a target capacity of 0 so that you can add capacity later, choose **Maintain target capacity**.
 - b. (Optional) For **Include On-Demand base capacity**, specify the number of On-Demand units to request. The number must be less than the **Total target capacity**. Amazon EC2 calculates the difference, and allocates the difference to Spot units to request.

Important

To specify optional On-Demand capacity, you must first choose a launch template.

- c. (Optional) By default, the Spot service terminates Spot Instances when they are interrupted. To maintain the target capacity, select **Maintain target capacity**. You can then specify that the Spot service terminates, stops, or hibernates Spot Instances when they are interrupted. To do so, choose the corresponding option from **Interruption behavior**.
- d. (Optional) To allow Spot Fleet to launch a replacement Spot Instance when an instance rebalance notification is emitted for an existing Spot Instance in the fleet, select **Capacity rebalance**, and then choose an instance replacement strategy. If you choose **Launch before terminate**, specify the delay (in seconds) before Spot Fleet terminates the old instances. For more information, see [Capacity Rebalancing \(p. 861\)](#).
- e. (Optional) To control the amount you pay per hour for all the Spot Instances in your fleet, select **Set maximum cost for Spot Instances** and then enter the maximum total amount you're willing to pay per hour. When the maximum total amount is reached, Spot Fleet stops launching Spot Instances even if it hasn't met the target capacity. For more information, see [Control spending \(p. 863\)](#).

7. For **Network**, do the following:

- a. For **Network**, choose an existing VPC or create a new one.

[Existing VPC] Choose the VPC.

[New VPC] Choose **Create new VPC** to go the Amazon VPC console. When you are done, return to the wizard and refresh the list.

- b. (Optional) For **Availability Zone**, let AWS choose the Availability Zones for your Spot Instances, or specify one or more Availability Zones.

If you have more than one subnet in an Availability Zone, choose the appropriate subnet from **Subnet**. To add subnets, choose **Create new subnet** to go to the Amazon VPC console. When you are done, return to the wizard and refresh the list.

8. For **Instance type requirements**, you can either specify instance attributes and let Amazon EC2 identify the optimal instance types with these attributes, or you can specify a list of instances. For more information, see [Attribute-based instance type selection for Spot Fleet \(p. 842\)](#).
 - a. If you choose **Specify instance attributes that match your compute requirements**, specify your instance attributes as follows:
 - i. For **vCPUs**, enter the desired minimum and maximum number of vCPUs. To specify no limit, select **No minimum**, **No maximum**, or both.

- ii. For **Memory (GiB)**, enter the desired minimum and maximum amount of memory. To specify no limit, select **No minimum**, **No maximum**, or both.
 - iii. (Optional) For **Additional instance attributes**, you can optionally specify one or more attributes to express your compute requirements in more detail. Each additional attribute adds a further constraint to your request. You can omit the additional attributes; when omitted, the default values are used. For a description of each attribute and their default values, see [get-spot-placement-scores](#) in the *Amazon EC2 Command Line Reference*.
 - iv. (Optional) To view the instance types with your specified attributes, expand **Preview matching instance types**. To exclude instance types from being used in your request, select the instances and then choose **Exclude selected instance types**.
- b. If you choose **Manually select instance types**, Spot Fleet provides a default list of instance types. To select more instance types, choose **Add instance types**, select the instance types to use in your request, and choose **Select**. To delete instance types, select the instance types and choose **Delete**.
9. For **Allocation strategy**, choose the strategy that meets your needs. For more information, see [Allocation strategy for Spot Instances \(p. 840\)](#).
 10. For **Your fleet request at a glance**, review your fleet configuration, and make any adjustments if necessary.
 11. (Optional) To download a copy of the launch configuration for use with the AWS CLI, choose **JSON config**.
 12. Choose **Launch**.

The Spot Fleet request type is `fleet`. When the request is fulfilled, requests of type `instance` are added, where the state is `active` and the status is `fulfilled`.

Create a Spot Fleet using the AWS CLI

To create a Spot Fleet request using the AWS CLI

- Use the [request-spot-fleet](#) command to create a Spot Fleet request.

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

For example configuration files, see [Spot Fleet example configurations \(p. 930\)](#).

The following is example output:

```
{  
    "SpotFleetRequestId": "sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE"  
}
```

Tag a Spot Fleet

To help categorize and manage your Spot Fleet requests, you can tag them with custom metadata. You can assign a tag to a Spot Fleet request when you create it, or afterward. You can assign tags using the Amazon EC2 console or a command line tool.

When you tag a Spot Fleet request, the instances and volumes that are launched by the Spot Fleet are not automatically tagged. You need to explicitly tag the instances and volumes launched by the Spot Fleet. You can choose to assign tags to only the Spot Fleet request, or to only the instances launched by the fleet, or to only the volumes attached to the instances launched by the fleet, or to all three.

Note

Volume tags are only supported for volumes that are attached to On-Demand Instances. You can't tag volumes that are attached to Spot Instances.

For more information about how tags work, see [Tag your Amazon EC2 resources \(p. 1692\)](#).

Contents

- [Prerequisite \(p. 876\)](#)
- [Tag a new Spot Fleet \(p. 877\)](#)
- [Tag a new Spot Fleet and the instances and volumes that it launches \(p. 878\)](#)
- [Tag an existing Spot Fleet \(p. 880\)](#)
- [View Spot Fleet request tags \(p. 880\)](#)

Prerequisite

Grant the IAM user the permission to tag resources. For more information, see [Example: Tag resources \(p. 1280\)](#).

To grant an IAM user the permission to tag resources

Create a IAM policy that includes the following:

- The `ec2:CreateTags` action. This grants the IAM user permission to create tags.
- The `ec2:RequestSpotFleet` action. This grants the IAM user permission to create a Spot Fleet request.
- **For Resource, you must specify "*".** This allows users to tag all resource types.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "TagSpotFleetRequest",  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateTags",  
                "ec2:RequestSpotFleet"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

Important

We currently do not support resource-level permissions for the `spot-fleet-request` resource. If you specify `spot-fleet-request` as a resource, you will get an unauthorized exception when you try to tag the fleet. The following example illustrates how *not* to set the policy.

```
{  
    "Effect": "Allow",  
    "Action": [  
        "ec2:CreateTags",  
        "ec2:RequestSpotFleet"  
    ],  
    "Resource": "arn:aws:ec2:us-east-1:111122223333:spot-fleet-request/*"
```

}

Tag a new Spot Fleet

To tag a new Spot Fleet request using the console

1. Follow the [Create a Spot Fleet request using defined parameters \(console\) \(p. 872\)](#) procedure.
2. To add a tag, expand **Additional configurations**, choose **Add new tag**, and enter the key and value for the tag. Repeat for each tag.

For each tag, you can tag the Spot Fleet request and the instances with the same tag. To tag both, ensure that both **Instance tags** and **Fleet tags** are selected. To tag only the Spot Fleet request, clear **Instance tags**. To tag only the instances launched by the fleet, clear **Fleet tags**.

3. Complete the required fields to create a Spot Fleet request, and then choose **Launch**. For more information, see [Create a Spot Fleet request using defined parameters \(console\) \(p. 872\)](#).

To tag a new Spot Fleet request using the AWS CLI

To tag a Spot Fleet request when you create it, configure the Spot Fleet request configuration as follows:

- Specify the tags for the Spot Fleet request in `SpotFleetRequestConfig`.
- For `ResourceType`, specify `spot-fleet-request`. If you specify another value, the fleet request will fail.
- For `Tags`, specify the key-value pair. You can specify more than one key-value pair.

In the following example, the Spot Fleet request is tagged with two tags: `Key=Environment` and `Value=Production`, and `Key=Cost-Center` and `Value=123`.

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "lowestPrice",  
        "ExcessCapacityTerminationPolicy": "default",  
        "IAMFleetRole": "arn:aws:iam::111122223333:role/aws-ec2-spot-fleet-tagging-role",  
        "LaunchSpecifications": [  
            {  
                "ImageId": "ami-0123456789EXAMPLE",  
                "InstanceType": "c4.large"  
            }  
        ],  
        "SpotPrice": "5",  
        "TargetCapacity": 2,  
        "TerminateInstancesWithExpiration": true,  
        "Type": "maintain",  
        "ReplaceUnhealthyInstances": true,  
        "InstanceInterruptionBehavior": "terminate",  
        "InstancePoolsToUseCount": 1,  
        "TagSpecifications": [  
            {  
                "ResourceType": "spot-fleet-request",  
                "Tags": [  
                    {  
                        "Key": "Environment",  
                        "Value": "Production"  
                    },  
                    {  
                        "Key": "Cost-Center",  
                        "Value": "123"  
                    }  
                ]  
            }  
        ]  
    }  
}
```

```
        ]
    }
}
```

Tag a new Spot Fleet and the instances and volumes that it launches

To tag a new Spot Fleet request and the instances and volumes that it launches using the AWS CLI

To tag a Spot Fleet request when you create it, and to tag the instances and volumes when they are launched by the fleet, configure the Spot Fleet request configuration as follows:

Spot Fleet request tags:

- Specify the tags for the Spot Fleet request in `SpotFleetRequestConfig`.
- For `ResourceType`, specify `spot-fleet-request`. If you specify another value, the fleet request will fail.
- For `Tags`, specify the key-value pair. You can specify more than one key-value pair.

Instance tags:

- Specify the tags for the instances in `LaunchSpecifications`.
- For `ResourceType`, specify `instance`. If you specify another value, the fleet request will fail.
- For `Tags`, specify the key-value pair. You can specify more than one key-value pair.

Alternatively, you can specify the tags for the instance in the [launch template \(p. 596\)](#) that is referenced in the Spot Fleet request.

Volume tags:

- Specify the tags for the volumes in the [launch template \(p. 596\)](#) that is referenced in the Spot Fleet request. Volume tagging in `LaunchSpecifications` is not supported.

In the following example, the Spot Fleet request is tagged with two tags: `Key=Environment` and `Value=Production`, and `Key=Cost-Center` and `Value=123`. The instances that are launched by the fleet are tagged with one tag (which is the same as one of the tags for the Spot Fleet request): `Key=Cost-Center` and `Value=123`.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "lowestPrice",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws:iam::111122223333:role/aws-ec2-spot-fleet-tagging-role",
        "LaunchSpecifications": [
            {
                "ImageId": "ami-0123456789EXAMPLE",
                "InstanceType": "c4.large",
                "TagSpecifications": [
                    {
                        "ResourceType": "instance",
                        "Tags": [
                            {
                                "Key": "Cost-Center",
                                "Value": "123"
                            }
                        ]
                    }
                ]
            }
        ]
    }
}
```

```
        ]
    }
],
"SpotPrice": "5",
"TargetCapacity": 2,
"TerminateInstancesWithExpiration": true,
"Type": "maintain",
"ReplaceUnhealthyInstances": true,
"InstanceInterruptionBehavior": "terminate",
"InstancePoolsToUseCount": 1,
"TagSpecifications": [
{
    "ResourceType": "spot-fleet-request",
    "Tags": [
        {
            "Key": "Environment",
            "Value": "Production"
        },
        {
            "Key": "Cost-Center",
            "Value": "123"
        }
    ]
}
]
```

To tag instances launched by a Spot Fleet using the AWS CLI

To tag instances when they are launched by the fleet, you can either specify the tags in the [launch template \(p. 596\)](#) that is referenced in the Spot Fleet request, or you can specify the tags in the Spot Fleet request configuration as follows:

- Specify the tags for the instances in `LaunchSpecifications`.
- For `ResourceType`, specify `instance`. If you specify another value, the fleet request will fail.
- For `Tags`, specify the key-value pair. You can specify more than one key-value pair.

In the following example, the instances that are launched by the fleet are tagged with one tag: `Key=Cost-Center` and `Value=123`.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "lowestPrice",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws:iam::111122223333:role/aws-ec2-spot-fleet-tagging-role",
        "LaunchSpecifications": [
            {
                "ImageId": "ami-0123456789EXAMPLE",
                "InstanceType": "c4.large",
                "TagSpecifications": [
                    {
                        "ResourceType": "instance",
                        "Tags": [
                            {
                                "Key": "Cost-Center",
                                "Value": "123"
                            }
                        ]
                    }
                ]
            }
        ]
    }
}
```

```
        ],
        "SpotPrice": "5",
        "TargetCapacity": 2,
        "TerminateInstancesWithExpiration": true,
        "Type": "maintain",
        "ReplaceUnhealthyInstances": true,
        "InstanceInterruptionBehavior": "terminate",
        "InstancePoolsToUseCount": 1
    }
}
```

To tag volumes attached to On-Demand Instances launched by a Spot Fleet using the AWS CLI

To tag volumes when they are created by the fleet, you must specify the tags in the [launch template \(p. 596\)](#) that is referenced in the Spot Fleet request.

Note

Volume tags are only supported for volumes that are attached to On-Demand Instances. You can't tag volumes that are attached to Spot Instances.

Volume tagging in `LaunchSpecifications` is not supported.

Tag an existing Spot Fleet

To tag an existing Spot Fleet request using the console

After you have created a Spot Fleet request, you can add tags to the fleet request using the console.

1. Open the Spot console at <https://console.aws.amazon.com/ec2spot>.
2. Select your Spot Fleet request.
3. Choose the **Tags** tab and choose **Create Tag**.

To tag an existing Spot Fleet request using the AWS CLI

You can use the `create-tags` command to tag existing resources. In the following example, the existing Spot Fleet request is tagged with Key=purpose and Value=test.

```
aws ec2 create-tags \
    --resources sfr-11112222-3333-4444-5555-66666EXAMPLE \
    --tags Key=purpose,Value=test
```

View Spot Fleet request tags

To view Spot Fleet request tags using the console

1. Open the Spot console at <https://console.aws.amazon.com/ec2spot>.
2. Select your Spot Fleet request and choose the **Tags** tab.

To describe Spot Fleet request tags

Use the `describe-tags` command to view the tags for the specified resource. In the following example, you describe the tags for the specified Spot Fleet request.

```
aws ec2 describe-tags \
    --filters "Name=resource-id,Values=sfr-11112222-3333-4444-5555-66666EXAMPLE"
```

```
{
```

```
"Tags": [
    {
        "Key": "Environment",
        "ResourceId": "sfr-11112222-3333-4444-5555-66666EXAMPLE",
        "ResourceType": "spot-fleet-request",
        "Value": "Production"
    },
    {

}

Describe your Spot Fleet

The Spot Fleet launches Spot Instances when your maximum price exceeds the Spot price and capacity is available. The Spot Instances run until they are interrupted or you terminate them.

To describe your Spot Fleet (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request. To see the configuration details, choose **Description**.
4. To list the Spot Instances for the Spot Fleet, choose **Instances**.
5. To view the history for the Spot Fleet, choose **History**.

To describe your Spot Fleet (AWS CLI)

Use the [describe-spot-fleet-requests](#) command to describe your Spot Fleet requests.

```
aws ec2 describe-spot-fleet-requests
```

Use the [describe-spot-fleet-instances](#) command to describe the Spot Instances for the specified Spot Fleet.

```
aws ec2 describe-spot-fleet-instances \
--spot-fleet-request-id sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE
```

Use the [describe-spot-fleet-request-history](#) command to describe the history for the specified Spot Fleet request.

```
aws ec2 describe-spot-fleet-request-history \
--spot-fleet-request-id sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
--start-time 2015-05-18T00:00:00Z
```

Modify a Spot Fleet request

You can modify an active Spot Fleet request to complete the following tasks:

- Increase the target capacity and On-Demand portion
- Decrease the target capacity and On-Demand portion

Note

You can't modify a one-time Spot Fleet request. You can only modify a Spot Fleet request if you selected **Maintain target capacity** when you created the Spot Fleet request.

When you increase the target capacity, the Spot Fleet launches additional Spot Instances. When you increase the On-Demand portion, the Spot Fleet launches additional On-Demand Instances.

When you increase the target capacity, the Spot Fleet launches the additional Spot Instances according to the allocation strategy for its Spot Fleet request. If the allocation strategy is `lowestPrice`, the Spot Fleet launches the instances from the lowest-priced Spot capacity pool in the Spot Fleet request. If the allocation strategy is `diversified`, the Spot Fleet distributes the instances across the pools in the Spot Fleet request.

When you decrease the target capacity, the Spot Fleet cancels any open requests that exceed the new target capacity. You can request that the Spot Fleet terminate Spot Instances until the size of the fleet reaches the new target capacity. If the allocation strategy is `lowestPrice`, the Spot Fleet terminates the instances with the highest price per unit. If the allocation strategy is `diversified`, the Spot Fleet terminates instances across the pools. Alternatively, you can request that the Spot Fleet keep the fleet at its current size, but not replace any Spot Instances that are interrupted or that you terminate manually.

When a Spot Fleet terminates an instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

To modify a Spot Fleet request (console)

1. Open the Spot console at <https://console.aws.amazon.com/ec2spot/home/fleet>.
2. Select your Spot Fleet request.
3. Choose **Actions, Modify target capacity**.
4. In **Modify target capacity**, do the following:
 - a. Enter the new target capacity and On-Demand portion.
 - b. (Optional) If you are decreasing the target capacity but want to keep the fleet at its current size, clear **Terminate instances**.
 - c. Choose **Submit**.

To modify a Spot Fleet request using the AWS CLI

Use the `modify-spot-fleet-request` command to update the target capacity of the specified Spot Fleet request.

```
aws ec2 modify-spot-fleet-request \
--spot-fleet-request-id sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
--target-capacity 20
```

You can modify the previous command as follows to decrease the target capacity of the specified Spot Fleet without terminating any Spot Instances as a result.

```
aws ec2 modify-spot-fleet-request \
--spot-fleet-request-id sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
--target-capacity 10 \
--excess-capacity-termination-policy NoTermination
```

Cancel a Spot Fleet request

When you are finished using your Spot Fleet, you can cancel the Spot Fleet request. This cancels all Spot requests associated with the Spot Fleet, so that no new Spot Instances are launched for your Spot Fleet. You must specify whether the Spot Fleet should terminate its Spot Instances. If you terminate the instances, the Spot Fleet request enters the `cancelled_terminating` state. Otherwise, the Spot Fleet request enters the `cancelled_running` state and the instances continue to run until they are interrupted or you terminate them manually.

To cancel a Spot Fleet request (console)

1. Open the Spot console at <https://console.aws.amazon.com/ec2spot/home/fleet>.
2. Select your Spot Fleet request.
3. Choose **Actions, Cancel spot request**.
4. In **Cancel spot request**, verify that you want to cancel the Spot Fleet. To keep the fleet at its current size, clear **Terminate instances**. When you are ready, choose **Confirm**.

To cancel a Spot Fleet request using the AWS CLI

Use the [cancel-spot-fleet-requests](#) command to cancel the specified Spot Fleet request and terminate the instances.

```
aws ec2 cancel-spot-fleet-requests \
--spot-fleet-request-ids sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
--terminate-instances
```

The following is example output:

```
{  
    "SuccessfulFleetRequests": [  
        {  
            "SpotFleetRequestId": "sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE",  
            "CurrentSpotFleetRequestState": "cancelled_terminating",  
            "PreviousSpotFleetRequestState": "active"  
        }  
    ],  
    "UnsuccessfulFleetRequests": []  
}
```

You can modify the previous command as follows to cancel the specified Spot Fleet request without terminating the instances.

```
aws ec2 cancel-spot-fleet-requests \
--spot-fleet-request-ids sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE \
--no-terminate-instances
```

The following is example output:

```
{  
    "SuccessfulFleetRequests": [  
        {  
            "SpotFleetRequestId": "sfr-73fb2ce-aa30-494c-8788-1cee4EXAMPLE",  
            "CurrentSpotFleetRequestState": "cancelled_running",  

```

CloudWatch metrics for Spot Fleet

Amazon EC2 provides Amazon CloudWatch metrics that you can use to monitor your Spot Fleet.

Important

To ensure accuracy, we recommend that you enable detailed monitoring when using these metrics. For more information, see [Enable or turn off detailed monitoring for your instances \(p. 976\)](#).

For more information about CloudWatch metrics provided by Amazon EC2, see [Monitor your instances using CloudWatch \(p. 975\)](#).

Spot Fleet metrics

The AWS/EC2Spot namespace includes the following metrics, plus the CloudWatch metrics for the Spot Instances in your fleet. For more information, see [Instance metrics \(p. 978\)](#).

Metric	Description
AvailableInstancePoolsCount	The Spot capacity pools specified in the Spot Fleet request. Units: Count
BidsSubmittedForCapacity	The capacity for which Amazon EC2 has submitted Spot Fleet requests. Units: Count
EligibleInstancePoolCount	The Spot capacity pools specified in the Spot Fleet request where Amazon EC2 can fulfill requests. Amazon EC2 does not fulfill requests in pools where the maximum price you're willing to pay for Spot Instances is less than the Spot price or the Spot price is greater than the price for On-Demand Instances. Units: Count
FulfilledCapacity	The capacity that Amazon EC2 has fulfilled. Units: Count
MaxPercentCapacityAllocation	The maximum value of PercentCapacityAllocation across all Spot Fleet pools specified in the Spot Fleet request. Units: Percent
PendingCapacity	The difference between TargetCapacity and FulfilledCapacity. Units: Count
PercentCapacityAllocation	The capacity allocated for the Spot capacity pool for the specified dimensions. To get the maximum value recorded across all Spot capacity pools, use MaxPercentCapacityAllocation. Units: Percent
TargetCapacity	The target capacity of the Spot Fleet request. Units: Count
TerminatingCapacity	The capacity that is being terminated because the provisioned capacity is greater than the target capacity. Units: Count

If the unit of measure for a metric is `Count`, the most useful statistic is `Average`.

Spot Fleet dimensions

To filter the data for your Spot Fleet, use the following dimensions.

Dimensions	Description
AvailabilityZone	Filter the data by Availability Zone.

Dimensions	Description
FleetRequestId	Filter the data by Spot Fleet request.
InstanceType	Filter the data by instance type.

View the CloudWatch metrics for your Spot Fleet

You can view the CloudWatch metrics for your Spot Fleet using the Amazon CloudWatch console. These metrics are displayed as monitoring graphs. These graphs show data points if the Spot Fleet is active.

Metrics are grouped first by namespace, and then by the various combinations of dimensions within each namespace. For example, you can view all Spot Fleet metrics or Spot Fleet metrics groups by Spot Fleet request ID, instance type, or Availability Zone.

To view Spot Fleet metrics

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2 Spot** namespace.

Note

If the **EC2 Spot** namespace is not displayed, there are two reasons for this. Either you've not yet used Spot Fleet—only the AWS services that you're using send metrics to Amazon CloudWatch. Or, if you've not used Spot Fleet for the past two weeks, the namespace does not appear.

4. (Optional) To filter the metrics by dimension, select one of the following:
 - **Fleet Request Metrics** – Group by Spot Fleet request
 - **By Availability Zone** – Group by Spot Fleet request and Availability Zone
 - **By Instance Type** – Group by Spot Fleet request and instance type
 - **By Availability Zone/Instance Type** – Group by Spot Fleet request, Availability Zone, and instance type
5. To view the data for a metric, select the check box next to the metric.

The screenshot shows the CloudWatch Metrics search interface. The search bar at the top has 'Fleet Request Metrics' selected. Below the search bar, there are four buttons: 'Fleet Request Metrics' (highlighted in blue), 'By Availability Zone', 'By Instance Type', and 'By Availability Zone/Instance Type'. A message below the buttons says 'Showing all results (18) for EC2 Spot > Fleet Request Metrics. For more results expand your search to All EC2 Spot Metrics.' There are two buttons at the bottom left: 'Select All' and 'Clear'. The main area displays a table titled 'EC2 Spot > Fleet Request Metrics'. The table has two columns: 'Metric Name' and 'FleetRequestId'. The 'Metric Name' column contains five entries: 'AvailableInstancesPoolsCount', 'BidsSubmittedForCapacity', 'CPUUtilization' (with a checked checkbox), and 'DiskReadBytes'. The 'FleetRequestId' column contains five entries: 'sfr-4a707781-8fac-459b-a5ae-4701fce47d7' repeated four times. The fifth row is highlighted in light blue.

FleetRequestId	Metric Name
sfr-4a707781-8fac-459b-a5ae-4701fce47d7	AvailableInstancesPoolsCount
sfr-4a707781-8fac-459b-a5ae-4701fce47d7	BidsSubmittedForCapacity
<input checked="" type="checkbox"/> sfr-4a707781-8fac-459b-a5ae-4701fce47d7	CPUUtilization
sfr-4a707781-8fac-459b-a5ae-4701fce47d7	DiskReadBytes

Automatic scaling for Spot Fleet

Automatic scaling is the ability to increase or decrease the target capacity of your Spot Fleet automatically based on demand. A Spot Fleet can either launch instances (scale out) or terminate instances (scale in), within the range that you choose, in response to one or more scaling policies.

Spot Fleet supports the following types of automatic scaling:

- [Target tracking scaling \(p. 888\)](#) – Increase or decrease the current capacity of the fleet based on a target value for a specific metric. This is similar to the way that your thermostat maintains the temperature of your home—you select temperature and the thermostat does the rest.
- [Step scaling \(p. 889\)](#) – Increase or decrease the current capacity of the fleet based on a set of scaling adjustments, known as step adjustments, that vary based on the size of the alarm breach.
- [Scheduled scaling \(p. 891\)](#) – Increase or decrease the current capacity of the fleet based on the date and time.

If you are using [instance weighting \(p. 864\)](#), keep in mind that Spot Fleet can exceed the target capacity as needed. Fulfilled capacity can be a floating-point number but target capacity must be an integer, so Spot Fleet rounds up to the next integer. You must take these behaviors into account when you look at the outcome of a scaling policy when an alarm is triggered. For example, suppose that the target capacity is 30, the fulfilled capacity is 30.1, and the scaling policy subtracts 1. When the alarm is triggered, the automatic scaling process subtracts 1 from 30.1 to get 29.1 and then rounds it up to 30, so no scaling action is taken. As another example, suppose that you selected instance weights of 2, 4, and 8, and a target capacity of 10, but no weight 2 instances were available so Spot Fleet provisioned instances of weights 4 and 8 for a fulfilled capacity of 12. If the scaling policy decreases target capacity by 20% and an alarm is triggered, the automatic scaling process subtracts 12×0.2 from 12 to get 9.6 and then rounds it up to 10, so no scaling action is taken.

The scaling policies that you create for Spot Fleet support a cooldown period. This is the number of seconds after a scaling activity completes where previous trigger-related scaling activities can influence future scaling events. For scale-out policies, while the cooldown period is in effect, the capacity that has been added by the previous scale-out event that initiated the cooldown is calculated as part of the desired capacity for the next scale out. The intention is to continuously (but not excessively) scale out. For scale in policies, the cooldown period is used to block subsequent scale in requests until it has expired. The intention is to scale in conservatively to protect your application's availability. However, if another alarm triggers a scale-out policy during the cooldown period after a scale-in, automatic scaling scales out your scalable target immediately.

We recommend that you scale based on instance metrics with a 1-minute frequency because that ensures a faster response to utilization changes. Scaling on metrics with a 5-minute frequency can result in slower response time and scaling on stale metric data. To send metric data for your instances to CloudWatch in 1-minute periods, you must specifically enable detailed monitoring. For more information, see [Enable or turn off detailed monitoring for your instances \(p. 976\)](#) and [Create a Spot Fleet request using defined parameters \(console\) \(p. 872\)](#).

For more information about configuring scaling for Spot Fleet, see the following resources:

- [application-autoscaling](#) section of the *AWS CLI Command Reference*
- [Application Auto Scaling API Reference](#)
- [Application Auto Scaling User Guide](#)

IAM permissions required for Spot Fleet automatic scaling

Automatic scaling for Spot Fleet is made possible by a combination of the Amazon EC2, Amazon CloudWatch, and Application Auto Scaling APIs. Spot Fleet requests are created with Amazon EC2, alarms are created with CloudWatch, and scaling policies are created with Application Auto Scaling.

In addition to the [IAM permissions for Spot Fleet \(p. 868\)](#) and Amazon EC2, the IAM user that accesses fleet scaling settings must have the appropriate permissions for the services that support dynamic scaling. IAM users must have permissions to use the actions shown in the following example policy.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "application-autoscaling:*",  
                "ec2:DescribeSpotFleetRequests",  
                "ec2:ModifySpotFleetRequest",  
                "cloudwatch:DeleteAlarms",  
                "cloudwatch:DescribeAlarmHistory",  
                "cloudwatch:DescribeAlarms",  
                "cloudwatch:DescribeAlarmsForMetric",  
                "cloudwatch:GetMetricStatistics",  
                "cloudwatch>ListMetrics",  
                "cloudwatch:PutMetricAlarm",  
                "cloudwatch:DisableAlarmActions",  
                "cloudwatch:EnableAlarmActions",  
                "iam>CreateServiceLinkedRole",  
                "sns>CreateTopic",  
                "sns:Subscribe",  
                "sns:Get*",  
                "sns>List*"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

You can also create your own IAM policies that allow more fine-grained permissions for calls to the Application Auto Scaling API. For more information, see [Authentication and Access Control](#) in the *Application Auto Scaling User Guide*.

The Application Auto Scaling service also needs permission to describe your Spot Fleet and CloudWatch alarms, and permissions to modify your Spot Fleet target capacity on your behalf. If you enable automatic scaling for your Spot Fleet, it creates a service-linked role named `AWSServiceRoleForApplicationAutoScaling_EC2SpotFleetRequest`. This service-linked role grants Application Auto Scaling permission to describe the alarms for your policies, to monitor the current capacity of the fleet, and to modify the capacity of the fleet. The original managed Spot Fleet role for Application Auto Scaling was `aws-ec2-spot-fleet-autoscale-role`, but it is no longer required. The service-linked role is the default role for Application Auto Scaling. For more information, see [Service-Linked Roles](#) in the *Application Auto Scaling User Guide*.

Scale Spot Fleet using a target tracking policy

With target tracking scaling policies, you select a metric and set a target value. Spot Fleet creates and manages the CloudWatch alarms that trigger the scaling policy and calculates the scaling adjustment based on the metric and the target value. The scaling policy adds or removes capacity as required to keep the metric at, or close to, the specified target value. In addition to keeping the metric close to the target value, a target tracking scaling policy also adjusts to the fluctuations in the metric due to a fluctuating load pattern and minimizes rapid fluctuations in the capacity of the fleet.

You can create multiple target tracking scaling policies for a Spot Fleet, provided that each of them uses a different metric. The fleet scales based on the policy that provides the largest fleet capacity. This enables you to cover multiple scenarios and ensure that there is always enough capacity to process your application workloads.

To ensure application availability, the fleet scales out proportionally to the metric as fast as it can, but scales in more gradually.

When a Spot Fleet terminates an instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

Do not edit or delete the CloudWatch alarms that Spot Fleet manages for a target tracking scaling policy. Spot Fleet deletes the alarms automatically when you delete the target tracking scaling policy.

Limitation

The Spot Fleet request must have a request type of `maintain`. Automatic scaling is not supported for requests of type `request`, or `Spot blocks`.

To configure a target tracking policy (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose **Auto Scaling**.
4. If automatic scaling is not configured, choose **Configure**.
5. Use **Scale capacity between** to set the minimum and maximum capacity for your fleet. Automatic scaling does not scale your fleet below the minimum capacity or above the maximum capacity.
6. For **Policy name**, enter a name for the policy.
7. Choose a **Target metric**.
8. Enter a **Target value** for the metric.
9. (Optional) Set **Cooldown period** to modify the default cooldown period.
10. (Optional) Select **Disable scale-in** to omit creating a scale-in policy based on the current configuration. You can create a scale-in policy using a different configuration.
11. Choose **Save**.

To configure a target tracking policy using the AWS CLI

1. Register the Spot Fleet request as a scalable target using the `register-scalable-target` command.
2. Create a scaling policy using the `put-scaling-policy` command.

Scale Spot Fleet using step scaling policies

With step scaling policies, you specify CloudWatch alarms to trigger the scaling process. For example, if you want to scale out when CPU utilization reaches a certain level, create an alarm using the `CPUUtilization` metric provided by Amazon EC2.

When you create a step scaling policy, you must specify one of the following scaling adjustment types:

- **Add** – Increase the target capacity of the fleet by a specified number of capacity units or a specified percentage of the current capacity.
- **Remove** – Decrease the target capacity of the fleet by a specified number of capacity units or a specified percentage of the current capacity.
- **Set to** – Set the target capacity of the fleet to the specified number of capacity units.

When an alarm is triggered, the automatic scaling process calculates the new target capacity using the fulfilled capacity and the scaling policy, and then updates the target capacity accordingly. For example, suppose that the target capacity and fulfilled capacity are 10 and the scaling policy adds 1. When the alarm is triggered, the automatic scaling process adds 1 to 10 to get 11, so Spot Fleet launches 1 instance.

When a Spot Fleet terminates an instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

Limitation

The Spot Fleet request must have a request type of `maintain`. Automatic scaling is not supported for requests of type `request`, or Spot blocks.

Prerequisites

- Consider which CloudWatch metrics are important to your application. You can create CloudWatch alarms based on metrics provided by AWS or your own custom metrics.
- For the AWS metrics that you will use in your scaling policies, enable CloudWatch metrics collection if the service that provides the metrics does not enable it by default.

To create a CloudWatch alarm

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Alarms**.
3. Choose **Create alarm**.
4. On the **Specify metric and conditions** page, choose **Select metric**.
5. Choose **EC2 Spot, Fleet Request Metrics**, select a metric (for example, `TargetCapacity`), and then choose **Select metric**.

The **Specify metric and conditions** page appears, showing a graph and other information about the metric you selected.

6. For **Period**, choose the evaluation period for the alarm, for example, 1 minute. When evaluating the alarm, each period is aggregated into one data point.

Note

A shorter period creates a more sensitive alarm.

7. For **Conditions**, define the alarm by defining the threshold condition. For example, you can define a threshold to trigger the alarm whenever the value of the metric is greater than or equal to 80 percent.
8. Under **Additional configuration**, for **Datapoints to alarm**, specify how many datapoints (evaluation periods) must be in the ALARM state to trigger the alarm, for example, 1 evaluation period or 2 out of 3 evaluation periods. This creates an alarm that goes to ALARM state if that many consecutive periods are breaching. For more information, see [Evaluating an Alarm](#) in the *Amazon CloudWatch User Guide*.
9. For **Missing data treatment**, choose one of the options (or leave the default of **Treat missing data as missing**). For more information, see [Configuring How CloudWatch Alarms Treat Missing Data](#) in the *Amazon CloudWatch User Guide*.
10. Choose **Next**.
11. (Optional) To receive notification of a scaling event, for **Notification**, you can choose or create the Amazon SNS topic you want to use to receive notifications. Otherwise, you can delete the notification now and add one later as needed.
12. Choose **Next**.
13. Under **Add a description**, enter a name and description for the alarm and choose **Next**.
14. Choose **Create alarm**.

To configure a step scaling policy for your Spot Fleet (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose **Auto Scaling**.

4. If automatic scaling is not configured, choose **Configure**.
5. Use **Scale capacity between** to set the minimum and maximum capacity for your fleet. Automatic scaling does not scale your fleet below the minimum capacity or above the maximum capacity.
6. Initially, **Scaling policies** contains policies named ScaleUp and ScaleDown. You can complete these policies, or choose **Remove policy** to delete them. You can also choose **Add policy**.
7. To define a policy, do the following:
 - a. For **Policy name**, enter a name for the policy.
 - b. For **Policy trigger**, select an existing alarm or choose **Create new alarm** to open the Amazon CloudWatch console and create an alarm.
 - c. For **Modify capacity**, select a scaling adjustment type, select a number, and select a unit.
 - d. (Optional) To perform step scaling, choose **Define steps**. By default, an add policy has a lower bound of -infinity and an upper bound of the alarm threshold. By default, a remove policy has a lower bound of the alarm threshold and an upper bound of +infinity. To add another step, choose **Add step**.
 - e. (Optional) To modify the default value for the cooldown period, select a number from **Cooldown period**.
8. Choose **Save**.

To configure step scaling policies for your Spot Fleet using the AWS CLI

1. Register the Spot Fleet request as a scalable target using the [register-scalable-target](#) command.
2. Create a scaling policy using the [put-scaling-policy](#) command.
3. Create an alarm that triggers the scaling policy using the [put-metric-alarm](#) command.

Scale Spot Fleet using scheduled scaling

Scaling based on a schedule enables you to scale your application in response to predictable changes in demand. To use scheduled scaling, you create *scheduled actions*, which tell Spot Fleet to perform scaling activities at specific times. When you create a scheduled action, you specify an existing Spot Fleet, when the scaling activity should occur, minimum capacity, and maximum capacity. You can create scheduled actions that scale one time only or that scale on a recurring schedule.

You can only create a scheduled action for Spot Fleets that already exist. You can't create a scheduled action at the same time that you create a Spot Fleet.

Limitation

The Spot Fleet request must have a request type of `maintain`. Automatic scaling is not supported for requests of type `request`, or Spot blocks.

To create a one-time scheduled action

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose the **Scheduled Scaling** tab near the bottom of the screen.
4. Choose **Create Scheduled Action**.
5. For **Name**, specify a name for the scheduled action.
6. Enter a value for **Minimum capacity**, **Maximum capacity**, or both.
7. For **Recurrence**, choose **Once**.
8. (Optional) Choose a date and time for **Start time**, **End time**, or both.
9. Choose **Submit**.

To scale on a recurring schedule

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose the **Scheduled Scaling** tab near the bottom of the screen.
4. For **Recurrence**, choose one of the predefined schedules (for example, **Every day**), or choose **Custom** and enter a cron expression. For more information about the cron expressions supported by scheduled scaling, see [Cron Expressions](#) in the *Amazon CloudWatch Events User Guide*.
5. (Optional) Choose a date and time for **Start time**, **End time**, or both.
6. Choose **Submit**.

To edit a scheduled action

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose the **Scheduled Scaling** tab near the bottom of the screen.
4. Select the scheduled action and choose **Actions**, **Edit**.
5. Make the needed changes and choose **Submit**.

To delete a scheduled action

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose the **Scheduled Scaling** tab near the bottom of the screen.
4. Select the scheduled action and choose **Actions**, **Delete**.
5. When prompted for confirmation, choose **Delete**.

To manage scheduled scaling using the AWS CLI

Use the following commands:

- [put-scheduled-action](#)
- [describe-scheduled-actions](#)
- [delete-scheduled-action](#)

Monitor fleet events using Amazon EventBridge

When the state of an EC2 Fleet or Spot Fleet changes, the fleet emits a notification. The notification is made available as an event that is sent to Amazon EventBridge (formerly known as Amazon CloudWatch Events). Events are emitted on a best effort basis.

With Amazon EventBridge, you can create rules that trigger programmatic actions in response to an event. For example, you can create two EventBridge rules, one that's triggered when a fleet state changes, and one that's triggered when an instance in the fleet is terminated. You can configure the first rule so that, if the fleet state changes, the rule invokes an SNS topic to send an email notification to you. You can configure the second rule so that, if an instance is terminated, the rule invokes a Lambda function to launch a new instance.

Topics

- [EC2 Fleet event types \(p. 893\)](#)

- [Spot Fleet event types \(p. 897\)](#)
- [Create Amazon EventBridge rules \(p. 902\)](#)

EC2 Fleet event types

Note

Only fleets of type `maintain` and `request` emit events. Fleets of type `instant` do not emit events because they submit synchronous one-time requests, and the state of the fleet is known immediately in the response.

There are five EC2 Fleet event types. For each event type, there are several sub-types.

The events are sent to EventBridge in JSON format. The following fields in the event form the event pattern that is defined in the rule, and which trigger an action:

```
"source": "aws.ec2fleet"  
  
    Identifies that the event is from EC2 Fleet.  
"detail-type": "EC2 Fleet State Change"  
  
    Identifies the event type.  
"detail": { "sub-type": "submitted" }  
  
    Identifies the event sub-type.
```

Event types

- [EC2 Fleet State Change \(p. 893\)](#)
- [EC2 Fleet Spot Instance Request Change \(p. 894\)](#)
- [EC2 Fleet Instance Change \(p. 895\)](#)
- [EC2 Fleet Information \(p. 896\)](#)
- [EC2 Fleet Error \(p. 896\)](#)

EC2 Fleet State Change

EC2 Fleet sends an `EC2 Fleet State Change` event to Amazon EventBridge when an EC2 Fleet changes state.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "715ed6b3-b8fc-27fe-fad6-528c7b8bf8a2",  
    "detail-type": "EC2 Fleet State Change",  
    "source": "aws.ec2fleet",  
    "account": "123456789012",  
    "time": "2020-11-09T09:00:20Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:fleet/fleet-598fb973-87b7-422d-  
        be4d-6b0809bfff0a"  
    ],  
    "detail": {  
        "sub-type": "active"  
    }  
}
```

The possible values for sub-type are:

`active`

The EC2 Fleet request has been validated and Amazon EC2 is attempting to maintain the target number of running instances.

`cancelled`

The EC2 Fleet request is canceled and has no running instances. The EC2 Fleet will be deleted two days after its instances are terminated.

`cancelled_running`

The EC2 Fleet request is canceled and does not launch additional instances. Its existing instances continue to run until they are interrupted or terminated. The request remains in this state until all instances are interrupted or terminated.

`cancelled_terminating`

The EC2 Fleet request is canceled and its instances are terminating. The request remains in this state until all instances are terminated.

`expired`

The EC2 Fleet request has expired. If the request was created with `TerminateInstancesWithExpiration` set, a subsequent `terminated` event indicates that the instances are terminated.

`modify_in_progress`

The EC2 Fleet request is being modified. The request remains in this state until the modification is fully processed.

`modify_succeeded`

The EC2 Fleet request was modified.

`submitted`

The EC2 Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances.

`progress`

The EC2 Fleet request is in the process of being fulfilled.

EC2 Fleet Spot Instance Request Change

EC2 Fleet sends an `EC2 Fleet Spot Instance Request Change` event to Amazon EventBridge when a Spot Instance request in the fleet changes state.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "19331f74-bf4b-a3dd-0f1b-ddb1422032b9",  
    "detail-type": "EC2 Fleet Spot Instance Request Change",  
    "source": "aws.ec2fleet",  
    "account": "123456789012",  
    "time": "2020-11-09T09:00:05Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:fleet/  
        fleet-83fd4e48-552a-40ef-9532-82a3acca5f10"]  
}
```

```
],
  "detail": {
    "spot-instance-request-id": "sir-rmqsk6h",
    "description": "SpotInstanceRequestId sir-rmqsk6h, PreviousState: cancelled_running",
    "sub-type": "cancelled"
  }
}
```

The possible values for sub-type are:

active

The Spot Instance request is fulfilled and has an associated Spot Instance.

cancelled

You cancelled the Spot Instance request, or the Spot Instance request expired.

disabled

You stopped the Spot Instance.

submitted

The Spot Instance request is submitted.

EC2 Fleet Instance Change

EC2 Fleet sends an `EC2 Fleet Instance Change` event to Amazon EventBridge when an instance in the fleet changes state.

The following is example data for this event.

```
{
  "version": "0",
  "id": "542ce428-c8f1-0608-c015-e8ed6522c5bc",
  "detail-type": "EC2 Fleet Instance Change",
  "source": "aws.ec2fleet",
  "account": "123456789012",
  "time": "2020-11-09T09:00:23Z",
  "region": "us-east-1",
  "resources": [
    "arn:aws:ec2:us-east-1:123456789012:fleet/fleet-598fb973-87b7-422d-be4d-6b0809bfff0a"
  ],
  "detail": {
    "instance-id": "i-0c594155dd5ff1829",
    "description": "{\"instanceType\":\"c5.large\",\"image\":\"ami-6057e21a\",\"productDescription\":\"Linux/UNIX\",\"availabilityZone\":\"us-east-1d\"}",
    "sub-type": "launched"
  }
}
```

The possible values for sub-type are:

launched

A new instance was launched.

terminated

The instance was terminated.

termination_notified

An instance termination notification was sent when a Spot Instance was terminated by Amazon EC2 during scale-down, when the target capacity of the fleet was modified down, for example, from a target capacity of 4 to a target capacity of 3.

EC2 Fleet Information

EC2 Fleet sends an `EC2 Fleet Information` event to Amazon EventBridge when there is an error during fulfillment. The information event does not block the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "76529817-d605-4571-7224-d36cc1b2c0c4",  
    "detail-type": "EC2 Fleet Information",  
    "source": "aws.ec2fleet",  
    "account": "123456789012",  
    "time": "2020-11-09T08:17:07Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:fleet/fleet-8becf5fe-  
        bb9e-415d-8f54-3fa5a8628b91"  
    ],  
    "detail": {  
        "description": "c4.xlarge, ami-0947d2ba12ee1ff75, Linux/UNIX, us-east-1a,  
        Spot price in either SpotFleetRequestConfigData or SpotFleetLaunchSpecification or  
        LaunchTemplate or LaunchTemplateOverrides is less than Spot market price $0.0619",  
        "sub-type": "launchSpecUnusable"  
    }  
}
```

The possible values for sub-type are:

fleetProgressHalted

The price in every launch specification is not valid because it is below the Spot price (all the launch specifications have produced `launchSpecUnusable` events). A launch specification might become valid if the Spot price changes.

launchSpecTemporarilyBlacklisted

The configuration is not valid and several attempts to launch instances have failed. For more information, see the description of the event.

launchSpecUnusable

The price in a launch specification is not valid because it is below the Spot price.

registerWithLoadBalancersFailed

An attempt to register instances with load balancers failed. For more information, see the description of the event.

EC2 Fleet Error

EC2 Fleet sends an `EC2 Fleet Error` event to Amazon EventBridge when there is an error during fulfillment. The error event blocks the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "69849a22-6d0f-d4ce-602b-b47c1c98240e",  
    "detail-type": "EC2 Fleet Error",  
    "source": "aws.ec2fleet",  
    "account": "123456789012",  
    "time": "2020-10-07T01:44:24Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:fleet/fleet-9bb19bc6-60d3-4fd2-ae47-  
        d33e68eafa08"  
    ],  
    "detail": {  
        "description": "m3.large, ami-00068cd7555f543d5, Linux/UNIX: IPv6 is not supported  
        for the instance type 'm3.large'. ",  
        "sub-type": "spotFleetRequestConfigurationInvalid"  
    }  
}
```

The possible values for sub-type are:

`iamFleetRoleInvalid`

The EC2 Fleet does not have the required permissions to either launch or terminate an instance.

`allLaunchSpecsTemporarilyBlacklisted`

None of the configurations are valid, and several attempts to launch instances have failed. For more information, see the description of the event.

`spotInstanceCountLimitExceeded`

You've reached the limit on the number of Spot Instances that you can launch.

`spotFleetRequestConfigurationInvalid`

The configuration is not valid. For more information, see the description of the event.

Spot Fleet event types

There are five Spot Fleet event types. For each event type, there are several sub-types.

The events are sent to EventBridge in JSON format. The following fields in the event form the event pattern that is defined in the rule, and which trigger an action:

`"source": "aws.ec2spotfleet"`

Identifies that the event is from Spot Fleet.

`"detail-type": "EC2 Spot Fleet State Change"`

Identifies the event type.

`"detail": { "sub-type": "submitted" }`

Identifies the event sub-type.

EC2 Spot Fleet State Change

Spot Fleet sends an EC2 Spot Fleet State Change event to Amazon EventBridge when a Spot Fleet changes state.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "d1af1091-6cc3-2e24-203a-3b870e455d5b",  
    "detail-type": "EC2 Spot Fleet State Change",  
    "source": "aws.ec2spotfleet",  
    "account": "123456789012",  
    "time": "2020-11-09T08:57:06Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:spot-fleet-request/sfr-4b6d274d-0cea-4b2c-  
        b3be-9dc627ad1f55"  
    ],  
    "detail": {  
        "sub-type": "submitted"  
    }  
}
```

The possible values for sub-type are:

active

The Spot Fleet request has been validated and Amazon EC2 is attempting to maintain the target number of running instances.

cancelled

The Spot Fleet request is canceled and has no running instances. The Spot Fleet will be deleted two days after its instances are terminated.

cancelled_running

The Spot Fleet request is canceled and does not launch additional instances. Its existing instances continue to run until they are interrupted or terminated. The request remains in this state until all instances are interrupted or terminated.

cancelled_terminating

The Spot Fleet request is canceled and its instances are terminating. The request remains in this state until all instances are terminated.

expired

The Spot Fleet request has expired. If the request was created with TerminateInstancesWithExpiration set, a subsequent terminated event indicates that the instances are terminated.

modify_in_progress

The Spot Fleet request is being modified. The request remains in this state until the modification is fully processed.

modify_succeeded

The Spot Fleet request was modified.

submitted

The Spot Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances.

progress

The Spot Fleet request is in the process of being fulfilled.

EC2 Spot Fleet Spot Instance Request Change

Spot Fleet sends an `EC2 Spot Fleet Spot Instance Request Change` event to Amazon EventBridge when a Spot Instance request in the fleet changes state.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "cd141ef0-14af-d670-a71d-fe46e9971bd2",

    ],  
    "detail": {  
        "spot-instance-request-id": "sir-a2w9gc5h",  
        "description": "SpotInstanceRequestId sir-a2w9gc5h, PreviousState:  
cancelled_running",  
        "sub-type": "cancelled"  
    }  
}
```

The possible values for sub-type are:

active

The Spot Instance request is fulfilled and has an associated Spot Instance.

cancelled

You cancelled the Spot Instance request, or the Spot Instance request expired.

disabled

You stopped the Spot Instance.

submitted

The Spot Instance request is submitted.

EC2 Spot Fleet Instance Change

Spot Fleet sends an `EC2 Spot Fleet Instance Change` event to Amazon EventBridge when an instance in the fleet changes state.

The following is example data for this event.

```
{
```

```
"version": "0",

    "description": "{\"instanceType\":\"r4.2xlarge\", \"image\":\"ami-032930428bf1abbff\",
\", \"productDescription\":\"Linux/UNIX\", \"availabilityZone\":\"us-east-1a\"}",
    "sub-type": "launched"
}
}
```

The possible values for sub-type are:

launched

A new instance was launched.

terminated

The instance was terminated.

termination_notified

An instance termination notification was sent when a Spot Instance was terminated by Amazon EC2 during scale-down, when the target capacity of the fleet was modified down, for example, from a target capacity of 4 to a target capacity of 3.

EC2 Spot Fleet Information

Spot Fleet sends an EC2 Spot Fleet Information event to Amazon EventBridge when there is an error during fulfillment. The information event does not block the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```
{
    "version": "0",
    "id": "73a60f70-3409-a66c-635c-7f66c5f5b669",
    "detail-type": "EC2 Spot Fleet Information",
    "source": "aws.ec2spotfleet",
    "account": "123456789012",
    "time": "2020-11-08T20:56:12Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws:ec2:us-east-1:123456789012:spot-fleet-request/sfr-2531ea06-
af18-4647-8757-7d69c94971b1"
    ],
    "detail": {
        "description": "r3.8xlarge, ami-032930428bf1abbff, Linux/UNIX, us-east-1a, Spot bid
price is less than Spot market price $0.5291",
        "sub-type": "launchSpecUnusable"
    }
}
```

The possible values for sub-type are:

fleetProgressHalted

The price in every launch specification is not valid because it is below the Spot price (all the launch specifications have produced `launchSpecUnusable` events). A launch specification might become valid if the Spot price changes.

launchSpecTemporarilyBlacklisted

The configuration is not valid and several attempts to launch instances have failed. For more information, see the description of the event.

launchSpecUnusable

The price in a launch specification is not valid because it is below the Spot price.

registerWithLoadBalancersFailed

An attempt to register instances with load balancers failed. For more information, see the description of the event.

EC2 Spot Fleet Error

Spot Fleet sends an `EC2_Spot_Fleet_Error` event to Amazon EventBridge when there is an error during fulfillment. The error event blocks the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```
{  
    "version": "0",  
    "id": "10adc4e7-675c-643e-125c-5bfa1b1ba5d2",  
    "detail-type": "EC2 Spot Fleet Error",  
    "source": "aws.ec2spotfleet",  
    "account": "123456789012",  
    "time": "2020-11-09T06:56:07Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:123456789012:spot-fleet-request/  
sfr-38725d30-25f1-4f30-83ce-2907c56dba17"  
    ],  
    "detail": {  
        "description": "r4.2xlarge, ami-032930428bf1abbff, Linux/UNIX: The  
associatePublicIPAddress parameter can only be specified for the network interface with  
DeviceIndex 0.",  
        "sub-type": "spotFleetRequestConfigurationInvalid"  
    }  
}
```

The possible values for sub-type are:

iamFleetRoleInvalid

The Spot Fleet does not have the required permissions to either launch or terminate an instance.

allLaunchSpecsTemporarilyBlacklisted

None of the configurations are valid, and several attempts to launch instances have failed. For more information, see the description of the event.

spotInstanceCountLimitExceeded

You've reached the limit on the number of Spot Instances that you can launch.

spotFleetRequestConfigurationInvalid

The configuration is not valid. For more information, see the description of the event.

Create Amazon EventBridge rules

When a notification of a state change is emitted for an EC2 Fleet or Spot Fleet, the event for the notification is sent to Amazon EventBridge. If EventBridge detects an event pattern that matches a pattern defined in a rule, EventBridge invokes a target (or targets) specified in the rule.

You can write an EventBridge rule and automate what actions to take when the event pattern matches the rule.

Topics

- [Create Amazon EventBridge rules to monitor EC2 Fleet events \(p. 902\)](#)
- [Create Amazon EventBridge rules to monitor Spot Fleet events \(p. 904\)](#)

Create Amazon EventBridge rules to monitor EC2 Fleet events

When a notification of a state change is emitted for an EC2 Fleet, the event for the notification is sent to Amazon EventBridge in the form of a JSON file. You can write an EventBridge rule to automate what actions to take when an event pattern matches the rule. If EventBridge detects an event pattern that matches a pattern defined in a rule, EventBridge invokes the target (or targets) specified in the rule.

The following fields form the event pattern that is defined in the rule:

```
"source": "aws.ec2fleet"  
  
    Identifies that the event is from EC2 Fleet.  
  
"detail-type": "EC2 Fleet State Change"  
  
    Identifies the event type.  
  
"detail": { "sub-type": "submitted" }  
  
    Identifies the event sub-type.
```

For the list of EC2 Fleet events and example event data, see [the section called “EC2 Fleet event types” \(p. 893\)](#).

Examples

- [Create an EventBridge rule to send a notification \(p. 902\)](#)
- [Create an EventBridge rule to trigger a Lambda function \(p. 903\)](#)

Create an EventBridge rule to send a notification

The following example creates an EventBridge rule to send an email, text message, or mobile push notification every time that Amazon EC2 emits an EC2 Fleet state change notification. The signal in this example is emitted as an `EC2 Fleet State Change` event, which triggers the action defined by the rule. Before creating the EventBridge rule, you must create the Amazon SNS topic for the email, text message, or mobile push notification.

To create an EventBridge rule to send a notification when an EC2 Fleet state changes

1. Open the Amazon EventBridge console at <https://console.aws.amazon.com/events/>.
2. Choose **Create rule**.
3. Enter a **Name** for the rule, and, optionally, a description.

A rule can't have the same name as another rule in the same Region and on the same event bus.

4. For **Define pattern**, choose **Event pattern**.
5. Under **Event matching pattern**, you can choose **Pre-defined pattern by service** or **Custom pattern**. The **Custom pattern** allows you to create a more detailed rule.
 - a. If you choose **Pre-defined pattern by service**, do the following:
 - i. For **Service provider**, choose **AWS**.
 - ii. For **Service name**, choose **EC2 Fleet**.
 - iii. For **Event type**, select the required event type. For this example, choose **EC2 Fleet Instance Change**.
 - b. If you choose **Custom pattern**, do the following:
 - In the **Event pattern** box, add the following pattern to match the **EC2 Fleet Instance Change** event for this example, and then choose **Save**.

```
{  
    "source": ["aws.ec2fleet"],  
    "detail-type": ["EC2 Fleet Instance Change"]  
}
```

6. For **Select event bus**, choose **AWS default event bus**. When an AWS service in your account emits an event, it always goes to your account's default event bus.
7. Confirm that **Enable the rule on the selected event bus** is toggled on.
8. For **Target**, choose **SNS topic** to send an email, text message, or mobile push notification when the event occurs.
9. For **Topic**, choose an existing topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person \(A2P\) messaging](#) in the *Amazon Simple Notification Service Developer Guide*.
10. For **Configure input**, choose the input for the email, text message, or mobile push notification.
11. Choose **Create**.

For more information, see [Amazon EventBridge rules](#) and [Amazon EventBridge event patterns](#) in the *Amazon EventBridge User Guide*

Create an EventBridge rule to trigger a Lambda function

The following example creates an EventBridge rule to trigger a Lambda function every time that Amazon EC2 emits an EC2 Fleet instance change notification for when an instance is launched. The signal in this example is emitted as an **EC2 Fleet Instance Change** event, sub-type **launched**, which triggers the action defined by the rule. Before creating the EventBridge rule, you must create the Lambda function.

To create an EventBridge rule to trigger a Lambda function when an instance in an EC2 Fleet changes state

1. Open the AWS Lambda console at <https://console.aws.amazon.com/lambda/>.
2. Choose **Create function**.
3. Enter a name for your function, configure the code, and then choose **Create function**.

For more information about using Lambda, see [Create a Lambda function with the console](#) in the *AWS Lambda Developer Guide*.

4. Open the Amazon EventBridge console at <https://console.aws.amazon.com/events/>.
5. Choose **Create rule**.
6. Enter a **Name** for the rule, and, optionally, a description.

A rule can't have the same name as another rule in the same Region and on the same event bus.

7. For **Define pattern**, choose **Event pattern**.
8. Under **Event matching pattern**, you can choose **Pre-defined pattern by service** or **Custom pattern**. The **Custom pattern** allows you to create a more detailed rule.
 - a. If you choose **Pre-defined pattern by service**, do the following:
 - i. For **Service provider**, choose **AWS**.
 - ii. For **Service name**, choose **EC2 Fleet**.
 - iii. For **Event type**, select the required event type. For this example, choose **EC2 Fleet Instance Change**.
 - b. If you choose **Custom pattern**, do the following:
 - In the **Event pattern** box, add the following pattern to match the **EC2 Fleet Instance Change** event and launched sub-type for this example, and then choose **Save**.

```
{  
    "source": ["aws.ec2fleet"],  
    "detail-type": ["EC2 Fleet Instance Change"],  
    "detail": {  
        "sub-type": ["launched"]  
    }  
}
```

9. For **Target**, choose **Lambda function**, and for **Function**, choose the function that you created to respond when the event occurs.
10. Choose **Create**.

In this example, the Lambda function will be triggered when the **EC2 Fleet Instance Change** event with the sub-type **launched** occurs.

For a tutorial on how to create a Lambda function and an EventBridge rule that runs the Lambda function, see [Tutorial: Log the State of an Amazon EC2 Instance Using EventBridge](#) in the *AWS Lambda Developer Guide*.

Create Amazon EventBridge rules to monitor Spot Fleet events

When a notification of a state change is emitted for a Spot Fleet, the event for the notification is sent to Amazon EventBridge in the form of a JSON file. You can write an EventBridge rule to automate what actions to take when an event pattern matches the rule. If EventBridge detects an event pattern that matches a pattern defined in a rule, EventBridge invokes the target (or targets) specified in the rule.

The following fields form the event pattern that is defined in the rule:

```
"source": "aws.ec2spotfleet"  
  
    Identifies that the event is from Spot Fleet.  
"detail-type": "EC2 Spot Fleet State Change"  
  
    Identifies the event type.  
"detail": { "sub-type": "submitted" }  
  
    Identifies the event sub-type.
```

For the list of Spot Fleet events and example event data, see [the section called “Spot Fleet event types” \(p. 897\)](#).

Examples

- [Create an EventBridge rule to send a notification \(p. 902\)](#)
- [Create an EventBridge rule to trigger a Lambda function \(p. 903\)](#)

Create an EventBridge rule to send a notification

The following example creates an EventBridge rule to send an email, text message, or mobile push notification every time that Amazon EC2 emits a Spot Fleet state change notification. The signal in this example is emitted as an `EC2_Spot_Fleet_State_Change` event, which triggers the action defined by the rule. Before creating the EventBridge rule, you must create the Amazon SNS topic for the email, text message, or mobile push notification.

To create an EventBridge rule to send a notification when a Spot Fleet state changes

1. Open the Amazon EventBridge console at <https://console.aws.amazon.com/events/>.
2. Choose **Create rule**.
3. Enter a **Name** for the rule, and, optionally, a description.

A rule can't have the same name as another rule in the same Region and on the same event bus.
4. For **Define pattern**, choose **Event pattern**.
5. Under **Event matching pattern**, you can choose **Pre-defined pattern by service** or **Custom pattern**. The **Custom pattern** allows you to create a more detailed rule.
 - a. If you choose **Pre-defined pattern by service**, do the following:
 - i. For **Service provider**, choose **AWS**.
 - ii. For **Service name**, choose **EC2 Spot Fleet**.
 - iii. For **Event type**, select the required event type. For this example, choose **EC2 Spot Fleet Instance Change**.
 - b. If you choose **Custom pattern**, do the following:
 - In the **Event pattern** box, add the following pattern to match the `EC2_Spot_Fleet_Instance_Change` event for this example, and then choose **Save**.

```
{  
    "source": ["aws.ec2spotfleet"],  
    "detail-type": ["EC2 Spot Fleet Instance Change"]  
}
```

6. For **Select event bus**, choose **AWS default event bus**. When an AWS service in your account emits an event, it always goes to your account's default event bus.
7. Confirm that **Enable the rule on the selected event bus** is toggled on.
8. For **Target**, choose **SNS topic** to send an email, text message, or mobile push notification when the event occurs.
9. For **Topic**, choose an existing topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person \(A2P\) messaging](#) in the *Amazon Simple Notification Service Developer Guide*.
10. For **Configure input**, choose the input for the email, text message, or mobile push notification.
11. Choose **Create**.

For more information, see [Amazon EventBridge rules](#) and [Amazon EventBridge event patterns](#) in the *Amazon EventBridge User Guide*

Create an EventBridge rule to trigger a Lambda function

The following example creates an EventBridge rule to trigger a Lambda function every time that Amazon EC2 emits a Spot Fleet instance change notification for when an instance is launched. The signal in this example is emitted as an `EC2 Spot Fleet Instance Change` event, sub-type `launched`, which triggers the action defined by the rule. Before creating the EventBridge rule, you must create the Lambda function.

To create an EventBridge rule to trigger a Lambda function when an instance in a Spot Fleet changes state

1. Open the AWS Lambda console at <https://console.aws.amazon.com/lambda/>.
2. Choose **Create function**.
3. Enter a name for your function, configure the code, and then choose **Create function**.

For more information about using Lambda, see [Create a Lambda function with the console](#) in the *AWS Lambda Developer Guide*.

4. Open the Amazon EventBridge console at <https://console.aws.amazon.com/events/>.
5. Choose **Create rule**.
6. Enter a **Name** for the rule, and, optionally, a description.

A rule can't have the same name as another rule in the same Region and on the same event bus.
7. For **Define pattern**, choose **Event pattern**.
8. Under **Event matching pattern**, you can choose **Pre-defined pattern by service** or **Custom pattern**. The **Custom pattern** allows you to create a more detailed rule.
 - a. If you choose **Pre-defined pattern by service**, do the following:
 - i. For **Service provider**, choose **AWS**.
 - ii. For **Service name**, choose **EC2 Spot Fleet**.
 - iii. For **Event type**, select the required event type. For this example, choose **EC2 Spot Fleet Instance Change**.
 - b. If you choose **Custom pattern**, do the following:
 - In the **Event pattern** box, add the following pattern to match the `EC2 Spot Fleet Instance Change` event and `launched` sub-type for this example, and then choose **Save**.

```
{  
    "source": ["aws.ec2spotfleet"],  
    "detail-type": ["EC2 Spot Fleet Instance Change"],  
    "detail": {  
        "sub-type": ["launched"]  
    }  
}
```

9. For **Target**, choose **Lambda function**, and for **Function**, choose the function that you created to respond when the event occurs.
10. Choose **Create**.

In this example, the Lambda function will be triggered when the `EC2 Fleet Instance Change` event with the sub-type `launched` occurs.

For a tutorial on how to create a Lambda function and an EventBridge rule that runs the Lambda function, see [Tutorial: Log the State of an Amazon EC2 Instance Using EventBridge](#) in the *AWS Lambda Developer Guide*.

Tutorials for EC2 Fleet and Spot Fleet

The following tutorials take you through the common processes for creating EC2 Fleets and Spot Fleets.

Tutorials

- [Tutorial: Use EC2 Fleet with instance weighting \(p. 907\)](#)
- [Tutorial: Use EC2 Fleet with On-Demand as the primary capacity \(p. 909\)](#)
- [Tutorial: Launch On-Demand Instances using targeted Capacity Reservations \(p. 910\)](#)
- [Tutorial: Use Spot Fleet with instance weighting \(p. 915\)](#)

Tutorial: Use EC2 Fleet with instance weighting

This tutorial uses a fictitious company called Example Corp to illustrate the process of requesting an EC2 Fleet using instance weighting.

Objective

Example Corp, a pharmaceutical company, wants to use the computational power of Amazon EC2 for screening chemical compounds that might be used to fight cancer.

Planning

Example Corp first reviews [Spot Best Practices](#). Next, Example Corp determines the requirements for their EC2 Fleet.

Instance types

Example Corp has a compute- and memory-intensive application that performs best with at least 60 GB of memory and eight virtual CPUs (vCPUs). They want to maximize these resources for the application at the lowest possible price. Example Corp decides that any of the following EC2 instance types would meet their needs:

Instance type	Memory (GiB)	vCPUs
r3.2xlarge	61	8
r3.4xlarge	122	16
r3.8xlarge	244	32

Target capacity in units

With instance weighting, target capacity can equal a number of instances (the default) or a combination of factors such as cores (vCPUs), memory (GiBs), and storage (GBs). By considering the base for their application (60 GB of RAM and eight vCPUs) as one unit, Example Corp decides that 20 times this amount would meet their needs. So the company sets the target capacity of their EC2 Fleet request to 20.

Instance weights

After determining the target capacity, Example Corp calculates instance weights. To calculate the instance weight for each instance type, they determine the units of each instance type that are required to reach the target capacity as follows:

- r3.2xlarge (61.0 GB, 8 vCPUs) = 1 unit of 20
- r3.4xlarge (122.0 GB, 16 vCPUs) = 2 units of 20
- r3.8xlarge (244.0 GB, 32 vCPUs) = 4 units of 20

Therefore, Example Corp assigns instance weights of 1, 2, and 4 to the respective launch configurations in their EC2 Fleet request.

Price per unit hour

Example Corp uses the [On-Demand price](#) per instance hour as a starting point for their price. They could also use recent Spot prices, or a combination of the two. To calculate the price per unit hour, they divide their starting price per instance hour by the weight. For example:

Instance type	On-Demand price	Instance weight	Price per unit hour
r3.2xLarge	\$0.7	1	\$0.7
r3.4xLarge	\$1.4	2	\$0.7
r3.8xLarge	\$2.8	4	\$0.7

Example Corp could use a global price per unit hour of \$0.7 and be competitive for all three instance types. They could also use a global price per unit hour of \$0.7 and a specific price per unit hour of \$0.9 in the r3.8xlarge launch specification.

Verify permissions

Before creating an EC2 Fleet, Example Corp verifies that it has an IAM role with the required permissions. For more information, see [EC2 Fleet prerequisites](#) (p. 822).

Create a launch template

Next, Example Corp creates a launch template. The launch template ID is used in the following step. For more information, see [Create a launch template](#) (p. 596).

Create the EC2 Fleet

Example Corp creates a file, config.json, with the following configuration for its EC2 Fleet. In the following example, replace the resource identifiers with your own resource identifiers.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-07b3bc7625cdab851",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "r3.2xlarge",  
                    "SubnetId": "subnet-482e4972",  
                    "WeightedCapacity": 1  
                },  
                {  
                    "InstanceType": "r3.4xlarge",  
                    "SubnetId": "subnet-482e4972",  
                    "WeightedCapacity": 2  
                }  
            ]  
        }  
    ]  
}
```

```
        },
        {
            "InstanceType": "r3.8xlarge",
            "MaxPrice": "0.90",
            "SubnetId": "subnet-482e4972",
            "WeightedCapacity": 4
        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 20,
        "DefaultTargetCapacityType": "spot"
    }
}
```

Example Corp creates the EC2 Fleet using the following [create-fleet](#) command.

```
aws ec2 create-fleet \
--cli-input-json file://config.json
```

For more information, see [Create an EC2 Fleet \(p. 828\)](#).

Fulfillment

The allocation strategy determines which Spot capacity pools your Spot Instances come from.

With the lowest-price strategy (which is the default strategy), the Spot Instances come from the pool with the lowest price per unit at the time of fulfillment. To provide 20 units of capacity, the EC2 Fleet launches either 20 r3.2xlarge instances (20 divided by 1), 10 r3.4xlarge instances (20 divided by 2), or 5 r3.8xlarge instances (20 divided by 4).

If Example Corp used the diversified strategy, the Spot Instances would come from all three pools. The EC2 Fleet would launch 6 r3.2xlarge instances (which provide 6 units), 3 r3.4xlarge instances (which provide 6 units), and 2 r3.8xlarge instances (which provide 8 units), for a total of 20 units.

Tutorial: Use EC2 Fleet with On-Demand as the primary capacity

This tutorial uses a fictitious company called ABC Online to illustrate the process of requesting an EC2 Fleet with On-Demand as the primary capacity, and Spot capacity if available.

Objective

ABC Online, a restaurant delivery company, wants to be able to provision Amazon EC2 capacity across EC2 instance types and purchasing options to achieve their desired scale, performance, and cost.

Plan

ABC Online requires a fixed capacity to operate during peak periods, but would like to benefit from increased capacity at a lower price. ABC Online determines the following requirements for their EC2 Fleet:

- On-Demand Instance capacity – ABC Online requires 15 On-Demand Instances to ensure that they can accommodate traffic at peak periods.
- Spot Instance capacity – ABC Online would like to improve performance, but at a lower price, by provisioning 5 Spot Instances.

Verify permissions

Before creating an EC2 Fleet, ABC Online verifies that it has an IAM role with the required permissions. For more information, see [EC2 Fleet prerequisites \(p. 822\)](#).

Create a launch template

Next, ABC Online creates a launch template. The launch template ID is used in the following step. For more information, see [Create a launch template \(p. 596\)](#).

Create the EC2 Fleet

ABC Online creates a file, config.json, with the following configuration for its EC2 Fleet. In the following example, replace the resource identifiers with your own resource identifiers.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-07b3bc7625cdab851",  
                "Version": "2"  
            }  
        },  
        {"  
            "TargetCapacitySpecification": {  
                "TotalTargetCapacity": 20,  
                "OnDemandTargetCapacity": 15,  
                "DefaultTargetCapacityType": "spot"  
            }  
        }  
    ]  
}
```

ABC Online creates the EC2 Fleet using the following [create-fleet](#) command.

```
aws ec2 create-fleet \  
  --cli-input-json file://config.json
```

For more information, see [Create an EC2 Fleet \(p. 828\)](#).

Fulfillment

The allocation strategy determines that the On-Demand capacity is always fulfilled, while the balance of the target capacity is fulfilled as Spot if there is capacity and availability.

Tutorial: Launch On-Demand Instances using targeted Capacity Reservations

This tutorial walks you through all the steps that you must perform so that your EC2 Fleet launches On-Demand Instances into targeted Capacity Reservations.

You will learn how to configure a fleet to use targeted On-Demand Capacity Reservations first when launching On-Demand Instances. You will also learn how to configure the fleet so that, when the total On-Demand target capacity exceeds the number of available unused Capacity Reservations, the fleet uses the specified allocation strategy for selecting the instance pools in which to launch the remaining target capacity.

EC2 Fleet configuration

In this tutorial, the fleet configuration is as follows:

- Target capacity: 10 On-Demand Instances
- Total unused targeted Capacity Reservations: 6 (less than the fleet's On-Demand target capacity of 10 On-Demand Instances)
- Number of Capacity Reservation pools: 2 (us-east-1a and us-east-1b)
- Number of Capacity Reservations per pool: 3
- On-Demand allocation strategy: `lowest-price` (When the number of unused Capacity Reservations is less than the On-Demand target capacity, the fleet determines the pools in which to launch the remaining On-Demand capacity based on the On-Demand allocation strategy.)

Note that you can also use the `prioritized` allocation strategy instead of the `lowest-price` allocation strategy.

To launch On-Demand Instances into targeted Capacity Reservations, you must perform a number of steps, as follows:

- [Step 1: Create Capacity Reservations \(p. 911\)](#)
- [Step 2: Create a Capacity Reservation resource group \(p. 912\)](#)
- [Step 3: Add the Capacity Reservations to the Capacity Reservation resource group \(p. 912\)](#)
- [\(Optional\) Step 4: View the Capacity Reservations in the resource group \(p. 912\)](#)
- [Step 5: Create a launch template that specifies that the Capacity Reservation targets a specific resource group \(p. 913\)](#)
- [\(Optional\) Step 6: Describe the launch template \(p. 913\)](#)
- [Step 7: Create an EC2 Fleet \(p. 914\)](#)
- [\(Optional\) Step 8: View the number of remaining unused Capacity Reservations \(p. 915\)](#)

Step 1: Create Capacity Reservations

Use the `create-capacity-reservation` command to create the Capacity Reservations, three for `us-east-1a` and another three for `us-east-1b`. Except for the Availability Zone, the other attributes of the Capacity Reservations are identical.

3 Capacity Reservations in `us-east-1a`

```
aws ec2 create-capacity-reservation \
--availability-zone us-east-1a \
--instance-type c5.xlarge \
--instance-platform Linux/UNIX \
--instance-count 3 \
--instance-match-criteria targeted
```

Example of resulting Capacity Reservation ID

```
cr-1234567890abcdef1
```

3 Capacity Reservations in `us-east-1b`

```
aws ec2 create-capacity-reservation \
--availability-zone us-east-1b \
--instance-type c5.xlarge \
--instance-platform Linux/UNIX \
--instance-count 3 \
```

```
--instance-match-criteria targeted
```

Example of resulting Capacity Reservation ID

```
cr-54321abcdef567890
```

Step 2: Create a Capacity Reservation resource group

Use the [resource-groups](#) service and the [create-group](#) command to create a Capacity Reservation resource group. In this example, the resource group is named `my-cr-group`. For information about why you must create a resource group, see [Use Capacity Reservations for On-Demand Instances \(p. 816\)](#).

```
aws resource-groups create-group \
--name my-cr-group \
--configuration '{"Type": "AWS::EC2::CapacityReservationPool"}' \
'{"Type": "AWS::ResourceGroups::Generic", "Parameters": [{"Name": "allowed-resource-types", "Values": ["AWS::EC2::CapacityReservation"]}]}'
```

Step 3: Add the Capacity Reservations to the Capacity Reservation resource group

Use the [resource-groups](#) service and the [group-resources](#) command to add the Capacity Reservations that you created in Step 1 to the Capacity Reservations resource group. Note that you must reference the On-Demand Capacity Reservations by their ARNs.

```
aws resource-groups group-resources \
--group my-cr-group \
--resource-arns \
arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-1234567890abcdef1 \
arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-54321abcdef567890
```

Example output

```
{  
    "Failed": [],  
    "Succeeded": [  
        "arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-1234567890abcdef1",  
        "arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-54321abcdef567890"  
    ]  
}
```

(Optional) Step 4: View the Capacity Reservations in the resource group

Use the [resource-groups](#) service and the [list-group-resources](#) command to optionally describe the resource group to view its Capacity Reservations.

```
aws resource-groups list-group-resources --group my-cr-group
```

Example output

```
{  
    "ResourceIdentifiers": [  
        {  
            "Arn": "arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-1234567890abcdef1",  
            "Type": "AWS::EC2::CapacityReservation"  
        }  
    ]  
}
```

Amazon Elastic Compute Cloud
User Guide for Linux Instances
Tutorial: Launch On-Demand Instances
using targeted Capacity Reservations

```
        "ResourceType": "AWS::EC2::CapacityReservation",
        "ResourceArn": "arn:aws:ec2:us-east-1:123456789012:capacity-reservation/
cr-1234567890abcdef1"
    },
{
    "ResourceType": "AWS::EC2::CapacityReservation",
    "ResourceArn": "arn:aws:ec2:us-east-1:123456789012:capacity-reservation/
cr-54321abcdef567890"
}
]
```

Step 5: Create a launch template that specifies that the Capacity Reservation targets a specific resource group

Use the [create-launch-template](#) command to create a launch template in which to specify the Capacity Reservations to use. In this example, the fleet will use targeted Capacity Reservations, which have been added to a resource group. Therefore, the launch template data specifies that the Capacity Reservation targets a specific resource group. In this example, the launch template is named `my-launch-template`.

```
aws ec2 create-launch-template \
--launch-template-name my-launch-template \
--launch-template-data \
'{"ImageId": "ami-0123456789example", \
"CapacityReservationSpecification": \
{"CapacityReservationTarget": \
{ "CapacityReservationResourceGroupArn": "arn:aws:resource-groups:us-
east-1:123456789012:group/my-cr-group" \
}} \
}'
```

(Optional) Step 6: Describe the launch template

Use the [describe-launch-template](#) command to optionally describe the launch template to view its configuration.

```
aws ec2 describe-launch-template-versions --launch-template-name my-launch-template
```

Example output

```
{
    "LaunchTemplateVersions": [
        {
            "LaunchTemplateId": "lt-01234567890example",
            "LaunchTemplateName": "my-launch-template",
            "VersionNumber": 1,
            "CreateTime": "2021-01-19T20:50:19.000Z",
            "CreatedBy": "arn:aws:iam::123456789012:user/Admin",
            "DefaultVersion": true,
            "LaunchTemplateData": {
                "ImageId": "ami-0947d2ba12ee1ff75",
                "CapacityReservationSpecification": {
                    "CapacityReservationTarget": {
                        "CapacityReservationResourceGroupArn": "arn:aws:resource-groups:us-
east-1:123456789012:group/my-cr-group"
                    }
                }
            }
        }
    ]
}
```

```
    ]  
}
```

Step 7: Create an EC2 Fleet

Create an EC2 Fleet that specifies the configuration information for the instances that it will launch. The following EC2 Fleet configuration shows only the pertinent configurations for this example. The launch template `my-launch-template` is the launch template you created in Step 5. There are two instance pools, each with the same instance type (`c5.xlarge`), but with different Availability Zones (`us-east-1a` and `us-east-1b`). The price of the instance pools is the same because pricing is defined for the Region, not per Availability Zone. The total target capacity is 10, and the default target capacity type is on-demand. The On-Demand allocation strategy is `lowest-price`. The usage strategy for Capacity Reservations is `use-capacity-reservations-first`.

Note

The fleet type must be `instant`. Other fleet types do not support `use-capacity-reservations-first`.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "my-launch-template",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "c5.xlarge",  
                    "AvailabilityZone": "us-east-1a"  
                },  
                {  
                    "InstanceType": "c5.xlarge",  
                    "AvailabilityZone": "us-east-1b"  
                }  
            ]  
        }  
    ],  
    "TargetCapacitySpecification": {  
        "TotalTargetCapacity": 10,  
        "DefaultTargetCapacityType": "on-demand"  
    },  
    "OnDemandOptions": {  
        "AllocationStrategy": "lowest-price",  
        "CapacityReservationOptions": {  
            "UsageStrategy": "use-capacity-reservations-first"  
        }  
    },  
    "Type": "instant"  
}
```

After you create the `instant` fleet using the preceding configuration, the following 10 instances are launched to meet the target capacity:

- The Capacity Reservations are used first to launch 6 On-Demand Instances as follows:
 - 3 On-Demand Instances are launched into the 3 `c5.xlarge` targeted Capacity Reservations in `us-east-1a`
 - 3 On-Demand Instances are launched into the 3 `c5.xlarge` targeted Capacity Reservations in `us-east-1b`
- To meet the target capacity, 4 additional On-Demand Instances are launched into regular On-Demand capacity according to the On-Demand allocation strategy, which is `lowest-price` in this example.

However, because the pools are the same price (because price is per Region and not per Availability Zone), the fleet launches the remaining 4 On-Demand Instances into either of the pools.

(Optional) Step 8: View the number of remaining unused Capacity Reservations

After the fleet is launched, you can optionally run [describe-capacity-reservations](#) to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the Capacity Reservations in all of the pools were used.

```
{ "CapacityReservationId": "cr-111",
  "InstanceType": "c5.xlarge",
  "AvailableInstanceCount": 0
}

{ "CapacityReservationId": "cr-222",
  "InstanceType": "c5.xlarge",
  "AvailableInstanceCount": 0
}
```

Tutorial: Use Spot Fleet with instance weighting

This tutorial uses a fictitious company called Example Corp to illustrate the process of requesting a Spot Fleet using instance weighting.

Objective

Example Corp, a pharmaceutical company, wants to leverage the computational power of Amazon EC2 for screening chemical compounds that might be used to fight cancer.

Planning

Example Corp first reviews [Spot Best Practices](#). Next, Example Corp determines the following requirements for their Spot Fleet.

Instance types

Example Corp has a compute- and memory-intensive application that performs best with at least 60 GB of memory and eight virtual CPUs (vCPUs). They want to maximize these resources for the application at the lowest possible price. Example Corp decides that any of the following EC2 instance types would meet their needs:

Instance type	Memory (GiB)	vCPUs
r3.2xlarge	61	8
r3.4xlarge	122	16
r3.8xlarge	244	32

Target capacity in units

With instance weighting, target capacity can equal a number of instances (the default) or a combination of factors such as cores (vCPUs), memory (GiBs), and storage (GBs). By considering the base for their

application (60 GB of RAM and eight vCPUs) as 1 unit, Example Corp decides that 20 times this amount would meet their needs. So the company sets the target capacity of their Spot Fleet request to 20.

Instance weights

After determining the target capacity, Example Corp calculates instance weights. To calculate the instance weight for each instance type, they determine the units of each instance type that are required to reach the target capacity as follows:

- r3.2xlarge (61.0 GB, 8 vCPUs) = 1 unit of 20
- r3.4xlarge (122.0 GB, 16 vCPUs) = 2 units of 20
- r3.8xlarge (244.0 GB, 32 vCPUs) = 4 units of 20

Therefore, Example Corp assigns instance weights of 1, 2, and 4 to the respective launch configurations in their Spot Fleet request.

Price per unit hour

Example Corp uses the [On-Demand price](#) per instance hour as a starting point for their price. They could also use recent Spot prices, or a combination of the two. To calculate the price per unit hour, they divide their starting price per instance hour by the weight. For example:

Instance type	On-Demand price	Instance weight	Price per unit hour
r3.2xLarge	\$0.7	1	\$0.7
r3.4xLarge	\$1.4	2	\$0.7
r3.8xLarge	\$2.8	4	\$0.7

Example Corp could use a global price per unit hour of \$0.7 and be competitive for all three instance types. They could also use a global price per unit hour of \$0.7 and a specific price per unit hour of \$0.9 in the r3.8xlarge launch specification.

Verify permissions

Before creating a Spot Fleet request, Example Corp verifies that it has an IAM role with the required permissions. For more information, see [Spot Fleet permissions \(p. 867\)](#).

Create the request

Example Corp creates a file, config.json, with the following configuration for its Spot Fleet request:

```
{  
    "SpotPrice": "0.70",  
    "TargetCapacity": 20,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "r3.2xlarge",  
            "SubnetId": "subnet-482e4972",  
            "WeightedCapacity": 1  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "r3.4xlarge",  
            "SubnetId": "subnet-482e4972",  
            "WeightedCapacity": 2  
        }  
    ]  
}
```

```
        "SubnetId": "subnet-482e4972",
        "WeightedCapacity": 2
    },
    {
        "ImageId": "ami-1a2b3c4d",
        "InstanceType": "r3.8xlarge",
        "SubnetId": "subnet-482e4972",
        "SpotPrice": "0.90",
        "WeightedCapacity": 4
    }
]
```

Example Corp creates the Spot Fleet request using the [request-spot-fleet](#) command.

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

For more information, see [Spot Fleet request types \(p. 839\)](#).

Fulfillment

The allocation strategy determines which Spot capacity pools your Spot Instances come from.

With the `lowestPrice` strategy (which is the default strategy), the Spot Instances come from the pool with the lowest price per unit at the time of fulfillment. To provide 20 units of capacity, the Spot Fleet launches either 20 `r3.2xlarge` instances (20 divided by 1), 10 `r3.4xlarge` instances (20 divided by 2), or 5 `r3.8xlarge` instances (20 divided by 4).

If Example Corp used the `diversified` strategy, the Spot Instances would come from all three pools. The Spot Fleet would launch 6 `r3.2xlarge` instances (which provide 6 units), 3 `r3.4xlarge` instances (which provide 6 units), and 2 `r3.8xlarge` instances (which provide 8 units), for a total of 20 units.

Example configurations for EC2 Fleet and Spot Fleet

The following examples show launch configurations that you can use to create EC2 Fleets and Spot Fleets.

Topics

- [EC2 Fleet example configurations \(p. 917\)](#)
- [Spot Fleet example configurations \(p. 930\)](#)

EC2 Fleet example configurations

The following examples show launch configurations that you can use with the `create-fleet` command to create an EC2 Fleet. For more information about the parameters, see `create-fleet` in the *AWS CLI Command Reference*.

Examples

- [Example 1: Launch Spot Instances as the default purchasing option \(p. 918\)](#)
- [Example 2: Launch On-Demand Instances as the default purchasing option \(p. 918\)](#)
- [Example 3: Launch On-Demand Instances as the primary capacity \(p. 919\)](#)
- [Example 4: Launch Spot Instances using the lowest-price allocation strategy \(p. 919\)](#)

- [Example 5: Launch On-Demand Instances using multiple Capacity Reservations \(p. 920\)](#)
- [Example 6: Launch On-Demand Instances using Capacity Reservations when the total target capacity exceeds the number of unused Capacity Reservations \(p. 922\)](#)
- [Example 7: Launch On-Demand Instances using targeted Capacity Reservations \(p. 925\)](#)
- [Example 8: Configure Capacity Rebalancing to launch replacement Spot Instances \(p. 927\)](#)
- [Example 9: Launch Spot Instances in a capacity-optimized fleet \(p. 928\)](#)
- [Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities \(p. 929\)](#)

Example 1: Launch Spot Instances as the default purchasing option

The following example specifies the minimum parameters required in an EC2 Fleet: a launch template, target capacity, and default purchasing option. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing option is spot, which results in the fleet launching 2 Spot Instances.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-0e8c754449b27161c",  
                "Version": "1"  
            }  
        },  
        {  
            "TargetCapacitySpecification": {  
                "TotalTargetCapacity": 2,  
                "DefaultTargetCapacityType": "spot"  
            }  
        }  
    ]  
}
```

Example 2: Launch On-Demand Instances as the default purchasing option

The following example specifies the minimum parameters required in an EC2 Fleet: a launch template, target capacity, and default purchasing option. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing option is on-demand, which results in the fleet launching 2 On-Demand Instances.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-0e8c754449b27161c",  
                "Version": "1"  
            }  
        },  
        {  
            "TargetCapacitySpecification": {  
                "TotalTargetCapacity": 2,  
                "DefaultTargetCapacityType": "on-demand"  
            }  
        }  
    ]  
}
```

Example 3: Launch On-Demand Instances as the primary capacity

The following example specifies the total target capacity of 2 instances for the fleet, and a target capacity of 1 On-Demand Instance. The default purchasing option is spot. The fleet launches 1 On-Demand Instance as specified, but needs to launch one more instance to fulfill the total target capacity. The purchasing option for the difference is calculated as `TotalTargetCapacity - OnDemandTargetCapacity = DefaultTargetCapacityType`, which results in the fleet launching 1 Spot Instance.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-0e8c754449b27161c",  
                "Version": "1"  
            }  
        },  
        {  
            "TargetCapacitySpecification": {  
                "TotalTargetCapacity": 2,  
                "OnDemandTargetCapacity": 1,  
                "DefaultTargetCapacityType": "spot"  
            }  
        }  
    ]  
}
```

Example 4: Launch Spot Instances using the lowest-price allocation strategy

If the allocation strategy for Spot Instances is not specified, the default allocation strategy, which is `lowest-price`, is used. The following example uses the `lowest-price` allocation strategy. The three launch specifications, which override the launch template, have different instance types but the same weighted capacity and subnet. The total target capacity is 2 instances and the default purchasing option is `spot`. The EC2 Fleet launches 2 Spot Instances using the instance type of the launch specification with the lowest price.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-0e8c754449b27161c",  
                "Version": "1"  
            }  
        }  
    ],  
    "Overrides": [  
        {  
            "InstanceType": "c4.large",  
            "WeightedCapacity": 1,  
            "SubnetId": "subnet-a4f6c5d3"  
        },  
        {  
            "InstanceType": "c3.large",  
            "WeightedCapacity": 1,  
            "SubnetId": "subnet-a4f6c5d3"  
        },  
        {  
            "InstanceType": "c5.large",  
            "WeightedCapacity": 1,  
            "SubnetId": "subnet-a4f6c5d3"  
        }  
    ]  
}
```

```
        }
    ]
}

],
"TargetCapacitySpecification": {
    "TotalTargetCapacity": 2,
    "DefaultTargetCapacityType": "spot"
}
}
```

Example 5: Launch On-Demand Instances using multiple Capacity Reservations

You can configure a fleet to use On-Demand Capacity Reservations first when launching On-Demand Instances by setting the usage strategy for Capacity Reservations to `use-capacity-reservations-first`. This example demonstrates how the fleet selects the Capacity Reservations to use when there are more Capacity Reservations than are needed to fulfil the target capacity.

In this example, the fleet configuration is as follows:

- Target capacity: 12 On-Demand Instances
- Total unused Capacity Reservations: 15 (more than the fleet's target capacity of 12 On-Demand Instances)
- Number of Capacity Reservation pools: 3 (`m5.large`, `m4.xlarge`, and `m4.2xlarge`)
- Number of Capacity Reservations per pool: 5
- On-Demand allocation strategy: `lowest-price` (When there are multiple unused Capacity Reservations in multiple instance pools, the fleet determines the pools in which to launch the On-Demand Instances based on the On-Demand allocation strategy.)

Note that you can also use the `prioritized` allocation strategy instead of the `lowest-price` allocation strategy.

Capacity Reservations

The account has the following 15 unused Capacity Reservations in 3 different pools. The number of Capacity Reservations in each pool is indicated by `AvailableInstanceCount`.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "m5.large",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1a",
    "AvailableInstanceCount": 5,
    "InstanceMatchCriteria": "open",
    "State": "active"
}

{
    "CapacityReservationId": "cr-222",
    "InstanceType": "m4.xlarge",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1a",
    "AvailableInstanceCount": 5,
    "InstanceMatchCriteria": "open",
    "State": "active"
}
```

```
{  
    "CapacityReservationId": "cr-333",  
    "InstanceType": "m4.2xlarge",  
    "InstancePlatform": "Linux/UNIX",  
    "AvailabilityZone": "us-east-1a",  
    "AvailableInstanceCount": 5,  
    "InstanceMatchCriteria": "open",  
    "State": "active"  
}
```

Fleet configuration

The following fleet configuration shows only the pertinent configurations for this example. The total target capacity is 12, and the default target capacity type is on-demand. The On-Demand allocation strategy is lowest-price. The usage strategy for Capacity Reservations is use-capacity-reservations-first.

In this example, the On-Demand Instance price is:

- m5.large – \$0.096 per hour
- m4.xlarge – \$0.20 per hour
- m4.2xlarge – \$0.40 per hour

Note

The fleet type must be of type instant. Other fleet types do not support use-capacity-reservations-first.

```
{  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-abc1234567example",  
                "Version": "1"  
            }  
            "Overrides": [  
                {  
                    "InstanceType": "m5.large",  
                    "AvailabilityZone": "us-east-1a",  
                    "WeightedCapacity": 1  
                },  
                {  
                    "InstanceType": "m4.xlarge",  
                    "AvailabilityZone": "us-east-1a",  
                    "WeightedCapacity": 1  
                },  
                {  
                    "InstanceType": "m4.2xlarge",  
                    "AvailabilityZone": "us-east-1a",  
                    "WeightedCapacity": 1  
                }  
            ]  
        },  
        {  
            "TargetCapacitySpecification": {  
                "TotalTargetCapacity": 12,  
                "DefaultTargetCapacityType": "on-demand"  
            },  
            "OnDemandOptions": {  
                "AllocationStrategy": "lowest-price"  
                "CapacityReservationOptions": {  
                    "UsageStrategy": "use-capacity-reservations-first"  
                }  
            }  
        }  
    ]  
}
```

```
        },
    },
    "Type": "instant",
}
```

After you create the `instant` fleet using the preceding configuration, the following 12 instances are launched to meet the target capacity:

- 5 `m5.large` On-Demand Instances in `us-east-1a` – `m5.large` in `us-east-1a` is the lowest price, and there are 5 available unused `m5.large` Capacity Reservations
- 5 `m4.xlarge` On-Demand Instances in `us-east-1a` – `m4.xlarge` in `us-east-1a` is the next lowest price, and there are 5 available unused `m4.xlarge` Capacity Reservations
- 2 `m4.2xlarge` On-Demand Instances in `us-east-1a` – `m4.2xlarge` in `us-east-1a` is the third lowest price, and there are 5 available unused `m4.2xlarge` Capacity Reservations of which only 2 are needed to meet the target capacity

After the fleet is launched, you can run [describe-capacity-reservations](#) to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the `m5.large` and `m4.xlarge` Capacity Reservations were used, with 3 `m4.2xlarge` Capacity Reservations remaining unused.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "m5.large",
    "AvailableInstanceCount": 0
}

{
    "CapacityReservationId": "cr-222",
    "InstanceType": "m4.xlarge",
    "AvailableInstanceCount": 0
}

{
    "CapacityReservationId": "cr-333",
    "InstanceType": "m4.2xlarge",
    "AvailableInstanceCount": 3
}
```

Example 6: Launch On-Demand Instances using Capacity Reservations when the total target capacity exceeds the number of unused Capacity Reservations

You can configure a fleet to use On-Demand Capacity Reservations first when launching On-Demand Instances by setting the usage strategy for Capacity Reservations to `use-capacity-reservations-first`. This example demonstrates how the fleet selects the instance pools in which to launch On-Demand Instances when the total target capacity exceeds the number of available unused Capacity Reservations.

In this example, the fleet configuration is as follows:

- Target capacity: 16 On-Demand Instances
- Total unused Capacity Reservations: 15 (less than the fleet's target capacity of 16 On-Demand Instances)
- Number of Capacity Reservation pools: 3 (`m5.large`, `m4.xlarge`, and `m4.2xlarge`)
- Number of Capacity Reservations per pool: 5

- On-Demand allocation strategy: `lowest-price` (When the number of unused Capacity Reservations is less than the On-Demand target capacity, the fleet determines the pools in which to launch the remaining On-Demand capacity based on the On-Demand allocation strategy.)

Note that you can also use the `prioritized` allocation strategy instead of the `lowest-price` allocation strategy.

Capacity Reservations

The account has the following 15 unused Capacity Reservations in 3 different pools. The number of Capacity Reservations in each pool is indicated by `AvailableInstanceCount`.

```
{  
    "CapacityReservationId": "cr-111",  
    "InstanceType": "m5.large",  
    "InstancePlatform": "Linux/UNIX",  
    "AvailabilityZone": "us-east-1a",  
    "AvailableInstanceCount": 5,  
    "InstanceMatchCriteria": "open",  
    "State": "active"  
}  
  
{  
    "CapacityReservationId": "cr-222",  
    "InstanceType": "m4.xlarge",  
    "InstancePlatform": "Linux/UNIX",  
    "AvailabilityZone": "us-east-1a",  
    "AvailableInstanceCount": 5,  
    "InstanceMatchCriteria": "open",  
    "State": "active"  
}  
  
{  
    "CapacityReservationId": "cr-333",  
    "InstanceType": "m4.2xlarge",  
    "InstancePlatform": "Linux/UNIX",  
    "AvailabilityZone": "us-east-1a",  
    "AvailableInstanceCount": 5,  
    "InstanceMatchCriteria": "open",  
    "State": "active"  
}
```

Fleet configuration

The following fleet configuration shows only the pertinent configurations for this example. The total target capacity is 16, and the default target capacity type is `on-demand`. The On-Demand allocation strategy is `lowest-price`. The usage strategy for Capacity Reservations is `use-capacity-reservations-first`.

In this example, the On-Demand Instance price is:

- `m5.large` – \$0.096 per hour
- `m4.xlarge` – \$0.20 per hour
- `m4.2xlarge` – \$0.40 per hour

Note

The fleet type must be `instant`. Other fleet types do not support `use-capacity-reservations-first`.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateId": "lt-0e8c754449b27161c",
                "Version": "1"
            }
        },
        "Overrides": [
            {
                "InstanceType": "m5.large",
                "AvailabilityZone": "us-east-1a",
                "WeightedCapacity": 1
            },
            {
                "InstanceType": "m4.xlarge",
                "AvailabilityZone": "us-east-1a",
                "WeightedCapacity": 1
            },
            {
                "InstanceType": "m4.2xlarge",
                "AvailabilityZone": "us-east-1a",
                "WeightedCapacity": 1
            }
        ]
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 16,
        "DefaultTargetCapacityType": "on-demand"
    },
    "OnDemandOptions": {
        "AllocationStrategy": "lowest-price"
        "CapacityReservationOptions": {
            "UsageStrategy": "use-capacity-reservations-first"
        }
    },
    "Type": "instant",
}
}
```

After you create the `instant` fleet using the preceding configuration, the following 16 instances are launched to meet the target capacity:

- 6 `m5.large` On-Demand Instances in `us-east-1a` – `m5.large` in `us-east-1a` is the lowest price, and there are 5 available unused `m5.large` Capacity Reservations. The Capacity Reservations are used first to launch 5 On-Demand Instances. After the remaining `m4.xlarge` and `m4.2xlarge` Capacity Reservations are used, to meet the target capacity an additional On-Demand Instance is launched according to the On-Demand allocation strategy, which is `lowest-price` in this example.
- 5 `m4.xlarge` On-Demand Instances in `us-east-1a` – `m4.xlarge` in `us-east-1a` is the next lowest price, and there are 5 available unused `m4.xlarge` Capacity Reservations
- 5 `m4.2xlarge` On-Demand Instances in `us-east-1a` – `m4.2xlarge` in `us-east-1a` is the third lowest price, and there are 5 available unused `m4.2xlarge` Capacity Reservations

After the fleet is launched, you can run [describe-capacity-reservations](#) to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the Capacity Reservations in all of the pools were used.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "m5.large",
}
```

```
        "AvailableInstanceCount": 0
    }

{
    "CapacityReservationId": "cr-222",
    "InstanceType": "m4.xlarge",
    "AvailableInstanceCount": 0
}

{
    "CapacityReservationId": "cr-333",
    "InstanceType": "m4.2xlarge",
    "AvailableInstanceCount": 0
}
```

Example 7: Launch On-Demand Instances using targeted Capacity Reservations

You can configure a fleet to use targeted On-Demand Capacity Reservations first when launching On-Demand Instances by setting the usage strategy for Capacity Reservations to `use-capacity-reservations-first`. This example demonstrates how to launch On-Demand Instances into targeted Capacity Reservations, where the attributes of the Capacity Reservations are the same except for their Availability Zones (`us-east-1a` and `us-east-1b`). It also demonstrates how the fleet selects the instance pools in which to launch On-Demand Instances when the total target capacity exceeds the number of available unused Capacity Reservations.

In this example, the fleet configuration is as follows:

- Target capacity: 10 On-Demand Instances
- Total unused targeted Capacity Reservations: 6 (less than the fleet's On-Demand target capacity of 10 On-Demand Instances)
- Number of Capacity Reservation pools: 2 (`us-east-1a` and `us-east-1b`)
- Number of Capacity Reservations per pool: 3
- On-Demand allocation strategy: `lowest-price` (When the number of unused Capacity Reservations is less than the On-Demand target capacity, the fleet determines the pools in which to launch the remaining On-Demand capacity based on the On-Demand allocation strategy.)

Note that you can also use the `prioritized` allocation strategy instead of the `lowest-price` allocation strategy.

For a walkthrough of the procedures that you must perform to accomplish this example, see [Tutorial: Launch On-Demand Instances using targeted Capacity Reservations \(p. 910\)](#).

Capacity Reservations

The account has the following 6 unused Capacity Reservations in 2 different pools. In this example, the pools differ by their Availability Zones. The number of Capacity Reservations in each pool is indicated by `AvailableInstanceCount`.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "c5.xlarge",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1a",
    "AvailableInstanceCount": 3,
    "InstanceMatchCriteria": "open",
    "State": "active"
}
```

```
{
    "CapacityReservationId": "cr-222",
    "InstanceType": "c5.xlarge",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1b",
    "AvailableInstanceCount": 3,
    "InstanceMatchCriteria": "open",
    "State": "active"
}
```

Fleet configuration

The following fleet configuration shows only the pertinent configurations for this example. The total target capacity is 10, and the default target capacity type is on-demand. The On-Demand allocation strategy is lowest-price. The usage strategy for Capacity Reservations is use-capacity-reservations-first.

In this example, the On-Demand Instance price for c5.xlarge in us-east-1 is \$0.17 per hour.

Note

The fleet type must be instant. Other fleet types do not support use-capacity-reservations-first.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-launch-template",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceType": "c5.xlarge",
                    "AvailabilityZone": "us-east-1a"
                },
                {
                    "InstanceType": "c5.xlarge",
                    "AvailabilityZone": "us-east-1b"
                }
            ]
        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 10,
        "DefaultTargetCapacityType": "on-demand"
    },
    "OnDemandOptions": {
        "AllocationStrategy": "lowest-price",
        "CapacityReservationOptions": {
            "UsageStrategy": "use-capacity-reservations-first"
        }
    },
    "Type": "instant"
}
```

After you create the instant fleet using the preceding configuration, the following 10 instances are launched to meet the target capacity:

- The Capacity Reservations are used first to launch 6 On-Demand Instances as follows:
 - 3 On-Demand Instances are launched into the 3 c5.xlarge targeted Capacity Reservations in us-east-1a

- 3 On-Demand Instances are launched into the 3 c5.xlarge targeted Capacity Reservations in us-east-1b
- To meet the target capacity, 4 additional On-Demand Instances are launched into regular On-Demand capacity according to the On-Demand allocation strategy, which is lowest-price in this example. However, because the pools are the same price (because price is per Region and not per Availability Zone), the fleet launches the remaining 4 On-Demand Instances into either of the pools.

After the fleet is launched, you can run [describe-capacity-reservations](#) to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the Capacity Reservations in all of the pools were used.

```
{  
    "CapacityReservationId": "cr-111",  
    "InstanceType": "c5.xlarge",  
    "AvailableInstanceCount": 0  
}  
  
{  
    "CapacityReservationId": "cr-222",  
    "InstanceType": "c5.xlarge",  
    "AvailableInstanceCount": 0  
}
```

Example 8: Configure Capacity Rebalancing to launch replacement Spot Instances

The following example configures the EC2 Fleet to launch a replacement Spot Instance when Amazon EC2 emits a rebalance recommendation for a Spot Instance in the fleet. To configure the automatic replacement of Spot Instances, for `ReplacementStrategy`, specify `launch-before-terminate`. To configure the time delay from when the new replacement Spot Instances are launched to when the old Spot Instances are automatically deleted, for `termination-delay`, specify a value in seconds. For more information, see [Configuration options \(p. 817\)](#).

Note

We recommend using `launch-before-terminate` only if you can predict how long your instance shutdown procedures will take to complete so that the old instances are only terminated after these procedures are completed. You are charged for all instances while they are running.

The effectiveness of the Capacity Rebalancing strategy depends on the number of Spot capacity pools specified in the EC2 Fleet request. We recommend that you configure the fleet with a diversified set of instance types and Availability Zones, and for `AllocationStrategy`, specify `capacity-optimized`. For more information about what you should consider when configuring an EC2 Fleet for Capacity Rebalancing, see [Capacity Rebalancing \(p. 816\)](#).

```
{  
    "ExcessCapacityTerminationPolicy": "termination",  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "LaunchTemplate",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "c3.large",  
                    "WeightedCapacity": 1,  
                    "Placement": {  
                        "AvailabilityZone": "us-east-1b"  
                    }  
                }  
            ]  
        }  
    ]  
}
```

```
        "AvailabilityZone": "us-east-1a"
    }
},
{
    "InstanceType": "c4.large",
    "WeightedCapacity": 1,
    "Placement": {
        "AvailabilityZone": "us-east-1a"
    }
},
{
    "InstanceType": "c5.large",
    "WeightedCapacity": 1,
    "Placement": {
        "AvailabilityZone": "us-east-1a"
    }
}
]
},
],
"TargetCapacitySpecification": {
    "TotalTargetCapacity": 5,
    "DefaultTargetCapacityType": "spot"
},
"SpotOptions": {
    "AllocationStrategy": "capacity-optimized",
    "MaintenanceStrategies": {
        "CapacityRebalance": {
            "ReplacementStrategy": "launch-before-terminate",
            "TerminationDelay": "720"
        }
    }
}
}
```

Example 9: Launch Spot Instances in a capacity-optimized fleet

The following example demonstrates how to configure an EC2 Fleet with a Spot allocation strategy that optimizes for capacity. To optimize for capacity, you must set `AllocationStrategy` to `capacity-optimized`.

In the following example, the three launch specifications specify three Spot capacity pools. The target capacity is 50 Spot Instances. The EC2 Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching.

```
{  
    "SpotOptions": {  
        "AllocationStrategy": "capacity-optimized",  
    },  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "my-launch-template",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "r4.2xlarge",  
                    "Placement": {  
                        "AvailabilityZone": "us-west-2a"  
                    },  
                },  
            ]  
        }  
    ]  
}
```

```
        "InstanceType": "m4.2xlarge",
        "Placement": {
            "AvailabilityZone": "us-west-2b"
        },
    },
    {
        "InstanceType": "c5.2xlarge",
        "Placement": {
            "AvailabilityZone": "us-west-2b"
        }
    }
]
},
"TargetCapacitySpecification": {
    "TotalTargetCapacity": 50,
    "DefaultTargetCapacityType": "spot"
}
}
```

Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities

The following example demonstrates how to configure an EC2 Fleet with a Spot allocation strategy that optimizes for capacity while using priority on a best-effort basis.

When using the `capacity-optimized-prioritized` allocation strategy, you can use the `Priority` parameter to specify the priorities of the Spot capacity pools, where the lower the number the higher priority. You can also set the same priority for several Spot capacity pools if you favor them equally. If you do not set a priority for a pool, the pool will be considered last in terms of priority.

To prioritize Spot capacity pools, you must set `AllocationStrategy` to `capacity-optimized-prioritized`. EC2 Fleet will optimize for capacity first, but will honor the priorities on a best-effort basis (for example, if honoring the priorities will not significantly affect EC2 Fleet's ability to provision optimal capacity). This is a good option for workloads where the possibility of disruption must be minimized and the preference for certain instance types matters.

In the following example, the three launch specifications specify three Spot capacity pools. Each pool is prioritized, where the lower the number the higher priority. The target capacity is 50 Spot Instances. The EC2 Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with the highest priority on a best-effort basis, but optimizes for capacity first.

```
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized-prioritized"
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-launch-template",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceType": "r4.2xlarge",
                    "Priority": 1,
                    "Placement": {
                        "AvailabilityZone": "us-west-2a"
                    },
                },
            ]
        }
    ]
}
```

```
{  
    "InstanceType": "m4.2xlarge",  
    "Priority": 2,  
    "Placement": {  
        "AvailabilityZone": "us-west-2b"  
    },  
},  
{  
    "InstanceType": "c5.2xlarge",  
    "Priority": 3,  
    "Placement": {  
        "AvailabilityZone": "us-west-2b"  
    }  
}  
]  
],  
"TargetCapacitySpecification": {  
    "TotalTargetCapacity": 50,  
    "DefaultTargetCapacityType": "spot"  
}
```

Spot Fleet example configurations

The following examples show launch configurations that you can use with the [request-spot-fleet](#) command to create a Spot Fleet request. For more information, see [Create a Spot Fleet request \(p. 872\)](#).

Note

For Spot Fleet, you can't specify an network interface ID in a launch specification. Make sure you omit the `NetworkInterfaceID` parameter in your launch specification.

Examples

- [Example 1: Launch Spot Instances using the lowest-priced Availability Zone or subnet in the Region \(p. 930\)](#)
- [Example 2: Launch Spot Instances using the lowest-priced Availability Zone or subnet in a specified list \(p. 931\)](#)
- [Example 3: Launch Spot Instances using the lowest-priced instance type in a specified list \(p. 932\)](#)
- [Example 4. Override the price for the request \(p. 933\)](#)
- [Example 5: Launch a Spot Fleet using the diversified allocation strategy \(p. 935\)](#)
- [Example 6: Launch a Spot Fleet using instance weighting \(p. 937\)](#)
- [Example 7: Launch a Spot Fleet with On-Demand capacity \(p. 938\)](#)
- [Example 8: Configure Capacity Rebalancing to launch replacement Spot Instances \(p. 938\)](#)
- [Example 9: Launch Spot Instances in a capacity-optimized fleet \(p. 939\)](#)
- [Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities \(p. 940\)](#)

Example 1: Launch Spot Instances using the lowest-priced Availability Zone or subnet in the Region

The following example specifies a single launch specification without an Availability Zone or subnet. The Spot Fleet launches the instances in the lowest-priced Availability Zone that has a default subnet. The price you pay does not exceed the On-Demand price.

```
{  
    "TargetCapacity": 20,
```

```
"IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
"LaunchSpecifications": [
    {
        "ImageId": "ami-1a2b3c4d",
        "KeyName": "my-key-pair",
        "SecurityGroups": [
            {
                "GroupId": "sg-1a2b3c4d"
            }
        ],
        "InstanceType": "m3.medium",
        "IamInstanceProfile": {
            "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
        }
    }
]
```

Example 2: Launch Spot Instances using the lowest-priced Availability Zone or subnet in a specified list

The following examples specify two launch specifications with different Availability Zones or subnets, but the same instance type and AMI.

Availability Zones

The Spot Fleet launches the instances in the default subnet of the lowest-priced Availability Zone that you specified.

```
{
    "TargetCapacity": 20,
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "KeyName": "my-key-pair",
            "SecurityGroups": [
                {
                    "GroupId": "sg-1a2b3c4d"
                }
            ],
            "InstanceType": "m3.medium",
            "Placement": {
                "AvailabilityZone": "us-west-2a, us-west-2b"
            },
            "IamInstanceProfile": {
                "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
            }
        }
    ]
}
```

Subnets

You can specify default subnets or nondefault subnets, and the nondefault subnets can be from a default VPC or a nondefault VPC. The Spot service launches the instances in whichever subnet is in the lowest-priced Availability Zone.

You can't specify different subnets from the same Availability Zone in a Spot Fleet request.

```
{
```

```

    "TargetCapacity": 20,
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "KeyName": "my-key-pair",
            "SecurityGroups": [
                {
                    "GroupId": "sg-1a2b3c4d"
                }
            ],
            "InstanceType": "m3.medium",
            "SubnetId": "subnet-a61dafcf, subnet-65ea5f08",
            "IamInstanceProfile": {
                "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
            }
        }
    ]
}

```

If the instances are launched in a default VPC, they receive a public IPv4 address by default. If the instances are launched in a nondefault VPC, they do not receive a public IPv4 address by default. Use a network interface in the launch specification to assign a public IPv4 address to instances launched in a nondefault VPC. When you specify a network interface, you must include the subnet ID and security group ID using the network interface.

```

...
{
    "ImageId": "ami-1a2b3c4d",
    "KeyName": "my-key-pair",
    "InstanceType": "m3.medium",
    "NetworkInterfaces": [
        {
            "DeviceIndex": 0,
            "SubnetId": "subnet-1a2b3c4d",
            "Groups": [ "sg-1a2b3c4d" ],
            "AssociatePublicIpAddress": true
        }
    ],
    "IamInstanceProfile": {
        "Arn": "arn:aws:iam::880185128111:instance-profile/my-iam-role"
    }
}
...

```

Example 3: Launch Spot Instances using the lowest-priced instance type in a specified list

The following examples specify two launch configurations with different instance types, but the same AMI and Availability Zone or subnet. The Spot Fleet launches the instances using the specified instance type with the lowest price.

Availability Zone

```

{
    "TargetCapacity": 20,
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",

```

```

    "SecurityGroups": [
        {
            "GroupId": "sg-1a2b3c4d"
        }
    ],
    "InstanceType": "cc2.8xlarge",
    "Placement": {
        "AvailabilityZone": "us-west-2b"
    }
},
{
    "ImageId": "ami-1a2b3c4d",
    "SecurityGroups": [
        {
            "GroupId": "sg-1a2b3c4d"
        }
    ],
    "InstanceType": "r3.8xlarge",
    "Placement": {
        "AvailabilityZone": "us-west-2b"
    }
}
]
}

```

Subnet

```

{
    "TargetCapacity": 20,
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "SecurityGroups": [
                {
                    "GroupId": "sg-1a2b3c4d"
                }
            ],
            "InstanceType": "cc2.8xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "SecurityGroups": [
                {
                    "GroupId": "sg-1a2b3c4d"
                }
            ],
            "InstanceType": "r3.8xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        }
    ]
}

```

Example 4. Override the price for the request

We recommended that you use the default maximum price, which is the On-Demand price. If you prefer, you can specify a maximum price for the fleet request and maximum prices for individual launch specifications.

The following examples specify a maximum price for the fleet request and maximum prices for two of the three launch specifications. The maximum price for the fleet request is used for any launch

specification that does not specify a maximum price. The Spot Fleet launches the instances using the instance type with the lowest price.

Availability Zone

```
{  
    "SpotPrice": "1.00",  
    "TargetCapacity": 30,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "c3.2xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2b"  
            },  
            "SpotPrice": "0.10"  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "c3.4xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2b"  
            },  
            "SpotPrice": "0.20"  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "c3.8xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2b"  
            }  
        }  
    ]  
}
```

Subnet

```
{  
    "SpotPrice": "1.00",  
    "TargetCapacity": 30,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "c3.2xlarge",  
            "SubnetId": "subnet-1a2b3c4d",  
            "SpotPrice": "0.10"  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "c3.4xlarge",  
            "SubnetId": "subnet-1a2b3c4d",  
            "SpotPrice": "0.20"  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "c3.8xlarge",  
            "SubnetId": "subnet-1a2b3c4d"  
        }  
    ]  
}
```

Example 5: Launch a Spot Fleet using the diversified allocation strategy

The following example uses the diversified allocation strategy. The launch specifications have different instance types but the same AMI and Availability Zone or subnet. The Spot Fleet distributes the 30 instances across the three launch specifications, such that there are 10 instances of each type. For more information, see [Allocation strategy for Spot Instances \(p. 840\)](#).

Availability Zone

```
{  
    "SpotPrice": "0.70",  
    "TargetCapacity": 30,  
    "AllocationStrategy": "diversified",  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "c4.2xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2b"  
            }  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "m3.2xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2b"  
            }  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "r3.2xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2b"  
            }  
        }  
    ]  
}
```

Subnet

```
{  
    "SpotPrice": "0.70",  
    "TargetCapacity": 30,  
    "AllocationStrategy": "diversified",  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "c4.2xlarge",  
            "SubnetId": "subnet-1a2b3c4d"  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "m3.2xlarge",  
            "SubnetId": "subnet-1a2b3c4d"  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "r3.2xlarge",  
            "SubnetId": "subnet-1a2b3c4d"  
        }  
    ]  
}
```

```
        }
    ]
}
```

A best practice to increase the chance that a spot request can be fulfilled by EC2 capacity in the event of an outage in one of the Availability Zones is to diversify across zones. For this scenario, include each Availability Zone available to you in the launch specification. And, instead of using the same subnet each time, use three unique subnets (each mapping to a different zone).

Availability Zone

```
{
    "SpotPrice": "0.70",
    "TargetCapacity": 30,
    "AllocationStrategy": "diversified",
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "c4.2xlarge",
            "Placement": {
                "AvailabilityZone": "us-west-2a"
            }
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "m3.2xlarge",
            "Placement": {
                "AvailabilityZone": "us-west-2b"
            }
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "r3.2xlarge",
            "Placement": {
                "AvailabilityZone": "us-west-2c"
            }
        }
    ]
}
```

Subnet

```
{
    "SpotPrice": "0.70",
    "TargetCapacity": 30,
    "AllocationStrategy": "diversified",
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "c4.2xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "m3.2xlarge",
            "SubnetId": "subnet-2a2b3c4d"
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "r3.2xlarge",
            "SubnetId": "subnet-3a2b3c4d"
        }
    ]
}
```

```
        ]  
    }  
}
```

Example 6: Launch a Spot Fleet using instance weighting

The following examples use instance weighting, which means that the price is per unit hour instead of per instance hour. Each launch configuration lists a different instance type and a different weight. The Spot Fleet selects the instance type with the lowest price per unit hour. The Spot Fleet calculates the number of Spot Instances to launch by dividing the target capacity by the instance weight. If the result isn't an integer, the Spot Fleet rounds it up to the next integer, so that the size of your fleet is not below its target capacity.

If the `r3.2xlarge` request is successful, Spot provisions 4 of these instances. Divide 20 by 6 for a total of 3.33 instances, then round up to 4 instances.

If the `c3.xlarge` request is successful, Spot provisions 7 of these instances. Divide 20 by 3 for a total of 6.66 instances, then round up to 7 instances.

For more information, see [Spot Fleet instance weighting \(p. 864\)](#).

Availability Zone

```
{  
    "SpotPrice": "0.70",  
    "TargetCapacity": 20,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "r3.2xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2b"  
            },  
            "WeightedCapacity": 6  
        },  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "c3.xlarge",  
            "Placement": {  
                "AvailabilityZone": "us-west-2b"  
            },  
            "WeightedCapacity": 3  
        }  
    ]  
}
```

Subnet

```
{  
    "SpotPrice": "0.70",  
    "TargetCapacity": 20,  
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",  
    "LaunchSpecifications": [  
        {  
            "ImageId": "ami-1a2b3c4d",  
            "InstanceType": "r3.2xlarge",  
            "SubnetId": "subnet-1a2b3c4d",  
            "WeightedCapacity": 6  
        },  
    ]  
}
```

```
{  
    "ImageId": "ami-1a2b3c4d",  
    "InstanceType": "c3.xlarge",  
    "SubnetId": "subnet-1a2b3c4d",  
    "WeightedCapacity": 3  
}  
]  
}
```

Example 7: Launch a Spot Fleet with On-Demand capacity

To ensure that you always have instance capacity, you can include a request for On-Demand capacity in your Spot Fleet request. If there is capacity, the On-Demand request is always fulfilled. The balance of the target capacity is fulfilled as Spot if there is capacity and availability.

The following example specifies the desired target capacity as 10, of which 5 must be On-Demand capacity. Spot capacity is not specified; it is implied in the balance of the target capacity minus the On-Demand capacity. Amazon EC2 launches 5 capacity units as On-Demand, and 5 capacity units ($10-5=5$) as Spot if there is available Amazon EC2 capacity and availability.

For more information, see [On-Demand in Spot Fleet \(p. 860\)](#).

```
{  
    "IamFleetRole": "arn:aws:iam::781603563322:role/aws-ec2-spot-fleet-tagging-role",  
    "AllocationStrategy": "lowestPrice",  
    "TargetCapacity": 10,  
    "SpotPrice": null,  
    "ValidFrom": "2018-04-04T15:58:13Z",  
    "ValidUntil": "2019-04-04T15:58:13Z",  
    "TerminateInstancesWithExpiration": true,  
    "LaunchSpecifications": [],  
    "Type": "maintain",  
    "OnDemandTargetCapacity": 5,  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateId": "lt-0dbb04d4a6cca5ad1",  
                "Version": "2"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "t2.medium",  
                    "WeightedCapacity": 1,  
                    "SubnetId": "subnet-d0dc51fb"  
                }  
            ]  
        }  
    ]  
}
```

Example 8: Configure Capacity Rebalancing to launch replacement Spot Instances

The following example configures the Spot Fleet to launch a replacement Spot Instance when Amazon EC2 emits a rebalance recommendation for a Spot Instance in the fleet. To configure the automatic replacement of Spot Instances, for `ReplacementStrategy`, specify `launch-before-terminate`. To configure the time delay from the launch of the new replacement Spot Instances to the automatic deletion of the old Spot Instances, for `termination-delay`, specify a value in seconds. For more information, see [Configuration options \(p. 861\)](#).

Note

We recommend using `launch-before-terminate` only if you can predict how long your instance shutdown procedures will take to complete. This ensures that the old instances are terminated only after the shutdown procedures are completed. You are charged for all instances while they are running.

The effectiveness of the Capacity Rebalancing strategy depends on the number of Spot capacity pools specified in the Spot Fleet request. We recommend that you configure the fleet with a diversified set of instance types and Availability Zones, and for `AllocationStrategy`, specify `capacityOptimized`. For more information about what you should consider when configuring a Spot Fleet for Capacity Rebalancing, see [Capacity Rebalancing \(p. 861\)](#).

```
{  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "capacityOptimized",

            {  
                "LaunchTemplateSpecification": {  
                    "LaunchTemplateName": "LaunchTemplate",  
                    "Version": "1"  
                },  
                "Overrides": [  
                    {  
                        "InstanceType": "c3.large",  
                        "WeightedCapacity": 1,  
                        "Placement": {  
                            "AvailabilityZone": "us-east-1a"  
                        }  
                    },  
                    {  
                        "InstanceType": "c4.large",  
                        "WeightedCapacity": 1,  
                        "Placement": {  
                            "AvailabilityZone": "us-east-1a"  
                        }  
                    },  
                    {  
                        "InstanceType": "c5.large",  
                        "WeightedCapacity": 1,  
                        "Placement": {  
                            "AvailabilityZone": "us-east-1a"  
                        }  
                    }  
                ]  
            },  
            "TargetCapacity": 5,  
            "SpotMaintenanceStrategies": {  
                "CapacityRebalance": {  
                    "ReplacementStrategy": "launch-before-terminate",  
                    "TerminationDelay": "720"  
                }  
            }  
        ]  
    }  
}
```

Example 9: Launch Spot Instances in a capacity-optimized fleet

The following example demonstrates how to configure a Spot Fleet with a Spot allocation strategy that optimizes for capacity. To optimize for capacity, you must set `AllocationStrategy` to `capacityOptimized`.

In the following example, the three launch specifications specify three Spot capacity pools. The target capacity is 50 Spot Instances. The Spot Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching.

```
{  
    "TargetCapacity": "50",  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "capacityOptimized",  
    },  
    "LaunchTemplateConfigs": [  
        {  
            "LaunchTemplateSpecification": {  
                "LaunchTemplateName": "my-launch-template",  
                "Version": "1"  
            },  
            "Overrides": [  
                {  
                    "InstanceType": "r4.2xlarge",  
                    "AvailabilityZone": "us-west-2a"  
                },  
                {  
                    "InstanceType": "m4.2xlarge",  
                    "AvailabilityZone": "us-west-2b"  
                },  
                {  
                    "InstanceType": "c5.2xlarge",  
                    "AvailabilityZone": "us-west-2b"  
                }  
            ]  
        }  
    ]  
}
```

Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities

The following example demonstrates how to configure a Spot Fleet with a Spot allocation strategy that optimizes for capacity while using priority on a best-effort basis.

When using the `capacityOptimizedPrioritized` allocation strategy, you can use the `Priority` parameter to specify the priorities of the Spot capacity pools, where the lower the number the higher priority. You can also set the same priority for several Spot capacity pools if you favor them equally. If you do not set a priority for a pool, the pool will be considered last in terms of priority.

To prioritize Spot capacity pools, you must set `AllocationStrategy` to `capacityOptimizedPrioritized`. Spot Fleet will optimize for capacity first, but will honor the priorities on a best-effort basis (for example, if honoring the priorities will not significantly affect Spot Fleet's ability to provision optimal capacity). This is a good option for workloads where the possibility of disruption must be minimized and the preference for certain instance types matters.

In the following example, the three launch specifications specify three Spot capacity pools. Each pool is prioritized, where the lower the number the higher priority. The target capacity is 50 Spot Instances. The Spot Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with the highest priority on a best-effort basis, but optimizes for capacity first.

```
{  
    "TargetCapacity": "50",  
    "SpotFleetRequestConfig": {  
        "AllocationStrategy": "capacityOptimizedPrioritized"  
    },  
}
```

```
"LaunchTemplateConfigs": [
    {
        "LaunchTemplateSpecification": {
            "LaunchTemplateName": "my-launch-template",
            "Version": "1"
        },
        "Overrides": [
            {
                "InstanceType": "r4.2xlarge",
                "Priority": 1,
                "AvailabilityZone": "us-west-2a"
            },
            {
                "InstanceType": "m4.2xlarge",
                "Priority": 2,
                "AvailabilityZone": "us-west-2b"
            },
            {
                "InstanceType": "c5.2xlarge",
                "Priority": 3,
                "AvailabilityZone": "us-west-2b"
            }
        ]
    }
]
```

Fleet quotas

The usual Amazon EC2 quotas apply to instances launched by an EC2 Fleet or a Spot Fleet, such as [Spot Instance limits \(p. 496\)](#) and [volume limits \(p. 1644\)](#). In addition, the following limits apply:

- The number of active EC2 Fleets and Spot Fleets per Region: 1,000* †
- The number of Spot capacity pools (unique combination of instance type and subnet): 300* ‡
- The size of the user data in a launch specification: 16 KB †
- The target capacity per EC2 Fleet or Spot Fleet: 10,000
- The target capacity across all EC2 Fleets and Spot Fleets in a Region: 100,000*
- An EC2 Fleet request or a Spot Fleet request can't span Regions.
- An EC2 Fleet request or a Spot Fleet request can't span different subnets from the same Availability Zone.

* These limits apply to both your EC2 Fleets and your Spot Fleets.

† These are hard limits. You cannot request a limit increase for these limits.

‡ This limit only applies to fleets of type `request` or `maintain`. This limit does not apply to `instant` fleets.

To request a limit increase for target capacity

If you need more than the default limits for target capacity, complete the AWS Support Center [Create case](#) form to request a limit increase. For **Limit type**, choose **EC2 Fleet**, choose a Region, and then choose **Target Fleet Capacity per Fleet (in units)** or **Target Fleet Capacity per Region (in units)**, or both.

Monitor Amazon EC2

Monitoring is an important part of maintaining the reliability, availability, and performance of your Amazon Elastic Compute Cloud (Amazon EC2) instances and your AWS solutions. You should collect monitoring data from all of the parts in your AWS solutions so that you can more easily debug a multi-point failure if one occurs. Before you start monitoring Amazon EC2, however, you should create a monitoring plan that should include:

- What are your goals for monitoring?
- What resources will you monitor?
- How often will you monitor these resources?
- What monitoring tools will you use?
- Who will perform the monitoring tasks?
- Who should be notified when something goes wrong?

After you have defined your monitoring goals and have created your monitoring plan, the next step is to establish a baseline for normal Amazon EC2 performance in your environment. You should measure Amazon EC2 performance at various times and under different load conditions. As you monitor Amazon EC2, you should store a history of monitoring data that you collect. You can compare current Amazon EC2 performance to this historical data to help you to identify normal performance patterns and performance anomalies, and devise methods to address them. For example, you can monitor CPU utilization, disk I/O, and network utilization for your EC2 instances. When performance falls outside your established baseline, you might need to reconfigure or optimize the instance to reduce CPU utilization, improve disk I/O, or reduce network traffic.

To establish a baseline you should, at a minimum, monitor the following items:

Item to monitor	Amazon EC2 metric	Monitoring agent/CloudWatch Logs
CPU utilization	CPUUtilization (p. 978)	
Network utilization	NetworkIn (p. 978) NetworkOut (p. 978)	
Disk performance	DiskReadOps (p. 978) DiskWriteOps (p. 978)	
Disk Reads/Writes	DiskReadBytes (p. 978) DiskWriteBytes (p. 978)	
Memory utilization, disk swap utilization, disk space utilization, page file utilization, log collection		[Linux and Windows Server instances] Collect Metrics and Logs from Amazon EC2 Instances and On-Premises Servers with the CloudWatch Agent [Migration from previous CloudWatch Logs agent on

Item to monitor	Amazon EC2 metric	Monitoring agent/CloudWatch Logs
		Windows Server instances] Migrate Windows Server Instance Log Collection to the CloudWatch Agent

Automated and manual monitoring

AWS provides various tools that you can use to monitor Amazon EC2. You can configure some of these tools to do the monitoring for you, while some of the tools require manual intervention.

Monitoring tools

- [Automated monitoring tools \(p. 943\)](#)
- [Manual monitoring tools \(p. 944\)](#)

Automated monitoring tools

You can use the following automated monitoring tools to watch Amazon EC2 and report back to you when something is wrong:

- **System status checks** – monitor the AWS systems required to use your instance to ensure that they are working properly. These checks detect problems with your instance that require AWS involvement to repair. When a system status check fails, you can choose to wait for AWS to fix the issue or you can resolve it yourself (for example, by stopping and restarting or terminating and replacing an instance). Examples of problems that cause system status checks to fail include:

- Loss of network connectivity
- Loss of system power
- Software issues on the physical host
- Hardware issues on the physical host that impact network reachability

For more information, see [Status checks for your instances \(p. 945\)](#).

- **Instance status checks** – monitor the software and network configuration of your individual instance. These checks detect problems that require your involvement to repair. When an instance status check fails, typically you will need to address the problem yourself (for example, by rebooting the instance or by making modifications in your operating system). Examples of problems that may cause instance status checks to fail include:

- Failed system status checks
- Misconfigured networking or startup configuration
- Exhausted memory
- Corrupted file system
- Incompatible kernel

For more information, see [Status checks for your instances \(p. 945\)](#).

- **Amazon CloudWatch alarms** – watch a single metric over a time period you specify, and perform one or more actions based on the value of the metric relative to a given threshold over a number of time periods. The action is a notification sent to an Amazon Simple Notification Service (Amazon SNS) topic or Amazon EC2 Auto Scaling policy. Alarms invoke actions for sustained state changes only. CloudWatch alarms will not invoke actions simply because they are in a particular state; the state

must have changed and been maintained for a specified number of periods. For more information, see [Monitor your instances using CloudWatch \(p. 975\)](#).

- **Amazon EventBridge** – automate your AWS services and respond automatically to system events. Events from AWS services are delivered to EventBridge in near real time, and you can specify automated actions to take when an event matches a rule you write. For more information, see [What is Amazon EventBridge?](#).
- **Amazon CloudWatch Logs** – monitor, store, and access your log files from Amazon EC2 instances, AWS CloudTrail, or other sources. For more information, see the [Amazon CloudWatch Logs User Guide](#).
- **CloudWatch agent** – collect logs and system-level metrics from both hosts and guests on your EC2 instances and on-premises servers. For more information, see [Collecting Metrics and Logs from Amazon EC2 Instances and On-Premises Servers with the CloudWatch Agent](#) in the *Amazon CloudWatch User Guide*.
- **AWS Management Pack for Microsoft System Center Operations Manager** – links Amazon EC2 instances and the Windows or Linux operating systems running inside them. The AWS Management Pack is an extension to Microsoft System Center Operations Manager. It uses a designated computer in your datacenter (called a watcher node) and the Amazon Web Services APIs to remotely discover and collect information about your AWS resources. For more information, see [AWS Management Pack for Microsoft System Center](#).

Manual monitoring tools

Another important part of monitoring Amazon EC2 involves manually monitoring those items that the monitoring scripts, status checks, and CloudWatch alarms don't cover. The Amazon EC2 and CloudWatch console dashboards provide an at-a-glance view of the state of your Amazon EC2 environment.

- Amazon EC2 Dashboard shows:
 - Service Health and Scheduled Events by Region
 - Instance state
 - Status checks
 - Alarm status
 - Instance metric details (In the navigation pane choose **Instances**, select an instance, and choose the **Monitoring** tab)
 - Volume metric details (In the navigation pane choose **Volumes**, select a volume, and choose the **Monitoring** tab)
- Amazon CloudWatch Dashboard shows:
 - Current alarms and status
 - Graphs of alarms and resources
 - Service health status

In addition, you can use CloudWatch to do the following:

- Graph Amazon EC2 monitoring data to troubleshoot issues and discover trends
- Search and browse all your AWS resource metrics
- Create and edit alarms to be notified of problems
- See at-a-glance overviews of your alarms and AWS resources

Best practices for monitoring

Use the following best practices for monitoring to help you with your Amazon EC2 monitoring tasks.

- Make monitoring a priority to head off small problems before they become big ones.

- Create and implement a monitoring plan that collects monitoring data from all of the parts in your AWS solution so that you can more easily debug a multi-point failure if one occurs. Your monitoring plan should address, at a minimum, the following questions:
 - What are your goals for monitoring?
 - What resources you will monitor?
 - How often you will monitor these resources?
 - What monitoring tools will you use?
 - Who will perform the monitoring tasks?
 - Who should be notified when something goes wrong?
- Automate monitoring tasks as much as possible.
- Check the log files on your EC2 instances.

Monitor the status of your instances

You can monitor the status of your instances by viewing status checks and scheduled events for your instances.

A status check gives you the information that results from automated checks performed by Amazon EC2. These automated checks detect whether specific issues are affecting your instances. The status check information, together with the data provided by Amazon CloudWatch, gives you detailed operational visibility into each of your instances.

You can also see status of specific events that are scheduled for your instances. The status of events provides information about upcoming activities that are planned for your instances, such as rebooting or retirement. They also provide the scheduled start and end time of each event.

Contents

- [Status checks for your instances \(p. 945\)](#)
- [Scheduled events for your instances \(p. 952\)](#)

Status checks for your instances

With instance status monitoring, you can quickly determine whether Amazon EC2 has detected any problems that might prevent your instances from running applications. Amazon EC2 performs automated checks on every running EC2 instance to identify hardware and software issues. You can view the results of these status checks to identify specific and detectable problems. The event status data augments the information that Amazon EC2 already provides about the state of each instance (such as pending, running, stopping) and the utilization metrics that Amazon CloudWatch monitors (CPU utilization, network traffic, and disk activity).

Status checks are performed every minute, returning a pass or a fail status. If all checks pass, the overall status of the instance is **OK**. If one or more checks fail, the overall status is **impaired**. Status checks are built into Amazon EC2, so they cannot be disabled or deleted.

When a status check fails, the corresponding CloudWatch metric for status checks is incremented. For more information, see [Status check metrics \(p. 984\)](#). You can use these metrics to create CloudWatch alarms that are triggered based on the result of the status checks. For example, you can create an alarm to warn you if status checks fail on a specific instance. For more information, see [Create and edit status check alarms \(p. 949\)](#).

You can also create an Amazon CloudWatch alarm that monitors an Amazon EC2 instance and automatically recovers the instance if it becomes impaired due to an underlying issue. For more information, see [Recover your instance \(p. 667\)](#).

Contents

- [Types of status checks \(p. 946\)](#)
- [View status checks \(p. 947\)](#)
- [Report instance status \(p. 949\)](#)
- [Create and edit status check alarms \(p. 949\)](#)

Types of status checks

There are two types of status checks: system status checks and instance status checks.

System status checks

System status checks monitor the AWS systems on which your instance runs. These checks detect underlying problems with your instance that require AWS involvement to repair. When a system status check fails, you can choose to wait for AWS to fix the issue, or you can resolve it yourself. For instances backed by Amazon EBS, you can stop and start the instance yourself, which in most cases results in the instance being migrated to a new host. For Linux instances backed by instance store, you can terminate and replace the instance. For Windows instances, the root volume must be an Amazon EBS volume; instance store is not supported for the root volume. Note that instance store volumes are ephemeral and all data is lost when the instance is stopped.

The following are examples of problems that can cause system status checks to fail:

- Loss of network connectivity
- Loss of system power
- Software issues on the physical host
- Hardware issues on the physical host that impact network reachability

Note

If you perform a restart from the operating system on a bare metal instance, the system status check might temporarily return a fail status. When the instance becomes available, the system status check should return a pass status.

Instance status checks

Instance status checks monitor the software and network configuration of your individual instance. Amazon EC2 checks the health of the instance by sending an address resolution protocol (ARP) request to the network interface (NIC). These checks detect problems that require your involvement to repair. When an instance status check fails, you typically must address the problem yourself (for example, by rebooting the instance or by making instance configuration changes).

The following are examples of problems that can cause instance status checks to fail:

- Failed system status checks
- Incorrect networking or startup configuration
- Exhausted memory
- Corrupted file system
- Incompatible kernel

Note

If you perform a restart from the operating system on a bare metal instance, the instance status check might temporarily return a fail status. When the instance becomes available, the instance status check should return a pass status.

View status checks

Amazon EC2 provides you with several ways to view and work with status checks.

View status using the console

You can view status checks by using the AWS Management Console.

New console

To view status checks (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. On the **Instances** page, the **Status check** column lists the operational status of each instance.
4. To view the status of a specific instance, select the instance, and then choose the **Status checks** tab.

The screenshot shows the AWS Management Console interface for viewing instance status checks. At the top, there is a table listing three instances:

Name	Instance ID	Instance state	Instance type	Status check	Alarm status	Avail
-	I-0c0186a12aab3741d	Running	t2.large	1/2 checks ...	No alarms +	eu-w
-	I-0138edcaf722db475	Running	m4.large	2/2 checks ...	No alarms +	eu-w
-	I-02c65b735153975ec	Running	t3.medium	2/2 checks ...	No alarms +	eu-w

Below the table, a specific instance (I-0c0186a12aab3741d) is selected. The "Status checks" tab is highlighted in orange. The "Status checks" section displays the following information:

Status checks Info
Status checks detect problems that may impair i-0c0186a12aab3741d from running your applications.

System status checks
System reachability check passed

Instance status checks
Instance reachability check failed
Check failure at 2020/12/16 17:30 GMT+2 (about 1 month)

Need assistance?
If your instance is unreachable for more than 20 minutes, the **Open support case** button becomes available so that you can contact the Support Center.
Open support case
Visit the [Support Center](#) or post a question to the [Discussion Forums](#)

If your instance has a failed status check, you typically must address the problem yourself (for example, by rebooting the instance or by making instance configuration changes). However, if your instance has a failed status check *and* has been unreachable for over 20 minutes, choose **Open support case** to submit a request for assistance. To troubleshoot system or instance status check failures yourself, see [Troubleshoot instances with failed status checks \(p. 1726\)](#).

5. To review the CloudWatch metrics for status checks, select the instance, and then choose the **Monitoring** tab. Scroll until you see the graphs for the following metrics:
 - **Status check failed (any)**
 - **Status check failed (instance)**
 - **Status check failed (system)**

Old console

To view status checks (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Instances**.
3. On the **Instances** page, the **Status Checks** column lists the operational status of each instance.
4. To view the status of a specific instance, select the instance, and then choose the **Status Checks** tab.

The screenshot shows the AWS EC2 Instances page with the 'Status Checks' tab selected. It displays two main sections: 'System Status Checks' and 'Instance Status Checks'. The 'System Status Checks' section indicates that system reachability checks have passed. The 'Instance Status Checks' section shows a failed check for 'Instance reachability' at October 7, 2013 11:52:11 AM UTC+2 (16 minutes ago). A note at the bottom encourages users to submit feedback if they experience issues.

If you have an instance with a failed status check and the instance has been unreachable for over 20 minutes, choose **AWS Support** to submit a request for assistance. To troubleshoot system or instance status check failures yourself, see [Troubleshoot instances with failed status checks \(p. 1726\)](#).

5. To review the CloudWatch metrics for status checks, select the instance, and then choose the **Monitoring** tab. Scroll until you see the graphs for the following metrics:
 - **Status Check Failed (Any)**
 - **Status Check Failed (Instance)**
 - **Status Check Failed (System)**

View status using the command line

You can view status checks for running instances by using the [describe-instance-status](#) (AWS CLI) command.

To view the status of all instances, use the following command.

```
aws ec2 describe-instance-status
```

To get the status of all instances with an instance status of `impaired`, use the following command.

```
aws ec2 describe-instance-status \
--filters Name=instance-status.status,Values=impaired
```

To get the status of a single instance, use the following command.

```
aws ec2 describe-instance-status \
--instance-ids i-1234567890abcdef0
```

Alternatively, use the following commands:

- [Get-EC2InstanceState](#) (AWS Tools for Windows PowerShell)
- [DescribeInstanceState](#) (Amazon EC2 Query API)

If you have an instance with a failed status check, see [Troubleshoot instances with failed status checks \(p. 1726\)](#).

Report instance status

You can provide feedback if you are having problems with an instance whose status is not shown as impaired, or if you want to send AWS additional details about the problems you are experiencing with an impaired instance.

We use reported feedback to identify issues impacting multiple customers, but do not respond to individual account issues. Providing feedback does not change the status check results that you currently see for the instance.

Report status feedback using the console

New console

To report instance status (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose the **Status Checks** tab, choose **Actions** (the second **Actions** menu in the bottom half of the page), and then choose **Report instance status**.
4. Complete the **Report instance status** form, and then choose **Submit**.

Old console

To report instance status (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose the **Status Checks** tab, and choose **Submit feedback**.
4. Complete the **Report Instance Status** form, and then choose **Submit**.

Report status feedback using the command line

Use the `report-instance-status` (AWS CLI) command to send feedback about the status of an impaired instance.

```
aws ec2 report-instance-status \
  --instances i-1234567890abcdef0 \
  --status impaired \
  --reason-codes code
```

Alternatively, use the following commands:

- [Send-EC2InstanceState](#) (AWS Tools for Windows PowerShell)
- [ReportInstanceState](#) (Amazon EC2 Query API)

Create and edit status check alarms

You can use the [status check metrics \(p. 984\)](#) to create CloudWatch alarms to notify you when an instance has a failed status check.

Create a status check alarm using the console

Use the following procedure to configure an alarm that sends you a notification by email, or stops, terminates, or recovers an instance when it fails a status check.

New console

To create a status check alarm (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose the **Status Checks** tab, and choose **Actions, Create status check alarm**.
4. On the **Manage CloudWatch alarms** page, under **Add or edit alarm**, choose **Create an alarm**.
5. For **Alarm notification**, turn the toggle on to configure Amazon Simple Notification Service (Amazon SNS) notifications. Select an existing Amazon SNS topic or enter a name to create a new topic.

If you add an email address to the list of recipients or created a new topic, Amazon SNS sends a subscription confirmation email message to each new address. Each recipient must confirm the subscription by choosing the link contained in that message. Alert notifications are sent only to confirmed addresses.

6. For **Alarm action**, turn the toggle on to specify an action to take when the alarm is triggered. Select the action.
7. For **Alarm thresholds**, specify the metric and criteria for the alarm.

You can leave the default settings for **Group samples by (Average)** and **Type of data to sample (Status check failed:either)**, or you can change them to suit your needs.

For **Consecutive period**, set the number of periods to evaluate and, in **Period**, enter the evaluation period duration before triggering the alarm and sending an email.

8. (Optional) For **Sample metric data**, choose **Add to dashboard**.
9. Choose **Create**.

Old console

To create a status check alarm (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose the **Status Checks** tab, and choose **Create Status Check Alarm**.
4. Select **Send a notification to**. Choose an existing SNS topic, or choose **create topic** to create a new one. If creating a new topic, in **With these recipients**, enter your email address and the addresses of any additional recipients, separated by commas.
5. (Optional) Select **Take the action**, and then select the action that you'd like to take.
6. In **Whenever**, select the status check that you want to be notified about.

If you selected **Recover this instance** in the previous step, select **Status Check Failed (System)**.

7. In **For at least**, set the number of periods you want to evaluate and in **consecutive periods**, select the evaluation period duration before triggering the alarm and sending an email.
8. (Optional) In **Name of alarm**, replace the default name with another name for the alarm.
9. Choose **Create Alarm**.

Important

If you added an email address to the list of recipients or created a new topic, Amazon SNS sends a subscription confirmation email message to each new address. Each recipient must confirm the subscription by choosing the link contained in that message. Alert notifications are sent only to confirmed addresses.

If you need to make changes to an instance status alarm, you can edit it.

New console

To edit a status check alarm using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitoring, Manage CloudWatch alarms**.
4. On the **Manage CloudWatch alarms** page, under **Add or edit alarm**, choose **Edit an alarm**.
5. For **Search for alarm**, choose the alarm.
6. When you are finished making changes, choose **Update**.

Old console

To edit a status check alarm using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, CloudWatch Monitoring, Add/Edit Alarms**.
4. In the **Alarm Details** dialog box, choose the name of the alarm.
5. In the **Edit Alarm** dialog box, make the desired changes, and then choose **Save**.

Create a status check alarm using the AWS CLI

In the following example, the alarm publishes a notification to an SNS topic, `arn:aws:sns:us-west-2:111122223333:my-sns-topic`, when the instance fails either the instance check or system status check for at least two consecutive periods. The CloudWatch metric used is `StatusCheckFailed`.

To create a status check alarm using the AWS CLI

1. Select an existing SNS topic or create a new one. For more information, see [Using the AWS CLI with Amazon SNS](#) in the *AWS Command Line Interface User Guide*.
2. Use the following `list-metrics` command to view the available Amazon CloudWatch metrics for Amazon EC2.

```
aws cloudwatch list-metrics --namespace AWS/EC2
```

3. Use the following `put-metric-alarm` command to create the alarm.

```
aws cloudwatch put-metric-alarm --alarm-name StatusCheckFailed-Alarm-for-i-1234567890abcdef0 --metric-name StatusCheckFailed --namespace AWS/EC2 --statistic Maximum --dimensions Name=InstanceId,Value=i-1234567890abcdef0 --unit Count --period 300 --evaluation-periods 2 --threshold 1 --comparison-operator GreaterThanOrEqualToThreshold --alarm-actions arn:aws:sns:us-west-2:111122223333:my-sns-topic
```

The period is the time frame, in seconds, in which Amazon CloudWatch metrics are collected. This example uses 300, which is 60 seconds multiplied by 5 minutes. The evaluation period is the number of consecutive periods for which the value of the metric must be compared to the threshold. This example uses 2. The alarm actions are the actions to perform when this alarm is triggered. This example configures the alarm to send an email using Amazon SNS.

Scheduled events for your instances

AWS can schedule events for your instances, such as a reboot, stop/start, or retirement. These events do not occur frequently. If one of your instances will be affected by a scheduled event, AWS sends an email to the email address that's associated with your AWS account prior to the scheduled event. The email provides details about the event, including the start and end date. Depending on the event, you might be able to take action to control the timing of the event. AWS also sends an AWS Health event, which you can monitor and manage by using Amazon CloudWatch Events. For more information about monitoring AWS Health events with CloudWatch, see [Monitoring AWS Health events with CloudWatch Events](#).

Scheduled events are managed by AWS; you cannot schedule events for your instances. You can view the events scheduled by AWS, customize scheduled event notifications to include or remove tags from the email notification, perform actions when an instance is scheduled to reboot, retire, or stop.

To update the contact information for your account so that you can be sure to be notified about scheduled events, go to the [Account Settings](#) page.

Contents

- [Types of scheduled events \(p. 952\)](#)
- [View scheduled events \(p. 952\)](#)
- [Customize scheduled event notifications \(p. 956\)](#)
- [Work with instances scheduled to stop or retire \(p. 958\)](#)
- [Work with instances scheduled for reboot \(p. 959\)](#)
- [Work with instances scheduled for maintenance \(p. 961\)](#)
- [Reschedule a scheduled event \(p. 961\)](#)
- [Define event windows for scheduled events \(p. 963\)](#)

Types of scheduled events

Amazon EC2 can create the following types of events for your instances, where the event occurs at a scheduled time:

- **Instance stop:** At the scheduled time, the instance is stopped. When you start it again, it's migrated to a new host. Applies only to instances backed by Amazon EBS.
- **Instance retirement:** At the scheduled time, the instance is stopped if it is backed by Amazon EBS, or terminated if it is backed by instance store.
- **Instance reboot:** At the scheduled time, the instance is rebooted.
- **System reboot:** At the scheduled time, the host for the instance is rebooted.
- **System maintenance:** At the scheduled time, the instance might be temporarily affected by network maintenance or power maintenance.

View scheduled events

In addition to receiving notification of scheduled events in email, you can check for scheduled events by using one of the following methods.

New console

To view scheduled events for your instances using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. You can view scheduled events in the following screens:
 - In the navigation pane, choose **Events**. Any resources with an associated event are displayed. You can filter by **Resource ID**, **Resource type**, **Availability zone**, **Event status**, or **Event type**.

The screenshot shows the 'Events' page with a search bar and three filters applied: 'Resource type: instance', 'Event status: Scheduled', and 'Event type: instance-stop'. A single event is listed: 'i-02c48fffa61cd16f' with status 'Scheduled' and type 'instance-stop'. The description indicates the instance is running on degraded hardware, and the start time is 2019/07/22 15:00 GMT+2.

- Alternatively, in the navigation pane, choose **EC2 Dashboard**. Any resources with an associated event are displayed under **Scheduled events**.

The screenshot shows the EC2 Dashboard with a sidebar titled 'Scheduled events'. Under 'US East (N. Virginia)', it says '7 instance(s) have scheduled events' and '1 volume(s) are impaired'.

Old console

To view scheduled events for your instances using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. You can view scheduled events in the following screens:
 - In the navigation pane, choose **Events**. Any resources with an associated event are displayed. You can filter by resource type, or by specific event types. You can select the resource to view details.

The screenshot shows the 'Events' page with a 'Filter' bar set to 'All resource types', 'All event types', and 'Ongoing and scheduled'. A single event is listed: 'my-instance' with resource type 'instance' and event type 'instance-stop'.

Event: i-c3870335

Availability Zone	us-west-2a
Event type	instance-stop
Event status	Scheduled
Description	The instance is running on degraded hardware
Start time	May 22, 2015 at 5:00:00 PM UTC-7
End time	

- Alternatively, in the navigation pane, choose **EC2 Dashboard**. Any resources with an associated event are displayed under **Scheduled Events**.

Scheduled Events

US West (Oregon):

1 instances have scheduled events

- Some events are also shown for affected resources. For example, in the navigation pane, choose **Instances** and select an instance. If the instance has an associated instance stop or instance retirement event, it is displayed in the lower pane.

Retiring: This instance is scheduled for retirement after May 22, 2015 at 5:00:00 PM UTC-7. (i)

AWS CLI

To view scheduled events for your instances using the AWS CLI

Use the [describe-instance-status](#) command.

```
aws ec2 describe-instance-status \
--instance-id i-1234567890abcdef0 \
--query "InstanceStatuses[ ].Events"
```

The following example output shows a reboot event.

```
[{"Events": [
{
    "InstanceEventId": "instance-event-0d59937288b749b32",
    "Code": "system-reboot",
    "Description": "The instance is scheduled for a reboot",
    "NotAfter": "2019-03-15T22:00:00.000Z",
    "NotBefore": "2019-03-14T20:00:00.000Z",
    "NotBeforeDeadline": "2019-04-05T11:00:00.000Z"
}
]}
```

The following example output shows an instance retirement event.

```
[{"Events": [
{
    "InstanceEventId": "instance-event-0e439355b779n26",
    "Code": "instance-stop",
    "Description": "The instance is running on degraded hardware",
    "NotBefore": "2015-05-23T00:00:00.000Z"
}
]}
```

PowerShell

To view scheduled events for your instances using the AWS Tools for Windows PowerShell

Use the following [Get-EC2InstanceState](#) command.

```
PS C:\> (Get-EC2InstanceStatus -InstanceId i-1234567890abcdef0).Events
```

The following example output shows an instance retirement event.

```
Code      : instance-stop
Description : The instance is running on degraded hardware
NotBefore : 5/23/2015 12:00:00 AM
```

Instance metadata

To view scheduled events for your instances using instance metadata

You can retrieve information about active maintenance events for your instances from the [instance metadata \(p. 726\)](#) by using Instance Metadata Service Version 2 or Instance Metadata Service Version 1.

IMDSv2

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" -v http://169.254.169.254/latest/meta-data/events/maintenance/scheduled
```

IMDSv1

```
[ec2-user ~]$ curl http://169.254.169.254/latest/meta-data/events/maintenance/scheduled
```

The following is example output with information about a scheduled system reboot event, in JSON format.

```
[
  {
    "NotBefore" : "21 Jan 2019 09:00:43 GMT",
    "Code" : "system-reboot",
    "Description" : "scheduled reboot",
    "EventId" : "instance-event-0d59937288b749b32",
    "NotAfter" : "21 Jan 2019 09:17:23 GMT",
    "State" : "active"
  }
]
```

To view event history about completed or canceled events for your instances using instance metadata

You can retrieve information about completed or canceled events for your instances from [instance metadata \(p. 726\)](#) by using Instance Metadata Service Version 2 or Instance Metadata Service Version 1.

IMDSv2

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" -v http://169.254.169.254/latest/meta-data/events/maintenance/history
```

IMDSv1

```
[ec2-user ~]$ curl http://169.254.169.254/latest/meta-data/events/maintenance/history
```

The following is example output with information about a system reboot event that was canceled, and a system reboot event that was completed, in JSON format.

```
[  
  {  
    "NotBefore" : "21 Jan 2019 09:00:43 GMT",  
    "Code" : "system-reboot",  
    "Description" : "[Canceled] scheduled reboot",  
    "EventId" : "instance-event-0d59937288b749b32",  
    "NotAfter" : "21 Jan 2019 09:17:23 GMT",  
    "State" : "canceled"  
  },  
  {  
    "NotBefore" : "29 Jan 2019 09:00:43 GMT",  
    "Code" : "system-reboot",  
    "Description" : "[Completed] scheduled reboot",  
    "EventId" : "instance-event-0d59937288b749b32",  
    "NotAfter" : "29 Jan 2019 09:17:23 GMT",  
    "State" : "completed"  
  }  
]
```

AWS Health

You can use the AWS Personal Health Dashboard to learn about events that can affect your instance. The AWS Personal Health Dashboard organizes issues in three groups: open issues, scheduled changes, and other notifications. The scheduled changes group contains items that are ongoing or upcoming.

For more information, see [Getting started with the AWS Personal Health Dashboard](#) in the [AWS Health User Guide](#).

Customize scheduled event notifications

You can customize scheduled event notifications to include tags in the email notification. This makes it easier to identify the affected resource (instances or Dedicated Hosts) and to prioritize actions for the upcoming event.

When you customize event notifications to include tags, you can choose to include:

- All of the tags that are associated with the affected resource
- Only specific tags that are associated with the affected resource

For example, suppose that you assign `application`, `costcenter`, `project`, and `owner` tags to all of your instances. You can choose to include all of the tags in event notifications. Alternatively, if you'd like to see only the `owner` and `project` tags in event notifications, then you can choose to include only those tags.

After you select the tags to include, the event notifications will include the resource ID (instance ID or Dedicated Host ID) and the tag key and value pairs that are associated with the affected resource.

Topics

- [Include tags in event notifications \(p. 957\)](#)
- [Remove tags from event notifications \(p. 957\)](#)

- [View the tags to be included in event notifications \(p. 958\)](#)

Include tags in event notifications

The tags that you choose to include apply to all resources (instances and Dedicated Hosts) in the selected Region. To customize event notifications in other Regions, first select the required Region and then perform the following steps.

You can include tags in event notifications by using one of the following methods.

New console

To include tags in event notifications

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event notifications**.
4. Select **Include resource tags in event notifications**.
5. Do one of the following, depending on the tags that you want to include in event notifications:
 - To include all of the tags associated with the affected instance or Dedicated Host, select **Include all resource tags**.
 - To manually select the tags to include, select **Choose the tags to include**, and then for **Choose the tags to include**, enter the tag key and press **Enter**.
6. Choose **Save**.

AWS CLI

To include all tags in event notifications

Use the [register-instance-event-notification-attributes](#) AWS CLI command and set the `IncludeAllTagsOfInstance` parameter to `true`.

```
aws ec2 register-instance-event-notification-attributes --instance-tag-attribute  
"IncludeAllTagsOfInstance=true"
```

To include specific tags in event notifications

Use the [register-instance-event-notification-attributes](#) AWS CLI command and specify the tags to include by using the `InstanceTagKeys` parameter.

```
aws ec2 register-instance-event-notification-attributes --instance-tag-attribute  
'InstanceTagKeys=[tag_key_1, tag_key_2, tag_key_3]'
```

Remove tags from event notifications

You can remove tags from event notifications by using one of the following methods.

New console

To remove tags from event notifications

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.

3. Choose **Actions, Manage event notifications**.
4. Do one of the following, depending on the tag that you want to remove from event notifications.
 - To remove all tags from event notifications, clear **Include resource tags in event notifications**.
 - To remove specific tags from event notifications, choose **Remove (X)** for the tags listed below the **Choose the tags to include** field.
5. Choose **Save**.

AWS CLI

To remove all tags from event notifications

Use the [deregister-instance-event-notification-attributes](#) AWS CLI command and set the `IncludeAllTagsOfInstance` parameter to `false`.

```
aws ec2 deregister-instance-event-notification-attributes --instance-tag-attribute "IncludeAllTagsOfInstance=false"
```

To remove specific tags from event notifications

Use the [deregister-instance-event-notification-attributes](#) AWS CLI command and specify the tags to remove by using the `InstanceTagKeys` parameter.

```
aws ec2 deregister-instance-event-notification-attributes --instance-tag-attribute 'InstanceTagKeys=[ "tag_key_1", "tag_key_2", "tag_key_3" ]'
```

View the tags to be included in event notifications

You can view the tags that are to be included in event notifications by using one of the following methods.

New console

To view the tags that are to be included in event notifications

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event notifications**.

AWS CLI

To view the tags that are to be included in event notifications

Use the [describe-instance-event-notification-attributes](#) AWS CLI command.

```
aws ec2 describe-instance-event-notification-attributes
```

Work with instances scheduled to stop or retire

When AWS detects irreparable failure of the underlying host for your instance, it schedules the instance to stop or terminate, depending on the type of root device for the instance. If the root device is an EBS

volume, the instance is scheduled to stop. If the root device is an instance store volume, the instance is scheduled to terminate. For more information, see [Instance retirement \(p. 658\)](#).

Important

Any data stored on instance store volumes is lost when an instance is stopped, hibernated, or terminated. This includes instance store volumes that are attached to an instance that has an EBS volume as the root device. Be sure to save data from your instance store volumes that you might need later before the instance is stopped, hibernated, or terminated.

Actions for Instances Backed by Amazon EBS

You can wait for the instance to stop as scheduled. Alternatively, you can stop and start the instance yourself, which migrates it to a new host. For more information about stopping your instance, in addition to information about the changes to your instance configuration when it's stopped, see [Stop and start your instance \(p. 637\)](#).

You can automate an immediate stop and start in response to a scheduled instance stop event. For more information, see [Automating Actions for EC2 Instances](#) in the *AWS Health User Guide*.

If your instance is part of an Auto Scaling group with health checks enabled, then the instance is replaced when a scheduled event is created for that instance. The Auto Scaling group does not wait for the scheduled event to complete, but replaces the instance immediately upon receiving the notification.

Actions for Instances Backed by Instance Store

We recommend that you launch a replacement instance from your most recent AMI and migrate all necessary data to the replacement instance before the instance is scheduled to terminate. Then, you can terminate the original instance, or wait for it to terminate as scheduled.

Work with instances scheduled for reboot

When AWS must perform tasks such as installing updates or maintaining the underlying host, it can schedule the instance or the underlying host for a reboot. You can [reschedule most reboot events \(p. 961\)](#) so that your instance is rebooted at a specific date and time that suits you.

If you stop your linked [EC2-Classic instance \(p. 1217\)](#), it is automatically unlinked from the VPC and the VPC security groups are no longer associated with the instance. You can link your instance to the VPC again after you've restarted it.

If your instance is part of an Auto Scaling group with health checks enabled, then the instance is replaced when a scheduled event is created for that instance. The Auto Scaling group does not wait for the scheduled event to complete, but replaces the instance immediately upon receiving the notification.

View the reboot event type

You can view whether a reboot event is an instance reboot or a system reboot by using one of the following methods.

New console

To view the type of scheduled reboot event using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Resource type: instance** from the filter list.
4. For each instance, view the value in the **Event type** column. The value is either **system-reboot** or **instance-reboot**.

Old console

To view the type of scheduled reboot event using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Instance resources** from the filter list.
4. For each instance, view the value in the **Event Type** column. The value is either **system-reboot** or **instance-reboot**.

AWS CLI

To view the type of scheduled reboot event using the AWS CLI

Use the [describe-instance-status](#) command.

```
aws ec2 describe-instance-status --instance-id i-1234567890abcdef0
```

For scheduled reboot events, the value for **Code** is either **system-reboot** or **instance-reboot**. The following example output shows a **system-reboot** event.

```
[  
  "Events": [  
    {  
      "InstanceEventId": "instance-event-0d59937288b749b32",  
      "Code": "system-reboot",  
      "Description": "The instance is scheduled for a reboot",  
      "NotAfter": "2019-03-14T22:00:00.000Z",  
      "NotBefore": "2019-03-14T20:00:00.000Z",  
      "NotBeforeDeadline": "2019-04-05T11:00:00.000Z"  
    }  
  ]  
]
```

Actions for instance reboot

You can wait for the instance reboot to occur within its scheduled maintenance window, [reschedule \(p. 961\)](#) the instance reboot to a date and time that suits you, or [reboot \(p. 657\)](#) the instance yourself at a time that is convenient for you.

After your instance is rebooted, the scheduled event is cleared and the event's description is updated. The pending maintenance to the underlying host is completed, and you can begin using your instance again after it has fully booted.

Actions for system reboot

It is not possible for you to reboot the system yourself. You can wait for the system reboot to occur during its scheduled maintenance window, or you can [reschedule \(p. 961\)](#) the system reboot to a date and time that suits you. A system reboot typically completes in a matter of minutes. After the system reboot has occurred, the instance retains its IP address and DNS name, and any data on local instance store volumes is preserved. After the system reboot is complete, the scheduled event for the instance is cleared, and you can verify that the software on your instance is operating as expected.

Alternatively, if it is necessary to maintain the instance at a different time and you can't reschedule the system reboot, then you can stop and start an Amazon EBS-backed instance, which migrates it to a new

host. However, the data on the local instance store volumes is not preserved. You can also automate an immediate instance stop and start in response to a scheduled system reboot event. For more information, see [Automating Actions for EC2 Instances](#) in the *AWS Health User Guide*. For an instance store-backed instance, if you can't reschedule the system reboot, then you can launch a replacement instance from your most recent AMI, migrate all necessary data to the replacement instance before the scheduled maintenance window, and then terminate the original instance.

Work with instances scheduled for maintenance

When AWS must maintain the underlying host for an instance, it schedules the instance for maintenance. There are two types of maintenance events: network maintenance and power maintenance.

During network maintenance, scheduled instances lose network connectivity for a brief period of time. Normal network connectivity to your instance is restored after maintenance is complete.

During power maintenance, scheduled instances are taken offline for a brief period, and then rebooted. When a reboot is performed, all of your instance's configuration settings are retained.

After your instance has rebooted (this normally takes a few minutes), verify that your application is working as expected. At this point, your instance should no longer have a scheduled event associated with it, or if it does, the description of the scheduled event begins with **[Completed]**. It sometimes takes up to 1 hour for the instance status description to refresh. Completed maintenance events are displayed on the Amazon EC2 console dashboard for up to a week.

Actions for Instances Backed by Amazon EBS

You can wait for the maintenance to occur as scheduled. Alternatively, you can stop and start the instance, which migrates it to a new host. For more information about stopping your instance, in addition to information about the changes to your instance configuration when it's stopped, see [Stop and start your instance \(p. 637\)](#).

You can automate an immediate stop and start in response to a scheduled maintenance event. For more information, see [Automating Actions for EC2 Instances](#) in the *AWS Health User Guide*.

Actions for instances backed by instance store

You can wait for the maintenance to occur as scheduled. Alternatively, if you want to maintain normal operation during a scheduled maintenance window, you can launch a replacement instance from your most recent AMI, migrate all necessary data to the replacement instance before the scheduled maintenance window, and then terminate the original instance.

Reschedule a scheduled event

You can reschedule an event so that it occurs at a specific date and time that suits you. Only events that have a deadline date can be rescheduled. There are other [limitations for rescheduling an event \(p. 963\)](#).

You can reschedule an event by using one of the following methods.

New console

To reschedule an event using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Resource type: instance** from the filter list.
4. Select one or more instances, and then choose **Actions, Schedule event**.

Only events that have an event deadline date, indicated by a value for **Deadline**, can be rescheduled. If one of the selected events does not have a deadline date, **Actions, Schedule event** is disabled.

5. For **New start time**, enter a new date and time for the event. The new date and time must occur before the **Event deadline**.
6. Choose **Save**.

It might take a minute or 2 for the updated event start time to be reflected in the console.

Old console

To reschedule an event using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Instance resources** from the filter list.
4. Select one or more instances, and then choose **Actions, Schedule Event**.

Only events that have an event deadline date, indicated by a value for **Event Deadline**, can be rescheduled.

5. For **Event start time**, enter a new date and time for the event. The new date and time must occur before the **Event Deadline**.
6. Choose **Schedule Event**.

It might take a minute or 2 for the updated event start time to be reflected in the console.

AWS CLI

To reschedule an event using the AWS CLI

1. Only events that have an event deadline date, indicated by a value for **NotBeforeDeadline**, can be rescheduled. Use the [describe-instance-status](#) command to view the **NotBeforeDeadline** parameter value.

```
aws ec2 describe-instance-status --instance-id i-1234567890abcdef0
```

The following example output shows a system-reboot event that can be rescheduled because **NotBeforeDeadline** contains a value.

```
[  
  "Events": [  
    {  
      "InstanceEventId": "instance-event-0d59937288b749b32",  
      "Code": "system-reboot",  
      "Description": "The instance is scheduled for a reboot",  
      "NotAfter": "2019-03-14T22:00:00.000Z",  
      "NotBefore": "2019-03-14T20:00:00.000Z",  
      "NotBeforeDeadline": "2019-04-05T11:00:00.000Z"  
    }  
  ]
```

2. To reschedule the event, use the [modify-instance-event-start-time](#) command. Specify the new event start time by using the **not-before** parameter. The new event start time must fall before the **NotBeforeDeadline**.

```
aws ec2 modify-instance-event-start-time --instance-id i-1234567890abcdef0  
--instance-event-id instance-event-0d59937288b749b32 --not-  
before 2019-03-25T10:00:00.000
```

It might take a minute or 2 before the [describe-instance-status](#) command returns the updated `not-before` parameter value.

Limitations

- Only events with an event deadline date can be rescheduled. The event can be rescheduled up to the event deadline date. The **Deadline** column in the console and the `NotBeforeDeadline` field in the AWS CLI indicate if the event has a deadline date.
- Only events that have not yet started can be rescheduled. The **Start time** column in the console and the `NotBefore` field in the AWS CLI indicate the event start time. Events that are scheduled to start in the next 5 minutes cannot be rescheduled.
- The new event start time must be at least 60 minutes from the current time.
- If you reschedule multiple events using the console, the event deadline date is determined by the event with the earliest event deadline date.

Define event windows for scheduled events

You can define custom event windows that recur weekly for scheduled events that reboot, stop, or terminate your Amazon EC2 instances. You can associate one or more instances with an event window. If a scheduled event for those instances is planned, AWS will schedule the events within the associated event window.

You can use event windows to maximize workload availability by specifying event windows that occur during off-peak periods for your workload. You can also align the event windows with your internal maintenance schedules.

You define an event window by specifying a set of time ranges. The minimum time range is 2 hours. The combined time ranges must total at least 4 hours.

You can associate one or more instances with an event window by using either instance IDs or instance tags. You can also associate Dedicated Hosts with an event window by using the host ID.

Warning

Event windows are applicable only for scheduled events that stop, reboot, or terminate instances.

Event windows are *not* applicable for:

- Expedited scheduled events and network maintenance events.
- Unscheduled maintenance such as AutoRecovery and unplanned reboots.

Work with event windows

- [Considerations \(p. 964\)](#)
- [View event windows \(p. 964\)](#)
- [Create event windows \(p. 966\)](#)
- [Modify event windows \(p. 970\)](#)
- [Delete event windows \(p. 974\)](#)
- [Tag event windows \(p. 975\)](#)

Considerations

- All event window times are in UTC.
- The minimum weekly event window duration is 4 hours.
- The time ranges within an event window must each be at least 2 hours.
- Only one target type (instance ID, Dedicated Host ID, or instance tag) can be associated with an event window.
- A target (instance ID, Dedicated Host ID, or instance tag) can only be associated with one event window.
- A maximum of 100 instance IDs, or 50 Dedicated Host IDs, or 50 instance tags can be associated with an event window. The instance tags can be associated with any number of instances.
- A maximum of 200 event windows can be created per AWS Region.
- Multiple instances that are associated with event windows can potentially have scheduled events occur at the same time.
- If AWS has already scheduled an event, modifying an event window won't change the time of the scheduled event. If the event has a deadline date, you can [reschedule the event \(p. 961\)](#).
- You can stop and start an instance prior to the scheduled event, which migrates the instance to a new host, and the scheduled event will no longer take place.

View event windows

You can view event windows by using one of the following methods.

Console

To view event windows using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event windows**.
4. Select an event window to view its details.

AWS CLI

To describe all event windows using the AWS CLI

Use the [describe-instance-event-windows](#) command.

```
aws ec2 describe-instance-event-windows \
--region us-east-1
```

Expected output

```
{
    "InstanceEventWindows": [
        {
            "InstanceEventWindowId": "iew-0abcdef1234567890",
            "Name": "myEventWindowName",
            "CronExpression": "* 21-23 * * 2,3",
            "AssociationTarget": {
                "InstanceIds": [
                    "i-1234567890abcdef0",
                    "i-1234567890abcdef1",
                    "i-1234567890abcdef2",
                    "i-1234567890abcdef3",
                    "i-1234567890abcdef4",
                    "i-1234567890abcdef5",
                    "i-1234567890abcdef6",
                    "i-1234567890abcdef7",
                    "i-1234567890abcdef8",
                    "i-1234567890abcdef9"
                ]
            }
        }
    ]
}
```

```
        "i-0598c7d356eba48d7"
    ],
    "Tags": [],
    "DedicatedHostIds": []
},
"State": "active",
"Tags": []
}
...
],
"NextToken": "9d624e0c-388b-4862-a31e-a85c64fc1d4a"
}
```

To describe a specific event window using the AWS CLI

Use the [describe-instance-event-windows](#) command with the `--instance-event-window-id` parameter to describe a specific event window.

```
aws ec2 describe-instance-event-windows \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890
```

To describe event windows that match one or more filters using the AWS CLI

Use the [describe-instance-event-windows](#) command with the `--filters` parameter. In the following example, the `instance-id` filter is used to describe all of the event windows that are associated with the specified instance.

When a filter is used, it performs a direct match. However, the `instance-id` filter is different. If there is no direct match to the instance ID, then it falls back to indirect associations with the event window, such as the instance's tags or Dedicated Host ID (if the instance is on a Dedicated Host).

For the list of supported filters, see [describe-instance-event-windows](#) in the *AWS CLI Reference*.

```
aws ec2 describe-instance-event-windows \
--region us-east-1 \
--filters Name=instance-id,Values=i-1234567890abcdef0 \
--max-results 100 \
--next-token <next-token-value>
```

Expected output

In the following example, the instance is on a Dedicated Host, which is associated with the event window.

```
{
    "InstanceEventWindows": [
        {
            "InstanceEventWindowId": "iew-0dbc0adb66f235982",
            "TimeRanges": [
                {
                    "StartWeekDay": "sunday",
                    "StartHour": 2,
                    "EndWeekDay": "sunday",
                    "EndHour": 8
                }
            ]
        }
    ]
}
```

```
"Name": "myEventWindowName",
"AssociationTarget": {
    "InstanceIds": [],
    "Tags": [],

]
```

Create event windows

You can create one or more event windows. For each event window, you specify one or more blocks of time. For example, you can create an event window with blocks of time that occur every day at 4 AM for 2 hours. Or you can create an event window with blocks of time that occur on Sundays from 2 AM to 4 AM and on Wednesdays from 3 AM to 5 AM.

For the event window constraints, see [Considerations \(p. 964\)](#) earlier in this topic.

Event windows recur weekly until you delete them.

Use one of the following methods to create an event window.

Console

To create an event window using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Create instance event window**.
4. For **Event window name**, enter a descriptive name for the event window.
5. For **Event window schedule**, choose to specify the blocks of time in the event window by using the cron schedule builder or by specifying time ranges.
 - If you choose **Cron schedule builder**, specify the following:
 1. For **Days (UTC)**, specify the days of the week on which the event window occurs.
 2. For **Start time (UTC)**, specify the time when the event window begins.
 3. For **Duration**, specify the duration of the blocks of time in the event window. The minimum duration per block of time is 2 hours. The minimum duration of the event window must equal or exceed 4 hours in total. All times are in UTC.
 - If you choose **Time ranges**, choose **Add new time range** and specify the start day and time and the end day and time. Repeat for each time range. The minimum duration per time range is 2 hours. The minimum duration for all time ranges combined must equal or exceed 4 hours in total.
6. (Optional) For **Target details**, associate one or more instances with the event window so that if the instances are scheduled for maintenance, the scheduled event will occur during the associated event window. You can associate one or more instances with an event window by using instance IDs or instance tags. You can associate Dedicated Hosts with an event window by using the host ID.

Note that you can create the event window without associating a target with the window. Later, you can modify the window to associate one or more targets.

7. (Optional) For **Event window tags**, choose **Add tag**, and enter the key and value for the tag. Repeat for each tag.
8. Choose **Create event window**.

AWS CLI

To create an event window using the AWS CLI, you first create the event window, and then you associate one or more targets with the event window.

Create an event window

You can define either a set of time ranges or a cron expression when creating the event window, but not both.

To create an event window with a time range using the AWS CLI

Use the [create-instance-event-window](#) command and specify the `--time-range` parameter. You can't also specify the `--cron-expression` parameter.

```
aws ec2 create-instance-event-window \
    --region us-east-1 \
    --time-range StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8 \
    --tag-specifications "ResourceType=instance-event-window,Tags=[{Key=K1,Value=V1}]"
    \
    --name myEventWindowName
```

Expected output

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "TimeRanges": [
            {
                "StartWeekDay": "monday",
                "StartHour": 2,
                "EndWeekDay": "wednesday",
                "EndHour": 8
            }
        ],
        "Name": "myEventWindowName",
        "State": "creating",
        "Tags": [
            {
                "Key": "K1",
                "Value": "V1"
            }
        ]
    }
}
```

To create an event window with a cron expression using the AWS CLI

Use the [create-instance-event-window](#) command and specify the `--cron-expression` parameter. You can't also specify the `--time-range` parameter.

```
aws ec2 create-instance-event-window \
    --region us-east-1 \
    --cron-expression "* 21-23 * * 2,3" \
```

```
--tag-specifications "ResourceType=instance-event-window,Tags=[{Key=K1,Value=V1}]"
\ --name myEventWindowName
```

Expected output

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "State": "creating",
        "Tags": [
            {
                "Key": "K1",
                "Value": "V1"
            }
        ]
    }
}
```

Associate a target with an event window

You can associate only one type of target (instance IDs, Dedicated Host IDs, or instance tags) with an event window.

To associate instance tags with an event window using the AWS CLI

Use the [associate-instance-event-window](#) command and specify the `instance-event-window-id` parameter to specify the event window. To associate instance tags, specify the `--association-target` parameter, and for the parameter values, specify one or more tags.

```
aws ec2 associate-instance-event-window \
    --region us-east-1 \
    --instance-event-window-id iew-0abcdef1234567890 \
    --association-target "InstanceTags=[{Key=k2,Value=v2},{Key=k1,Value=v1}]"
```

Expected output

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
            "Tags": [
                {
                    "Key": "k2",
                    "Value": "v2"
                },
                {
                    "Key": "k1",
                    "Value": "v1"
                }
            ],
            "DedicatedHostIds": []
        },
        "State": "creating"
    }
}
```

}

To associate one or more instances with an event window using the AWS CLI

Use the [associate-instance-event-window](#) command and specify the `instance-event-window-id` parameter to specify the event window. To associate instances, specify the `--association-target` parameter, and for the parameter values, specify one or more instance IDs.

```
aws ec2 associate-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"
```

Expected output

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [
                "i-1234567890abcdef0",
                "i-0598c7d356eba48d7"
            ],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating"
    }
}
```

To associate a Dedicated Host with an event window using the AWS CLI

Use the [associate-instance-event-window](#) command and specify the `instance-event-window-id` parameter to specify the event window. To associate a Dedicated Host, specify the `--association-target` parameter, and for the parameter values, specify one or more Dedicated Host IDs.

```
aws ec2 associate-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--association-target "DedicatedHostIds=h-029fa35a02b99801d"
```

Expected output

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
            "Tags": [],
            "DedicatedHostIds": [
                "h-029fa35a02b99801d"
            ]
        },
        "State": "creating"
    }
}
```

```
}
```

Modify event windows

You can modify all of the fields of an event window except its ID. For example, when daylight savings begin, you might want to modify the event window schedule. For existing event windows, you might want to add or remove targets.

Use one of the following methods to modify an event window.

Console

To modify an event window using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event windows**.
4. Select the event window to modify, and then choose **Actions, Modify instance event window**.
5. Modify the fields in the event window, and then choose **Modify event window**.

AWS CLI

To modify an event window using the AWS CLI, you can modify the time range or cron expression, and associate or disassociate one or more targets with the event window.

Modify the event window time

You can modify either a time range or a cron expression when modifying the event window, but not both.

To modify the time range of an event window using the AWS CLI

Use the `modify-instance-event-window` command and specify the event window to modify. Specify the `--time-range` parameter to modify the time range. You can't also specify the `--cron-expression` parameter.

```
aws ec2 modify-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890
--time-range StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8
```

Expected output

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "TimeRanges": [
            {
                "StartWeekDay": "monday",
                "StartHour": 2,
                "EndWeekDay": "wednesday",
                "EndHour": 8
            }
        ],
        "Name": "myEventWindowName",
```

```
"AssociationTarget": {  
    "InstanceIds": [  
        "i-0abcdef1234567890",  
        "i-0be35f9acb8ba01f0"  
    ],  
    "Tags": [],  
    "DedicatedHostIds": []  
},  
"State": "creating",  
"Tags": [  
    {  
        "Key": "K1",  
        "Value": "V1"  
    }  
]  
}
```

To modify a set of time ranges for an event window using the AWS CLI

Use the [modify-instance-event-window](#) command and specify the event window to modify. Specify the `--time-range` parameter to modify the time range. You can't also specify the `--cron-expression` parameter in the same call.

```
aws ec2 modify-instance-event-window \  
    --region us-east-1 \  
    --instance-event-window-id iew-0abcdef1234567890 \  
    --time-range '[{"StartWeekDay": "monday", "StartHour": 2, "EndWeekDay":  
    "wednesday", "EndHour": 8},  
    {"StartWeekDay": "thursday", "StartHour": 2, "EndWeekDay": "friday", "EndHour": 8}]'
```

Expected output

```
{  
    "InstanceEventWindow": {  
        "InstanceEventWindowId": "iew-0abcdef1234567890",  
        "TimeRanges": [  
            {  
                "StartWeekDay": "monday",  
                "StartHour": 2,  
                "EndWeekDay": "wednesday",  
                "EndHour": 8  
            },  
            {  
                "StartWeekDay": "thursday",  
                "StartHour": 2,  
                "EndWeekDay": "friday",  
                "EndHour": 8  
            }  
        ],  
        "Name": "myEventWindowName",  
        "AssociationTarget": {  
            "InstanceIds": [  
                "i-0abcdef1234567890",  
                "i-0be35f9acb8ba01f0"  
            ],  
            "Tags": [],  
            "DedicatedHostIds": []  
        },  
        "State": "creating",  
        "Tags": [  
            {  
                "Key": "K1",  
                "Value": "V1"  
            }  
        ]  
    }  
}
```

```
        "Value": "V1"
    }
}
}
```

To modify the cron expression of an event window using the AWS CLI

Use the [modify-instance-event-window](#) command and specify the event window to modify. Specify the `--cron-expression` parameter to modify the cron expression. You can't also specify the `--time-range` parameter.

```
aws ec2 modify-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--cron-expression "* 21-23 * * 2,3"
```

Expected output

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [
        "i-0abcdef1234567890",
        "i-0be35f9acb8ba01f0"
      ],
      "Tags": [],
      "DedicatedHostIds": []
    },
    "State": "creating",
    "Tags": [
      {
        "Key": "K1",
        "Value": "V1"
      }
    ]
  }
}
```

Modify the targets associated with an event window

You can associate additional targets with an event window. You can also disassociate existing targets from an event window. However, only one type of target (instance IDs, Dedicated Host IDs, or instance tags) can be associated with an event window.

To associate additional targets with an event window

For the instructions on how to associate targets with an event window, see [Associate a target with an event window](#).

To disassociate instance tags from an event window using the AWS CLI

Use the [disassociate-instance-event-window](#) command and specify the `instance-event-window-id` parameter to specify the event window. To disassociate instance tags, specify the `--association-target` parameter, and for the parameter values, specify one or more tags.

```
aws ec2 disassociate-instance-event-window \
```

```
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--association-target "InstanceTags=[{Key=k2,Value=v2},{Key=k1,Value=v1}]"
```

Expected output

```
{  
    "InstanceEventWindow": {  
        "InstanceEventWindowId": "iew-0abcdef1234567890",  
        "Name": "myEventWindowName",  
        "CronExpression": "* 21-23 * * 2,3",  
        "AssociationTarget": {  
            "InstanceIds": [],  
            "Tags": [],  
            "DedicatedHostIds": []  
        },  
        "State": "creating"  
    }  
}
```

To disassociate one or more instances from an event window using the AWS CLI

Use the [disassociate-instance-event-window](#) command and specify the `instance-event-window-id` parameter to specify the event window. To disassociate instances, specify the `--association-target` parameter, and for the parameter values, specify one or more instance IDs.

```
aws ec2 disassociate-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"
```

Expected output

```
{  
    "InstanceEventWindow": {  
        "InstanceEventWindowId": "iew-0abcdef1234567890",  
        "Name": "myEventWindowName",  
        "CronExpression": "* 21-23 * * 2,3",  
        "AssociationTarget": {  
            "InstanceIds": [],  
            "Tags": [],  
            "DedicatedHostIds": []  
        },  
        "State": "creating"  
    }  
}
```

To disassociate a Dedicated Host from an event window using the AWS CLI

Use the [disassociate-instance-event-window](#) command and specify the `instance-event-window-id` parameter to specify the event window. To disassociate a Dedicated Host, specify the `--association-target` parameter, and for the parameter values, specify one or more Dedicated Host IDs.

```
aws ec2 disassociate-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--association-target DedicatedHostIds=h-029fa35a02b99801d
```

Expected output

```
{  
    "InstanceEventWindow": {  
        "InstanceEventWindowId": "iew-0abcdef1234567890",  
        "Name": "myEventWindowName",  
        "CronExpression": "* 21-23 * * 2,3",  
        "AssociationTarget": {  
            "InstanceIds": [],  
            "Tags": [],  
            "DedicatedHostIds": []  
        },  
        "State": "creating"  
    }  
}
```

Delete event windows

You can delete one event window at a time by using one of the following methods.

Console

To delete an event window using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event windows**.
4. Select the event window to delete, and then choose **Actions, Delete instance event window**.
5. When prompted, enter **delete**, and then choose **Delete**.

AWS CLI

To delete an event window using the AWS CLI

Use the `delete-instance-event-window` command and specify the event window to delete.

```
aws ec2 delete-instance-event-window \  
  --region us-east-1 \  
  --instance-event-window-id iew-0abcdef1234567890
```

To force delete an event window using the AWS CLI

Use the `--force-delete` parameter if the event window is currently associated with targets.

```
aws ec2 delete-instance-event-window \  
  --region us-east-1 \  
  --instance-event-window-id iew-0abcdef1234567890 \  
  --force-delete
```

Expected output

```
{  
    "InstanceEventWindowState": {  
        "InstanceEventWindowId": "iew-0abcdef1234567890",  
        "State": "deleting"  
    }  
}
```

}

Tag event windows

You can tag an event window when you create it, or afterwards.

To tag an event window when you create it, see [Create event windows \(p. 966\)](#).

Use one of the following methods to tag an event window.

Console

To tag an existing event window using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event windows**.
4. Select the event window to tag, and then choose **Actions, Manage instance event window tags**.
5. Choose **Add tag** to add a tag. Repeat for each tag.
6. Choose **Save**.

AWS CLI

To tag an existing event window using the AWS CLI

Use the `create-tags` command to tag existing resources. In the following example, the existing event window is tagged with Key=purpose and Value=test.

```
aws ec2 create-tags \
    --resources iew-0abcdef1234567890 \
    --tags Key=purpose,Value=test
```

Monitor your instances using CloudWatch

You can monitor your instances using Amazon CloudWatch, which collects and processes raw data from Amazon EC2 into readable, near real-time metrics. These statistics are recorded for a period of 15 months, so that you can access historical information and gain a better perspective on how your web application or service is performing.

By default, Amazon EC2 sends metric data to CloudWatch in 5-minute periods. To send metric data for your instance to CloudWatch in 1-minute periods, you can enable detailed monitoring on the instance. For more information, see [Enable or turn off detailed monitoring for your instances \(p. 976\)](#).

The Amazon EC2 console displays a series of graphs based on the raw data from Amazon CloudWatch. Depending on your needs, you might prefer to get data for your instances from Amazon CloudWatch instead of the graphs in the console.

For more information about Amazon CloudWatch, see the [Amazon CloudWatch User Guide](#).

Contents

- [Enable or turn off detailed monitoring for your instances \(p. 976\)](#)
- [List the available CloudWatch metrics for your instances \(p. 978\)](#)

- [Get statistics for metrics for your instances \(p. 989\)](#)
- [Graph metrics for your instances \(p. 997\)](#)
- [Create a CloudWatch alarm for an instance \(p. 997\)](#)
- [Create alarms that stop, terminate, reboot, or recover an instance \(p. 999\)](#)

Enable or turn off detailed monitoring for your instances

By default, your instance is enabled for basic monitoring. You can optionally enable detailed monitoring. After you enable detailed monitoring, the Amazon EC2 console displays monitoring graphs with a 1-minute period for the instance.

The following describes the data interval and charge for basic and detailed monitoring for instances.

Monitoring type	Description	Charges
Basic monitoring	Data is available automatically in 5-minute periods.	No charge.
Detailed monitoring	Data is available in 1-minute periods. To get this level of data, you must specifically enable it for the instance. For the instances where you've enabled detailed monitoring, you can also get aggregated data across groups of similar instances.	You are charged per metric that is sent to CloudWatch. You are not charged for data storage. For more information, see Paid tier and Example 1 - EC2 Detailed Monitoring on the Amazon CloudWatch pricing page .

Topics

- [Required IAM permissions \(p. 976\)](#)
- [Enable detailed monitoring \(p. 976\)](#)
- [Turn off detailed monitoring \(p. 977\)](#)

Required IAM permissions

To enable detailed monitoring for an instance, your IAM user must have permission to use the [MonitorInstances](#) API action. To turn off detailed monitoring for an instance, your IAM user must have permission to use the [UnmonitorInstances](#) API action.

Enable detailed monitoring

You can enable detailed monitoring on an instance as you launch it or after the instance is running or stopped. Enabling detailed monitoring on an instance does not affect the monitoring of the EBS volumes attached to the instance. For more information, see [Amazon CloudWatch metrics for Amazon EBS \(p. 1603\)](#).

New console

To enable detailed monitoring for an existing instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitoring, Manage detailed monitoring**.
4. On the **Detailed monitoring** detail page, for **Detailed monitoring**, select the **Enable** check box.
5. Choose **Save**.

To enable detailed monitoring when launching an instance

When launching an instance using the AWS Management Console, select the **Monitoring** check box on the **Configure Instance Details** page.

Old console

To enable detailed monitoring for an existing instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, CloudWatch Monitoring, Enable Detailed Monitoring**.
4. In the **Enable Detailed Monitoring** dialog box, choose **Yes, Enable**.
5. Choose **Close**.

To enable detailed monitoring when launching an instance (console)

When launching an instance using the AWS Management Console, select the **Monitoring** check box on the **Configure Instance Details** page.

AWS CLI

To enable detailed monitoring for an existing instance

Use the following `monitor-instances` command to enable detailed monitoring for the specified instances.

```
aws ec2 monitor-instances --instance-ids i-1234567890abcdef0
```

To enable detailed monitoring when launching an instance

Use the `run-instances` command with the `--monitoring` flag to enable detailed monitoring.

```
aws ec2 run-instances --image-id ami-09092360 --monitoring Enabled=true...
```

Turn off detailed monitoring

You can turn off detailed monitoring on an instance as you launch it or after the instance is running or stopped.

New console

To turn off detailed monitoring

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitoring, Manage detailed monitoring**.
4. On the **Detailed monitoring** detail page, for **Detailed monitoring**, clear the **Enable** check box.

5. Choose **Save**.

Old console

To turn off detailed monitoring

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, CloudWatch Monitoring, Disable Detailed Monitoring**.
4. In the **Disable Detailed Monitoring** dialog box, choose **Yes, Disable**.
5. Choose **Close**.

AWS CLI

To turn off detailed monitoring

Use the following `unmonitor-instances` command to turn off detailed monitoring for the specified instances.

```
aws ec2 unmonitor-instances --instance-ids i-1234567890abcdef0
```

List the available CloudWatch metrics for your instances

Amazon EC2 sends metrics to Amazon CloudWatch. You can use the AWS Management Console, the AWS CLI, or an API to list the metrics that Amazon EC2 sends to CloudWatch. By default, each data point covers the 5 minutes that follow the start time of activity for the instance. If you've enabled detailed monitoring, each data point covers the next minute of activity from the start time. Note that for the Minimum, Maximum, and Average statistics, the minimum granularity for the metrics that EC2 provides is 1 minute.

For information about getting the statistics for these metrics, see [Get statistics for metrics for your instances \(p. 989\)](#).

- [List metrics using the console \(p. 986\)](#)
- [List metrics using the AWS CLI \(p. 988\)](#)

Instance metrics

The `AWS/EC2` namespace includes the following instance metrics.

Metric	Description
CPUUtilization	<p>The percentage of allocated EC2 compute units that are currently in use on the instance. This metric identifies the processing power required to run an application on a selected instance.</p> <p>Depending on the instance type, tools in your operating system can show a different percentage than CloudWatch when the instance is not allocated a full processor core.</p> <p>Units: Percent</p>
DiskReadOps	<p>Completed read operations from all instance store volumes available to the instance in a specified period of time.</p> <p>To calculate the average I/O operations per second (IOPS) for the period, divide the total operations in the period by the number of seconds in that period.</p> <p>If there are no instance store volumes, either the value is 0 or the metric is not reported.</p> <p>Units: Count</p>
DiskWriteOps	<p>Completed write operations to all instance store volumes available to the instance in a specified period of time.</p> <p>To calculate the average I/O operations per second (IOPS) for the period, divide the total operations in the period by the number of seconds in that period.</p> <p>If there are no instance store volumes, either the value is 0 or the metric is not reported.</p> <p>Units: Count</p>
DiskReadBytes	<p>Bytes read from all instance store volumes available to the instance.</p> <p>This metric is used to determine the volume of the data the application reads from the hard disk of the instance. This can be used to determine the speed of the application.</p> <p>The number reported is the number of bytes received during the period. If you are using basic (5-minute) monitoring, you can divide this number by 300 to find Bytes/second. If you have detailed (1-minute) monitoring, divide it by 60.</p> <p>If there are no instance store volumes, either the value is 0 or the metric is not reported.</p> <p>Units: Bytes</p>
DiskWriteBytes	<p>Bytes written to all instance store volumes available to the instance.</p> <p>This metric is used to determine the volume of the data the application writes onto the hard disk of the instance. This can be used to determine the speed of the application.</p> <p>The number reported is the number of bytes received during the period. If you are using basic (5-minute) monitoring, you can divide</p>

Metric	Description
	<p>this number by 300 to find Bytes/second. If you have detailed (1-minute) monitoring, divide it by 60.</p> <p>If there are no instance store volumes, either the value is 0 or the metric is not reported.</p> <p>Units: Bytes</p>
MetadataNoToken	<p>The number of times the instance metadata service was successfully accessed using a method that does not use a token.</p> <p>This metric is used to determine if there are any processes accessing instance metadata that are using Instance Metadata Service Version 1, which does not use a token. If all requests use token-backed sessions, i.e., Instance Metadata Service Version 2, the value is 0. For more information, see Transition to using Instance Metadata Service Version 2 (p. 729).</p> <p>Units: Count</p>
NetworkIn	<p>The number of bytes received by the instance on all network interfaces. This metric identifies the volume of incoming network traffic to a single instance.</p> <p>The number reported is the number of bytes received during the period. If you are using basic (5-minute) monitoring and the statistic is Sum, you can divide this number by 300 to find Bytes/second. If you have detailed (1-minute) monitoring and the statistic is Sum, divide it by 60.</p> <p>Units: Bytes</p>
NetworkOut	<p>The number of bytes sent out by the instance on all network interfaces. This metric identifies the volume of outgoing network traffic from a single instance.</p> <p>The number reported is the number of bytes sent during the period. If you are using basic (5-minute) monitoring and the statistic is Sum, you can divide this number by 300 to find Bytes/second. If you have detailed (1-minute) monitoring and the statistic is Sum, divide it by 60.</p> <p>Units: Bytes</p>
NetworkPacketsIn	<p>The number of packets received by the instance on all network interfaces. This metric identifies the volume of incoming traffic in terms of the number of packets on a single instance.</p> <p>This metric is available for basic monitoring only (5-minute periods). To calculate the number of packets per second (PPS) your instance received for the 5 minutes, divide the Sum statistic value by 300.</p> <p>Units: Count</p>

Metric	Description
NetworkPacketsOut	<p>The number of packets sent out by the instance on all network interfaces. This metric identifies the volume of outgoing traffic in terms of the number of packets on a single instance.</p> <p>This metric is available for basic monitoring only (5-minute periods). To calculate the number of packets per second (PPS) your instance received for the 5 minutes, divide the Sum statistic value by 300.</p> <p>Units: Count</p>

CPU credit metrics

The AWS/EC2 namespace includes the following CPU credit metrics for your [burstable performance instances \(p. 266\)](#).

Metric	Description
CPUCreditUsage	<p>The number of CPU credits spent by the instance for CPU utilization. One CPU credit equals one vCPU running at 100% utilization for one minute or an equivalent combination of vCPUs, utilization, and time (for example, one vCPU running at 50% utilization for two minutes or two vCPUs running at 25% utilization for two minutes).</p> <p>CPU credit metrics are available at a 5-minute frequency only. If you specify a period greater than five minutes, use the <code>Sum</code> statistic instead of the <code>Average</code> statistic.</p> <p>Units: Credits (vCPU-minutes)</p>
CPUCreditBalance	<p>The number of earned CPU credits that an instance has accrued since it was launched or started. For T2 Standard, the <code>CPUCreditBalance</code> also includes the number of launch credits that have been accrued.</p> <p>Credits are accrued in the credit balance after they are earned, and removed from the credit balance when they are spent. The credit balance has a maximum limit, determined by the instance size. After the limit is reached, any new credits that are earned are discarded. For T2 Standard, launch credits do not count towards the limit.</p> <p>The credits in the <code>CPUCreditBalance</code> are available for the instance to spend to burst beyond its baseline CPU utilization.</p> <p>When an instance is running, credits in the <code>CPUCreditBalance</code> do not expire. When a T3 or T3a instance stops, the <code>CPUCreditBalance</code> value persists for seven days. Thereafter, all accrued credits are lost. When a T2 instance stops, the <code>CPUCreditBalance</code> value does not persist, and all accrued credits are lost.</p> <p>CPU credit metrics are available at a 5-minute frequency only.</p>

Metric	Description
	Units: Credits (vCPU-minutes)
CPUSurplusCreditBalance	<p>The number of surplus credits that have been spent by an unlimited instance when its CPUCreditBalance value is zero.</p> <p>The CPUSurplusCreditBalance value is paid down by earned CPU credits. If the number of surplus credits exceeds the maximum number of credits that the instance can earn in a 24-hour period, the spent surplus credits above the maximum incur an additional charge.</p> <p>CPU credit metrics are available at a 5-minute frequency only.</p> <p>Units: Credits (vCPU-minutes)</p>
CPUSurplusCreditsCharged	<p>The number of spent surplus credits that are not paid down by earned CPU credits, and which thus incur an additional charge.</p> <p>Spent surplus credits are charged when any of the following occurs:</p> <ul style="list-style-type: none"> • The spent surplus credits exceed the maximum number of credits that the instance can earn in a 24-hour period. Spent surplus credits above the maximum are charged at the end of the hour. • The instance is stopped or terminated. • The instance is switched from unlimited to standard. <p>CPU credit metrics are available at a 5-minute frequency only.</p> <p>Units: Credits (vCPU-minutes)</p>

Dedicated Host metrics

The AWS/EC2 namespace includes the following metrics for T3 Dedicated Hosts.

Metric	Description
DedicatedHostCPUUtilization	<p>The percentage of allocated compute capacity that is currently in use by the instances running on the Dedicated Host.</p> <p>Unit: Percent</p>

Amazon EBS metrics for Nitro-based instances

The AWS/EC2 namespace includes the following Amazon EBS metrics for the Nitro-based instances. For the list of Nitro-based instance types, see [Instances built on the Nitro System \(p. 247\)](#).

Metric	Description
EBSReadOps	Completed read operations from all Amazon EBS volumes attached to the instance in a specified period of time.

Metric	Description
	<p>To calculate the average read I/O operations per second (Read IOPS) for the period, divide the total operations in the period by the number of seconds in that period. If you are using basic (5-minute) monitoring, you can divide this number by 300 to calculate the Read IOPS. If you have detailed (1-minute) monitoring, divide it by 60.</p> <p>Unit: Count</p>
EBSWriteOps	<p>Completed write operations to all EBS volumes attached to the instance in a specified period of time.</p> <p>To calculate the average write I/O operations per second (Write IOPS) for the period, divide the total operations in the period by the number of seconds in that period. If you are using basic (5-minute) monitoring, you can divide this number by 300 to calculate the Write IOPS. If you have detailed (1-minute) monitoring, divide it by 60.</p> <p>Unit: Count</p>
EBSReadBytes	<p>Bytes read from all EBS volumes attached to the instance in a specified period of time.</p> <p>The number reported is the number of bytes read during the period. If you are using basic (5-minute) monitoring, you can divide this number by 300 to find Read Bytes/second. If you have detailed (1-minute) monitoring, divide it by 60.</p> <p>Unit: Bytes</p>
EBSWriteBytes	<p>Bytes written to all EBS volumes attached to the instance in a specified period of time.</p> <p>The number reported is the number of bytes written during the period. If you are using basic (5-minute) monitoring, you can divide this number by 300 to find Write Bytes/second. If you have detailed (1-minute) monitoring, divide it by 60.</p> <p>Unit: Bytes</p>
EBSIOBalance%	<p>Provides information about the percentage of I/O credits remaining in the burst bucket. This metric is available for basic monitoring only.</p> <p>Instance sizes that support this metric can be found in the table under EBS optimized by default (p. 1563): the instances in the Instance size column that include an asterisk (*) support this metric.</p> <p>The Sum statistic is not applicable to this metric.</p> <p>Unit: Percent</p>

Metric	Description
EBSByteBalance%	<p>Provides information about the percentage of throughput credits remaining in the burst bucket. This metric is available for basic monitoring only.</p> <p>Instance sizes that support this metric can be found in the table under EBS optimized by default (p. 1563): the instances in the Instance size column that include an asterisk (*) support this metric.</p> <p>The Sum statistic is not applicable to this metric.</p> <p>Unit: Percent</p>

For information about the metrics provided for your EBS volumes, see [Amazon EBS metrics \(p. 1603\)](#). For information about the metrics provided for your Spot fleets, see [CloudWatch metrics for Spot Fleet \(p. 884\)](#).

Status check metrics

The AWS/EC2 namespace includes the following status check metrics. By default, status check metrics are available at a 1-minute frequency at no charge. For a newly-launched instance, status check metric data is only available after the instance has completed the initialization state (within a few minutes of the instance entering the running state). For more information about EC2 status checks, see [Status checks for your instances \(p. 945\)](#).

Metric	Description
StatusCheckFailed	<p>Reports whether the instance has passed both the instance status check and the system status check in the last minute.</p> <p>This metric can be either 0 (passed) or 1 (failed).</p> <p>By default, this metric is available at a 1-minute frequency at no charge.</p> <p>Units: Count</p>
StatusCheckFailed_Instance	<p>Reports whether the instance has passed the instance status check in the last minute.</p> <p>This metric can be either 0 (passed) or 1 (failed).</p> <p>By default, this metric is available at a 1-minute frequency at no charge.</p> <p>Units: Count</p>
StatusCheckFailed_System	<p>Reports whether the instance has passed the system status check in the last minute.</p> <p>This metric can be either 0 (passed) or 1 (failed).</p> <p>By default, this metric is available at a 1-minute frequency at no charge.</p> <p>Units: Count</p>

Traffic mirroring metrics

The AWS/EC2 namespace includes metrics for mirrored traffic. For more information, see [Monitoring mirrored traffic using Amazon CloudWatch](#) in the *Amazon VPC Traffic Mirroring Guide*.

Amazon EC2 metric dimensions

You can use the following dimensions to refine the metrics listed in the previous tables.

Dimension	Description
AutoScalingGroupName	This dimension filters the data you request for all instances in a specified capacity group. An <i>Auto Scaling group</i> is a collection of instances you define if you're using Auto Scaling. This dimension is available only for Amazon EC2 metrics when the instances are in such an Auto Scaling group. Available for instances with Detailed or Basic Monitoring enabled.
ImageId	This dimension filters the data you request for all instances running this Amazon EC2 Amazon Machine Image (AMI). Available for instances with Detailed Monitoring enabled.
InstanceId	This dimension filters the data you request for the identified instance only. This helps you pinpoint an exact instance from which to monitor data.
InstanceType	This dimension filters the data you request for all instances running with this specified instance type. This helps you categorize your data by the type of instance running. For example, you might compare data from an m1.small instance and an m1.large instance to determine which has the better business value for your application. Available for instances with Detailed Monitoring enabled.

Amazon EC2 usage metrics

You can use CloudWatch usage metrics to provide visibility into your account's usage of resources. Use these metrics to visualize your current service usage on CloudWatch graphs and dashboards.

Amazon EC2 usage metrics correspond to AWS service quotas. You can configure alarms that alert you when your usage approaches a service quota. For more information about CloudWatch integration with service quotas, see [Service Quotas Integration and Usage Metrics](#).

Amazon EC2 publishes the following metrics in the AWS/Usage namespace.

Metric	Description
ResourceCount	The number of the specified resources running in your account. The resources are defined by the dimensions associated with the metric. The most useful statistic for this metric is MAXIMUM, which represents the maximum number of resources used during the 1-minute period.

The following dimensions are used to refine the usage metrics that are published by Amazon EC2.

Dimension	Description
Service	The name of the AWS service containing the resource. For Amazon EC2 usage metrics, the value for this dimension is EC2 .
Type	The type of entity that is being reported. Currently, the only valid value for Amazon EC2 usage metrics is Resource .
Resource	The type of resource that is running. Currently, the only valid value for Amazon EC2 usage metrics is vCPU , which returns information on instances that are running.
Class	<p>The class of resource being tracked. For Amazon EC2 usage metrics with vCPU as the value of the Resource dimension, the valid values are Standard/OnDemand, F/OnDemand, G/OnDemand, Inf/OnDemand, P/OnDemand, and X/OnDemand.</p> <p>The values for this dimension define the first letter of the instance types that are reported by the metric. For example, Standard/OnDemand returns information about all running instances with types that start with A, C, D, H, I, M, R, T, and Z, and G/OnDemand returns information about all running instances with types that start with G.</p>

List metrics using the console

Metrics are grouped first by namespace, and then by the various dimension combinations within each namespace. For example, you can view all metrics provided by Amazon EC2, or metrics grouped by instance ID, instance type, image (AMI) ID, or Auto Scaling group.

To view available metrics by category (console)

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2** metric namespace.

The screenshot shows the AWS CloudWatch Metrics console. At the top, there are three tabs: 'All metrics' (which is selected), 'Graphed metrics', and 'Graph options'. Below the tabs is a search bar with the placeholder text 'Search for any metric, dimension or resource id'. The main area displays '722 Metrics' and lists several services with their respective metric counts:

EBS	117 Metrics	EC2	316 Metrics
EFS	7 Metrics	ELB	210 Metrics
ElasticBeanstalk	8 Metrics	RDS	60 Metrics
S3	4 Metrics		

4. Select a metric dimension (for example, **Per-Instance Metrics**).

The screenshot shows the AWS CloudWatch Metrics console with the 'Graphed metrics' tab selected for the 'EC2' service. The path 'All > EC2' is shown in the top left. A search bar at the top right contains the placeholder text 'Search for any metric, dimension or resource id'. The main area displays '103 Metrics' and lists five dimensions:

By Auto Scaling Group	28 Metrics
By Image (AMI) Id	7 Metrics
Per-Instance Metrics	54 Metrics
Aggregated by Instance Type	7 Metrics
Across All Instances	7 Metrics

- To sort the metrics, use the column heading. To graph a metric, select the check box next to the metric. To filter by resource, choose the resource ID and then choose **Add to search**. To filter by metric, choose the metric name and then choose **Add to search**.

	Instance Name (192)	InstanceId	Metric Name
<input type="checkbox"/>	my-instance	i-abbc12a7	CPUUtilization
<input type="checkbox"/>	my-instance		DiskReadBytes
<input type="checkbox"/>	my-instance		DiskReadOps
<input type="checkbox"/>	my-instance		DiskWriteBytes
<input type="checkbox"/>	my-instance		DiskWriteOps
<input type="checkbox"/>	my-instance		NetworkIn
<input type="checkbox"/>	my-instance		NetworkOut
<input type="checkbox"/>	my-instance	i-abbc12a7	NetworkPacketsIn
<input type="checkbox"/>	my-instance	i-abbc12a7	NetworkPacketsOut

List metrics using the AWS CLI

Use the [list-metrics](#) command to list the CloudWatch metrics for your instances.

To list all the available metrics for Amazon EC2 (AWS CLI)

The following example specifies the AWS/EC2 namespace to view all the metrics for Amazon EC2.

```
aws cloudwatch list-metrics --namespace AWS/EC2
```

The following is example output:

```
{  
  "Metrics": [  
    {  
      "Namespace": "AWS/EC2",  
      "Dimensions": [  
        {  
          "Name": "InstanceId",  
          "Value": "i-1234567890abcdef0"  
        }  
      ],  
      "MetricName": "NetworkOut"  
    },  
    {  
      "Namespace": "AWS/EC2",  
      "Dimensions": [  
        {  
          "Name": "InstanceId",  
          "Value": "i-1234567890abcdef0"  
        }  
      ],  
      "MetricName": "CPUUtilization"  
    }  
  ]  
}
```

```
},
{
  "Namespace": "AWS/EC2",
  "Dimensions": [
    {
      "Name": "InstanceId",
      "Value": "i-1234567890abcdef0"
    }
  ],
  "MetricName": "NetworkIn"
},
...
]
```

To list all the available metrics for an instance (AWS CLI)

The following example specifies the AWS/EC2 namespace and the `InstanceId` dimension to view the results for the specified instance only.

```
aws cloudwatch list-metrics --namespace AWS/EC2 --dimensions
  Name=InstanceId,Value=i-1234567890abcdef0
```

To list a metric across all instances (AWS CLI)

The following example specifies the AWS/EC2 namespace and a metric name to view the results for the specified metric only.

```
aws cloudwatch list-metrics --namespace AWS/EC2 --metric-name CPUUtilization
```

Get statistics for metrics for your instances

You can get statistics for the CloudWatch metrics for your instances.

Contents

- [Statistics overview \(p. 989\)](#)
- [Get statistics for a specific instance \(p. 990\)](#)
- [Aggregate statistics across instances \(p. 993\)](#)
- [Aggregate statistics by Auto Scaling group \(p. 995\)](#)
- [Aggregate statistics by AMI \(p. 996\)](#)

Statistics overview

Statistics are metric data aggregations over specified periods of time. CloudWatch provides statistics based on the metric data points provided by your custom data or provided by other services in AWS to CloudWatch. Aggregations are made using the namespace, metric name, dimensions, and the data point unit of measure, within the time period you specify. The following table describes the available statistics.

Statistic	Description
Minimum	The lowest value observed during the specified period. You can use this value to determine low volumes of activity for your application.

Statistic	Description
Maximum	The highest value observed during the specified period. You can use this value to determine high volumes of activity for your application.
Sum	All values submitted for the matching metric added together. This statistic can be useful for determining the total volume of a metric.
Average	The value of Sum / SampleCount during the specified period. By comparing this statistic with the Minimum and Maximum, you can determine the full scope of a metric and how close the average use is to the Minimum and Maximum. This comparison helps you to know when to increase or decrease your resources as needed.
SampleCount	The count (number) of data points used for the statistical calculation.
pNN.NN	The value of the specified percentile. You can specify any percentile, using up to two decimal places (for example, p95.45).

Get statistics for a specific instance

The following examples show you how to use the AWS Management Console or the AWS CLI to determine the maximum CPU utilization of a specific EC2 instance.

Requirements

- You must have the ID of the instance. You can get the instance ID using the AWS Management Console or the [describe-instances](#) command.
- By default, basic monitoring is enabled, but you can enable detailed monitoring. For more information, see [Enable or turn off detailed monitoring for your instances \(p. 976\)](#).

To display the CPU utilization for a specific instance (console)

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2** metric namespace.

The screenshot shows the AWS CloudWatch Metrics console with the following interface elements:

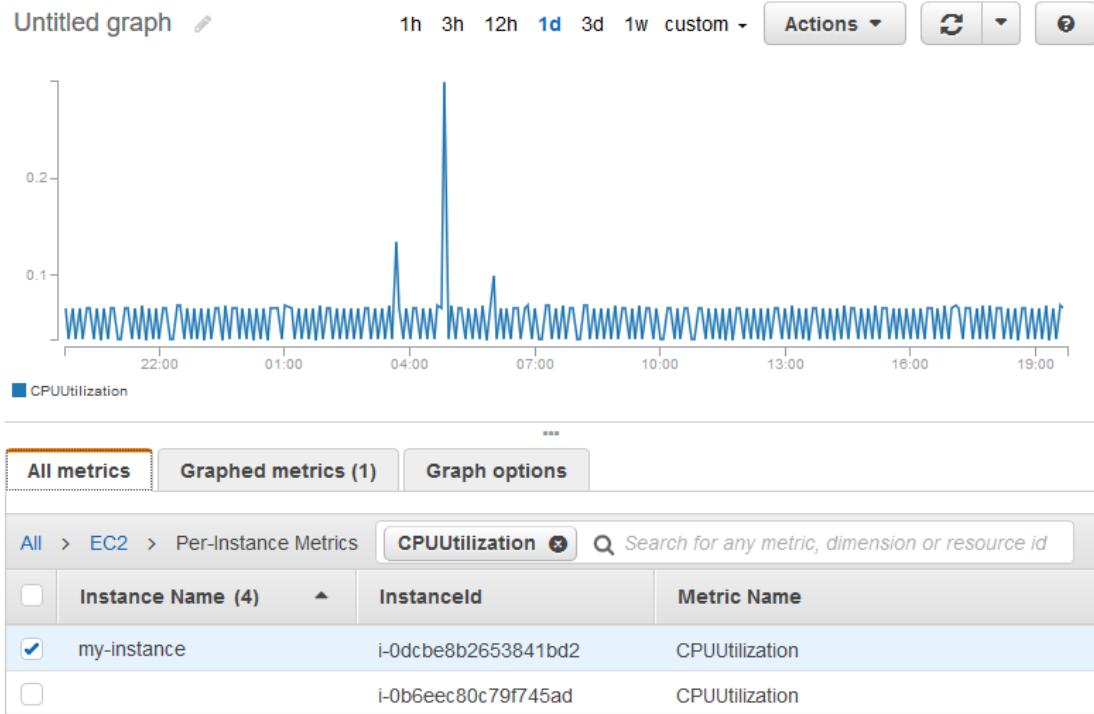

- Top Navigation:** Buttons for "All metrics", "Graphed metrics", and "Graph options".
- Search Bar:** A search input field with placeholder text "Search for any metric, dimension or resource id".
- Section Header:** "722 Metrics"
- Service Metrics Summary:** A grid of boxes showing metrics for different services:
 - EBS: 117 Metrics
 - EC2: 316 Metrics
 - EFS: 7 Metrics
 - ELB: 210 Metrics
 - ElasticBeanstalk: 8 Metrics
 - RDS: 60 Metrics
 - S3: 4 Metrics

4. Choose the **Per-Instance Metrics** dimension.

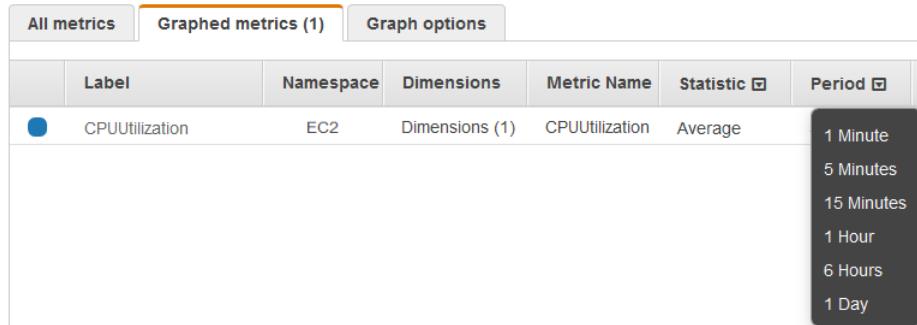

The screenshot shows the AWS CloudWatch Metrics console for the EC2 service with the following interface elements:

- Top Navigation:** Buttons for "All metrics", "Graphed metrics", and "Graph options".
- Breadcrumb:** "All > EC2"
- Search Bar:** A search input field with placeholder text "Search for any metric, dimension or resource id".
- Section Header:** "103 Metrics"
- Dimension Options:** A list of dimension categories:
 - By Auto Scaling Group
 - By Image (AMI) Id
 - Per-Instance Metrics** (highlighted in blue)
 - Aggregated by Instance Type
 - Across All Instances

- In the search field, enter **CPUutilization** and press Enter. Choose the row for the specific instance, which displays a graph for the **CPUUtilization** metric for the instance. To name the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose **custom**.

- To change the statistic or the period for the metric, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose a different value.

To get the CPU utilization for a specific instance (AWS CLI)

Use the following `get-metric-statistics` command to get the **CPUUtilization** metric for the specified instance, using the specified period and time interval:

```
aws cloudwatch get-metric-statistics --namespace AWS/EC2 --metric-name CPUUtilization --period 3600 \
--statistics Maximum --dimensions Name=InstanceId,Value=i-1234567890abcdef0 \
--start-time 2016-10-18T23:18:00 --end-time 2016-10-19T23:18:00
```

The following is example output. Each value represents the maximum CPU utilization percentage for a single EC2 instance.

```
{  
    "Datapoints": [  
        {  
            "Timestamp": "2016-10-19T00:18:00Z",  
            "Maximum": 0.3300000000000002,  
            "Unit": "Percent"  
        },  
        {  
            "Timestamp": "2016-10-19T03:18:00Z",  
            "Maximum": 99.67000000000002,  
            "Unit": "Percent"  
        },  
        {  
            "Timestamp": "2016-10-19T07:18:00Z",  
            "Maximum": 0.3400000000000002,  
            "Unit": "Percent"  
        },  
        {  
            "Timestamp": "2016-10-19T12:18:00Z",  
            "Maximum": 0.3400000000000002,  
            "Unit": "Percent"  
        },  
        ...  
    ],  
    "Label": "CPUUtilization"  
}
```

Aggregate statistics across instances

Aggregate statistics are available for instances that have detailed monitoring enabled. Instances that use basic monitoring are not included in the aggregates. Before you can get statistics aggregated across instances, you must [enable detailed monitoring \(p. 976\)](#) (at an additional charge), which provides data in 1-minute periods.

Note that Amazon CloudWatch cannot aggregate data across AWS Regions. Metrics are completely separate between Regions.

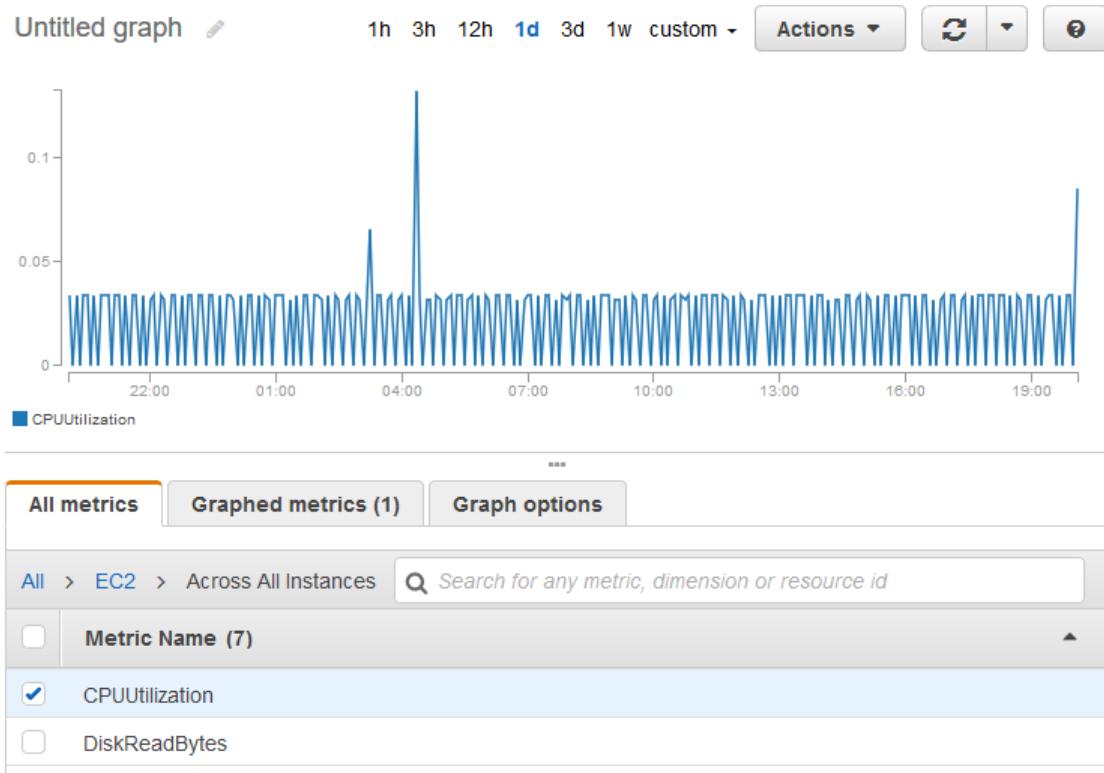

This example shows you how to use detailed monitoring to get the average CPU usage for your EC2 instances. Because no dimension is specified, CloudWatch returns statistics for all dimensions in the AWS / EC2 namespace.

Important

This technique for retrieving all dimensions across an AWS namespace does not work for custom namespaces that you publish to Amazon CloudWatch. With custom namespaces, you must specify the complete set of dimensions that are associated with any given data point to retrieve statistics that include the data point.

To display average CPU utilization across your instances (console)

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2** namespace and then choose **Across All Instances**.
4. Choose the row that contains **CPUUtilization**, which displays a graph for the metric for all your EC2 instances. To name the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose **custom**.

- To change the statistic or the period for the metric, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose a different value.

To get average CPU utilization across your instances (AWS CLI)

Use the [get-metric-statistics](#) command as follows to get the average of the **CPUUtilization** metric across your instances.

```
aws cloudwatch get-metric-statistics \
--namespace AWS/EC2 \
--metric-name CPUUtilization \
--period 3600 --statistics "Average" "SampleCount" \
--start-time 2016-10-11T23:18:00 \
--end-time 2016-10-12T23:18:00
```

The following is example output:

```
{
    "Datapoints": [
        {
            "SampleCount": 238.0,
            "Timestamp": "2016-10-12T07:18:00Z",
            "Average": 0.038235294117647062,
            "Unit": "Percent"
        },
        {
            "SampleCount": 240.0,
            "Timestamp": "2016-10-12T09:18:00Z",
            "Average": 0.1667083333333332,
            "Unit": "Percent"
        }
    ]
}
```

```
"SampleCount": 238.0,  
"Timestamp": "2016-10-11T23:18:00Z",  
"Average": 0.041596638655462197,  
"Unit": "Percent"  
,  
...  
],  
"Label": "CPUUtilization"  
}
```

Aggregate statistics by Auto Scaling group

You can aggregate statistics for the EC2 instances in an Auto Scaling group. Note that Amazon CloudWatch cannot aggregate data across AWS Regions. Metrics are completely separate between Regions.

This example shows you how to retrieve the total bytes written to disk for one Auto Scaling group. The total is computed for 1-minute periods for a 24-hour interval across all EC2 instances in the specified Auto Scaling group.

To display DiskWriteBytes for the instances in an Auto Scaling group (console)

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2** namespace and then choose **By Auto Scaling Group**.
4. Choose the row for the **DiskWriteBytes** metric and the specific Auto Scaling group, which displays a graph for the metric for the instances in the Auto Scaling group. To name the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose **custom**.
5. To change the statistic or the period for the metric, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose a different value.

To display DiskWriteBytes for the instances in an Auto Scaling group (AWS CLI)

Use the `get-metric-statistics` command as follows.

```
aws cloudwatch get-metric-statistics --namespace AWS/EC2 --metric-name DiskWriteBytes --  
period 360 \  
--statistics "Sum" "SampleCount" --dimensions Name=AutoScalingGroupName,Value=my-asg --  
start-time 2016-10-16T23:18:00 --end-time 2016-10-18T23:18:00
```

The following is example output:

```
{  
    "Datapoints": [  
        {  
            "SampleCount": 18.0,  
            "Timestamp": "2016-10-19T21:36:00Z",  
            "Sum": 0.0,  
            "Unit": "Bytes"  
        },  
        {  
            "SampleCount": 5.0,  
            "Timestamp": "2016-10-19T21:42:00Z",  
            "Sum": 0.0,  
            "Unit": "Bytes"  
        }  
    ],  
    "Label": "DiskWriteBytes"
```

}

Aggregate statistics by AMI

You can aggregate statistics for your instances that have detailed monitoring enabled. Instances that use basic monitoring are not included in the aggregates. Before you can get statistics aggregated across instances, you must [enable detailed monitoring \(p. 976\)](#) (at an additional charge), which provides data in 1-minute periods.

Note that Amazon CloudWatch cannot aggregate data across AWS Regions. Metrics are completely separate between Regions.

This example shows you how to determine average CPU utilization for all instances that use a specific Amazon Machine Image (AMI). The average is over 60-second time intervals for a one-day period.

To display the average CPU utilization by AMI (console)

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2** namespace and then choose **By Image (AMI) Id**.
4. Choose the row for the **CPUUtilization** metric and the specific AMI, which displays a graph for the metric for the specified AMI. To name the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose **custom**.
5. To change the statistic or the period for the metric, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose a different value.

To get the average CPU utilization for an image ID (AWS CLI)

Use the `get-metric-statistics` command as follows.

```
aws cloudwatch get-metric-statistics --namespace AWS/EC2 --metric-name CPUUtilization --period 3600 \
--statistics Average --dimensions Name=ImageId,Value=ami-3c47a355 --start-time 2016-10-10T00:00:00 --end-time 2016-10-11T00:00:00
```

The following is example output. Each value represents an average CPU utilization percentage for the EC2 instances running the specified AMI.

```
{
  "Datapoints": [
    {
      "Timestamp": "2016-10-10T07:00:00Z",
      "Average": 0.04100000000000009,
      "Unit": "Percent"
    },
    {
      "Timestamp": "2016-10-10T14:00:00Z",
      "Average": 0.079579831932773085,
      "Unit": "Percent"
    },
    {
      "Timestamp": "2016-10-10T06:00:00Z",
      "Average": 0.03600000000000011,
      "Unit": "Percent"
    },
    ...
  ],
  "Label": "CPUUtilization"
```

}

Graph metrics for your instances

After you launch an instance, you can open the Amazon EC2 console and view the monitoring graphs for the instance on the **Monitoring** tab. Each graph is based on one of the available Amazon EC2 metrics.

The following graphs are available:

- Average CPU Utilization (Percent)
- Average Disk Reads (Bytes)
- Average Disk Writes (Bytes)
- Maximum Network In (Bytes)
- Maximum Network Out (Bytes)
- Summary Disk Read Operations (Count)
- Summary Disk Write Operations (Count)
- Summary Status (Any)
- Summary Status Instance (Count)
- Summary Status System (Count)

For more information about the metrics and the data they provide to the graphs, see [List the available CloudWatch metrics for your instances \(p. 978\)](#).

Graph Metrics Using the CloudWatch Console

You can also use the CloudWatch console to graph metric data generated by Amazon EC2 and other AWS services. For more information, see [Graph Metrics](#) in the *Amazon CloudWatch User Guide*.

Create a CloudWatch alarm for an instance

You can create a CloudWatch alarm that monitors CloudWatch metrics for one of your instances. CloudWatch will automatically send you a notification when the metric reaches a threshold you specify. You can create a CloudWatch alarm using the Amazon EC2 console, or using the more advanced options provided by the CloudWatch console.

To create an alarm using the CloudWatch console

For examples, see [Creating Amazon CloudWatch Alarms](#) in the *Amazon CloudWatch User Guide*.

New console

To create an alarm using the Amazon EC2 console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, Manage CloudWatch alarms**.
4. On the **Manage CloudWatch alarms** detail page, under **Add or edit alarm**, select **Create an alarm**.
5. For **Alarm notification**, choose whether to turn the toggle on or off to configure Amazon Simple Notification Service (Amazon SNS) notifications. Enter an existing Amazon SNS topic or enter a name to create a new topic.
6. For **Alarm action**, choose whether to turn the toggle on or off to specify an action to take when the alarm is triggered. Select an action from the dropdown.

7. For **Alarm thresholds**, select the metric and criteria for the alarm. For example, you can leave the default settings for **Group samples by (Average)** and **Type of data to sample (CPU utilization)**. For **Alarm when**, choose \geq and enter **0 . 80**. For **Consecutive period**, enter **1**. For **Period**, select **5 minutes**.
8. (Optional) For **Sample metric data**, choose **Add to dashboard**.
9. Choose **Create**.

Old console

To create an alarm using the Amazon EC2 console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance.
4. On the **Monitoring** tab located at the bottom of the page, choose **Create Alarm**. Or, from the **Actions** dropdown, choose **CloudWatch Monitoring, Add/Edit Alarm**.
5. In the **Create Alarm** dialog box, do the following:
 - a. Choose **create topic**. For **Send a notification to**, enter a name for the SNS topic. For **With these recipients**, enter one or more email addresses to receive notification.
 - b. Specify the metric and the criteria for the policy. For example, you can leave the default settings for **Whenever** (Average of CPU Utilization). For **Is**, choose \geq and enter 80 percent. For **For at least**, enter 1 consecutive period of 5 Minutes.
 - c. Choose **Create Alarm**.

The screenshot shows the 'Create Alarm' dialog box. At the top, it says 'Create Alarm'. Below that, a message states: 'You can use CloudWatch alarms to be notified automatically whenever metric data reaches a level you define. To edit an alarm, first choose whom to notify and then define when the notification should be sent.' There are two sections: 'Send a notification to:' (checkbox checked, value 'my-topic') and 'With these recipients:' (input field 'me@mycompany.com'). Under 'Take the action:' (checkbox unchecked), there are four radio button options: 'Recover this instance' (info icon), 'Stop this instance' (info icon), 'Terminate this instance' (info icon), and 'Reboot this instance' (info icon). Below these are fields for 'Whenever' (dropdown 'Average' selected, 'CPU Utilization' dropdown), 'Is' (operator ' \geq ', value '80', unit 'Percent'), 'For at least' (input '1', dropdown 'consecutive period(s)', value '5 Minutes'), and 'Name of alarm' (input 'CPU-Utilization'). At the bottom right are 'Cancel' and 'Create Alarm' buttons.

You can edit your CloudWatch alarm settings from the Amazon EC2 console or the CloudWatch console. If you want to delete your alarm, you can do so from the CloudWatch console. For more information, see [Editing or Deleting a CloudWatch Alarm](#) in the *Amazon CloudWatch User Guide*.

Create alarms that stop, terminate, reboot, or recover an instance

Using Amazon CloudWatch alarm actions, you can create alarms that automatically stop, terminate, reboot, or recover your instances. You can use the stop or terminate actions to help you save money when you no longer need an instance to be running. You can use the reboot and recover actions to automatically reboot those instances or recover them onto new hardware if a system impairment occurs.

The `AWSLambdaRoleForCloudWatchEvents` service-linked role enables AWS to perform alarm actions on your behalf. The first time you create an alarm in the AWS Management Console, the IAM CLI, or the IAM API, CloudWatch creates the service-linked role for you.

There are a number of scenarios in which you might want to automatically stop or terminate your instance. For example, you might have instances dedicated to batch payroll processing jobs or scientific computing tasks that run for a period of time and then complete their work. Rather than letting those instances sit idle (and accrue charges), you can stop or terminate them, which can help you to save money. The main difference between using the stop and the terminate alarm actions is that you can easily start a stopped instance if you need to run it again later, and you can keep the same instance ID and root volume. However, you cannot start a terminated instance. Instead, you must launch a new instance.

You can add the stop, terminate, reboot, or recover actions to any alarm that is set on an Amazon EC2 per-instance metric, including basic and detailed monitoring metrics provided by Amazon CloudWatch (in the `AWS/EC2` namespace), as well as any custom metrics that include the `InstanceId` dimension, as long as its value refers to a valid running Amazon EC2 instance.

Console support

You can create alarms using the Amazon EC2 console or the CloudWatch console. The procedures in this documentation use the Amazon EC2 console. For procedures that use the CloudWatch console, see [Create Alarms That Stop, Terminate, Reboot, or Recover an Instance](#) in the *Amazon CloudWatch User Guide*.

Permissions

If you are an AWS Identity and Access Management (IAM) user, you must have the `iam:CreateServiceLinkedRole` to create or modify an alarm that performs EC2 alarm actions.

Contents

- [Add stop actions to Amazon CloudWatch alarms \(p. 999\)](#)
- [Add terminate actions to Amazon CloudWatch alarms \(p. 1001\)](#)
- [Add reboot actions to Amazon CloudWatch alarms \(p. 1002\)](#)
- [Add recover actions to Amazon CloudWatch alarms \(p. 1004\)](#)

- [Amazon CloudWatch alarm action scenarios \(p. 1006\)](#)

Add stop actions to Amazon CloudWatch alarms

You can create an alarm that stops an Amazon EC2 instance when a certain threshold has been met. For example, you may run development or test instances and occasionally forget to shut them off. You can create an alarm that is triggered when the average CPU utilization percentage has been lower than 10 percent for 24 hours, signaling that it is idle and no longer in use. You can adjust the threshold, duration, and period to suit your needs, plus you can add an Amazon Simple Notification Service (Amazon SNS) notification so that you receive an email when the alarm is triggered.

Instances that use an Amazon EBS volume as the root device can be stopped or terminated, whereas instances that use the instance store as the root device can only be terminated.

New console

To create an alarm to stop an idle instance (Amazon EC2 console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
 2. In the navigation pane, choose **Instances**.
 3. Select the instance and choose **Actions, Monitor and troubleshoot, Manage CloudWatch alarms**.
- Alternatively, you can choose the plus sign () in the **Alarm status** column.
4. On the **Manage CloudWatch alarms** page, do the following:
 - a. Choose **Create an alarm**.
 - b. To receive an email when the alarm is triggered, for **Alarm notification**, choose an existing Amazon SNS topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person \(A2P\) messaging](#) in the *Amazon Simple Notification Service Developer Guide*.
 - c. Toggle on **Alarm action**, and choose **Stop**.
 - d. For **Group samples by** and **Type of data to sample**, choose a statistic and a metric. In this example, choose **Average** and **CPU utilization**.
 - e. For **Alarm When** and **Percent**, specify the metric threshold. In this example, specify **<=** and **10** percent.
 - f. For **Consecutive period** and **Period**, specify the evaluation period for the alarm. In this example, specify **1 consecutive period of 5 Minutes**.
 - g. Amazon CloudWatch automatically creates an alarm name for you. To change the name, for **Alarm name**, enter a new name. Alarm names must contain only ASCII characters.

Note

You can adjust the alarm configuration based on your own requirements before creating the alarm, or you can edit them later. This includes the metric, threshold, duration, action, and notification settings. However, after you create an alarm, you cannot edit its name later.

- h. Choose **Create**.

Old console

To create an alarm to stop an idle instance (Amazon EC2 console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance. On the **Monitoring** tab, choose **Create Alarm**.
4. In the **Create Alarm** dialog box, do the following:
 - a. To receive an email when the alarm is triggered, for **Send a notification to**, choose an existing Amazon SNS topic, or choose **create topic** to create a new one.

To create a new topic, for **Send a notification to**, enter a name for the topic, and then for **With these recipients**, enter the email addresses of the recipients (separated by commas). After you create the alarm, you will receive a subscription confirmation email that you must accept before you can get notifications for this topic.

5. Choose **Take the action, Stop this instance**.

- c. For **Whenever**, choose the statistic you want to use and then choose the metric. In this example, choose **Average** and **CPU Utilization**.
- d. For **Is**, specify the metric threshold. In this example, enter **10** percent.
- e. For **For at least**, specify the evaluation period for the alarm. In this example, enter **24** consecutive period(s) of **1 Hour**.
- f. To change the name of the alarm, for **Name of alarm**, enter a new name. Alarm names must contain only ASCII characters.

If you don't enter a name for the alarm, Amazon CloudWatch automatically creates one for you.

Note

You can adjust the alarm configuration based on your own requirements before creating the alarm, or you can edit them later. This includes the metric, threshold, duration, action, and notification settings. However, after you create an alarm, you cannot edit its name later.

- g. Choose **Create Alarm**.

Add terminate actions to Amazon CloudWatch alarms

You can create an alarm that terminates an EC2 instance automatically when a certain threshold has been met (as long as termination protection is not enabled for the instance). For example, you might want to terminate an instance when it has completed its work, and you don't need the instance again. If you might want to use the instance later, you should stop the instance instead of terminating it. For information on enabling and disabling termination protection for an instance, see [Enable termination protection \(p. 663\)](#).

New console

To create an alarm to terminate an idle instance (Amazon EC2 console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, Manage CloudWatch alarms**.

Alternatively, you can choose the plus sign (+) in the **Alarm status** column.

4. On the **Manage CloudWatch alarms** page, do the following:
 - a. Choose **Create an alarm**.
 - b. To receive an email when the alarm is triggered, for **Alarm notification**, choose an existing Amazon SNS topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person \(A2P\) messaging](#) in the [Amazon Simple Notification Service Developer Guide](#).
 - c. Toggle on **Alarm action**, and choose **Terminate**.
 - d. For **Group samples by** and **Type of data to sample**, choose a statistic and a metric. In this example, choose **Average** and **CPU utilization**.
 - e. For **Alarm When** and **Percent**, specify the metric threshold. In this example, specify **=>** and **10** percent.
 - f. For **Consecutive period** and **Period**, specify the evaluation period for the alarm. In this example, specify **24** consecutive periods of **1 Hour**.
 - g. Amazon CloudWatch automatically creates an alarm name for you. To change the name, for **Alarm name**, enter a new name. Alarm names must contain only ASCII characters.

Note

You can adjust the alarm configuration based on your own requirements before creating the alarm, or you can edit them later. This includes the metric, threshold, duration, action, and notification settings. However, after you create an alarm, you cannot edit its name later.

- h. Choose **Create**.

Old console

To create an alarm to terminate an idle instance (Amazon EC2 console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance. On the **Monitoring** tab, choose **Create Alarm**.
4. In the **Create Alarm** dialog box, do the following:
 - a. To receive an email when the alarm is triggered, for **Send a notification to**, choose an existing Amazon SNS topic, or choose **create topic** to create a new one.

To create a new topic, for **Send a notification to**, enter a name for the topic, and then for **With these recipients**, enter the email addresses of the recipients (separated by commas). After you create the alarm, you will receive a subscription confirmation email that you must accept before you can get notifications for this topic.

- b. Choose **Take the action, Terminate this instance**.
- c. For **Whenever**, choose a statistic and then choose the metric. In this example, choose **Average** and **CPU Utilization**.
- d. For **Is**, specify the metric threshold. In this example, enter **10** percent.
- e. For **For at least**, specify the evaluation period for the alarm. In this example, enter **24** consecutive period(s) of **1 Hour**.
- f. To change the name of the alarm, for **Name of alarm**, enter a new name. Alarm names must contain only ASCII characters.

If you don't enter a name for the alarm, Amazon CloudWatch automatically creates one for you.

Note

You can adjust the alarm configuration based on your own requirements before creating the alarm, or you can edit them later. This includes the metric, threshold, duration, action, and notification settings. However, after you create an alarm, you cannot edit its name later.

- g. Choose **Create Alarm**.

Add reboot actions to Amazon CloudWatch alarms

You can create an Amazon CloudWatch alarm that monitors an Amazon EC2 instance and automatically reboots the instance. The reboot alarm action is recommended for Instance Health Check failures (as opposed to the recover alarm action, which is suited for System Health Check failures). An instance reboot is equivalent to an operating system reboot. In most cases, it takes only a few minutes to reboot your instance. When you reboot an instance, it remains on the same physical host, so your instance keeps its public DNS name, private IP address, and any data on its instance store volumes.

Rebooting an instance doesn't start a new instance billing period (with a minimum one-minute charge), unlike stopping and restarting your instance. For more information, see [Reboot your instance \(p. 657\)](#).

Important

To avoid a race condition between the reboot and recover actions, avoid setting the same number of evaluation periods for a reboot alarm and a recover alarm. We recommend that you set reboot alarms to three evaluation periods of one minute each. For more information, see [Evaluating an alarm](#) in the *Amazon CloudWatch User Guide*.

New console

To create an alarm to reboot an instance (Amazon EC2 console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, Manage CloudWatch alarms**.

Alternatively, you can choose the plus sign (+) in the **Alarm status** column.

4. On the **Manage CloudWatch alarms** page, do the following:
 - a. Choose **Create an alarm**.
 - b. To receive an email when the alarm is triggered, for **Alarm notification**, choose an existing Amazon SNS topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person \(A2P\) messaging](#) in the *Amazon Simple Notification Service Developer Guide*.
 - c. Toggle on **Alarm action**, and choose **Reboot**.
 - d. For **Group samples by** and **Type of data to sample**, choose a statistic and a metric. In this example, choose **Average** and **Status check failed: instance**.
 - e. For **Consecutive period** and **Period**, specify the evaluation period for the alarm. In this example, enter **3 consecutive periods of 5 Minutes**.
 - f. Amazon CloudWatch automatically creates an alarm name for you. To change the name, for **Alarm name**, enter a new name. Alarm names must contain only ASCII characters.
 - g. Choose **Create**.

Old console

To create an alarm to reboot an instance (Amazon EC2 console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance. On the **Monitoring** tab, choose **Create Alarm**.
4. In the **Create Alarm** dialog box, do the following:

- a. To receive an email when the alarm is triggered, for **Send a notification to**, choose an existing Amazon SNS topic, or choose **create topic** to create a new one.

To create a new topic, for **Send a notification to**, enter a name for the topic, and for **With these recipients**, enter the email addresses of the recipients (separated by commas). After you create the alarm, you will receive a subscription confirmation email that you must accept before you can get notifications for this topic.

- b. Select **Take the action, Reboot this instance**.
- c. For **Whenever**, choose **Status Check Failed (Instance)**.
- d. For **For at least**, specify the evaluation period for the alarm. In this example, enter **3 consecutive period(s) of 5 Minutes**.

- e. To change the name of the alarm, for **Name of alarm**, enter a new name. Alarm names must contain only ASCII characters.

If you don't enter a name for the alarm, Amazon CloudWatch automatically creates one for you.

- f. Choose **Create Alarm**.

Add recover actions to Amazon CloudWatch alarms

You can create an Amazon CloudWatch alarm that monitors an Amazon EC2 instance. If the instance becomes impaired due to an underlying hardware failure or a problem that requires AWS involvement to repair, you can automatically recover the instance. Terminated instances cannot be recovered. A recovered instance is identical to the original instance, including the instance ID, private IP addresses, Elastic IP addresses, and all instance metadata.

CloudWatch prevents you from adding a recovery action to an alarm that is on an instance which does not support recovery actions.

When the `StatusCheckFailed_System` alarm is triggered, and the recover action is initiated, you are notified by the Amazon SNS topic that you chose when you created the alarm and associated the recover action. During instance recovery, the instance is migrated during an instance reboot, and any data that is in-memory is lost. When the process is complete, information is published to the SNS topic you've configured for the alarm. Anyone who is subscribed to this SNS topic receives an email notification that includes the status of the recovery attempt and any further instructions. You notice an instance reboot on the recovered instance.

Note

The recover action can be used only with `StatusCheckFailed_System`, not with `StatusCheckFailed_Instance`.

The following problems can cause system status checks to fail:

- Loss of network connectivity
- Loss of system power
- Software issues on the physical host
- Hardware issues on the physical host that impact network reachability

The recover action is supported only on instances that meet certain characteristics. For more information, see [the section called "Requirements" \(p. 668\)](#).

If your instance has a public IP address, it retains the public IP address after recovery.

Important

To avoid a race condition between the reboot and recover actions, avoid setting the same number of evaluation periods for a reboot alarm and a recover alarm. We recommend that you set recover alarms to two evaluation periods of one minute each. For more information, see [Evaluating an Alarm](#) in the *Amazon CloudWatch User Guide*.

New console

To create an alarm to recover an instance (Amazon EC2 console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, Manage CloudWatch alarms**.

Alternatively, you can choose the plus sign (+) in the **Alarm status** column.

4. On the **Manage CloudWatch alarms** page, do the following:
 - a. Choose **Create an alarm**.
 - b. To receive an email when the alarm is triggered, for **Alarm notification**, choose an existing Amazon SNS topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person \(A2P\) messaging](#) in the *Amazon Simple Notification Service Developer Guide*.
 - Note**
Users must subscribe to the specified SNS topic to receive email notifications when the alarm is triggered. The AWS account root user always receives email notifications when automatic instance recovery actions occur, even if an SNS topic is not specified or the root user is not subscribed to the specified SNS topic.
 - c. Toggle on **Alarm action**, and choose **Recover**.
 - d. For **Group samples by** and **Type of data to sample**, choose a statistic and a metric. In this example, choose **Average** and **Status check failed: system**.
 - e. For **Consecutive period** and **Period**, specify the evaluation period for the alarm. In this example, enter **2 consecutive periods of 5 Minutes**.
 - f. Amazon CloudWatch automatically creates an alarm name for you. To change the name, for **Alarm name**, enter a new name. Alarm names must contain only ASCII characters.
 - g. Choose **Create**.

Old console

To create an alarm to recover an instance (Amazon EC2 console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance. On the **Monitoring** tab, choose **Create Alarm**.
4. In the **Create Alarm** dialog box, do the following:
 - a. To receive an email when the alarm is triggered, for **Send a notification to**, choose an existing Amazon SNS topic, or choose **create topic** to create a new one.

To create a new topic, for **Send a notification to**, enter a name for the topic, and for **With these recipients**, enter the email addresses of the recipients (separated by commas). After you create the alarm, you will receive a subscription confirmation email that you must accept before you can get email for this topic.

Note

- Users must subscribe to the specified SNS topic to receive email notifications when the alarm is triggered.
 - The AWS account root user always receives email notifications when automatic instance recovery actions occur, even if an SNS topic is not specified.
 - The AWS account root user always receives email notifications when automatic instance recovery actions occur, even if it is not subscribed to the specified SNS topic.
- b. Select **Take the action, Recover this instance**.
 - c. For **Whenever**, choose **Status Check Failed (System)**.
 - d. For **For at least**, specify the evaluation period for the alarm. In this example, enter **2 consecutive period(s) of 5 Minutes**.

- e. To change the name of the alarm, for **Name of alarm**, enter a new name. Alarm names must contain only ASCII characters.

If you don't enter a name for the alarm, Amazon CloudWatch automatically creates one for you.

- f. Choose **Create Alarm**.

Use the Amazon CloudWatch console to view alarm and action history

You can view alarm and action history in the Amazon CloudWatch console. Amazon CloudWatch keeps the last two weeks' worth of alarm and action history.

To view the history of triggered alarms and actions (CloudWatch console)

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Alarms**.
3. Select an alarm.
4. The **Details** tab shows the most recent state transition along with the time and metric values.
5. Choose the **History** tab to view the most recent history entries.

Amazon CloudWatch alarm action scenarios

You can use the Amazon EC2 console to create alarm actions that stop or terminate an Amazon EC2 instance when certain conditions are met. In the following screen capture of the console page where you set the alarm actions, we've numbered the settings. We've also numbered the settings in the scenarios that follow, to help you create the appropriate actions.

New console

Alarm notification Info toggle
 Configure the alarm to send notifications to an Amazon SNS topic when it is triggered.

Alarm action Info toggle
 Specify the action to take when the alarm is triggered.

Selection action to alarm fires

Alarm thresholds
 Specify the metric thresholds for the alarm.

Group samples by 2 ▼
Alarm When 4 ▼

Type of data to sample 3 ▼
5

Consecutive Period 6

Period 7 minutes ▼

Alarm name

Old console

Create Alarm

You can use CloudWatch alarms to be notified automatically whenever metric data reaches a level you define.
 To edit an alarm, first choose whom to notify and then define when the notification should be sent.

Send a notification to: create topic

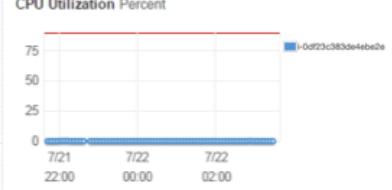

Take the action: Recover this instance (i)
 Stop this instance (i)
 Terminate this instance (i)
 Reboot this instance (i)

Whenever: 2 of 3

Is: 4 5 Percent

For at least: 6 consecutive period(s) of 7

Name of alarm:

Cancel
Create Alarm

Scenario 1: Stop idle development and test instances

Create an alarm that stops an instance used for software development or testing when it has been idle for at least an hour.

Setting	Value
1	Stop
2	Maximum
3	CPU Utilization
4	<=
5	10%
6	1
7	1 Hour

Scenario 2: Stop idle instances

Create an alarm that stops an instance and sends an email when the instance has been idle for 24 hours.

Setting	Value
1	Stop and email
2	Average
3	CPU Utilization
4	<=
5	5%
6	24
7	1 Hour

Scenario 3: Send email about web servers with unusually high traffic

Create an alarm that sends email when an instance exceeds 10 GB of outbound network traffic per day.

Setting	Value
1	Email
2	Sum
3	Network Out
4	>
5	10 GB
6	24

Setting	Value
7	1 Hour

Scenario 4: Stop web servers with unusually high traffic

Create an alarm that stops an instance and send a text message (SMS) if outbound traffic exceeds 1 GB per hour.

Setting	Value
1	Stop and send SMS
2	Sum
3	Network Out
4	>
5	1 GB
6	1
7	1 Hour

Scenario 5: Stop an impaired instance

Create an alarm that stops an instance that fails three consecutive status checks (performed at 5-minute intervals).

Setting	Value
1	Stop
2	Average
3	Status Check Failed: System
4	-
5	-
6	1
7	15 Minutes

Scenario 6: Terminate instances when batch processing jobs are complete

Create an alarm that terminates an instance that runs batch jobs when it is no longer sending results data.

Setting	Value
1	Terminate

Setting	Value
2	Maximum
3	Network Out
4	<=
5	100,000 bytes
6	1
7	5 Minutes

Automate Amazon EC2 with EventBridge

Amazon EventBridge enables you to automate your AWS services and respond automatically to system events such as application availability issues or resource changes. Events from AWS services are delivered to EventBridge in near real time. You can write simple rules to indicate which events are of interest to you, and the automated actions to take when an event matches a rule. The actions that can be automatically triggered include the following:

- Invoking an AWS Lambda function
- Invoking Amazon EC2 Run Command
- Relaying the event to Amazon Kinesis Data Streams
- Activating an AWS Step Functions state machine
- Notifying an Amazon SNS topic or an Amazon SQS queue

Some examples of using EventBridge with Amazon EC2 include:

- Activating a Lambda function whenever a new Amazon EC2 instance starts.
- Notifying an Amazon SNS topic when an Amazon EBS volume is created or modified.
- Sending a command to one or more Amazon EC2 instances using Amazon EC2 Run Command whenever a certain event in another AWS service occurs.

For more information, see the [Amazon EventBridge User Guide](#).

Monitor memory and disk metrics for Amazon EC2 Linux instances

You can use Amazon CloudWatch to collect metrics and logs from the operating systems for your EC2 instances.

Important

The CloudWatch monitoring scripts are deprecated. We recommend that you use the CloudWatch agent to collect metrics and logs. For more information, see [Collect Metrics from Amazon EC2 Instances and On-Premises Servers with the CloudWatch Agent](#) in the *Amazon CloudWatch User Guide*.

If you are still migrating from the deprecated monitoring scripts to the agent, and require information about the monitoring scripts, see [Deprecated: Collect metrics using the CloudWatch monitoring scripts \(p. 1011\)](#).

Collect metrics using the CloudWatch agent

You can use the CloudWatch agent to collect both system metrics and log files from Amazon EC2 instances and on-premises servers. The agent supports both Windows Server and Linux, and enables you to select the metrics to be collected, including sub-resource metrics such as per-CPU core. We recommend that you use the agent to collect metrics and logs instead of using the deprecated monitoring scripts. For more information, see [Collect Metrics from Amazon EC2 Instances and On-Premises Servers with the CloudWatch Agent](#) in the *Amazon CloudWatch User Guide*.

Deprecated: Collect metrics using the CloudWatch monitoring scripts

Important

The CloudWatch monitoring scripts are deprecated. We provide information about the monitoring scripts for customers who have not yet migrated from the deprecated monitoring scripts to the CloudWatch agent.

We recommend that you use the CloudWatch agent to collect metrics and logs. For more information, see [Collect Metrics from Amazon EC2 Instances and On-Premises Servers with the CloudWatch Agent](#) in the *Amazon CloudWatch User Guide*.

The monitoring scripts demonstrate how to produce and consume custom metrics for Amazon CloudWatch. These sample Perl scripts comprise a fully functional example that reports memory, swap, and disk space utilization metrics for a Linux instance.

Standard Amazon CloudWatch usage charges for custom metrics apply to your use of these scripts. For more information, see the [Amazon CloudWatch](#) pricing page.

Contents

- [Supported systems \(p. 1011\)](#)
- [Required permissions \(p. 1012\)](#)
- [Install required packages \(p. 1012\)](#)
- [Install monitoring scripts \(p. 1013\)](#)
- [mon-put-instance-data.pl \(p. 1014\)](#)
- [mon-get-instance-stats.pl \(p. 1017\)](#)
- [View your custom metrics in the console \(p. 1018\)](#)
- [Troubleshoot \(p. 1018\)](#)

Supported systems

The monitoring scripts were tested on instances using the following systems. Using the monitoring scripts on any other operating system is unsupported.

- Amazon Linux 2
- Amazon Linux AMI 2014.09.2 and later
- Red Hat Enterprise Linux 6.9 and 7.4
- SUSE Linux Enterprise Server 12
- Ubuntu Server 14.04 and 16.04

Required permissions

Ensure that the scripts have permission to call the following actions by associating an IAM role with your instance:

- cloudwatch:PutMetricData
- cloudwatch:GetMetricStatistics
- cloudwatch>ListMetrics
- ec2:DescribeTags

For more information, see [Work with IAM roles \(p. 1300\)](#).

Install required packages

With some versions of Linux, you must install additional Perl modules before you can use the monitoring scripts.

To install the required packages on Amazon Linux 2 and Amazon Linux AMI

1. Log on to your instance. For more information, see [Connect to your Linux instance \(p. 611\)](#).
2. At a command prompt, install packages as follows:

```
sudo yum install -y perl-Switch perl-Datetime perl-Sys-Syslog perl-LWP-Protocol-https  
perl-Digest-SHA.x86_64
```

To install the required packages on Ubuntu

1. Log on to your instance. For more information, see [Connect to your Linux instance \(p. 611\)](#).
2. At a command prompt, install packages as follows:

```
sudo apt-get update  
sudo apt-get install unzip  
sudo apt-get install libwww-perl libdatetime-perl
```

To install the required packages on Red Hat Enterprise Linux 7

1. Log on to your instance. For more information, see [Connect to your Linux instance \(p. 611\)](#).
2. At a command prompt, install packages as follows:

```
sudo yum install perl-Switch perl-Datetime perl-Sys-Syslog perl-LWP-Protocol-https  
perl-Digest-SHA --enablerepo="rhui-REGION-rhel-server-optional" -y  
sudo yum install zip unzip
```

To install the required packages on Red Hat Enterprise Linux 6.9

1. Log on to your instance. For more information, see [Connect to your Linux instance \(p. 611\)](#).
2. At a command prompt, install packages as follows:

```
sudo yum install perl-Datetime perl-CPAN perl-Net-SSLeay perl-IO-Socket-SSL perl-  
Digest-SHA gcc -y  
sudo yum install zip unzip
```

-
3. Run CPAN as an elevated user:

```
sudo cpan
```

Press ENTER through the prompts until you see the following prompt:

```
cpan[1]>
```

4. At the CPAN prompt, run each of the below commands: run one command and it installs, and when you return to the CPAN prompt, run the next command. Press ENTER like before when prompted to continue through the process:

```
cpan[1]> install YAML
cpan[2]> install LWP::Protocol::https
cpan[3]> install Sys::Syslog
cpan[4]> install Switch
```

To install the required packages on SUSE

1. Log on to your instance. For more information, see [Connect to your Linux instance \(p. 611\)](#).
2. On servers running SUSE Linux Enterprise Server 12, you might need to download the perl-Switch package. You can download and install this package using the following commands:

```
wget http://download.opensuse.org/repositories/devel:/languages:/perl/SLE_12_SP3/
noarch/perl-Switch-2.17-32.1.noarch.rpm
sudo rpm -i perl-Switch-2.17-32.1.noarch.rpm
```

3. Install the required packages as follows:

```
sudo zypper install perl-Switch perl-Datetime
sudo zypper install -y "perl(LWP::Protocol::https)"
```

Install monitoring scripts

The following steps show you how to download, uncompress, and configure the CloudWatch Monitoring Scripts on an EC2 Linux instance.

To download, install, and configure the monitoring scripts

1. At a command prompt, move to a folder where you want to store the monitoring scripts and run the following command to download them:

```
curl https://aws-cloudwatch.s3.amazonaws.com/downloads/
CloudWatchMonitoringScripts-1.2.2.zip -O
```

2. Run the following commands to install the monitoring scripts you downloaded:

```
unzip CloudWatchMonitoringScripts-1.2.2.zip && \
rm CloudWatchMonitoringScripts-1.2.2.zip && \
cd aws-scripts-mon
```

The package for the monitoring scripts contains the following files:

-
- **CloudWatchClient.pm** – Shared Perl module that simplifies calling Amazon CloudWatch from other scripts.
 - **mon-put-instance-data.pl** – Collects system metrics on an Amazon EC2 instance (memory, swap, disk space utilization) and sends them to Amazon CloudWatch.
 - **mon-get-instance-stats.pl** – Queries Amazon CloudWatch and displays the most recent utilization statistics for the EC2 instance on which this script is run.
 - **awscreds.template** – File template for AWS credentials that stores your access key ID and secret access key.
 - **LICENSE.txt** – Text file containing the Apache 2.0 license.
 - **NOTICE.txt** – Copyright notice.

mon-put-instance-data.pl

This script collects memory, swap, and disk space utilization data on the current system. It then makes a remote call to Amazon CloudWatch to report the collected data as custom metrics.

Options

Name	Description
--mem-util	Collects and sends the MemoryUtilization metrics in percentages. This metric counts memory allocated by applications and the operating system as used, and also includes cache and buffer memory as used if you specify the --mem-used-incl-cache-buff option.
--mem-used	Collects and sends the MemoryUsed metrics, reported in megabytes. This metric counts memory allocated by applications and the operating system as used, and also includes cache and buffer memory as used if you specify the --mem-used-incl-cache-buff option.
--mem-used-incl-cache-buff	If you include this option, memory currently used for cache and buffers is counted as "used" when the metrics are reported for --mem-util, --mem-used, and --mem-avail.
--mem-avail	Collects and sends the MemoryAvailable metrics, reported in megabytes. This metric counts memory allocated by applications and the operating system as used, and also includes cache and buffer memory as used if you specify the --mem-used-incl-cache-buff option.
--swap-util	Collects and sends SwapUtilization metrics, reported in percentages.
--swap-used	Collects and sends SwapUsed metrics, reported in megabytes.
--disk-path=PATH	Selects the disk on which to report. PATH can specify a mount point or any file located on a mount point for the filesystem that needs to be reported. For selecting multiple disks, specify a --disk-path=PATH for each one of them. To select a disk for the filesystems mounted on / and /home, use the following parameters: --disk-path=/ --disk-path=/home

Name	Description
--disk-space-util	<p>Collects and sends the DiskSpaceUtilization metric for the selected disks. The metric is reported in percentages.</p> <p>Note that the disk utilization metrics calculated by this script differ from the values calculated by the df -k -l command. If you find the values from df -k -l more useful, you can change the calculations in the script.</p>
--disk-space-used	<p>Collects and sends the DiskSpaceUsed metric for the selected disks. The metric is reported by default in gigabytes.</p> <p>Due to reserved disk space in Linux operating systems, disk space used and disk space available might not accurately add up to the amount of total disk space.</p>
--disk-space-avail	<p>Collects and sends the DiskSpaceAvailable metric for the selected disks. The metric is reported in gigabytes.</p> <p>Due to reserved disk space in the Linux operating systems, disk space used and disk space available might not accurately add up to the amount of total disk space.</p>
--memory-units=UNITS	Specifies units in which to report memory usage. If not specified, memory is reported in megabytes. UNITS may be one of the following: bytes, kilobytes, megabytes, gigabytes.
--disk-space-units=UNITS	Specifies units in which to report disk space usage. If not specified, disk space is reported in gigabytes. UNITS may be one of the following: bytes, kilobytes, megabytes, gigabytes.
--aws-credential-file=PATH	<p>Provides the location of the file containing AWS credentials.</p> <p>This parameter cannot be used with the --aws-access-key-id and --aws-secret-key parameters.</p>
--aws-access-key-id=VALUE	Specifies the AWS access key ID to use to identify the caller. Must be used together with the --aws-secret-key option. Do not use this option with the --aws-credential-file parameter.
--aws-secret-key=VALUE	Specifies the AWS secret access key to use to sign the request to CloudWatch. Must be used together with the --aws-access-key-id option. Do not use this option with --aws-credential-file parameter.
--aws-iam-role=VALUE	<p>Specifies the IAM role used to provide AWS credentials. The value =VALUE is required. If no credentials are specified, the default IAM role associated with the EC2 instance is applied. Only one IAM role can be used. If no IAM roles are found, or if more than one IAM role is found, the script will return an error.</p> <p>Do not use this option with the --aws-credential-file, --aws-access-key-id, or --aws-secret-key parameters.</p>
--aggregated[=only]	Adds aggregated metrics for instance type, AMI ID, and overall for the Region. The value =only is optional; if specified, the script reports only aggregated metrics.

Name	Description
--auto-scaling[=only]	Adds aggregated metrics for the Auto Scaling group. The value <code>=only</code> is optional; if specified, the script reports only Auto Scaling metrics. The IAM policy associated with the IAM account or role using the scripts need to have permissions to call the EC2 action DescribeTags .
--verify	Performs a test run of the script that collects the metrics, prepares a complete HTTP request, but does not actually call CloudWatch to report the data. This option also checks that credentials are provided. When run in verbose mode, this option outputs the metrics that will be sent to CloudWatch.
--from-cron	Use this option when calling the script from cron. When this option is used, all diagnostic output is suppressed, but error messages are sent to the local system log of the user account.
--verbose	Displays detailed information about what the script is doing.
--help	Displays usage information.
--version	Displays the version number of the script.

Examples

The following examples assume that you provided an IAM role or `awscreds.conf` file. Otherwise, you must provide credentials using the `--aws-access-key-id` and `--aws-secret-key` parameters for these commands.

The following example performs a simple test run without posting data to CloudWatch.

```
./mon-put-instance-data.pl --mem-util --verify --verbose
```

The following example collects all available memory metrics and sends them to CloudWatch, counting cache and buffer memory as used

```
./mon-put-instance-data.pl --mem-used-incl-cache-buff --mem-util --mem-used --mem-avail
```

The following example collects aggregated metrics for an Auto Scaling group and sends them to Amazon CloudWatch without reporting individual instance metrics.

```
./mon-put-instance-data.pl --mem-util --mem-used --mem-avail --auto-scaling=only
```

The following example collects aggregated metrics for instance type, AMI ID and region, and sends them to Amazon CloudWatch without reporting individual instance metrics

```
./mon-put-instance-data.pl --mem-util --mem-used --mem-avail --aggregated=only
```

To set a cron schedule for metrics reported to CloudWatch, start editing the crontab using the `crontab -e` command. Add the following command to report memory and disk space utilization to CloudWatch every five minutes:

```
*/5 * * * * ~/aws-scripts-mon/mon-put-instance-data.pl --mem-used-incl-cache-buff --mem-util --disk-space-util --disk-path=/ --from-cron
```

If the script encounters an error, it writes the error message in the system log.

mon-get-instance-stats.pl

This script queries CloudWatch for statistics on memory, swap, and disk space metrics within the time interval provided using the number of most recent hours. This data is provided for the Amazon EC2 instance on which this script is run.

Options

Name	Description
--recent-hours=N	Specifies the number of recent hours to report on, as represented by N where N is an integer.
--aws-credential-file=PATH	Provides the location of the file containing AWS credentials.
--aws-access-key-id=VALUE	Specifies the AWS access key ID to use to identify the caller. Must be used together with the --aws-secret-key option. Do not use this option with the --aws-credential-file option.
--aws-secret-key=VALUE	Specifies the AWS secret access key to use to sign the request to CloudWatch. Must be used together with the --aws-access-key-id option. Do not use this option with --aws-credential-file option.
--aws-iam-role=VALUE	Specifies the IAM role used to provide AWS credentials. The value =VALUE is required. If no credentials are specified, the default IAM role associated with the EC2 instance is applied. Only one IAM role can be used. If no IAM roles are found, or if more than one IAM role is found, the script will return an error. Do not use this option with the --aws-credential-file, --aws-access-key-id, or --aws-secret-key parameters.
--verify	Performs a test run of the script. This option also checks that credentials are provided.
--verbose	Displays detailed information about what the script is doing.
--help	Displays usage information.
--version	Displays the version number of the script.

Example

To get utilization statistics for the last 12 hours, run the following command:

```
./mon-get-instance-stats.pl --recent-hours=12
```

The following is an example response:

```
Instance metric statistics for the last 12 hours.

CPU Utilization
    Average: 1.06%, Minimum: 0.00%, Maximum: 15.22%

Memory Utilization
```

```
Average: 6.84%, Minimum: 6.82%, Maximum: 6.89%
```

Swap Utilization

```
Average: N/A, Minimum: N/A, Maximum: N/A
```

Disk Space Utilization on /dev/xvda1 mounted as /

```
Average: 9.69%, Minimum: 9.69%, Maximum: 9.69%
```

View your custom metrics in the console

After you successfully run the `mon-put-instance-data.pl` script, you can view your custom metrics in the Amazon CloudWatch console.

To view custom metrics

1. Run `mon-put-instance-data.pl` as described previously.
2. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
3. Choose **View Metrics**.
4. For **Viewing**, your custom metrics posted by the script are displayed with the prefix `System/Linux`.

Troubleshoot

The **CloudWatchClient.pm** module caches instance metadata locally. If you create an AMI from an instance where you have run the monitoring scripts, any instances launched from the AMI within the cache TTL (default: six hours, 24 hours for Auto Scaling groups) emit metrics using the instance ID of the original instance. After the cache TTL time period passes, the script retrieves fresh data and the monitoring scripts use the instance ID of the current instance. To immediately correct this, remove the cached data using the following command:

```
rm /var/tmp/aws-mon/instance-id
```

Log Amazon EC2 and Amazon EBS API calls with AWS CloudTrail

Amazon EC2 and Amazon EBS are integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in Amazon EC2 and Amazon EBS. CloudTrail captures all API calls for Amazon EC2 and Amazon EBS as events, including calls from the console and from code calls to the APIs. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon S3 bucket, including events for Amazon EC2 and Amazon EBS. If you don't configure a trail, you can still view the most recent events in the CloudTrail console in **Event history**. Using the information collected by CloudTrail, you can determine the request that was made to Amazon EC2 and Amazon EBS, the IP address from which the request was made, who made the request, when it was made, and additional details.

To learn more about CloudTrail, see the [AWS CloudTrail User Guide](#).

Amazon EC2 and Amazon EBS information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When activity occurs in Amazon EC2 and Amazon EBS, that activity is recorded in a CloudTrail event along with other AWS service events

in **Event history**. You can view, search, and download recent events in your AWS account. For more information, see [Viewing Events with CloudTrail Event History](#).

For an ongoing record of events in your AWS account, including events for Amazon EC2 and Amazon EBS, create a trail. A trail enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you create a trail in the console, the trail applies to all Regions. The trail logs events from all Regions in the AWS partition and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see:

- [Overview for Creating a Trail](#)
- [CloudTrail Supported Services and Integrations](#)
- [Configuring Amazon SNS Notifications for CloudTrail](#)
- [Receiving CloudTrail Log Files from Multiple Regions](#) and [Receiving CloudTrail Log Files from Multiple Accounts](#)

All Amazon EC2 actions, and Amazon EBS management actions, are logged by CloudTrail and are documented in the [Amazon EC2 API Reference](#). For example, calls to the [RunInstances](#), [DescribeInstances](#), or [CreateImage](#) actions generate entries in the CloudTrail log files.

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root or IAM user credentials.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another AWS service.

For more information, see the [CloudTrail userIdentity Element](#).

Understand Amazon EC2 and Amazon EBS log file entries

A trail is a configuration that enables delivery of events as log files to an Amazon S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. CloudTrail log files are not an ordered stack trace of the public API calls, so they do not appear in any specific order.

The following log file record shows that a user terminated an instance.

```
{  
    "Records": [  
        {  
            "eventVersion": "1.03",  
            "userIdentity": {  
                "type": "Root",  
                "principalId": "123456789012",  
                "arn": "arn:aws:iam::123456789012:root",  
                "accountId": "123456789012",  
                "accessKeyId": "AKIAIOSFODNN7EXAMPLE",  
                "userName": "user"  
            },  
            "eventTime": "2016-05-20T08:27:45Z",  
            "eventSource": "ec2.amazonaws.com",  
            "eventName": "TerminateInstances",  
            "awsRegion": "us-west-2",  
            "version": "1"  
        }  
    ]  
}
```

```
"sourceIPAddress":"198.51.100.1",

}
```

Use AWS CloudTrail to audit users that connect via EC2 Instance Connect

Use AWS CloudTrail to audit the users that connect to your instances via EC2 Instance Connect.

To audit SSH activity via EC2 Instance Connect using the AWS CloudTrail console

1. Open the AWS CloudTrail console at <https://console.aws.amazon.com/cloudtrail/>.
2. Verify that you are in the correct Region.
3. In the navigation pane, choose **Event history**.
4. For **Filter**, choose **Event source, ec2-instance-connect.amazonaws.com**.
5. (Optional) For **Time range**, select a time range.
6. Choose the **Refresh events** icon.
7. The page displays the events that correspond to the **SendSSHPublicKey** API calls. Expand an event using the arrow to view additional details, such as the user name and AWS access key that was used to make the SSH connection, and the source IP address.
8. To display the full event information in JSON format, choose **View event**. The **requestParameters** field contains the destination instance ID, OS user name, and public key that were used to make the SSH connection.

```
{
    "eventVersion": "1.05",
    "userIdentity": {
        "type": "IAMUser",
        "principalId": "ABCDEFGGNOMOOCB6XYTQEXAMPLE",
        "arn": "arn:aws:iam::1234567890120:user/IAM-friendly-name",
```

```
    "accountId": "123456789012",
    "accessKeyId": "ABCDEFGHIJKLMNO01234567890EXAMPLE",
    "userName": "IAM-friendly-name",
    "sessionContext": {
        "attributes": {
            "mfaAuthenticated": "false",
            "creationDate": "2018-09-21T21:37:58Z"
        }
    },
    "eventTime": "2018-09-21T21:38:00Z",
    "eventSource": "ec2-instance-connect.amazonaws.com",
    "eventName": "SendSSHPublicKey",
    "awsRegion": "us-west-2",
    "sourceIPAddress": "123.456.789.012",
    "userAgent": "aws-cli/1.15.61 Python/2.7.10 Darwin/16.7.0 botocore/1.10.60",
    "requestParameters": {
        "instanceId": "i-0123456789EXAMPLE",
        "osUser": "ec2-user",
        "SSHKey": {
            "publicKey": "ssh-rsa ABCDEFGHIJKLMNOP01234567890EXAMPLE"
        }
    },
    "responseElements": null,
    "requestID": "1a2s3d4f-bde6-11e8-a892-f7ec64543add",
    "eventID": "1a2w3d4r5-a88f-4e28-b3bf-30161f75be34",
    "eventType": "AwsApiCall",
    "recipientAccountId": "0987654321"
}
```

If you have configured your AWS account to collect CloudTrail events in an S3 bucket, you can download and audit the information programmatically. For more information, see [Getting and Viewing Your CloudTrail Log Files](#) in the *AWS CloudTrail User Guide*.

Networking in Amazon EC2

Amazon VPC enables you to launch AWS resources, such as Amazon EC2 instances, into a virtual network dedicated to your AWS account, known as a virtual private cloud (VPC). When you launch an instance, you can select a subnet from the VPC. The instance is configured with a primary network interface, which is a logical virtual network card. The instance receives a primary private IP address from the IPv4 address of the subnet, and it is assigned to the primary network interface.

You can control whether the instance receives a public IP address from Amazon's pool of public IP addresses. The public IP address of an instance is associated with your instance only until it is stopped or terminated. If you require a persistent public IP address, you can allocate an Elastic IP address for your AWS account and associate it with an instance or a network interface. An Elastic IP address remains associated with your AWS account until you release it, and you can move it from one instance to another as needed. You can bring your own IP address range to your AWS account, where it appears as an address pool, and then allocate Elastic IP addresses from your address pool.

To increase network performance and reduce latency, you can launch instances in a placement group. You can get significantly higher packet per second (PPS) performance using enhanced networking. You can accelerate high performance computing and machine learning applications using an Elastic Fabric Adapter (EFA), which is a network device that you can attach to a supported instance type.

Features

- [Regions and Zones \(p. 1022\)](#)
- [Amazon EC2 instance IP addressing \(p. 1037\)](#)
- [Amazon EC2 instance hostname types \(p. 1053\)](#)
- [Bring your own IP addresses \(BYOIP\) in Amazon EC2 \(p. 1058\)](#)
- [Assigning prefixes to Amazon EC2 network interfaces \(p. 1071\)](#)
- [Elastic IP addresses \(p. 1082\)](#)
- [Elastic network interfaces \(p. 1091\)](#)
- [Amazon EC2 instance network bandwidth \(p. 1122\)](#)
- [Enhanced networking on Linux \(p. 1124\)](#)
- [Elastic Fabric Adapter \(p. 1152\)](#)
- [Placement groups \(p. 1190\)](#)
- [Network maximum transmission unit \(MTU\) for your EC2 instance \(p. 1204\)](#)
- [Virtual private clouds \(p. 1207\)](#)
- [EC2-Classic \(p. 1209\)](#)

Regions and Zones

Amazon EC2 is hosted in multiple locations world-wide. These locations are composed of Regions, Availability Zones, Local Zones, AWS Outposts, and Wavelength Zones. Each *Region* is a separate geographic area.

- Availability Zones are multiple, isolated locations within each Region.
- Local Zones provide you the ability to place resources, such as compute and storage, in multiple locations closer to your end users.

- AWS Outposts brings native AWS services, infrastructure, and operating models to virtually any data center, co-location space, or on-premises facility.
- Wavelength Zones allow developers to build applications that deliver ultra-low latencies to 5G devices and end users. Wavelength deploys standard AWS compute and storage services to the edge of telecommunication carriers' 5G networks.

AWS operates state-of-the-art, highly available data centers. Although rare, failures can occur that affect the availability of instances that are in the same location. If you host all of your instances in a single location that is affected by a failure, none of your instances would be available.

To help you determine which deployment is best for you, see [AWS Wavelength FAQs](#).

Contents

- [Regions \(p. 1023\)](#)
- [Availability Zones \(p. 1027\)](#)
- [Local Zones \(p. 1031\)](#)
- [Wavelength Zones \(p. 1034\)](#)
- [AWS Outposts \(p. 1036\)](#)

Regions

Each Amazon EC2 Region is designed to be isolated from the other Amazon EC2 Regions. This achieves the greatest possible fault tolerance and stability.

When you view your resources, you see only the resources that are tied to the Region that you specified. This is because Regions are isolated from each other, and we don't automatically replicate resources across Regions.

When you launch an instance, you must select an AMI that's in the same Region. If the AMI is in another Region, you can copy the AMI to the Region you're using. For more information, see [Copy an AMI \(p. 180\)](#).

Note that there is a charge for data transfer between Regions. For more information, see [Amazon EC2 Pricing - Data Transfer](#).

Contents

- [Available Regions \(p. 1023\)](#)
- [Regions and endpoints \(p. 1025\)](#)
- [Describe your Regions \(p. 1025\)](#)
- [Get the Region name \(p. 1026\)](#)
- [Specify the Region for a resource \(p. 1026\)](#)

Available Regions

Your account determines the Regions that are available to you.

- An AWS account provides multiple Regions so that you can launch Amazon EC2 instances in locations that meet your requirements. For example, you might want to launch instances in Europe to be closer to your European customers or to meet legal requirements.
- An AWS GovCloud (US-West) account provides access to the AWS GovCloud (US-West) Region and the AWS GovCloud (US-East) Region. For more information, see [AWS GovCloud \(US\)](#).
- An Amazon AWS (China) account provides access to the Beijing and Ningxia Regions only. For more information, see [AWS in China](#).

The following table lists the Regions provided by an AWS account. You can't describe or access additional Regions from an AWS account, such as AWS GovCloud (US) Region or the China Regions. To use a Region introduced after March 20, 2019, you must enable the Region. For more information, see [Managing AWS Regions](#) in the *AWS General Reference*.

For information about available Wavelength Zones, see [Available Wavelength Zones](#) in the *AWS Wavelength Developer Guide*. For information about available Local Zones, see the section called "Available Local Zones" (p. 1032).

Code	Name	Opt-in Status
us-east-2	US East (Ohio)	Not required
us-east-1	US East (N. Virginia)	Not required
us-west-1	US West (N. California)	Not required
us-west-2	US West (Oregon)	Not required
af-south-1	Africa (Cape Town)	Required
ap-east-1	Asia Pacific (Hong Kong)	Required
ap-southeast-3	Asia Pacific (Jakarta)	Required
ap-south-1	Asia Pacific (Mumbai)	Not required
ap-northeast-3	Asia Pacific (Osaka)	Not required
ap-northeast-2	Asia Pacific (Seoul)	Not required
ap-southeast-1	Asia Pacific (Singapore)	Not required
ap-southeast-2	Asia Pacific (Sydney)	Not required
ap-northeast-1	Asia Pacific (Tokyo)	Not required
ca-central-1	Canada (Central)	Not required
eu-central-1	Europe (Frankfurt)	Not required
eu-west-1	Europe (Ireland)	Not required
eu-west-2	Europe (London)	Not required
eu-south-1	Europe (Milan)	Required
eu-west-3	Europe (Paris)	Not required
eu-north-1	Europe (Stockholm)	Not required
me-south-1	Middle East (Bahrain)	Required
sa-east-1	South America (São Paulo)	Not required

For more information, see [AWS Global Infrastructure](#).

The number and mapping of Availability Zones per Region may vary between AWS accounts. To get a list of the Availability Zones that are available to your account, you can use the Amazon EC2 console or the command line interface. For more information, see [Describe your Regions \(p. 1025\)](#).

Regions and endpoints

When you work with an instance using the command line interface or API actions, you must specify its Regional endpoint. For more information about the Regions and endpoints for Amazon EC2, see [Amazon EC2 endpoints and quotas](#) in the *Amazon Web Services General Reference*.

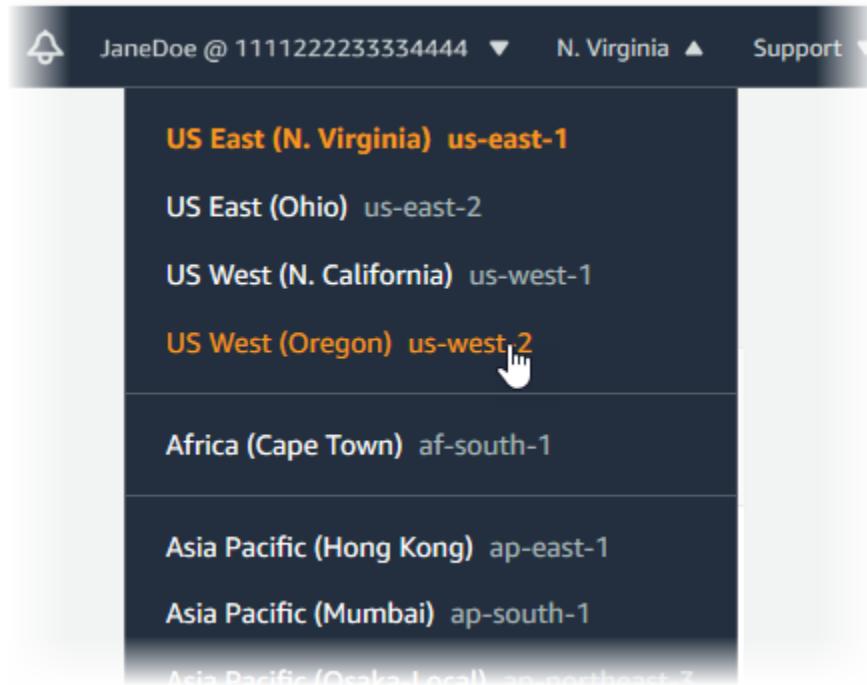

For more information about endpoints and protocols in AWS GovCloud (US-West), see [AWS GovCloud \(US-West\) Endpoints](#) in the *AWS GovCloud (US) User Guide*.

Describe your Regions

You can use the Amazon EC2 console or the command line interface to determine which Regions are available for your account. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

To find your Regions using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, view the options in the Region selector.

3. Your EC2 resources for this Region are displayed on the **EC2 Dashboard** in the **Resources** section.

To find your Regions using the AWS CLI

- Use the [describe-regions](#) command as follows to describe the Regions that are enabled for your account.

```
aws ec2 describe-regions
```

To describe all Regions, including any Regions that are disabled for your account, add the `--all-regions` option as follows.

```
aws ec2 describe-regions --all-regions
```

To find your Regions using the AWS Tools for Windows PowerShell

- Use the [Get-EC2Region](#) command as follows to describe the Regions for your account.

```
PS C:\> Get-EC2Region
```

Get the Region name

You can use the Amazon Lightsail API to view the name of a Region.

To view the Region name using the AWS CLI

- Use the [get-regions](#) command as follows to describe the name of the specified Region.

```
aws lightsail get-regions --query "regions[?name=='region-name'].displayName" --output text
```

The following example returns the name of the us-east-2 Region.

```
aws lightsail get-regions --query "regions[?name=='us-east-2'].displayName" --output text
```

The following is the output:

```
Ohio
```

Specify the Region for a resource

Every time you create an Amazon EC2 resource, you can specify the Region for the resource. You can specify the Region for a resource using the AWS Management Console or the command line.

Considerations

Some AWS resources might not be available in all Regions. Ensure that you can create the resources that you need in the desired Regions before you launch an instance.

To specify the Region for a resource using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Use the Region selector in the navigation bar.

To specify the default Region using the command line

You can set the value of an environment variable to the desired Regional endpoint (for example, <https://ec2.us-east-2.amazonaws.com>):

- [AWS_DEFAULT_REGION \(AWS CLI\)](#)
- [Set-AWSDefaultRegion \(AWS Tools for Windows PowerShell\)](#)

Alternatively, you can use the `--region` (AWS CLI) or `-Region` (AWS Tools for Windows PowerShell) command line option with each individual command. For example, `--region us-east-2`.

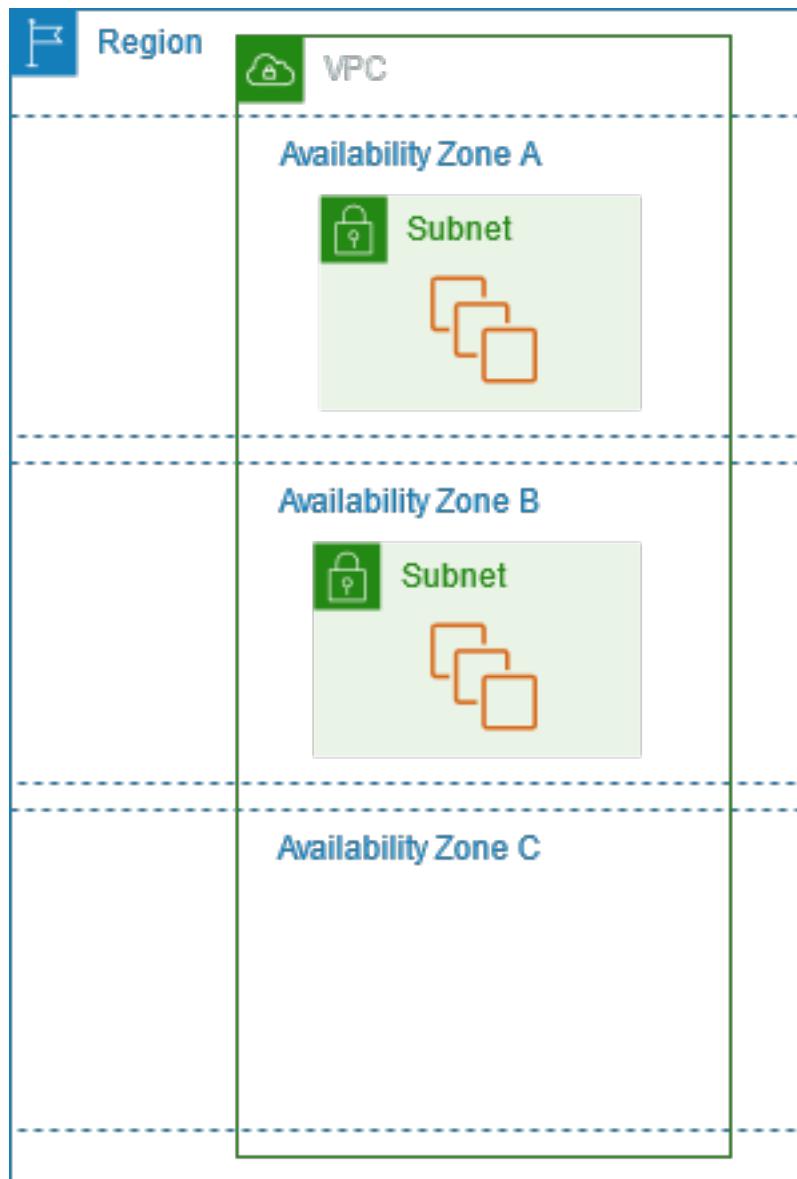

For more information about the endpoints for Amazon EC2, see [Amazon Elastic Compute Cloud Endpoints](#).

Availability Zones

Each Region has multiple, isolated locations known as *Availability Zones*. The code for Availability Zone is its Region code followed by a letter identifier. For example, `us-east-1a`.

When you launch an instance, you select a Region and a virtual private cloud (VPC), and then you can either select a subnet from one of the Availability Zones or let us choose one for you. If you distribute your instances across multiple Availability Zones and one instance fails, you can design your application so that an instance in another Availability Zone can handle requests. You can also use Elastic IP addresses to mask the failure of an instance in one Availability Zone by rapidly remapping the address to an instance in another Availability Zone.

The following diagram illustrates multiple Availability Zones in an AWS Region. Availability Zone A and Availability Zone B each have one subnet, and each subnet has instances. Availability Zone C has no subnets, therefore you can't launch instances into this Availability Zone.

As Availability Zones grow over time, our ability to expand them can become constrained. If this happens, we might restrict you from launching an instance in a constrained Availability Zone unless you already have an instance in that Availability Zone. Eventually, we might also remove the constrained Availability Zone from the list of Availability Zones for new accounts. Therefore, your account might have a different number of available Availability Zones in a Region than another account.

Contents

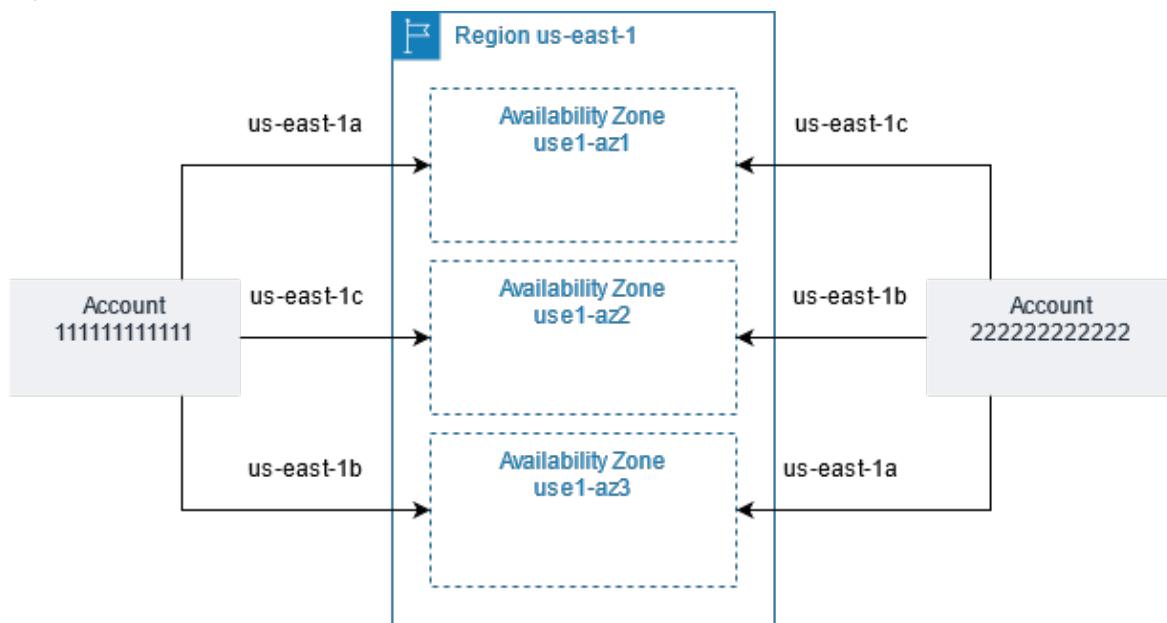

- [AZ IDs \(p. 1029\)](#)
- [Describe your Availability Zones \(p. 1029\)](#)
- [Launch instances in an Availability Zone \(p. 1030\)](#)
- [Migrate an instance to another Availability Zone \(p. 1030\)](#)

AZ IDs

To ensure that resources are distributed across the Availability Zones for a Region, we independently map Availability Zones to codes for each AWS account. For example, the Availability Zone `us-east-1a` for your AWS account might not be the same physical location as `us-east-1a` for another AWS account.

To coordinate Availability Zones across accounts, you must use the *AZ ID*, which is a unique and consistent identifier for an Availability Zone. For example, `use1-az1` is an AZ ID for the `us-east-1` Region and it has the same physical location in every AWS account. You can view the AZ IDs for your account to determine the physical location of your resources relative to the resources in another account. For example, if you share a subnet in the Availability Zone with the AZ ID `use1-az2` with another account, this subnet is available to that account in the Availability Zone whose AZ ID is also `use1-az2`.

The following diagram illustrates two accounts with different mappings of Availability Zone code to AZ ID.

Describe your Availability Zones

You can use the Amazon EC2 console or the command line interface to determine which Availability Zones are available for your account. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

To find your Availability Zones using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, view the options in the Region selector.
3. On the navigation pane, choose **EC2 Dashboard**.
4. The Availability Zones are listed in the **Service health** pane.

To find your Availability Zones using the AWS CLI

1. Use the `describe-availability-zones` command as follows to describe the Availability Zones within the specified Region.

```
aws ec2 describe-availability-zones --region region-name
```

2. Use the [describe-availability-zones](#) command as follows to describe the Availability Zones regardless of the opt-in status.

```
aws ec2 describe-availability-zones --all-availability-zones
```

To find your Availability Zones using the AWS Tools for Windows PowerShell

Use the [Get-EC2AvailabilityZone](#) command as follows to describe the Availability Zones within the specified Region.

```
PS C:\> Get-EC2AvailabilityZone -Region region-name
```

Launch instances in an Availability Zone

When you launch an instance, select a Region that puts your instances closer to specific customers, or meets the legal or other requirements that you have. By launching your instances in separate Availability Zones, you can protect your applications from the failure of a single location.

When you launch an instance, you can optionally specify an Availability Zone in the Region that you are using. If you do not specify an Availability Zone, we select an Availability Zone for you. When you launch your initial instances, we recommend that you accept the default Availability Zone, because this allows us to select the best Availability Zone for you based on system health and available capacity. If you launch additional instances, specify an Availability Zone only if your new instances must be close to, or separated from, your running instances.

Migrate an instance to another Availability Zone

If necessary, you can migrate an instance from one Availability Zone to another. For example, if you try to modify the instance type of your instance and we can't launch an instance of the new instance type in the current Availability Zone, you can migrate the instance to an Availability Zone with capacity for the new instance type.

The migration process involves:

- Creating an AMI from the original instance
- Launching an instance in the new Availability Zone
- Updating the configuration of the new instance, as shown in the following procedure

To migrate an instance to another Availability Zone

1. Create an AMI from the instance. The procedure depends on your operating system and the type of root device volume for the instance. For more information, see the documentation that corresponds to your operating system and root device volume:
 - [Create an Amazon EBS-backed Linux AMI](#)
 - [Create an instance store-backed Linux AMI](#)
 - [Create a custom Windows AMI](#)
2. If you need to preserve the private IPv4 address of the instance, you must delete the subnet in the current Availability Zone and then create a subnet in the new Availability Zone with the same IPv4 address range as the original subnet. Note that you must terminate all instances in a subnet before

you can delete it. Therefore, you should create AMIs from all of the instances in your subnet so that you can move all instances from the current subnet to the new subnet.

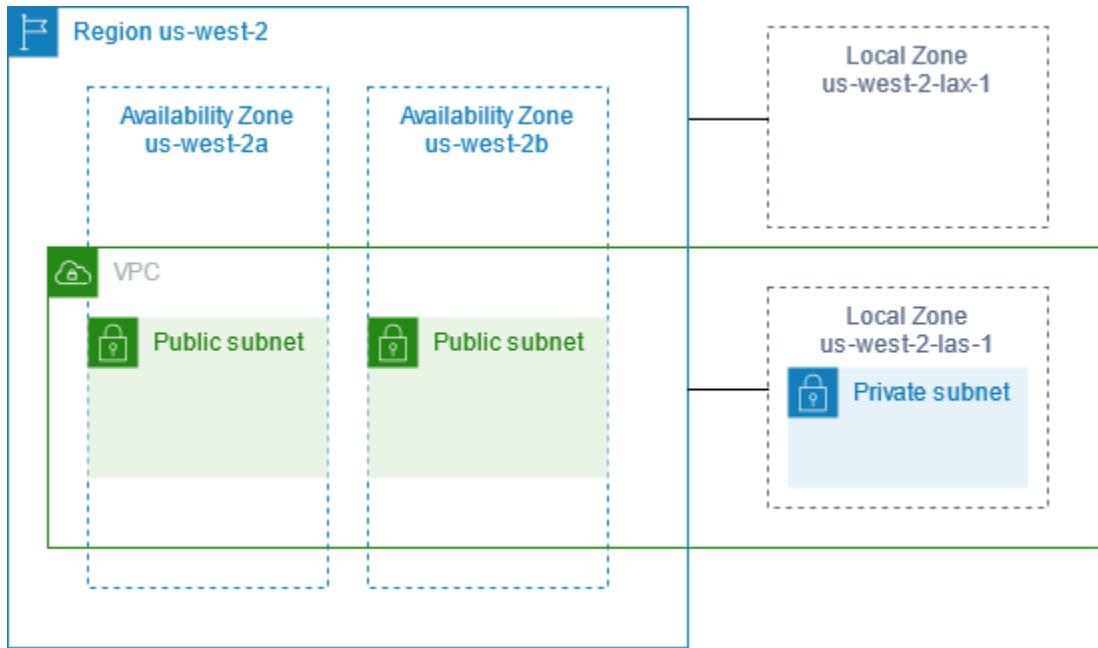

3. Launch an instance from the AMI that you just created, specifying the new Availability Zone or subnet. You can use the same instance type as the original instance, or select a new instance type. For more information, see [Launch instances in an Availability Zone \(p. 1030\)](#).
4. If the original instance has an associated Elastic IP address, associate it with the new instance. For more information, see [Disassociate an Elastic IP address \(p. 1087\)](#).
5. If the original instance is a Reserved Instance, change the Availability Zone for your reservation. (If you also changed the instance type, you can also change the instance type for your reservation.) For more information, see [Submit modification requests \(p. 431\)](#).
6. (Optional) Terminate the original instance. For more information, see [Terminate an instance \(p. 663\)](#).

Local Zones

A Local Zone is an extension of an AWS Region in geographic proximity to your users. Local Zones have their own connections to the internet and support AWS Direct Connect, so that resources created in a Local Zone can serve local users with low-latency communications. For more information, see [AWS Local Zones](#).

The code for a Local Zone is its Region code followed by an identifier that indicates its physical location. For example, us-west-2-lax-1 in Los Angeles. For more information, see [Available Local Zones \(p. 1032\)](#).

The following diagram illustrates the AWS Region us-west-2, two of its Availability Zones, and two of its Local Zones. The VPC spans the Availability Zones and one of the Local Zones. Each zone in the VPC has one subnet.

To use a Local Zone, you must first enable it. For more information, see [the section called “Opt in to Local Zones” \(p. 1033\)](#). Next, create a subnet in the Local Zone. Finally, launch resources in the Local Zone subnet, such as instances, so that your applications are close to your end users.

Contents

- [Available Local Zones \(p. 1032\)](#)

- [Describe your Local Zones \(p. 1033\)](#)
- [Opt in to Local Zones \(p. 1033\)](#)
- [Launch instances in a Local Zone \(p. 1034\)](#)

Available Local Zones

The following tables list the available Local Zones by parent Regions. For information about how to opt in, see [the section called “Opt in to Local Zones” \(p. 1033\)](#).

US East (N. Virginia) Local Zones

The following table lists Local Zones in US East (N. Virginia):

Parent Region	Zone Name	Location (metro area)
US East (N. Virginia)	us-east-1-atl-1a	Atlanta
US East (N. Virginia)	us-east-1-bos-1a	Boston
US East (N. Virginia)	us-east-1-chi-1a	Chicago
US East (N. Virginia)	us-east-1-dfw-1a	Dallas
US East (N. Virginia)	us-east-1-iah-1a	Houston
US East (N. Virginia)	us-east-1-mci-1a	Kansas City
US East (N. Virginia)	us-east-1-mia-1a	Miami
US East (N. Virginia)	us-east-1-msp-1a	Minneapolis
US East (N. Virginia)	us-east-1-nyc-1a	New York City *
US East (N. Virginia)	us-east-1-phl-1a	Philadelphia

* Located in New Jersey.

US West (Oregon) Local Zones

The following table lists Local Zones in US West (Oregon):

Parent Region	Zone Name	Location (metro area)
US West (Oregon)	us-west-2-den-1a	Denver
US West (Oregon)	us-west-2-las-1a	Las Vegas
US West (Oregon)	us-west-2-lax-1a	Los Angeles
US West (Oregon)	us-west-2-lax-1b	Los Angeles
US West (Oregon)	us-west-2-phx-1a	Phoenix
US West (Oregon)	us-west-2-pdx-1a	Portland
US West (Oregon)	us-west-2-sea-1a	Seattle

Describe your Local Zones

You can use the Amazon EC2 console or the command line interface to determine which Local Zones are available for your account. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

To find your Local Zones using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, view the options in the Region selector.
3. On the navigation pane, choose **EC2 Dashboard**.
4. The Local Zones are listed under **Service health, Zone status**.

To find your Local Zones using the AWS CLI

1. Use the [describe-availability-zones](#) command as follows to describe the Local Zones in the specified Region.

```
aws ec2 describe-availability-zones --region region-name
```

2. Use the [describe-availability-zones](#) command as follows to describe the Local Zones regardless of whether they are enabled.

```
aws ec2 describe-availability-zones --all-availability-zones
```

To find your Local Zones using the AWS Tools for Windows PowerShell

Use the [Get-EC2AvailabilityZone](#) command as follows to describe the Local Zones in the specified Region.

```
PS C:\> Get-EC2AvailabilityZone -Region region-name
```

Opt in to Local Zones

Before you can specify a Local Zone for a resource or service, you must opt in to Local Zones.

Consideration

Some AWS resources might not be available in all Regions. Make sure that you can create the resources that you need in the desired Regions or Local Zones before launching an instance in a specific Local Zone.

To opt in to Local Zones using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the upper-left corner of the page, select **New EC2 Experience**. You cannot complete this task using the old console experience.
3. From the Region selector in the navigation bar, select the Region for the Local Zone.
4. On the navigation pane, choose **EC2 Dashboard**.
5. In the upper-right corner of the page, choose **Account attributes, Zones**.
6. Choose **Manage**.
7. For **Zone group**, choose **Enabled**.
8. Choose **Update zone group**.

To opt in to Local Zones using the AWS CLI

- Use the [modify-availability-zone-group](#) command.

Launch instances in a Local Zone

When you launch an instance, you can specify a subnet that is in a Local Zone. You also allocate an IP address from a network border group. A network border group is a unique set of Availability Zones, Local Zones, or Wavelength Zones from which AWS advertises IP addresses, for example, `us-west-2-lax-1a`.

You can allocate the following IP addresses from a network border group:

- Amazon-provided Elastic IPv4 addresses
- Amazon-provided IPv6 VPC addresses

To launch an instance in a Local Zone:

1. Enable Local Zones. For more information, see [Opt in to Local Zones \(p. 1033\)](#).
2. Create a VPC in a Region that supports the Local Zone. For more information, see [Creating a VPC in the Amazon VPC User Guide](#).
3. Create a subnet. Select the Local Zone when you create the subnet. For more information, see [Creating a subnet in your VPC in the Amazon VPC User Guide](#).
4. Launch an instance, and select the subnet that you created in the Local Zone. For more information, see [Launch your instance \(p. 578\)](#).

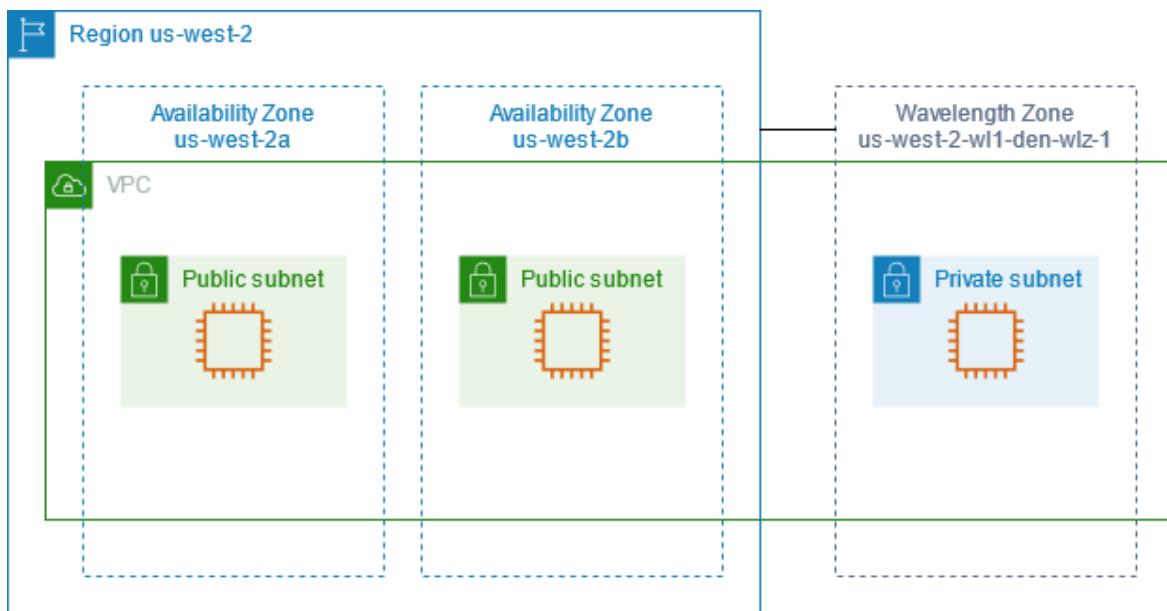

Wavelength Zones

AWS Wavelength enables developers to build applications that deliver ultra-low latencies to mobile devices and end users. Wavelength deploys standard AWS compute and storage services to the edge of telecommunication carriers' 5G networks. Developers can extend a virtual private cloud (VPC) to one or more Wavelength Zones, and then use AWS resources like Amazon EC2 instances to run applications that require ultra-low latency and a connection to AWS services in the Region.

A Wavelength Zone is an isolated zone in the carrier location where the Wavelength infrastructure is deployed. Wavelength Zones are tied to a Region. A Wavelength Zone is a logical extension of a Region, and is managed by the control plane in the Region.

The code for a Wavelength Zone is its Region code followed by an identifier that indicates the physical location. For example, `us-east-1-wl1-bos-wlz-1` in Boston.

The following diagram illustrates the AWS Region `us-west-2`, two of its Availability Zones, and a Wavelength Zone. The VPC spans the Availability Zones and the Wavelength Zone. Each zone in the VPC has one subnet, and each subnet has an instance.

To use a Wavelength Zone, you must first opt in to the Zone. For more information, see [the section called "Enable Wavelength Zones" \(p. 1036\)](#). Next, create a subnet in the Wavelength Zone. Finally, launch your resources in the Wavelength Zones subnet, so that your applications are closer to your end users.

Wavelength Zones are not available in every Region. For information about the Regions that support Wavelength Zones, see [Available Wavelength Zones](#) in the *AWS Wavelength Developer Guide*.

Contents

- [Describe your Wavelength Zones \(p. 1035\)](#)
- [Enable Wavelength Zones \(p. 1036\)](#)
- [Launch instances in a Wavelength Zone \(p. 1036\)](#)

Describe your Wavelength Zones

You can use the Amazon EC2 console or the command line interface to determine which Wavelength Zones are available for your account. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

To find your Wavelength Zones using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, view the options in the Region selector.
3. On the navigation pane, choose **EC2 Dashboard**.
4. The Wavelength Zones are listed under **Service health, Zone status**.

To find your Wavelength Zones using the AWS CLI

1. Use the `describe-availability-zones` command as follows to describe the Wavelength Zones within the specified Region.

```
aws ec2 describe-availability-zones --region region-name
```

2. Use the [describe-availability-zones](#) command as follows to describe the Wavelength Zones regardless of the opt-in status.

```
aws ec2 describe-availability-zones --all-availability-zones
```

To find your Wavelength Zone using the AWS Tools for Windows PowerShell

Use the [Get-EC2AvailabilityZone](#) command as follows to describe the Wavelength Zone within the specified Region.

```
PS C:\> Get-EC2AvailabilityZone -Region region-name
```

Enable Wavelength Zones

Before you specify a Wavelength Zone for a resource or service, you must opt in to Wavelength Zones.

Considerations

- Some AWS resources are not available in all Regions. Make sure that you can create the resources that you need in the desired Region or Wavelength Zone before launching an instance in a specific Wavelength Zone.

To opt in to Wavelength Zone using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the upper-left corner of the page, select **New EC2 Experience**. You cannot complete this task using the old console experience.
3. From the Region selector in the navigation bar, select the Region for the Wavelength Zone.
4. On the navigation pane, choose **EC2 Dashboard**.
5. In the upper-right corner of the page, choose **Account attributes, Zones**.
6. Under **Wavelength Zones**, choose **Manage** for the Wavelength Zone.
7. Choose **Enable**.
8. Choose **Update zone group**.

To enable Wavelength Zones using the AWS CLI

Use the [modify-availability-zone-group](#) command.

Launch instances in a Wavelength Zone

When you launch an instance, you can specify a subnet which is in a Wavelength Zone. You also allocate a carrier IP address from a network border group, which is a unique set of Availability Zones, Local Zones, or Wavelength Zones from which AWS advertises IP addresses, for example, us-east-1-wl1-bos-wlz-1.

For information about how to launch an instance in a Wavelength Zone, see [Get started with AWS Wavelength](#) in the *AWS Wavelength Developer Guide*.

AWS Outposts

AWS Outposts is a fully managed service that extends AWS infrastructure, services, APIs, and tools to customer premises. By providing local access to AWS managed infrastructure, AWS Outposts enables customers to build and run applications on premises using the same programming interfaces as in AWS.

Regions, while using local compute and storage resources for lower latency and local data processing needs.

An Outpost is a pool of AWS compute and storage capacity deployed at a customer site. AWS operates, monitors, and manages this capacity as part of an AWS Region. You can create subnets on your Outpost and specify them when you create AWS resources such as EC2 instances, EBS volumes, ECS clusters, and RDS instances. Instances in Outpost subnets communicate with other instances in the AWS Region using private IP addresses, all within the same VPC.

To begin using AWS Outposts, you must create an Outpost and order Outpost capacity. For more information about Outposts configurations, see [our catalog](#). After your Outpost equipment is installed, the compute and storage capacity is available for you when you launch Amazon EC2 instances and create Amazon EBS volumes on your Outpost.

Launch instances on an Outpost

You can launch EC2 instances in the Outpost subnet that you created. Security groups control inbound and outbound traffic for instances in an Outpost subnet, as they do for instances in an Availability Zone subnet. To connect to an EC2 instance in an Outpost subnet, you can specify a key pair when you launch the instance, as you do for instances in an Availability Zone subnet.

The root volume must be 30 GB or smaller. You can specify data volumes in the block device mapping of the AMI or the instance to provide additional storage. To trim unused blocks from the boot volume, see [How to Build Sparse EBS Volumes](#) in the AWS Partner Network Blog.

We recommend that you increase the NVMe timeout for the root volume. For more information, see [I/O operation timeout \(p. 1562\)](#).

For information about how to create an Outpost, see [Get started with AWS Outposts](#) in the *AWS Outposts User Guide*.

Create a volume on an Outpost

You can create EBS volumes in the Outpost subnet that you created. When you create the volume, specify the Amazon Resource Name (ARN) of the Outpost.

The following `create-volume` command creates an empty 50 GB volume on the specified Outpost.

```
aws ec2 create-volume --availability-zone us-east-2a --outpost-arn arn:aws:outposts:us-east-2:123456789012:outpost/op-03e6fecad652a6138 --size 50
```

You can dynamically modify the size of your Amazon EBS gp2 volumes without detaching them. For more information about modifying a volume without detaching it, see [Request modifications to your EBS volumes \(p. 1531\)](#).

Amazon EC2 instance IP addressing

Amazon EC2 and Amazon VPC support both the IPv4 and IPv6 addressing protocols. By default, Amazon VPC uses the IPv4 addressing protocol; you can't disable this behavior. When you create a VPC, you must specify an IPv4 CIDR block (a range of private IPv4 addresses). You can optionally assign an IPv6 CIDR block to your VPC and assign IPv6 addresses from that block to instances in your subnets.

Contents

- [Private IPv4 addresses \(p. 1038\)](#)
- [Public IPv4 addresses \(p. 1038\)](#)
- [Elastic IP addresses \(IPv4\) \(p. 1039\)](#)

- [IPv6 addresses \(p. 1039\)](#)
- [Work with the IPv4 addresses for your instances \(p. 1040\)](#)
- [Work with the IPv6 addresses for your instances \(p. 1043\)](#)
- [Multiple IP addresses \(p. 1045\)](#)
- [EC2 instance hostnames \(p. 1053\)](#)

Private IPv4 addresses

A private IPv4 address is an IP address that's not reachable over the Internet. You can use private IPv4 addresses for communication between instances in the same VPC. For more information about the standards and specifications of private IPv4 addresses, see [RFC 1918](#). We allocate private IPv4 addresses to instances using DHCP.

Note

You can create a VPC with a publicly routable CIDR block that falls outside of the private IPv4 address ranges specified in RFC 1918. However, for the purposes of this documentation, we refer to private IPv4 addresses (or 'private IP addresses') as the IP addresses that are within the IPv4 CIDR range of your VPC.

VPC subnets can be one of the following types:

- IPv4-only subnets: You can only create resources in these subnets with IPv4 addresses assigned to them.
- IPv6-only subnets: You can only create resources in these subnets with IPv6 addresses assigned to them.
- IPv4 and IPv6 subnets: You can create resources in these subnets with either IPv4 or IPv6 addresses assigned to them.

When you launch an EC2 instance into an IPv4-only or dual stack (IPv4 and IPv6) subnet, the instance receives a primary private IP address from the IPv4 address range of the subnet. For more information, see [VPC and subnet sizing](#) in the *Amazon VPC User Guide*. If you don't specify a primary private IP address when you launch the instance, we select an available IP address in the subnet's IPv4 range for you. Each instance has a default network interface (`eth0`) that is assigned the primary private IPv4 address. You can also specify additional private IPv4 addresses, known as *secondary private IPv4 addresses*. Unlike primary private IP addresses, secondary private IP addresses can be reassigned from one instance to another. For more information, see [Multiple IP addresses \(p. 1045\)](#).

A private IPv4 address, regardless of whether it is a primary or secondary address, remains associated with the network interface when the instance is stopped and started, or hibernated and started, and is released when the instance is terminated.

Public IPv4 addresses

A public IP address is an IPv4 address that's reachable from the Internet. You can use public addresses for communication between your instances and the Internet.

When you launch an instance in a default VPC, we assign it a public IP address by default. When you launch an instance into a nondefault VPC, the subnet has an attribute that determines whether instances launched into that subnet receive a public IP address from the public IPv4 address pool. By default, we don't assign a public IP address to instances launched in a nondefault subnet.

You can control whether your instance receives a public IP address as follows:

- Modifying the public IP addressing attribute of your subnet. For more information, see [Modifying the public IPv4 addressing attribute for your subnet](#) in the *Amazon VPC User Guide*.

- Enabling or disabling the public IP addressing feature during launch, which overrides the subnet's public IP addressing attribute. For more information, see [Assign a public IPv4 address during instance launch \(p. 1042\)](#).

A public IP address is assigned to your instance from Amazon's pool of public IPv4 addresses, and is not associated with your AWS account. When a public IP address is disassociated from your instance, it is released back into the public IPv4 address pool, and you cannot reuse it.

You cannot manually associate or disassociate a public IP (IPv4) address from your instance. Instead, in certain cases, we release the public IP address from your instance, or assign it a new one:

- We release your instance's public IP address when it is stopped, hibernated, or terminated. Your stopped or hibernated instance receives a new public IP address when it is started.
- We release your instance's public IP address when you associate an Elastic IP address with it. When you disassociate the Elastic IP address from your instance, it receives a new public IP address.
- If the public IP address of your instance in a VPC has been released, it will not receive a new one if there is more than one network interface attached to your instance.
- If your instance's public IP address is released while it has a secondary private IP address that is associated with an Elastic IP address, the instance does not receive a new public IP address.

If you require a persistent public IP address that can be associated to and from instances as you require, use an Elastic IP address instead.

If you use dynamic DNS to map an existing DNS name to a new instance's public IP address, it might take up to 24 hours for the IP address to propagate through the Internet. As a result, new instances might not receive traffic while terminated instances continue to receive requests. To solve this problem, use an Elastic IP address. You can allocate your own Elastic IP address, and associate it with your instance. For more information, see [Elastic IP addresses \(p. 1082\)](#).

Note

Instances that access other instances through their public NAT IP address are charged for regional or Internet data transfer, depending on whether the instances are in the same Region.

Elastic IP addresses (IPv4)

An Elastic IP address is a public IPv4 address that you can allocate to your account. You can associate it to and disassociate it from instances as you require. It's allocated to your account until you choose to release it. For more information about Elastic IP addresses and how to use them, see [Elastic IP addresses \(p. 1082\)](#).

We do not support Elastic IP addresses for IPv6.

IPv6 addresses

You can optionally associate an IPv6 CIDR block with your VPC and associate IPv6 CIDR blocks with your subnets. The IPv6 CIDR block for your VPC is automatically assigned from Amazon's pool of IPv6 addresses; you cannot choose the range yourself. For more information, see the following topics in the *Amazon VPC User Guide*:

- [VPC and subnet sizing for IPv6](#)
- [Associating an IPv6 CIDR block with your VPC](#)
- [Associating an IPv6 CIDR block with your subnet](#)

IPv6 addresses are globally unique and can be configured to remain private or reachable over the Internet. For more information about IPv6, see [IP Addressing in Your VPC](#) in the *Amazon VPC User Guide*.

Your instance receives an IPv6 address if an IPv6 CIDR block is associated with your VPC and subnet, and if one of the following is true:

- Your subnet is configured to automatically assign an IPv6 address to an instance during launch. For more information, see [Modifying the IPv6 addressing attribute for your subnet](#).
- You assign an IPv6 address to your instance during launch.
- You assign an IPv6 address to the primary network interface of your instance after launch.
- You assign an IPv6 address to a network interface in the same subnet, and attach the network interface to your instance after launch.

When your instance receives an IPv6 address during launch, the address is associated with the primary network interface (eth0) of the instance. You can disassociate the IPv6 address from the network interface.

An IPv6 address persists when you stop and start, or hibernate and start, your instance, and is released when you terminate your instance. You cannot reassign an IPv6 address while it's assigned to another network interface—you must first unassign it.

You can assign additional IPv6 addresses to your instance by assigning them to a network interface attached to your instance. The number of IPv6 addresses you can assign to a network interface and the number of network interfaces you can attach to an instance varies per instance type. For more information, see [IP addresses per network interface per instance type \(p. 1093\)](#).

Work with the IPv4 addresses for your instances

You can assign a public IPv4 address to your instance when you launch it. You can view the IPv4 addresses for your instance in the console through either the **Instances** page or the **Network Interfaces** page.

Contents

- [View the IPv4 addresses \(p. 1040\)](#)
- [Assign a public IPv4 address during instance launch \(p. 1042\)](#)

View the IPv4 addresses

You can use the Amazon EC2 console to view the private IPv4 addresses, public IPv4 addresses, and Elastic IP addresses of your instances. You can also determine the public IPv4 and private IPv4 addresses of your instance from within your instance by using instance metadata. For more information, see [Instance metadata and user data \(p. 726\)](#).

The public IPv4 address is displayed as a property of the network interface in the console, but it's mapped to the primary private IPv4 address through NAT. Therefore, if you inspect the properties of your network interface on your instance, for example, through `ifconfig` (Linux) or `ipconfig` (Windows), the public IPv4 address is not displayed. To determine your instance's public IPv4 address from an instance, use instance metadata.

New console

To view the IPv4 addresses for an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and select your instance.
3. The following information is available on the **Networking** tab:
 - **Public IPv4 address** — The public IPv4 address. If you associated an Elastic IP address with the instance or the primary network interface, this is the Elastic IP address.

- **Public IPv4 DNS** — The external DNS hostname.
 - **Private IP DNS name (IPv4 only)** — The private IPv4 address.
 - **Private IPv4 DNS** — The internal DNS hostname.
 - **Secondary private IPv4 addresses** — Any secondary private IPv4 addresses.
 - **Elastic IP addresses** — Any associated Elastic IP addresses.
4. Alternatively, under **Network interfaces** on the **Networking** tab, choose the interface ID for the primary network interface (for example, eni-123abc456def78901). The following information is available:
- **Private DNS (IPv4)** — The internal DNS hostname.
 - **Primary private IPv4 IP** — The primary private IPv4 address.
 - **Secondary private IPv4 IPs** — Any secondary private IPv4 addresses.
 - **Public DNS** — The external DNS hostname.
 - **IPv4 Public IP** — The public IPv4 address. If you associated an Elastic IP address with the instance or the primary network interface, this is the Elastic IP address.
 - **Elastic IPs** — Any associated Elastic IP addresses.

Old console

To view the IPv4 addresses for an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and select your instance.
3. The following information is available on the **Description** tab:
 - **Private DNS** — The internal DNS hostname.
 - **Private IPs** — The private IPv4 address.
 - **Secondary private IPs** — Any secondary private IPv4 addresses.
 - **Public DNS** — The external DNS hostname.
 - **IPv4 Public IP** — The public IPv4 address. If you associated an Elastic IP address with the instance or the primary network interface, this is the Elastic IP address.
 - **Elastic IPs** — Any associated Elastic IP addresses.
4. Alternatively, you can view the IPv4 addresses for the instance using the primary network interface. Under **Network interfaces** on the **Description** tab, choose **eth0**, and then choose the interface ID (for example, eni-123abc456def78901). The following information is available:
 - **Private Ipv4 DNS** — The internal DNS hostname.
 - **Private IPv4 address** — The primary private IPv4 address.
 - **Public IPv4 address** — The public IPv4 address. If you associated an Elastic IP address with the instance or the primary network interface, this is the Elastic IP address.
 - **Public IPv4 DNS** — The external DNS hostname.
 - **Secondary private IPv4 IPs** — Any secondary private IPv4 addresses.
 - **Elastic IPs** — Any associated Elastic IP addresses.

To view the IPv4 addresses for an instance using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [describe-instances](#) (AWS CLI)
- [Get-EC2Instance](#) (AWS Tools for Windows PowerShell).

To determine your instance's IPv4 addresses using instance metadata

1. Connect to your instance. For more information, see [Connect to your Linux instance \(p. 611\)](#).
2. Use the following command to access the private IP address:

IMDSv2

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" -v http://169.254.169.254/latest/meta-data/local-ipv4
```

IMDSv1

```
[ec2-user ~]$ curl http://169.254.169.254/latest/meta-data/local-ipv4
```

3. Use the following command to access the public IP address:

IMDSv2

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" -v http://169.254.169.254/latest/meta-data/public-ipv4
```

IMDSv1

```
[ec2-user ~]$ curl http://169.254.169.254/latest/meta-data/public-ipv4
```

If an Elastic IP address is associated with the instance, the value returned is that of the Elastic IP address.

Assign a public IPv4 address during instance launch

Each subnet has an attribute that determines whether instances launched into that subnet are assigned a public IP address. By default, nondefault subnets have this attribute set to false, and default subnets have this attribute set to true. When you launch an instance, a public IPv4 addressing feature is also available for you to control whether your instance is assigned a public IPv4 address; you can override the default behavior of the subnet's IP addressing attribute. The public IPv4 address is assigned from Amazon's pool of public IPv4 addresses, and is assigned to the network interface with the device index of eth0. This feature depends on certain conditions at the time you launch your instance.

Considerations

- You can't manually disassociate the public IP address from your instance after launch. Instead, it's automatically released in certain cases, after which you cannot reuse it. For more information, see [Public IPv4 addresses \(p. 1038\)](#). If you require a persistent public IP address that you can associate or disassociate at will, assign an Elastic IP address to the instance after launch instead. For more information, see [Elastic IP addresses \(p. 1082\)](#).
- You cannot auto-assign a public IP address if you specify more than one network interface. Additionally, you cannot override the subnet setting using the auto-assign public IP feature if you specify an existing network interface for eth0.
- The public IP addressing feature is only available during launch. However, whether you assign a public IP address to your instance during launch or not, you can associate an Elastic IP address with your

instance after it's launched. For more information, see [Elastic IP addresses \(p. 1082\)](#). You can also modify your subnet's public IPv4 addressing behavior. For more information, see [Modifying the public IPv4 addressing attribute for your subnet](#).

To enable or disable the public IP addressing feature using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Launch Instance**.
3. Select an AMI and an instance type, and then choose **Next: Configure Instance Details**.
4. On the **Configure Instance Details** page, for **Network**, select a VPC. The **Auto-assign Public IP** list is displayed. Choose **Enable** or **Disable** to override the default setting for the subnet.
5. Follow the steps on the next pages of the wizard to complete your instance's setup. For more information about the wizard configuration options, see [Launch an instance using the Launch Instance Wizard \(p. 580\)](#). On the final **Review Instance Launch** page, review your settings, and then choose **Launch** to choose a key pair and launch your instance.
6. On the **Instances** page, select your new instance and view its public IP address in **IPv4 Public IP** field in the details pane.

To enable or disable the public IP addressing feature using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- Use the `--associate-public-ip-address` or the `--no-associate-public-ip-address` option with the `run-instances` command (AWS CLI)
- Use the `-AssociatePublicIp` parameter with the `New-EC2Instance` command (AWS Tools for Windows PowerShell)

Work with the IPv6 addresses for your instances

You can view the IPv6 addresses assigned to your instance, assign a public IPv6 address to your instance, or unassign an IPv6 address from your instance. You can view these addresses in the console through either the **Instances** page or the **Network Interfaces** page.

Contents

- [View the IPv6 addresses \(p. 1043\)](#)
- [Assign an IPv6 address to an instance \(p. 1044\)](#)
- [Unassign an IPv6 address from an instance \(p. 1045\)](#)

View the IPv6 addresses

You can use the Amazon EC2 console, AWS CLI, and instance metadata to view the IPv6 addresses for your instances.

New console

To view the IPv6 addresses for an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance.

4. On the **Networking** tab, locate **IPv6 addresses**.
5. Alternatively, under **Network interfaces** on the **Networking** tab, choose the interface ID for the network interface (for example, eni-123abc456def78901). Locate **IPv6 IPs**.

Old console

To view the IPv6 addresses for an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance.
4. On the **Networking** tab, locate **IPv6 IPs**.
5. Alternatively, under **Network interfaces** on the **Description** tab, choose **eth0**, and then choose the interface ID (for example, eni-123abc456def78901). Locate **IPv6 IPs**.

To view the IPv6 addresses for an instance using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [describe-instances](#) (AWS CLI)
- [Get-EC2Instance](#) (AWS Tools for Windows PowerShell).

To view the IPv6 addresses for an instance using instance metadata

1. Connect to your instance. For more information, see [Connect to your Linux instance \(p. 611\)](#).
2. Use the following command to view the IPv6 address (you can get the MAC address from <http://169.254.169.254/latest/meta-data/network/interfaces/macs/>).

IMDSv2

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" -v http://169.254.169.254/latest/
meta-data/network/interfaces/macs/mac-address/ipv6s
```

IMDSv1

```
[ec2-user ~]$ curl http://169.254.169.254/latest/meta-data/network/interfaces/
macs/mac-address/ipv6s
```

Assign an IPv6 address to an instance

If your VPC and subnet have IPv6 CIDR blocks associated with them, you can assign an IPv6 address to your instance during or after launch. The IPv6 address is assigned from the IPv6 address range of the subnet, and is assigned to the network interface with the device index of eth0.

To assign an IPv6 address to an instance during launch

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Select an AMI and an instance type that supports IPv6, and choose **Next: Configure Instance Details**.

3. On the **Configure Instance Details** page, for **Network**, select a VPC and for **Subnet**, select a subnet. For **Auto-assign IPv6 IP**, choose **Enable**.
4. Follow the remaining steps in the wizard to launch your instance.

To assign an IPv6 address to an instance after launch

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance, and choose **Actions, Networking, Manage IP addresses**.
4. Expand the network interface. Under **IPv6 addresses**, choose **Assign new IP address**. Enter an IPv6 address from the range of the subnet or leave the field blank to let Amazon choose an IPv6 address for you.
5. Choose **Save**.

To assign an IPv6 address using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- Use the `--ipv6-addresses` option with the `run-instances` command (AWS CLI)
- Use the `Ipv6Addresses` property for `-NetworkInterface` in the `New-EC2Instance` command (AWS Tools for Windows PowerShell)
- `assign-ipv6-addresses` (AWS CLI)
- `Register-EC2Ipv6AddressList` (AWS Tools for Windows PowerShell)

Unassign an IPv6 address from an instance

You can unassign an IPv6 address from an instance at any time.

To unassign an IPv6 address from an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance, and choose **Actions, Networking, Manage IP addresses**.
4. Expand the network interface. Under **IPv6 addresses**, choose **Unassign** next to the IPv6 address.
5. Choose **Save**.

To unassign an IPv6 address from an instance using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- `unassign-ipv6-addresses` (AWS CLI)
- `Unregister-EC2Ipv6AddressList` (AWS Tools for Windows PowerShell).

Multiple IP addresses

You can specify multiple private IPv4 and IPv6 addresses for your instances. The number of network interfaces and private IPv4 and IPv6 addresses that you can specify for an instance depends on the instance type. For more information, see [IP addresses per network interface per instance type \(p. 1093\)](#).

It can be useful to assign multiple IP addresses to an instance in your VPC to do the following:

- Host multiple websites on a single server by using multiple SSL certificates on a single server and associating each certificate with a specific IP address.
- Operate network appliances, such as firewalls or load balancers, that have multiple IP addresses for each network interface.
- Redirect internal traffic to a standby instance in case your instance fails, by reassigning the secondary IP address to the standby instance.

Contents

- [How multiple IP addresses work \(p. 1046\)](#)
- [Work with multiple IPv4 addresses \(p. 1047\)](#)
- [Work with multiple IPv6 addresses \(p. 1050\)](#)

How multiple IP addresses work

The following list explains how multiple IP addresses work with network interfaces:

- You can assign a secondary private IPv4 address to any network interface. The network interface does not need to be attached to the instance.
- You can assign multiple IPv6 addresses to a network interface that's in a subnet that has an associated IPv6 CIDR block.
- You must choose a secondary IPv4 address from the IPv4 CIDR block range of the subnet for the network interface.
- You must choose IPv6 addresses from the IPv6 CIDR block range of the subnet for the network interface.
- You associate security groups with network interfaces, not individual IP addresses. Therefore, each IP address you specify in a network interface is subject to the security group of its network interface.
- Multiple IP addresses can be assigned and unassigned to network interfaces attached to running or stopped instances.
- Secondary private IPv4 addresses that are assigned to a network interface can be reassigned to another one if you explicitly allow it.
- An IPv6 address cannot be reassigned to another network interface; you must first unassign the IPv6 address from the existing network interface.
- When assigning multiple IP addresses to a network interface using the command line tools or API, the entire operation fails if one of the IP addresses can't be assigned.
- Primary private IPv4 addresses, secondary private IPv4 addresses, Elastic IP addresses, and IPv6 addresses remain with a secondary network interface when it is detached from an instance or attached to an instance.
- Although you can't detach the primary network interface from an instance, you can reassign the secondary private IPv4 address of the primary network interface to another network interface.

The following list explains how multiple IP addresses work with Elastic IP addresses (IPv4 only):

- Each private IPv4 address can be associated with a single Elastic IP address, and vice versa.
- When a secondary private IPv4 address is reassigned to another interface, the secondary private IPv4 address retains its association with an Elastic IP address.
- When a secondary private IPv4 address is unassigned from an interface, an associated Elastic IP address is automatically disassociated from the secondary private IPv4 address.

Work with multiple IPv4 addresses

You can assign a secondary private IPv4 address to an instance, associate an Elastic IPv4 address with a secondary private IPv4 address, and unassign a secondary private IPv4 address.

Contents

- [Assign a secondary private IPv4 address \(p. 1047\)](#)
- [Configure the operating system on your instance to recognize secondary private IPv4 addresses \(p. 1048\)](#)
- [Associate an Elastic IP address with the secondary private IPv4 address \(p. 1049\)](#)
- [View your secondary private IPv4 addresses \(p. 1049\)](#)
- [Unassign a secondary private IPv4 address \(p. 1050\)](#)

Assign a secondary private IPv4 address

You can assign the secondary private IPv4 address to the network interface for an instance as you launch the instance, or after the instance is running. This section includes the following procedures.

- [To assign a secondary private IPv4 address when launching an instance \(p. 1047\)](#)
- [To assign a secondary IPv4 address during launch using the command line \(p. 1048\)](#)
- [To assign a secondary private IPv4 address to a network interface \(p. 1048\)](#)
- [To assign a secondary private IPv4 to an existing instance using the command line \(p. 1048\)](#)

To assign a secondary private IPv4 address when launching an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Launch Instance**.
3. Select an AMI, then choose an instance type and choose **Next: Configure Instance Details**.
4. On the **Configure Instance Details** page, for **Network**, select a VPC and for **Subnet**, select a subnet.
5. In the **Network Interfaces** section, do the following, and then choose **Next: Add Storage**:
 - To add another network interface, choose **Add Device**. The console enables you to specify up to two network interfaces when you launch an instance. After you launch the instance, choose **Network Interfaces** in the navigation pane to add additional network interfaces. The total number of network interfaces that you can attach varies by instance type. For more information, see [IP addresses per network interface per instance type \(p. 1093\)](#).

Important

When you add a second network interface, the system can no longer auto-assign a public IPv4 address. You will not be able to connect to the instance over IPv4 unless you assign an Elastic IP address to the primary network interface (eth0). You can assign the Elastic IP address after you complete the Launch wizard. For more information, see [Work with Elastic IP addresses \(p. 1083\)](#).

6. For each network interface, under **Secondary IP addresses**, choose **Add IP**, and then enter a private IP address from the subnet range, or accept the default **Auto-assign** value to let Amazon select an address.
7. On the next **Add Storage** page, you can specify volumes to attach to the instance besides the volumes specified by the AMI (such as the root device volume), and then choose **Next: Add Tags**.
8. On the **Add Tags** page, specify tags for the instance, such as a user-friendly name, and then choose **Next: Configure Security Group**.
9. On the **Configure Security Group** page, select an existing security group or create a new one. Choose **Review and Launch**.

9. On the **Review Instance Launch** page, review your settings, and then choose **Launch** to choose a key pair and launch your instance. If you're new to Amazon EC2 and haven't created any key pairs, the wizard prompts you to create one.

Important

After you have added a secondary private IP address to a network interface, you must connect to the instance and configure the secondary private IP address on the instance itself. For more information, see [Configure the operating system on your instance to recognize secondary private IPv4 addresses \(p. 1048\)](#).

To assign a secondary IPv4 address during launch using the command line

- You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).
 - The `--secondary-private-ip-addresses` option with the `run-instances` command (AWS CLI)
 - Define `-NetworkInterface` and specify the `PrivateIpAddresses` parameter with the `New-EC2Instance` command (AWS Tools for Windows PowerShell).

To assign a secondary private IPv4 address to a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**, and then select the network interface attached to the instance.
3. Choose **Actions, Manage IP Addresses**.
4. Under **IPv4 Addresses**, choose **Assign new IP**.
5. Enter a specific IPv4 address that's within the subnet range for the instance, or leave the field blank to let Amazon select an IP address for you.
6. (Optional) Choose **Allow reassignment** to allow the secondary private IP address to be reassigned if it is already assigned to another network interface.
7. Choose **Yes, Update**.

Alternatively, you can assign a secondary private IPv4 address to an instance. Choose **Instances** in the navigation pane, select the instance, and then choose **Actions, Networking, Manage IP Addresses**. You can configure the same information as you did in the steps above. The IP address is assigned to the primary network interface (`eth0`) for the instance.

To assign a secondary private IPv4 to an existing instance using the command line

- You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).
 - `assign-private-ip-addresses` (AWS CLI)
 - `Register-EC2PrivateIpAddress` (AWS Tools for Windows PowerShell)

Configure the operating system on your instance to recognize secondary private IPv4 addresses

After you assign a secondary private IPv4 address to your instance, you need to configure the operating system on your instance to recognize the secondary private IP address.

- If you are using Amazon Linux, the `ec2-net-utils` package can take care of this step for you. It configures additional network interfaces that you attach while the instance is running, refreshes

secondary IPv4 addresses during DHCP lease renewal, and updates the related routing rules. You can immediately refresh the list of interfaces by using the command `sudo service network restart` and then view the up-to-date list using `ip addr 1i`. If you require manual control over your network configuration, you can remove the `ec2-net-utils` package. For more information, see [Configure your network interface using ec2-net-utils \(p. 1118\)](#).

- If you are using another Linux distribution, see the documentation for your Linux distribution. Search for information about configuring additional network interfaces and secondary IPv4 addresses. If the instance has two or more interfaces on the same subnet, search for information about using routing rules to work around asymmetric routing.

For information about configuring a Windows instance, see [Configuring a secondary private IP address for your Windows instance in a VPC](#) in the *Amazon EC2 User Guide for Windows Instances*.

Associate an Elastic IP address with the secondary private IPv4 address

To associate an Elastic IP address with a secondary private IPv4 address

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Choose **Actions**, and then select **Associate address**.
4. For **Network interface**, select the network interface, and then select the secondary IP address from the **Private IP** list.
5. Choose **Associate**.

To associate an Elastic IP address with a secondary private IPv4 address using the command line

- You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).
 - `associate-address` (AWS CLI)
 - `Register-EC2Address` (AWS Tools for Windows PowerShell)

View your secondary private IPv4 addresses

To view the private IPv4 addresses assigned to a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface with private IP addresses to view.
4. On the **Details** tab in the details pane, check the **Primary private IPv4 IP** and **Secondary private IPv4 IPs** fields for the primary private IPv4 address and any secondary private IPv4 addresses assigned to the network interface.

To view the private IPv4 addresses assigned to an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance with private IPv4 addresses to view.
4. On the **Description** tab in the details pane, check the **Private IPs** and **Secondary private IPs** fields for the primary private IPv4 address and any secondary private IPv4 addresses assigned to the instance through its network interface.

Unassign a secondary private IPv4 address

If you no longer require a secondary private IPv4 address, you can unassign it from the instance or the network interface. When a secondary private IPv4 address is unassigned from a network interface, the Elastic IP address (if it exists) is also disassociated.

To unassign a secondary private IPv4 address from an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select an instance, choose **Actions, Networking, Manage IP Addresses**.
4. Under **IPv4 Addresses**, choose **Unassign** for the IPv4 address to unassign.
5. Choose **Yes, Update**.

To unassign a secondary private IPv4 address from a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface, choose **Actions, Manage IP Addresses**.
4. Under **IPv4 Addresses**, choose **Unassign** for the IPv4 address to unassign.
5. Choose **Yes, Update**.

To unassign a secondary private IPv4 address using the command line

- You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).
 - [unassign-private-ip-addresses](#) (AWS CLI)
 - [Unregister-EC2PrivateIpAddress](#) (AWS Tools for Windows PowerShell)

Work with multiple IPv6 addresses

You can assign multiple IPv6 addresses to your instance, view the IPv6 addresses assigned to your instance, and unassign IPv6 addresses from your instance.

Contents

- [Assign multiple IPv6 addresses \(p. 1050\)](#)
- [View your IPv6 addresses \(p. 1052\)](#)
- [Unassign an IPv6 address \(p. 1052\)](#)

Assign multiple IPv6 addresses

You can assign one or more IPv6 addresses to your instance during launch or after launch. To assign an IPv6 address to an instance, the VPC and subnet in which you launch the instance must have an associated IPv6 CIDR block. For more information, see [VPCs and Subnets](#) in the *Amazon VPC User Guide*.

To assign multiple IPv6 addresses during launch

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the dashboard, choose **Launch Instance**.
3. Select an AMI, choose an instance type, and choose **Next: Configure Instance Details**. Ensure that you choose an instance type that supports IPv6. For more information, see [Instance types \(p. 240\)](#).

4. On the **Configure Instance Details** page, select a VPC from the **Network** list, and a subnet from the **Subnet** list.
5. In the **Network Interfaces** section, do the following, and then choose **Next: Add Storage**:
 - To assign a single IPv6 address to the primary network interface (eth0), under **IPv6 IPs**, choose **Add IP**. To add a secondary IPv6 address, choose **Add IP** again. You can enter an IPv6 address from the range of the subnet, or leave the default **Auto-assign** value to let Amazon choose an IPv6 address from the subnet for you.
 - Choose **Add Device** to add another network interface and repeat the steps above to add one or more IPv6 addresses to the network interface. The console enables you to specify up to two network interfaces when you launch an instance. After you launch the instance, choose **Network Interfaces** in the navigation pane to add additional network interfaces. The total number of network interfaces that you can attach varies by instance type. For more information, see [IP addresses per network interface per instance type \(p. 1093\)](#).
6. Follow the next steps in the wizard to attach volumes and tag your instance.
7. On the **Configure Security Group** page, select an existing security group or create a new one. If you want your instance to be reachable over IPv6, ensure that your security group has rules that allow access from IPv6 addresses. For more information, see [Security group rules for different use cases \(p. 1340\)](#). Choose **Review and Launch**.
8. On the **Review Instance Launch** page, review your settings, and then choose **Launch** to choose a key pair and launch your instance. If you're new to Amazon EC2 and haven't created any key pairs, the wizard prompts you to create one.

You can use the **Instances** screen Amazon EC2 console to assign multiple IPv6 addresses to an existing instance. This assigns the IPv6 addresses to the primary network interface (eth0) for the instance. To assign a specific IPv6 address to the instance, ensure that the IPv6 address is not already assigned to another instance or network interface.

To assign multiple IPv6 addresses to an existing instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance, choose **Actions, Networking, Manage IP Addresses**.
4. Under **IPv6 Addresses**, choose **Assign new IP** for each IPv6 address you want to add. You can specify an IPv6 address from the range of the subnet, or leave the **Auto-assign** value to let Amazon choose an IPv6 address for you.
5. Choose **Yes, Update**.

Alternatively, you can assign multiple IPv6 addresses to an existing network interface. The network interface must have been created in a subnet that has an associated IPv6 CIDR block. To assign a specific IPv6 address to the network interface, ensure that the IPv6 address is not already assigned to another network interface.

To assign multiple IPv6 addresses to a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select your network interface, choose **Actions, Manage IP Addresses**.
4. Under **IPv6 Addresses**, choose **Assign new IP** for each IPv6 address you want to add. You can specify an IPv6 address from the range of the subnet, or leave the **Auto-assign** value to let Amazon choose an IPv6 address for you.
5. Choose **Yes, Update**.

CLI overview

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- **Assign an IPv6 address during launch:**
 - Use the `--ipv6-addresses` or `--ipv6-address-count` options with the [run-instances](#) command (AWS CLI)
 - Define `-NetworkInterface` and specify the `Ipv6Addresses` or `Ipv6AddressCount` parameters with the [New-EC2Instance](#) command (AWS Tools for Windows PowerShell).
- **Assign an IPv6 address to a network interface:**
 - [assign-ipv6-addresses](#) (AWS CLI)
 - [Register-EC2Ipv6AddressList](#) (AWS Tools for Windows PowerShell)

View your IPv6 addresses

You can view the IPv6 addresses for an instance or for a network interface.

To view the IPv6 addresses assigned to an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance. In the details pane, review the **IPv6 IPs** field.

To view the IPv6 addresses assigned to a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select your network interface. In the details pane, review the **IPv6 IPs** field.

CLI overview

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- **View the IPv6 addresses for an instance:**
 - [describe-instances](#) (AWS CLI)
 - [Get-EC2Instance](#) (AWS Tools for Windows PowerShell).
- **View the IPv6 addresses for a network interface:**
 - [describe-network-interfaces](#) (AWS CLI)
 - [Get-EC2NetworkInterface](#) (AWS Tools for Windows PowerShell)

Unassign an IPv6 address

You can unassign an IPv6 address from the primary network interface of an instance, or you can unassign an IPv6 address from a network interface.

To unassign an IPv6 address from an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance, choose **Actions, Networking, Manage IP Addresses**.

4. Under **IPv6 Addresses**, choose **Unassign** for the IPv6 address to unassign.
5. Choose **Yes, Update**.

To unassign an IPv6 address from a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select your network interface, choose **Actions, Manage IP Addresses**.
4. Under **IPv6 Addresses**, choose **Unassign** for the IPv6 address to unassign.
5. Choose **Save**.

CLI overview

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [unassign-ipv6-addresses](#) (AWS CLI)
- [Unregister-EC2Ipv6AddressList](#) (AWS Tools for Windows PowerShell).

EC2 instance hostnames

When you create an EC2 instance, AWS creates a hostname for that instance. For more information on the types of hostnames and how they're provisioned by AWS, see [Amazon EC2 instance hostname types \(p. 1053\)](#). Amazon provides a DNS server that resolves Amazon-provided hostnames to IPv4 and IPv6 addresses. The Amazon DNS server is located at the base of your VPC network range plus two. For more information, see [DNS support for your VPC](#) in the *Amazon VPC User Guide*.

Amazon EC2 instance hostname types

This section describes the Amazon EC2 instance guest OS hostname types available when you launch instances into your VPC subnets.

Contents

- [Types of EC2 hostnames \(p. 1053\)](#)
- [Where you see RBN and IPBN \(p. 1055\)](#)
- [Modify RBN configurations \(p. 1057\)](#)

Types of EC2 hostnames

There are two hostname types for the guest OS hostname when EC2 instances are launched in a VPC:

- **IP address-based naming (IPBN):** The legacy naming scheme where, when you launch an instance, the *private IPv4 address* of the instance is included in the hostname of the instance. The IP address-based name exists for the life of the EC2 instance. When used as the Private DNS hostname, it will only return the private IPv4 address (A record).
- **Resource-based naming (RBN):** When you launch an instance, the *EC2 instance ID* is included in the hostname of the instance. The resource-based name exists for the life of the EC2 instance. When used as the Private DNS hostname, it can return both the Private IPv4 address (A record) and/or the IPv6 Global Unicast Address (AAAA record).

The EC2 instance guest OS hostname (of type IPBN or RBN) depends on the subnet settings:

- If the instance is launched into an IPv4-only subnet, you can select either IPBN or RBN.
- If the instance is launched into a dual-stack (IPv4+IPv6) subnet, you can select either IPBN or RBN.
- If the instance is launched into an IPv6-only subnet, RBN is used automatically.

Contents

- [IP address-based naming \(p. 1054\)](#)
- [Resource-based naming \(p. 1054\)](#)
- [The difference between IPBN and RBN \(p. 1054\)](#)

IP address-based naming

When you launch an EC2 instance with IP address-based naming (IPBN), the guest OS hostname is configured to use the private IPv4 address

- Format for an instance in us-east-1: `private-ipv4-address.ec2.internal`
- Example: `ip-10-24-34-0.ec2.internal`
- Format for an instance in any other AWS Region: `private-ipv4-address.region.compute.internal`
- Example: `ip-10-24-34-0.us-west-2.compute.internal`

Resource-based naming

Resource-based naming (RBN) is used automatically when you launch EC2 instances in IPv6-only subnets. RBN is not selected by default when you launch an instance in dual-stack (IPv4+IPv6) subnets, but it is an option that you can select depending on the subnet settings. After you launch an instance, you can manage the guest OS hostname configuration. For more information, see [Modify RBN configurations \(p. 1057\)](#).

When you launch an EC2 instance with a resource-based hostname type, the guest OS hostname is configured to use the EC2 instance ID.

- Format for an instance in us-east-1: `ec2-instance-id.ec2.internal`
- Example: `i-0123456789abcdef.ec2.internal`
- Format for an instance in any other AWS Region: `ec2-instance-id.region.compute.internal`
- Example: `i-0123456789abcdef.us-west-2.compute.internal`

The difference between IPBN and RBN

DNS queries for both IP address-based naming (IPBN) and resource-based naming (RBN) DNS hostnames coexist to ensure backward compatibility and to allow you to migrate from IPBN to RBN. For private DNS hostnames based on IPBN, you cannot configure whether a DNS A record query for the instance is responded to or not. DNS A record queries are always responded to. In contrast, for private DNS hostnames based on RBN, you can configure whether DNS A and/or DNS AAAA queries for the instance are responded to or not. You configure the response behavior when you launch an instance or modify a subnet. You make the RBN DNS query configuration change when you launch an instance, create a subnet, or modify a subnet. For more information, see [Modify RBN configurations \(p. 1057\)](#).

Where you see RBN and IPBN

This section describes where you see resource-based naming (RBN) and IP address-based naming (IPBN) in the EC2 console.

Contents

- [When creating an EC2 instance \(p. 1055\)](#)
- [When viewing the details of an existing EC2 instance \(p. 1056\)](#)

When creating an EC2 instance

When you create an EC2 instance, depending on which type of subnet you select, an RBN option might be available, or it might be selected and not modifiable. This section explains the scenarios in which you see RBN and IPBN options.

Scenario 1

You create an EC2 instance in the wizard and, when you configure the details, you choose a subnet that you configured to be IPv6-only.

1. Choose AMI 2. Choose Instance Type 3. Configure Instance 4. Add Storage 5. Add Tags 6. Configure Security Group 7. Review

Step 3: Configure Instance Details
Configure the instance to suit your requirements. You can launch multiple instances from the same AMI, request Spot instances to take advantage of the lower pricing, assign an access management role to the instance, and more.

Number of instances Launch into Auto Scaling Group

Purchasing option Request Spot instances

Network Subnet
0 IP Addresses available

Auto-assign Public IP Auto-assign IPv6 IP

Hostname type DNS Hostname Enable IP name IPv4 (A record) DNS requests Enable resource-based IPv4 (A record) DNS requests Enable resource-based IPv6 (AAAA record) DNS requests

In this case, the **Hostname type Resource name** is selected automatically and is not modifiable. **DNS Hostname** options are displayed, but **Enable resource-based IPv6 (AAAA record) DNS requests** is selected automatically and is not modifiable here. This means that the hostname for your EC2 instance is an RBN, and DNS requests to the RBN will resolve to the IPv6 address (AAAA record) of this EC2 instance.

Scenario 2

You create an EC2 instance in the wizard and, when you configure the details, you choose a subnet configured with an IPv4 CIDR block or both an IPv4 and IPv6 CIDR block ("dual stack").

1. Choose AMI 2. Choose Instance Type 3. Configure Instance 4. Add Storage 5. Add Tags 6. Configure Security Group 7. Review

Step 3: Configure Instance Details

Configure the instance to suit your requirements. You can launch multiple instances from the same AMI, request Spot instances to take advantage of the lower pricing, assign an access management role to the instance, and more.

Number of instances	1	Launch into Auto Scaling Group
Purchasing option		
<input type="checkbox"/> Request Spot instances		
Network		
Subnet		
Auto-assign Public IP		
Auto-assign IPv6 IP		
Hostname type		
DNS Hostname		

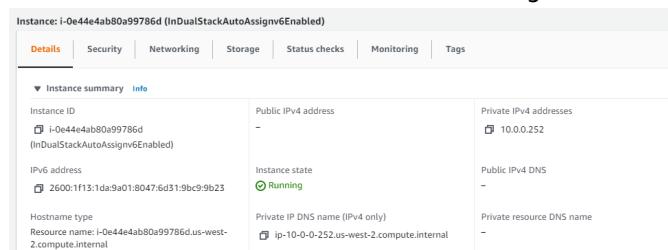

In this case, the RBN options **Hostname type** and **Resource-based DNS** are visible. **Enable IP name IPV4 (A record) DNS requests** is selected automatically and can't be changed. This means that requests to the IP name will resolve to the IPv4 address (A record) of this EC2 instance.

The RBN options default to the configurations of the subnet, but you can modify the options for this instance depending on the subnet settings:

- **Hostname type:** Determines whether you want the guest OS hostname of the EC2 instance to be the resource name (RBN) or IP name (IPBN).
- **Enable resource-based IPV4 (A record) DNS requests:** Determines whether requests to your resource name resolve to the private IPv4 address (A record) of this EC2 instance.
- **Enable resource-based IPV6 (AAAA record) DNS requests:** Determines whether requests to your resource name resolve to the IPv6 GUA address (AAAA record) of this EC2 instance.

When viewing the details of an existing EC2 instance

You can see the hostname values for an existing EC2 instance in the **Details** tab for the EC2 instance.

The screenshot shows the AWS Lambda Details tab for an instance named i-0e44e4ab80a99786d. The tab displays the following information:

- Instance ID:** i-0e44e4ab80a99786d (InDualStackAutoAssignv6Enabled)
- Public IPv4 address:** 10.0.0.252
- Private IPv4 addresses:** -
- Instance state:** Running
- Public IPv4 DNS:** -
- Private IP DNS name (IPv4 only):** ip-10-0-0-252.us-west-2.compute.internal
- Private resource DNS name:** -

You can see the following details related to IPBN and RBN:

- **Hostname type:** The hostname in IPBN or RBN format.
- **Private IP DNS name (IPv4 only):** The IPBN-based DNS name that will always resolve to the private IPv4 address of the instance.
- **Private resource DNS name:** The RBN-based DNS name that resolves to the DNS records selected for this instance.
- **Answer private resource DNS name:** The RBN resolves to IPv4 (A), IPv6 (AAAA) or IPv4 and IPv6 (A and AAAA) DNS records.

In addition, if you connect to your EC2 instance directly over SSH and enter the `hostname` command, you'll see the hostname in either the IPBN or RBN format.

Modify RBN configurations

Follow the steps in this section to modify resource-based naming (RBN) configurations for subnets or EC2 instances after they've been launched.

Contents

- [Subnets \(p. 1057\)](#)
- [EC2 instances \(p. 1057\)](#)

Subnets

Modify the RBN configurations for a subnet by selecting a subnet in the VPC console and choosing **Actions, Edit subnet settings**.

- **Hostname type:** Determines whether you want the default setting of the guest OS hostname of the EC2 instance launched in the subnet to be the resource name (RBN) or IP name (IPBN).
- **Enable DNS hostname IPv4 (A record) requests:** Determines whether DNS requests/queries to your resource name resolve to the IPv4 address (A record) of this EC2 instance.
- **Enable DNS hostname IPv6 (AAAA record) requests:** Determines whether DNS requests/queries to your resource name resolve to the IPv6 address (AAAA record) of this EC2 instance.

EC2 instances

Follow the steps in this section to modify the RBN configurations for an EC2 instance.

Important

- To change the **Use RBN as guest OS hostname** setting, you must first stop the instance. To change the **Answer DNS hostname IPv4 (A record) request** or **Answer DNS hostname IPv6 (AAAA record) requests** settings, you don't have to stop the instance.
- To modify any of the RBN settings for non-EBS backed EC2 instance types, you cannot stop the instance. You must terminate the instance and launch a new instance with the desired RBN configurations.

To modify the RBN configurations for an EC2 instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. If you're going to change the **Use RBN as guest OS hostname** setting, first stop the EC2 instance. Otherwise, skip this step.

To stop the instance, select the instance and choose **Instance state, Stop instance**.

3. Select the instance and choose **Actions, Instance settings, Change resource based naming options**.
 - **Use RBN as guest OS hostname:** Determines whether you want the guest OS hostname of the EC2 instance to be the resource name (RBN) or IP name (IPBN).
 - **Answer DNS hostname IPv4 (A record) requests:** Determines whether DNS requests/queries to your resource name resolve to the IPv4 address of this EC2 instance.
 - **Answer DNS hostname IPv6 (AAAA record) requests:** Determines whether DNS requests/queries to your resource name resolve to the IPv6 address (AAAA record) of this EC2 instance.
4. Choose **Save**.
5. If you stopped the instance, start it again.

Bring your own IP addresses (BYOIP) in Amazon EC2

You can bring part or all of your publicly routable IPv4 or IPv6 address range from your on-premises network to your AWS account. You continue to control the address range, but by default, AWS advertises it on the internet. After you bring the address range to AWS, it appears in your AWS account as an address pool.

BYOIP is not available in all Regions and for all resources. For a list of supported Regions and resources, see the [FAQ for Bring Your Own IP](#).

Note

The following steps describe how to bring your own IP address range for use in Amazon EC2 only. For steps to bring your own IP address range for use in AWS Global Accelerator, see [Bring your own IP addresses \(BYOIP\) in the AWS Global Accelerator Developer Guide](#).

Contents

- [BYOIP definitions \(p. 1058\)](#)
- [Requirements and quotas \(p. 1058\)](#)
- [Onboarding prerequisites for your BYOIP address range \(p. 1059\)](#)
- [Onboard your BYOIP \(p. 1064\)](#)
- [Work with your address range \(p. 1067\)](#)
- [Validate your BYOIP \(p. 1068\)](#)
- [Learn more \(p. 1071\)](#)

BYOIP definitions

- **X.509 Self-sign certificate** — A certificate standard most commonly used to encrypt and authenticate data within a network. It is a certificate used by AWS to validate control over IP space from an RDAP record. For more information about X.509 certificates, see [RFC 3280](#).
- **Registry Data Access Protocol (RDAP)** — A querying resource for registration data. It is updated by customers and used by AWS to verify control of an address space in the Regional Internet Registries (RIR).
- **Route Origin Authorization (ROA)** — An object created by RIRs for customers to authenticate IP advertisement in particular autonomous systems. For an overview, see [Route Origin Authorizations \(ROAs\)](#) on the ARIN website.
- **Local Internet Registry (LIR)** — Organizations such as internet service providers that allocate a block of IP addresses from a RIR for their customers.

Requirements and quotas

- The address range must be registered with your regional internet registry (RIR), such as the American Registry for Internet Numbers (ARIN), Réseaux IP Européens Network Coordination Centre (RIPE), or Asia-Pacific Network Information Centre (APNIC). It must be registered to a business or institutional entity and cannot be registered to an individual person.
- The most specific IPv4 address range that you can bring is /24.
- The most specific IPv6 address range that you can bring is /48 for CIDRs that are publicly advertised, and /56 for CIDRs that are [not publicly advertised \(p. 1066\)](#).

- ROAs are not required for CIDR ranges that are not publicly advertised, but the RDAP records still need to be updated.
- You can bring each address range to one Region at a time.
- You can bring a total of five IPv4 and IPv6 address ranges per Region to your AWS account.
- You cannot share your IP address range with other accounts using AWS RAM unless you use Amazon VPC IP Address Manager (IPAM) and integrate IPAM with AWS Organizations. For more information, see [Integrate IPAM with AWS Organizations](#) in the *Amazon VPC IPAM User Guide*.
- The addresses in the IP address range must have a clean history. We might investigate the reputation of the IP address range and reserve the right to reject an IP address range if it contains an IP address that has a poor reputation or is associated with malicious behavior.
- AWS doesn't support legacy allocations.
- For LIRs, it is common that they use a manual process to update their records. This can take days to deploy depending on the LIR.
- A single ROA object and RDAP record are needed for a large CIDR block. You can bring multiple smaller CIDR blocks from that range to AWS, even across multiple Regions, using the single object and record.

Onboarding prerequisites for your BYOIP address range

The onboarding process for BYOIP has two phases, for which you must perform three steps. These steps correspond to the steps depicted in the following diagram.

Preparation phase

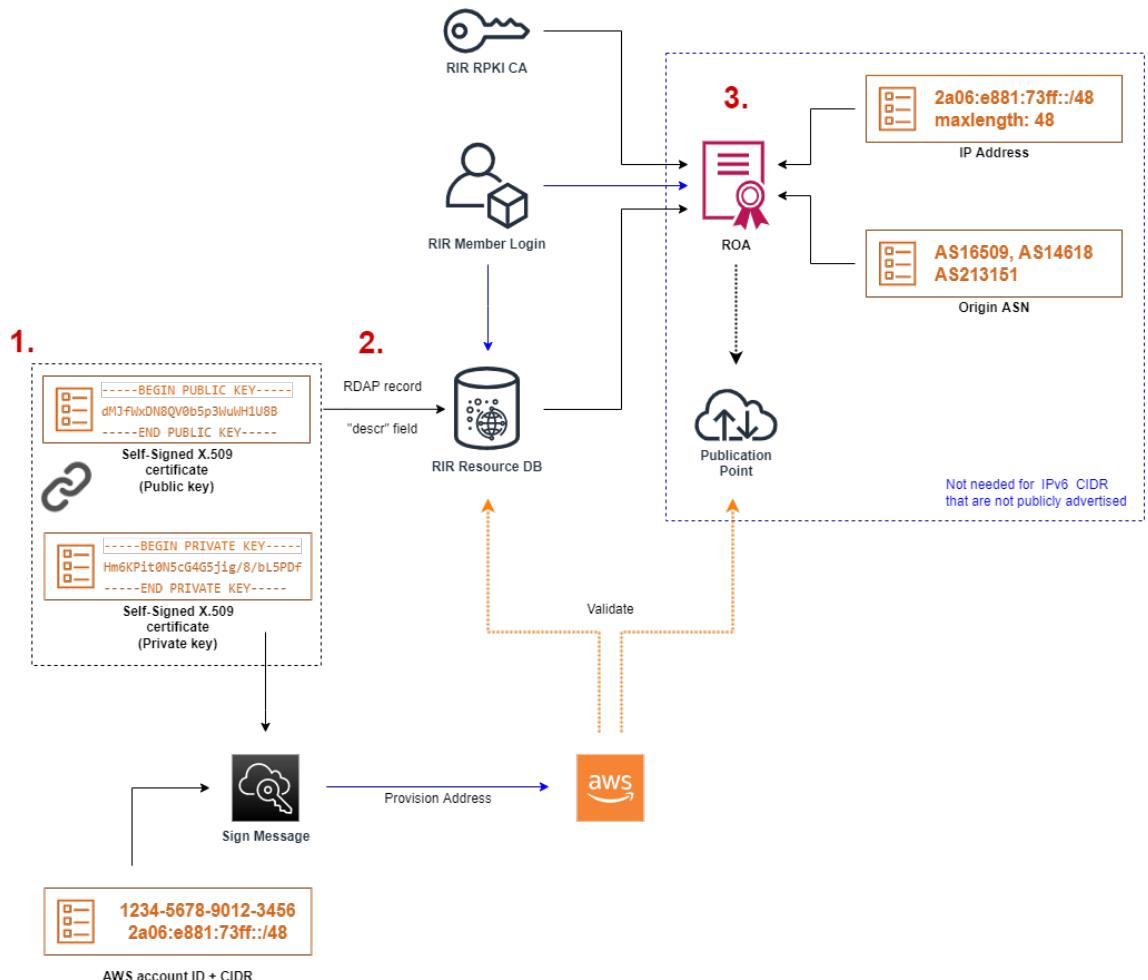

1. [Create an RSA key pair \(p. 1060\)](#), and use it to generate a self-signed X.509 certificate for authentication purposes.

RIR configuration phase

2. [Upload the self-signed certificate \(p. 1064\)](#) to your RDAP record comments.
3. [Create an ROA object \(p. 1064\)](#) in your RIR. The ROA defines the desired address range, the Autonomous System Numbers (ASNs) allowed to advertise the address range, and an expiration date to register with the Resource Public Key Infrastructure (RPKI) of your RIR.

Note

An ROA is not required for non-publicly advertised IPv6 address space.

To bring on multiple non-contiguous address ranges, you must repeat this process with each address range. However, the preparation and RIR configuration steps don't need to be repeated if splitting a contiguous block across several different Regions.

Bringing on an address range has no effect on any address ranges that you brought on previously.

Before onboarding your address range, complete the following prerequisites. For some tasks, you run Linux commands. On Windows, you can use the [Windows Subsystem for Linux](#) to run the Linux commands.

1. Create a key pair for AWS authentication

Use the following procedure to create a self-signed X.509 certificate and add it to the RDAP record for your RIR. This key pair is used to authenticate the address range with the RIR. The `openssl` commands require OpenSSL version 1.0.2 or later.

Copy the following commands and replace only the placeholder values (in colored italic text).

To create a self-signed X.509 certificate and add it to the RDAP record

This procedure follows the best practice of encrypting your private RSA key and requiring a passphrase to access it.

1. Generate an RSA 2048-bit key pair as shown in the following.

```
$ openssl genpkey -aes256 -algorithm RSA -pkeyopt rsa_keygen_bits:2048 -out private-key.pem
```

The `-aes256` parameter specifies the algorithm used to encrypt the private key. The command returns the following output, including prompts to set a passphrase:

```
.....+++
.+++
Enter PEM pass phrase: xxxxxxxx
Verifying - Enter PEM pass phrase: xxxxxxxx
```

You can inspect the key using the following command:

```
$ openssl pkey -in private-key.pem -text
```

This returns a passphrase prompt and the contents of the key, which should be similar to the following:

```
Enter pass phrase for private-key.pem: xxxxxxxx
-----BEGIN PRIVATE KEY-----

9a:77:5a:e5:87:d5:4f:01
```

Keep your private key in a secure location when it is not in use.

2. Generate your public key from the private key as follows. You will use this later to test that your signed authorization message validates correctly.

```
$ openssl rsa -in private-key.pem -pubout > public-key.pem
```

On inspection, your public key should look like this:

```
$ cat public-key.pem
-----BEGIN PUBLIC KEY-----
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAxQVx0SOB1SgIYd7HonIq
KISwkU2yXtfmLMTU42uF8isqVRiBVgxoWbOOBQh5Tzjk1Sfja+j++MPeqD0wz0t8a
PZGkMmQRZ9mBKdhAauba3990yhzUzmWVJpJ9MxzkhKTzmNnzMSEgcXsJcURQJ4sJk
nf/Ew7xyTGPPrbwCL1rk7L+ZdLSSpPmvdSuPrTt1HQ0e0p6OVlxMX7Aa1t4NcnaN0
wbMfIuf21lTnDQKcu4HtvxYsgN2gLy0eq+p7heh/JkYCOK+L5DEbDpQISQ52TzXs
Hm6KPitON5cG4G5jig/8/bL5PDF/oVEwbSF9H0bWxvjyyMN8VkrxqzEp9gc7D1bg
ywIDAQAB
-----END PUBLIC KEY-----
```

3. Generate an X.509 certificate using the key pair created in the previous. In this example, the certificate expires in 365 days, after which time it cannot be trusted. Be sure to set the expiration appropriately. The `tr -d "\n"` command strips newline characters (line breaks) from the output. You need to provide a Common Name when prompted, but the other fields can be left blank.

```
$ openssl req -new -x509 -key private-key.pem -days 365 | tr -d "\n" > certificate.pem
```

This results in output similar to the following:

```
Enter pass phrase for private-key.pem: ██████████
You are about to be asked to enter information that will be incorporated
into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank
For some fields there will be a default value,
If you enter '.', the field will be left blank.
-----
Country Name (2 letter code) []:
State or Province Name (full name) []:
Locality Name (eg, city) []:
Organization Name (eg, company) []:
Organizational Unit Name (eg, section) []:
Common Name (eg, fully qualified host name) []:example.com
Email Address []:
```

Note

The Common Name is not needed for AWS provisioning. It can be any internal or public domain name.

You can inspect the certificate with the following command:

```
$ cat certificate.pem
```

The output should be a long, PEM-encoded string without line breaks, prefaced by -----BEGIN CERTIFICATE----- and followed by -----END CERTIFICATE-----.

2. Upload the RDAP record to your RIR

Add the certificate that you previously created to the RDAP record for your RIR. Be sure to include the -----BEGIN CERTIFICATE----- and -----END CERTIFICATE----- strings before and after the encoded portion. All of this content must be on a single, long line. The procedure for updating RDAP depends on your RIR:

- For ARIN, add the certificate in the "Public Comments" section for your address range. Do not add it to the comments section for your organization.
- For RIPE, add the certificate as a new "descr" field for your address range. Do not add it to the comments section for your organization.
- For APNIC, email the public key to helpdesk@apnic.net to manually add it to the "remarks" field for your address range. Send the email using the APNIC authorized contact for the IP addresses.

3. Create an ROA object in your RIR

Create an ROA object to authorize the Amazon ASNs 16509 and 14618 to advertise your address range, as well as the ASNs that are currently authorized to advertise the address range. For the AWS GovCloud (US) Region, authorize ASN 8987. You must set the maximum length to the size of the smallest prefix that you want to bring (for example, /24). It might take up to 24 hours for the ROA to become available to Amazon. For more information, consult your RIR:

- ARIN — [ROA Requests](#)
- RIPE — [Managing ROAs](#)
- APNIC — [Route Management](#)

When you migrate advertisements from an on-premises workload to AWS, you must create an ROA for your existing ASN before creating the ROAs for Amazon's ASNs. Otherwise, you might see an impact to your existing routing and advertisements.

Note

This step is not required for non-publicly advertised IPv6 address space.

Onboard your BYOIP

The onboarding process for BYOIP has the following tasks depending on your needs:

Topics

- [Provision a publicly advertised address range in AWS \(p. 1065\)](#)
- [Provision an IPv6 address range that's not publicly advertised \(p. 1066\)](#)
- [Advertise the address range through AWS \(p. 1066\)](#)
- [Deprovision the address range \(p. 1067\)](#)

Provision a publicly advertised address range in AWS

When you provision an address range for use with AWS, you are confirming that you control the address range and are authorizing Amazon to advertise it. We also verify that you control the address range through a signed authorization message. This message is signed with the self-signed X.509 key pair that you used when updating the RDAP record with the X.509 certificate. AWS requires a cryptographically signed authorization message that it presents to the RIR. The RIR authenticates the signature against the certificate that you added to RDAP, and checks the authorization details against the ROA.

To provision the address range

1. Compose message

Compose the plaintext authorization message. The format of the message is as follows, where the date is the expiry date of the message:

```
1 | aws | account | cidr | YYYYMMDD | SHA256 | RSAPSS
```

Replace the account number, address range, and expiry date with your own values to create a message resembling the following:

```
text_message="1|aws|0123456789AB|198.51.100.0/24|20211231|SHA256|RSAPSS"
```

This is not to be confused with an ROA message, which has a similar appearance.

2. Sign message

Sign the plaintext message using the private key that you created previously. The signature returned by this command is a long string that you need to use in the next step.

Important

We recommend that you copy and paste this command. Except for the message content, do not modify or replace any of the values.

```
signed_message=$( echo -n $text_message | openssl dgst -sha256 -sigopt
  rsa_padding_mode:pss -sigopt rsa_pss_saltlen:-1 -sign private-key.pem -keyform PEM |
  openssl base64 | tr -- '+=' '-'_-' | tr -d "\n")
```

3. Provision address

Use the AWS CLI [provision-byoip-cidr](#) command to provision the address range. The `--cidr-authorization-context` option uses the message and signature strings that you created previously.

Important

You must specify the AWS Region where the BYOIP range should be provisioned if it differs from your [AWS CLI configuration Default region name](#).

```
aws ec2 provision-byoip-cidr --cidr address-range --cidr-authorization-context
Message="$text_message",Signature="$signed_message" --region us-east-1
```

Provisioning an address range is an asynchronous operation, so the call returns immediately, but the address range is not ready to use until its status changes from `pending-provision` to `provisioned`.

4. Monitor progress

It can take up to one week to complete the provisioning process for publicly advertisable ranges. Use the [describe-byoip-cidrs](#) command to monitor progress, as in this example:

```
aws ec2 describe-byoip-cidrs --max-results 5 --region us-east-1
```

If there are issues during provisioning and the status goes to `failed-provision`, you must run the `provision-byoip-cidr` command again after the issues have been resolved.

Provision an IPv6 address range that's not publicly advertised

By default, an address range is provisioned to be publicly advertised to the internet. You can provision an IPv6 address range that will not be publicly advertised. For routes that are not publicly advertisable, the provisioning process generally completes within minutes. When you associate an IPv6 CIDR block from a non-public address range with a VPC, the IPv6 CIDR can only be accessed through hybrid connectivity options that support IPv6, such as [AWS Direct Connect](#), [AWS Site-to-Site VPN](#), or [Amazon VPC Transit Gateways](#).

An ROA is not required to provision a non-public address range.

Important

You can only specify whether an address range is publicly advertised during provisioning. You cannot change the advertisable status later on.

To provision an IPv6 address range that will not be publicly advertised, use the following `provision-byoip-cidr` command.

```
aws ec2 provision-byoip-cidr --cidr address-range --cidr-authorization-context  
Message="$text_message",Signature="$signed_message" --no-publicly-advertisable --  
region us-east-1
```

Advertise the address range through AWS

After the address range is provisioned, it is ready to be advertised. You must advertise the exact address range that you provisioned. You can't advertise only a portion of the provisioned address range.

If you provisioned an IPv6 address range that will not be publicly advertised, you do not need to complete this step.

We recommend that you stop advertising the address range from other locations before you advertise it through AWS. If you keep advertising your IP address range from other locations, we can't reliably support it or troubleshoot issues. Specifically, we can't guarantee that traffic to the address range will enter our network.

To minimize down time, you can configure your AWS resources to use an address from your address pool before it is advertised, and then simultaneously stop advertising it from the current location and start advertising it through AWS. For more information about allocating an Elastic IP address from your address pool, see [Allocate an Elastic IP address \(p. 1083\)](#).

Limitations

- You can run the `advertise-byoip-cidr` command at most once every 10 seconds, even if you specify different address ranges each time.
- You can run the `withdraw-byoip-cidr` command at most once every 10 seconds, even if you specify different address ranges each time.

To advertise the address range, use the following `advertise-byoip-cidr` command.

```
aws ec2 advertise-byoip-cidr --cidr address-range --region us-east-1
```

To stop advertising the address range, use the following [withdraw-byoip-cidr](#) command.

```
aws ec2 withdraw-byoip-cidr --cidr address-range --region us-east-1
```

Deprovision the address range

To stop using your address range with AWS, first release any Elastic IP addresses and disassociate any IPv6 CIDR blocks that are still allocated from the address pool. Then stop advertising the address range, and finally, deprovision the address range.

You cannot deprovision a portion of the address range. If you want to use a more specific address range with AWS, deprovision the entire address range and provision a more specific address range.

(IPv4) To release each Elastic IP address, use the following [release-address](#) command.

```
aws ec2 release-address --allocation-id eipalloc-12345678abca --region us-east-1
```

(IPv6) To disassociate an IPv6 CIDR block, use the following [disassociate-vpc-cidr-block](#) command.

```
aws ec2 disassociate-vpc-cidr-block --association-id vpc-cidr-assoc-12345abcd1234abc1 --region us-east-1
```

To stop advertising the address range, use the following [withdraw-byoip-cidr](#) command.

```
aws ec2 withdraw-byoip-cidr --cidr address-range --region us-east-1
```

To deprovision the address range, use the following [deprovision-byoip-cidr](#) command.

```
aws ec2 deprovision-byoip-cidr --cidr address-range --region us-east-1
```

It can take up to a day to deprovision an address range.

Work with your address range

You can view and use the IPv4 and IPv6 address ranges that you've provisioned in your account.

IPv4 address ranges

You can create an Elastic IP address from your IPv4 address pool and use it with your AWS resources, such as EC2 instances, NAT gateways, and Network Load Balancers.

To view information about the IPv4 address pools that you've provisioned in your account, use the following [describe-public-ipv4-pools](#) command.

```
aws ec2 describe-public-ipv4-pools --region us-east-1
```

To create an Elastic IP address from your IPv4 address pool, use the [allocate-address](#) command. You can use the **--public-ipv4-pool** option to specify the ID of the address pool returned by [describe-byoip-cidrs](#). Or you can use the **--address** option to specify an address from the address range that you provisioned.

IPv6 address ranges

To view information about the IPv6 address pools that you've provisioned in your account, use the following [describe-ipv6-pools](#) command.

```
aws ec2 describe-ipv6-pools --region us-east-1
```

To create a VPC and specify an IPv6 CIDR from your IPv6 address pool, use the following [create-vpc](#) command. To let Amazon choose the IPv6 CIDR from your IPv6 address pool, omit the `--ipv6-cidr-block` option.

```
aws ec2 create-vpc --cidr-block 10.0.0.0/16 --ipv6-cidr-block ipv6-cidr --ipv6-pool pool-id  
--region us-east-1
```

To associate an IPv6 CIDR block from your IPv6 address pool with a VPC, use the following [associate-vpc-cidr-block](#) command. To let Amazon choose the IPv6 CIDR from your IPv6 address pool, omit the `--ipv6-cidr-block` option.

```
aws ec2 associate-vpc-cidr-block --vpc-id vpc-123456789abc123ab --ipv6-cidr-block ipv6-cidr  
--ipv6-pool pool-id --region us-east-1
```

To view your VPCs and the associated IPv6 address pool information, use the [describe-vpcs](#) command. To view information about associated IPv6 CIDR blocks from a specific IPv6 address pool, use the following [get-associated-ipv6-pool-cidrs](#) command.

```
aws ec2 get-associated-ipv6-pool-cidrs --pool-id pool-id --region us-east-1
```

If you disassociate the IPv6 CIDR block from your VPC, it's released back into your IPv6 address pool.

For more information about working with IPv6 CIDR blocks in the VPC console, see [Working with VPCs and Subnets](#) in the *Amazon VPC User Guide*.

Validate your BYOIP

1. Validate the self-signed x.509 key pair

Validate that the certificate has been uploaded and is valid via the whois command.

For ARIN, use `whois -h whois.arin.net r + 2001:0DB8:6172::/48` to look up the RDAP record for your address range. Check the `remarks` section for the NetRange (network range) in the command output. The certificate should be added in the Public Comments section for the address range.

You can inspect the `remarks` containing the certificate using the following command:

```
whois -h whois.arin.net r + 2001:0DB8:6172::/48 | grep Comment | grep BEGIN
```

This returns output with the contents of the key, which should be similar to the following:

```
remarks:  
-----BEGIN CERTIFICATE-----

For RIPE, use `whois -r -h whois.ripe.net 2001:0DB8:7269::/48` to look up the RDAP record for your address range. Check the `descr` section for the `inetnum` object (network range) in the command output. The certificate should be added as a new `desc` field for the address range.

You can inspect the `descr` containing the certificate using the following command:

```
whois -r -h whois.ripe.net 2001:0DB8:7269::/48 | grep descr | grep BEGIN
```

This returns output with the contents of the key, which should be similar to the following:

```

2. Validate the creation of an ROA object

Validate the successful creation of the ROA objects using a `whois` command. Be sure to test your address range against the Amazon ASNs 16509 and 14618, plus the ASNs that are currently authorized to advertise the address range.

You can inspect the ROA objects from different Amazon ASNs with your address range by using the following command:

```
whois -h whois.bgpmon.net " --roa 16509 2001:0DB8:1000::/48"
```

In this example output, the response has a result of 0 – Valid for the Amazon ASN 16509. This indicates the ROA object for the address range was created successfully:

```
0 - Valid  
-----  
ROA Details  
-----  
Origin ASN: AS16509  
Not valid Before: 2021-11-19 05:00:00  
Not valid After: 2021-12-24 05:00:00 Expires in 16d8h39m12s  
Trust Anchor: rpki.arin.net  
Prefixes: 2001:0DB8::/32 (max length /48)
```

In this example output, the response has an error of 1 – Not Found. This indicates the ROA object for the address range has not been created:

```
1 - Not Found
```

In this example output, the response has an error of 2 – Not Valid. This indicates the ROA object for the address range was not created successfully:

```
2 - Not Valid: Invalid Origin ASN, expected 15169
```

For more information, see the AWS Online Tech talk [Deep Dive on Bring Your Own IP](#).

Assigning prefixes to Amazon EC2 network interfaces

You can assign a private IPv4 or IPv6 CIDR range, either automatically or manually, to your network interfaces. By assigning prefixes, you scale and simplify the management of applications, including container and networking applications that require multiple IP addresses on an instance.

The following assignment options are available:

- **Automatic assignment** — AWS chooses the prefix from your VPC subnet's IPv4 or IPv6 CIDR and assigns to your network interface.
- **Manual Assignment** — You specify the prefix from your VPC subnet's IPv4 and IPv6 CIDRs, and AWS verifies that the prefix is not already assigned to other resources before assigning it to your network interface.

Assigning prefixes has the following benefits:

- Increased IP addresses on a network interface — When you use a prefix, you assign a block of IP addresses as opposed to individual IP addresses. This increases the number of IP addresses on a network interface.
- Simplified VPC management for containers — In container applications, each container requires a unique IP address. Assigning prefixes to your instance simplifies the management of your VPCs, as you can launch and terminate containers without having to call Amazon EC2 APIs for individual IP assignments.

Topics

- [Basics for assigning prefixes \(p. 1071\)](#)
- [Considerations and limits for prefixes \(p. 1072\)](#)
- [Work with prefixes \(p. 1072\)](#)

Basics for assigning prefixes

- You can assign a prefix to new or existing network interfaces.
- To use prefixes, you first assign a prefix to your network interface, then attach the network interface to your instance, and then configure your operating system.
- When you choose the option to specify a prefix, the prefix must meet the following requirements:
 - The IPv4 prefix that you can specify is /28.
 - The IPv6 prefix that you can specify is /80.
 - The prefix is in the subnet CIDR of the network interface, and it does not overlap with other prefixes or IP addresses assigned to existing resources in the subnet.
- You can assign a prefix to the primary or secondary network interface.
- You can assign an Elastic IP address to a network interface that has a prefix assigned to it.

- We resolve the private DNS host name of an instance to the primary private IPv4 address.
- We assign each private IPv4 address on a network interface, including those from prefixes, with the following forms:
 - us-east-1 Region

`ip-private-ipv4-address.ec2.internal`

- All other Regions

`ip-private-ipv4-address.region.compute.internal`

Considerations and limits for prefixes

Take the following into consideration when you use prefixes:

- Network interfaces with prefixes are supported with nitro-based instances.
- Prefixes for network interfaces are limited to private IPv4 and IPv6 addresses.
- See [IP addresses per network interface per instance type \(p. 1093\)](#) for limitations.
- The number of prefixes and IP addresses on a network interface must be less than the limit on the instance that the network interface is associated with. For example, if you have a c5.large instance, the limit is 10 IPv4 addresses and 10 IPv6 addresses on a network interface, and the total number of /28 and /80 prefixes must be less than 10.
- Prefixes are included in source/destination checks.

Work with prefixes

Topics

- [Assign prefixes during network interface creation \(p. 1072\)](#)
- [Assign prefixes to existing network interfaces \(p. 1077\)](#)
- [Configure your operating system for network interfaces with prefixes \(p. 1079\)](#)
- [View the prefixes assigned to your network interfaces \(p. 1079\)](#)
- [Remove prefixes from your network interfaces \(p. 1081\)](#)

Assign prefixes during network interface creation

If you use the automatic assignment option, you can reserve a block of IP addresses in your subnet. AWS chooses the prefixes from this block. For more information, see [Subnet CIDR reservations](#) in the *Amazon VPC User Guide*.

After you have created the network interface, use the [attach-network-interface](#) AWS CLI command to attach the network interface to your instance. You must configure your operating system to work with network interfaces with prefixes. For more information, see [Configure your operating system for network interfaces with prefixes \(p. 1079\)](#).

Topics

- [Assign automatic prefixes during network interface creation \(p. 1073\)](#)
- [Assign specific prefixes during network interface creation \(p. 1075\)](#)

Assign automatic prefixes during network interface creation

You can assign automatic prefixes during network interface creation using one of the following methods.

Console

To assign automatic prefixes during network interface creation

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces** and then choose **Create network interface**.
3. Specify a description for the network interface, select the subnet in which to create the network interface, and configure the private IPv4 and IPv6 addresses.
4. Expand **Advanced settings** and do the following:
 - a. To automatically assign an IPv4 prefix, for **IPv4 prefix delegation**, choose **Auto-assign**. Then for **Number of IPv4 prefixes**, specify the number of prefixes to assign.
 - b. To automatically assign an IPv6 prefix, for **IPv6 prefix delegation**, choose **Auto-assign**. Then for **Number of IPv6 prefixes**, specify the number of prefixes to assign.

Note

IPv6 prefix delegation appears only if the selected subnet is enabled for IPv6.

5. Select the security groups to associate with the network interface and assign resource tags if needed.
6. Choose **Create network interface**.

AWS CLI

To assign automatic IPv4 prefixes during network interface creation

Use the [create-network-interface](#) command and set `--ipv4-prefix-count` to the number of prefixes that you want AWS to assign. In the following example, AWS assigns 1 prefix.

```
$ aws ec2 create-network-interface \
--subnet-id subnet-047cfed18eEXAMPLE \
--description "IPv4 automatic example" \
--ipv4-prefix-count 1
```

Example output

```
{
  "NetworkInterface": {
    "AvailabilityZone": "us-west-2a",
    "Description": "IPv4 automatic example",
    "Groups": [
      {
        "GroupName": "default",
        "GroupId": "sg-044c2de2c4EXAMPLE"
      }
    ],
    "InterfaceType": "interface",
    "Ipv6Addresses": [],
    "MacAddress": "02:98:65:dd:18:47",
    "NetworkInterfaceId": "eni-02b80b4668EXAMPLE",
    "OwnerId": "123456789012",
    "PrivateIpAddress": "10.0.0.62",
    "PrivateIpAddresses": [
      {
        "Primary": true,
        "PrivateIpAddress": "10.0.0.62"
      }
    ]
  }
}
```

```
        },
    ],
    "Ipv4Prefixes": [
        {
            "Ipv4Prefix": "10.0.0.208/28"
        }
    ],
    "RequesterId": "AIDAI5AJI5LXF5XXDPCO",
    "RequesterManaged": false,
    "SourceDestCheck": true,
    "Status": "pending",
    "SubnetId": "subnet-047cfed18eEXAMPLE",
    "TagSet": [],
    "VpcId": "vpc-0e12f52b21EXAMPLE"
}
}
```

To assign automatic IPv6 prefixes during network interface creation

Use the [create-network-interface](#) command and set `--ipv6-prefix-count` to the number of prefixes that you want AWS to assign. In the following example, AWS assigns 1 prefix.

```
$ aws ec2 create-network-interface \
--subnet-id subnet-047cfed18eEXAMPLE \
--description "IPv6 automatic example" \
--ipv6-prefix-count 1
```

Example output

```
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "Description": "IPv6 automatic example",
        "Groups": [
            {
                "GroupName": "default",
                "GroupId": "sg-044c2de2c4EXAMPLE"
            }
        ],
        "InterfaceType": "interface",
        "Ipv6Addresses": [],
        "MacAddress": "02:bb:e4:31:fe:09",
        "NetworkInterfaceId": "eni-006edbca4EXAMPLE",
        "OwnerId": "123456789012",
        "PrivateIpAddress": "10.0.0.73",
        "PrivateIpAddresses": [
            {
                "Primary": true,
                "PrivateIpAddress": "10.0.0.73"
            }
        ],
        "Ipv6Prefixes": [
            {
                "Ipv6Prefix": "2600:1f13:fc2:a700:1768::/80"
            }
        ],
        "RequesterId": "AIDAI5AJI5LXF5XXDPCO",
        "RequesterManaged": false,
        "SourceDestCheck": true,
        "Status": "pending",
        "SubnetId": "subnet-047cfed18eEXAMPLE",
        "TagSet": [],
        "VpcId": "vpc-0e12f52b21EXAMPLE"
    }
}
```

```
}
```

Assign specific prefixes during network interface creation

You can assign specific prefixes during network interface creation using one of the following methods.

Console

To assign specific prefixes during network interface creation

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces** and then choose **Create network interface**.
3. Specify a description for the network interface, select the subnet in which to create the network interface, and configure the private IPv4 and IPv6 addresses.
4. Expand **Advanced settings** and do the following:
 - a. To assign a specific IPv4 prefix, for **IPv4 prefix delegation**, choose **Custom**. Then choose **Add new prefix** and enter the prefix to use.
 - b. To assign a specific IPv6 prefix, for **IPv6 prefix delegation**, choose **Custom**. Then choose **Add new prefix** and enter the prefix to use.

Note

IPv6 prefix delegation appears only if the selected subnet is enabled for IPv6.

5. Select the security groups to associate with the network interface and assign resource tags if needed.
6. Choose **Create network interface**.

AWS CLI

To assign specific IPv4 prefixes during network interface creation

Use the `create-network-interface` command and set `--ipv4-prefixes` to the prefixes. AWS selects IP addresses from this range. In the following example, the prefix CIDR is `10.0.0.208/28`.

```
$ aws ec2 create-network-interface \
--subnet-id subnet-047cfed18eEXAMPLE \
--description "IPv4 manual example" \
--ipv4-prefixes Ipv4Prefix=10.0.0.208/28
```

Example output

```
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "Description": "IPv4 manual example",
        "Groups": [
            {
                "GroupName": "default",
                "GroupId": "sg-044c2de2c4EXAMPLE"
            }
        ],
        "InterfaceType": "interface",
        "Ipv6Addresses": [],
        "MacAddress": "02:98:65:dd:18:47",
        "NetworkInterfaceId": "eni-02b80b4668EXAMPLE",
        "OwnerId": "123456789012",
        "PrivateDns": "ip-10-0-0-208.us-west-2.compute.internal",
        "PrivateIpAddress": "10.0.0.208",
        "Status": "available"
    }
}
```

```
"PrivateIpAddress": "10.0.0.62",
"PrivateIpAddresses": [
    {
        "Primary": true,
        "PrivateIpAddress": "10.0.0.62"
    }
],
"Ipv4Prefixes": [
    {
        "Ipv4Prefix": "10.0.0.208/28"
    }
],
"RequesterId": "AIDAI5AJI5LXF5XXDPCO",
"RequesterManaged": false,
"SourceDestCheck": true,
"Status": "pending",
"SubnetId": "subnet-047cfed18eEXAMPLE",
"TagSet": [],
"VpcId": "vpc-0e12f52b21EXAMPLE"
}
}
```

To assign specific IPv6 prefixes during network interface creation

Use the [create-network-interface](#) command and set `--ipv6-prefixes` to the prefixes. AWS selects IP addresses from this range. In the following example, the prefix CIDR is `2600:1f13:fc2:a700:1768::/80`.

```
$ aws ec2 create-network-interface \
--subnet-id subnet-047cfed18eEXAMPLE \
--description "IPv6 manual example" \
--ipv6-prefixes Ipv6Prefix=2600:1f13:fc2:a700:1768::/80
```

Example output

```
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "Description": "IPv6 automatic example",
        "Groups": [
            {
                "GroupName": "default",
                "GroupId": "sg-044c2de2c4EXAMPLE"
            }
        ],
        "InterfaceType": "interface",
        "Ipv6Addresses": [],
        "MacAddress": "02:bb:e4:31:fe:09",
        "NetworkInterfaceId": "eni-006edbcbfa4EXAMPLE",
        "OwnerId": "123456789012",
        "PrivateIpAddress": "10.0.0.73",
        "PrivateIpAddresses": [
            {
                "Primary": true,
                "PrivateIpAddress": "10.0.0.73"
            }
        ],
        "Ipv6Prefixes": [
            {
                "Ipv6Prefix": "2600:1f13:fc2:a700:1768::/80"
            }
        ],
    }
}
```

```
        "RequesterId": "AIDAI5AJI5LXF5XXDPCO",
        "RequesterManaged": false,
        "SourceDestCheck": true,
        "Status": "pending",
        "SubnetId": "subnet-047cfed18eEXAMPLE",
        "TagSet": [],
        "VpcId": "vpc-0e12f52b21EXAMPLE"
    }
}
```

Assign prefixes to existing network interfaces

After you have assigned the prefixes, use the [attach-network-interface](#) AWS CLI command to attach the network interface to your instance. You must configure your operating system to work with network interfaces with prefixes. For more information, see [Configure your operating system for network interfaces with prefixes \(p. 1079\)](#).

Assign automatic prefixes to an existing network interface

You can assign automatic prefixes to an existing network interface using one of the following methods.

Console

To assign automatic prefixes to an existing network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface to which to assign the prefixes, and choose **Actions, Manage prefixes**.
4. To automatically assign an IPv4 prefix, for **IPv4 prefix delegation**, choose **Auto-assign**. Then for **Number of IPv4 prefixes**, specify the number of prefixes to assign.
5. To automatically assign an IPv6 prefix, for **IPv6 prefix delegation**, choose **Auto-assign**. Then for **Number of IPv6 prefixes**, specify the number of prefixes to assign.

Note

IPv6 prefix delegation appears only if the selected subnet is enabled for IPv6.

6. Choose **Save**.

AWS CLI

You can use the [assign-ipv6-addresses](#) command to assign IPv6 prefixes and the [assign-private-ip-addresses](#) command to assign IPv4 prefixes to existing network interfaces.

To assign automatic IPv4 prefixes to an existing network interface

Use the [assign-private-ip-addresses](#) command and set `--ipv4-prefix-count` to the number of prefixes that you want AWS to assign. In the following example, AWS assigns 1 IPv4 prefix.

```
$ aws ec2 assign-private-ip-addresses \
--network-interface-id eni-081fbb4095EXAMPLE \
--ipv4-prefix-count 1
```

Example output

```
{  
    "NetworkInterfaceId": "eni-081fbb4095EXAMPLE",
```

```
"AssignedIpv4Prefixes": [  
    {  
        "Ipv4Prefix": "10.0.0.176/28"  
    }  
]
```

To assign automatic IPv6 prefixes to an existing network interface

Use the [assign-ipv6-addresses](#) command and set `--ipv6-prefix-count` to the number of prefixes that you want AWS to assign. In the following example, AWS assigns 1 IPv6 prefix.

```
$ aws ec2 assign-ipv6-addresses \  
--network-interface-id eni-00d577338cEXAMPLE \  
--ipv6-prefix-count 1
```

Example output

```
{  
    "AssignedIpv6Prefixes": [  
        "2600:1f13:fc2:a700:18bb::/80"  
    ],  
    "NetworkInterfaceId": "eni-00d577338cEXAMPLE"  
}
```

Assign specific prefixes to an existing network interface

You can assign specific prefixes to an existing network interface using one of the following methods.

Console

To assign specific prefixes to an existing network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface to which to assign the prefixes, and choose **Actions**, **Manage prefixes**.
4. To assign a specific IPv4 prefix, for **IPv4 prefix delegation**, choose **Custom**. Then choose **Add new prefix** and enter the prefix to use.
5. To assign a specific IPv6 prefix, for **IPv6 prefix delegation**, choose **Custom**. Then choose **Add new prefix** and enter the prefix to use.

Note

IPv6 prefix delegation appears only if the selected subnet is enabled for IPv6.

6. Choose **Save**.

AWS CLI

Assign specific IPv4 prefixes to an existing network interface

Use the [assign-private-ip-addresses](#) command and set `--ipv4-prefixes` to the prefix. AWS selects IPv4 addresses from this range. In the following example, the prefix CIDR is `10.0.0.208/28`.

```
$ aws ec2 assign-private-ip-addresses \  
--network-interface-id eni-081fbb4095EXAMPLE \  
--ipv4-prefixes 10.0.0.208/28
```

Example output

```
{  
    "NetworkInterfaceId": "eni-081fbb4095EXAMPLE",  
    "AssignedIpv4Prefixes": [  
        {  
            "Ipv4Prefix": "10.0.0.208/28"  
        }  
    ]  
}
```

Assign specific IPv6 prefixes to an existing network interface

Use the [assign-ipv6-addresses](#) command and set `--ipv6-prefixes` to the prefix. AWS selects IPv6 addresses from this range. In the following example, the prefix CIDR is `2600:1f13:fc2:a700:18bb::/80`.

```
$ aws ec2 assign-ipv6-addresses \  
--network-interface-id eni-00d577338cEXAMPLE \  
--ipv6-prefixes 2600:1f13:fc2:a700:18bb::/80
```

Example output

```
{  
    "NetworkInterfaceId": "eni-00d577338cEXAMPLE",  
    "AssignedIpv6Prefixes": [  
        {  
            "Ipv6Prefix": "2600:1f13:fc2:a700:18bb::/80"  
        }  
    ]  
}
```

Configure your operating system for network interfaces with prefixes

Amazon Linux AMIs might contain additional scripts installed by AWS, known as `ec2-net-utils`. These scripts optionally automate the configuration of your network interfaces. They are available for Amazon Linux only.

If you are not using Amazon Linux, you can use a Container Network Interface (CNI) for Kubernetes plug-in, or `dockerd` if you use Docker to manage your containers.

View the prefixes assigned to your network interfaces

You can view the prefixes assigned to your network interfaces using one of the following methods.

Console

To view the automatic prefixes assigned to an existing network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface for which to view the prefixes and choose the **Details** tab.
4. The **IPv4 Prefix Delegation** field lists the assigned IPv4 prefixes, and the **IPv6 Prefix Delegation** field lists the assigned IPv6 prefixes.

AWS CLI

You can use the [describe-network-interfaces](#) AWS CLI command to view the prefixes assigned to your network interfaces.

```
$ aws ec2 describe-network-interfaces
```

Example output

```
{  
    "NetworkInterfaces": [  
        {  
            "AvailabilityZone": "us-west-2a",  
            "Description": "IPv4 automatic example",  
            "Groups": [  
                {  
                    "GroupName": "default",  
                    "GroupId": "sg-044c2de2c4EXAMPLE"  
                }  
            ],  
            "InterfaceType": "interface",  
            "Ipv6Addresses": [],  
            "MacAddress": "02:98:65:dd:18:47",  
            "NetworkInterfaceId": "eni-02b80b4668EXAMPLE",  
            "OwnerId": "123456789012",  
            "PrivateIpAddress": "10.0.0.62",  
            "PrivateIpAddresses": [  
                {  
                    "Primary": true,  
                    "PrivateIpAddress": "10.0.0.62"  
                }  
            ],  
            "Ipv4Prefixes": [  
                {  
                    "Ipv4Prefix": "10.0.0.208/28"  
                }  
            ],  
            "Ipv6Prefixes": [],  
            "RequesterId": "AIDAI5AJI5LXF5XXDPCO",  
            "RequesterManaged": false,  
            "SourceDestCheck": true,  
            "Status": "available",  
            "SubnetId": "subnet-05eef9fb78EXAMPLE",  
            "TagSet": [],  
            "VpcId": "vpc-0e12f52b2146bf252"  
        },  
        {  
            "AvailabilityZone": "us-west-2a",  
            "Description": "IPv6 automatic example",  
            "Groups": [  
                {  
                    "GroupName": "default",  
                    "GroupId": "sg-044c2de2c411c91b5"  
                }  
            ],  
            "InterfaceType": "interface",  
            "Ipv6Addresses": [],  
            "MacAddress": "02:bb:e4:31:fe:09",  
            "NetworkInterfaceId": "eni-006edbcfa4EXAMPLE",  
            "OwnerId": "123456789012",  
            "PrivateIpAddress": "10.0.0.73",  
            "PrivateIpAddresses": [  
                {  
                    "Primary": true,  
                }  
            ]  
        }  
    ]  
}
```

```
        "PrivateIpAddress": "10.0.0.73"
    },
],
"Ipv4Prefixes": [],
"Ipv6Prefixes": [
{
    "Ipv6Prefix": "2600:1f13:fc2:a700:1768::/80"
}
],
"RequesterId": "AIDAI5AJI5LXF5XXDPCO",
"RequesterManaged": false,
"SourceDestCheck": true,
"Status": "available",
"SubnetId": "subnet-05eef9fb78EXAMPLE",
"TagSet": [],
"VpcId": "vpc-0e12f52b21EXAMPLE"
}
]
```

Remove prefixes from your network interfaces

You can remove prefixes from your network interfaces using one of the following methods.

Console

To remove the prefixes from a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface from which to remove the prefixes and choose **Actions, Manage prefixes**.
4. Do one of the following:
 - To remove all assigned prefixes, for **IPv4 prefix delegation** and **IPv6 prefix delegation**, choose **Do not assign**.
 - To remove specific assigned prefixes, for **IPv4 prefix delegation** or **IPv6 prefix delegation**, choose **Custom** and then choose **Unassign** next to the prefixes to remove.

Note

IPv6 prefix delegation appears only if the selected subnet is enabled for IPv6.

5. Choose **Save**.

AWS CLI

You can use the **unassign-ipv6-addresses** command to remove IPv6 prefixes and the **unassign-private-ip-addresses** commands to remove IPv4 prefixes from your existing network interfaces.

To remove IPv4 prefixes from a network interface

Use the **unassign-private-ip-addresses** command and set **--ipv4-prefix** to the address that you want to remove.

```
$ aws ec2 unassign-private-ip-addresses \
--network-interface-id eni-081fbb4095EXAMPLE \
```

```
--ipv4-prefixes 10.0.0.176/28
```

To remove IPv6 prefixes from a network interface

Use the [unassign-ipv6-addresses](#) command and set --ipv6-prefix to the address that you want to remove.

```
$ aws ec2 unassign-ipv6-addresses \
--network-interface-id eni-00d577338cEXAMPLE \
--ipv6-prefix 2600:1f13:fc2:a700:18bb::/80
```

Elastic IP addresses

An *Elastic IP address* is a static IPv4 address designed for dynamic cloud computing. An Elastic IP address is allocated to your AWS account, and is yours until you release it. By using an Elastic IP address, you can mask the failure of an instance or software by rapidly remapping the address to another instance in your account. Alternatively, you can specify the Elastic IP address in a DNS record for your domain, so that your domain points to your instance. For more information, see the documentation for your domain registrar, or [Set up dynamic DNS on Your Amazon Linux instance \(p. 718\)](#).

An Elastic IP address is a public IPv4 address, which is reachable from the internet. If your instance does not have a public IPv4 address, you can associate an Elastic IP address with your instance to enable communication with the internet. For example, this allows you to connect to your instance from your local computer.

We currently do not support Elastic IP addresses for IPv6.

Contents

- [Elastic IP address pricing \(p. 1082\)](#)
- [Elastic IP address basics \(p. 1082\)](#)
- [Work with Elastic IP addresses \(p. 1083\)](#)
- [Use reverse DNS for email applications \(p. 1089\)](#)
- [Elastic IP address limit \(p. 1090\)](#)

Elastic IP address pricing

To ensure efficient use of Elastic IP addresses, we impose a small hourly charge if an Elastic IP address is not associated with a running instance, or if it is associated with a stopped instance or an unattached network interface. While your instance is running, you are not charged for one Elastic IP address associated with the instance, but you are charged for any additional Elastic IP addresses associated with the instance.

For more information, see Elastic IP Addresses on the [Amazon EC2 Pricing, On-Demand Pricing page](#).

Elastic IP address basics

The following are the basic characteristics of an Elastic IP address:

- An Elastic IP address is static; it does not change over time.
- To use an Elastic IP address, you first allocate one to your account, and then associate it with your instance or a network interface.

- When you associate an Elastic IP address with an instance, it is also associated with the instance's primary network interface. When you associate an Elastic IP address with a network interface that is attached to an instance, it is also associated with the instance.
- When you associate an Elastic IP address with an instance or its primary network interface, the instance's public IPv4 address (if it had one) is released back into Amazon's pool of public IPv4 addresses. You cannot reuse a public IPv4 address, and you cannot convert a public IPv4 address to an Elastic IP address. For more information, see [Public IPv4 addresses \(p. 1038\)](#).
- You can disassociate an Elastic IP address from a resource, and then associate it with a different resource. To avoid unexpected behavior, ensure that all active connections to the resource named in the existing association are closed before you make the change. After you have associated your Elastic IP address to a different resource, you can reopen your connections to the newly associated resource.
- A disassociated Elastic IP address remains allocated to your account until you explicitly release it. We impose a small hourly charge for Elastic IP addresses that are not associated with a running instance.
- When you associate an Elastic IP address with an instance that previously had a public IPv4 address, the public DNS host name of the instance changes to match the Elastic IP address.
- We resolve a public DNS host name to the public IPv4 address or the Elastic IP address of the instance outside the network of the instance, and to the private IPv4 address of the instance from within the network of the instance.
- An Elastic IP address comes from Amazon's pool of IPv4 addresses, or from a custom IP address pool that you have brought to your AWS account.
- When you allocate an Elastic IP address from an IP address pool that you have brought to your AWS account, it does not count toward your Elastic IP address limits. For more information, see [Elastic IP address limit \(p. 1090\)](#).
- When you allocate the Elastic IP addresses, you can associate the Elastic IP addresses with a network border group. This is the location from which we advertise the CIDR block. Setting the network border group limits the CIDR block to this group. If you do not specify the network border group, we set the border group containing all of the Availability Zones in the Region (for example, us-west-2).
- An Elastic IP address is for use in a specific network border group only.
- An Elastic IP address is for use in a specific Region only, and cannot be moved to a different Region.

Work with Elastic IP addresses

The following sections describe how you can work with Elastic IP addresses.

Tasks

- [Allocate an Elastic IP address \(p. 1083\)](#)
- [Describe your Elastic IP addresses \(p. 1084\)](#)
- [Tag an Elastic IP address \(p. 1085\)](#)
- [Associate an Elastic IP address with an instance or network interface \(p. 1086\)](#)
- [Disassociate an Elastic IP address \(p. 1087\)](#)
- [Release an Elastic IP address \(p. 1088\)](#)
- [Recover an Elastic IP address \(p. 1089\)](#)

Allocate an Elastic IP address

You can allocate an Elastic IP address from Amazon's pool of public IPv4 addresses, or from a custom IP address pool that you have brought to your AWS account. For more information about bringing your own IP address range to your AWS account, see [Bring your own IP addresses \(BYOIP\) in Amazon EC2 \(p. 1058\)](#).

You can allocate an Elastic IP address using one of the following methods.

New console

To allocate an Elastic IP address

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network & Security, Elastic IPs**.
3. Choose **Allocate Elastic IP address**.
4. For **Public IPv4 address pool**, choose one of the following:
 - **Amazon's pool of IPv4 addresses**—If you want an IPv4 address to be allocated from Amazon's pool of IPv4 addresses.
 - **Public IPv4 address that you bring to your AWS account**—If you want to allocate an IPv4 address from an IP address pool that you have brought to your AWS account. This option is disabled if you do not have any IP address pools.
 - **Customer owned pool of IPv4 addresses**—If you want to allocate an IPv4 address from a pool created from your on-premises network for use with an AWS Outpost. This option is disabled if you do not have an AWS Outpost.
5. (Optional) Add or remove a tag.

[Add a tag] Choose **Add new tag** and do the following:

 - For **Key**, enter the key name.
 - For **Value**, enter the key value.

[Remove a tag] Choose **Remove** to the right of the tag's Key and Value.
6. Choose **Allocate**.

Old console

To allocate an Elastic IP address

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Choose **Allocate new address**.
4. For **IPv4 address pool**, choose **Amazon pool**.
5. Choose **Allocate**, and close the confirmation screen.

AWS CLI

To allocate an Elastic IP address

Use the [allocate-address](#) AWS CLI command.

PowerShell

To allocate an Elastic IP address

Use the [New-EC2Address](#) AWS Tools for Windows PowerShell command.

Describe your Elastic IP addresses

You can describe an Elastic IP address using one of the following methods.

New console

To describe your Elastic IP addresses

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to view and choose **Actions, View details**.

Old console

To describe your Elastic IP addresses

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select a filter from the Resource Attribute list to begin searching. You can use multiple filters in a single search.

AWS CLI

To describe your Elastic IP addresses

Use the [describe-addresses](#) AWS CLI command.

PowerShell

To describe your Elastic IP addresses

Use the [Get-EC2Address](#) AWS Tools for Windows PowerShell command.

Tag an Elastic IP address

You can assign custom tags to your Elastic IP addresses to categorize them in different ways, for example, by purpose, owner, or environment. This helps you to quickly find a specific Elastic IP address based on the custom tags that you assigned to it.

Cost allocation tracking using Elastic IP address tags is not supported.

You can tag an Elastic IP address using one of the following methods.

New console

To tag an Elastic IP address

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to tag and choose **Actions, View details**.
4. In the **Tags** section, choose **Manage tags**.
5. Specify a tag key and value pair.
6. (Optional) Choose **Add tag** to add additional tags.
7. Choose **Save**.

Old console

To tag an Elastic IP address

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to tag and choose **Tags**.
4. Choose **Add/Edit Tags**.
5. In the **Add/Edit Tags** dialog box, choose **Create Tag**, and then specify the key and value for the tag.
6. (Optional) Choose **Create Tag** to add additional tags to the Elastic IP address.
7. Choose **Save**.

AWS CLI

To tag an Elastic IP address

Use the [create-tags](#) AWS CLI command.

```
aws ec2 create-tags --resources eipalloc-12345678 --tags Key=Owner,Value=TeamA
```

PowerShell

To tag an Elastic IP address

Use the [New-EC2Tag](#) AWS Tools for Windows PowerShell command.

The `New-EC2Tag` command needs a `Tag` parameter, which specifies the key and value pair to be used for the Elastic IP address tag. The following commands create the `Tag` parameter.

```
PS C:\> $tag = New-Object Amazon.EC2.Model.Tag
PS C:\> $tag.Key = "Owner"
PS C:\> $tag.Value = "TeamA"
```

```
PS C:\> New-EC2Tag -Resource eipalloc-12345678 -Tag $tag
```

Associate an Elastic IP address with an instance or network interface

If you're associating an Elastic IP address with your instance to enable communication with the internet, you must also ensure that your instance is in a public subnet. For more information, see [Internet Gateways](#) in the *Amazon VPC User Guide*.

You can associate an Elastic IP address with an instance or network interface using one of the following methods.

New console

To associate an Elastic IP address with an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to associate and choose **Actions, Associate Elastic IP address**.
4. For **Resource type**, choose **Instance**.
5. For instance, choose the instance with which to associate the Elastic IP address. You can also enter text to search for a specific instance.

6. (Optional) For **Private IP address**, specify a private IP address with which to associate the Elastic IP address.
7. Choose **Associate**.

To associate an Elastic IP address with a network interface

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to associate and choose **Actions, Associate Elastic IP address**.
4. For **Resource type**, choose **Network interface**.
5. For **Network interface**, choose the network interface with which to associate the Elastic IP address. You can also enter text to search for a specific network interface.
6. (Optional) For **Private IP address**, specify a private IP address with which to associate the Elastic IP address.
7. Choose **Associate**.

Old console

To associate an Elastic IP address with an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select an Elastic IP address and choose **Actions, Associate address**.
4. Select the instance from **Instance** and then choose **Associate**.

AWS CLI

To associate an Elastic IP address

Use the [associate-address](#) AWS CLI command.

PowerShell

To associate an Elastic IP address

Use the [Register-EC2Address](#) AWS Tools for Windows PowerShell command.

Disassociate an Elastic IP address

You can disassociate an Elastic IP address from an instance or network interface at any time. After you disassociate the Elastic IP address, you can reassociate it with another resource.

You can disassociate an Elastic IP address using one of the following methods.

New console

To disassociate and reassociate an Elastic IP address

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to disassociate, choose **Actions, Disassociate Elastic IP address**.
4. Choose **Disassociate**.

Old console

To disassociate and reassociate an Elastic IP address

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address, choose **Actions**, and then select **Disassociate address**.
4. Choose **Disassociate address**.

AWS CLI

To disassociate an Elastic IP address

Use the [disassociate-address](#) AWS CLI command.

PowerShell

To disassociate an Elastic IP address

Use the [Unregister-EC2Address](#) AWS Tools for Windows PowerShell command.

Release an Elastic IP address

If you no longer need an Elastic IP address, we recommend that you release it using one of the following methods. The address to release must not be currently associated with an AWS resource, such as an EC2 instance, NAT gateway, or Network Load Balancer.

New console

To release an Elastic IP address

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to release and choose **Actions**, **Release Elastic IP addresses**.
4. Choose **Release**.

Old console

To release an Elastic IP address

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address, choose **Actions**, and then select **Release addresses**. Choose **Release** when prompted.

AWS CLI

To release an Elastic IP address

Use the [release-address](#) AWS CLI command.

PowerShell

To release an Elastic IP address

Use the [Remove-EC2Address](#) AWS Tools for Windows PowerShell command.

Recover an Elastic IP address

If you have released your Elastic IP address, you might be able to recover it. The following rules apply:

- You cannot recover an Elastic IP address if it has been allocated to another AWS account, or if it will result in your exceeding your Elastic IP address limit.
- You cannot recover tags associated with an Elastic IP address.
- You can recover an Elastic IP address using the Amazon EC2 API or a command line tool only.

AWS CLI

To recover an Elastic IP address

Use the [allocate-address](#) AWS CLI command and specify the IP address using the `--address` parameter as follows.

```
aws ec2 allocate-address --domain vpc --address 203.0.113.3
```

PowerShell

To recover an Elastic IP address

Use the [New-EC2Address](#) AWS Tools for Windows PowerShell command and specify the IP address using the `-Address` parameter as follows.

```
PS C:\> New-EC2Address -Address 203.0.113.3 -Domain vpc -Region us-east-1
```

Use reverse DNS for email applications

If you intend to send email to third parties from an instance, we recommend that you provision one or more Elastic IP addresses and assign static reverse DNS records to the Elastic IP addresses that you use to send email. This can help you avoid having your email flagged as spam by some anti-spam organizations. AWS works with ISPs and internet anti-spam organizations to reduce the chance that your email sent from these addresses will be flagged as spam.

Considerations

- Before you create a reverse DNS record, you must set a corresponding forward DNS record (record type A) that points to your Elastic IP address.
- If a reverse DNS record is associated with an Elastic IP address, the Elastic IP address is locked to your account and cannot be released from your account until the record is removed.

To create a reverse DNS record using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address and choose **Actions, Update reverse DNS**.
4. For **Reverse DNS domain name**, enter the domain name.
5. Enter **update** to confirm.

6. Choose **Update**.

To create a reverse DNS record using the AWS CLI

Use the [modify-address-attribute](#) AWS CLI command.

To remove a reverse DNS record using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address and choose **Actions, Update reverse DNS**.
4. For **Reverse DNS domain name**, clear the domain name.
5. Enter **update** to confirm.
6. Choose **Update**.

To remove a reverse DNS record using the AWS CLI

Use the [reset-address-attribute](#) AWS CLI command.

AWS GovCloud (US) Region

You can't create a reverse DNS record using the methods above. AWS must assign the static reverse DNS records for you. Open [Request to remove reverse DNS and email sending limitations](#) and provide us with your Elastic IP addresses and reverse DNS records.

Elastic IP address limit

By default, all AWS accounts are limited to five (5) Elastic IP addresses per Region, because public (IPv4) internet addresses are a scarce public resource. We strongly encourage you to use an Elastic IP address primarily for the ability to remap the address to another instance in the case of instance failure, and to use [DNS hostnames](#) for all other inter-node communication.

To verify how many Elastic IP addresses are in use

Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/> and choose **Elastic IPs** from the navigation pane.

To verify your current account limit for Elastic IP addresses

You can verify your limit in either the Amazon EC2 console or the Service Quotas console. Do one of the following:

- Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

Choose **Limits** from the navigation pane, and then enter **IP** in the search field. The limit is **EC2-VPC Elastic IPs**. If you have access to EC2-Classic, there is an additional limit, **EC2-Classic Elastic IPs**.

- Open the Service Quotas console at <https://console.aws.amazon.com/servicequotas/>.

On the Dashboard, choose **Amazon Elastic Compute Cloud (Amazon EC2)**. If Amazon Elastic Compute Cloud (Amazon EC2) is not listed on the Dashboard, choose **AWS services**, enter **EC2** in the search field, and then choose **Amazon Elastic Compute Cloud (Amazon EC2)**.

On the Amazon EC2 service quotas page, enter **IP** in the search field. The limit is **EC2-VPC Elastic IPs**. If you have access to EC2-Classic, there is an additional limit, **EC2-Classic Elastic IPs**. For more information, choose the limit.

If you think your architecture warrants additional Elastic IP addresses, you can request a quota increase directly from the Service Quotas console.

Elastic network interfaces

An *elastic network interface* is a logical networking component in a VPC that represents a virtual network card. It can include the following attributes:

- A primary private IPv4 address from the IPv4 address range of your VPC
- One or more secondary private IPv4 addresses from the IPv4 address range of your VPC
- One Elastic IP address (IPv4) per private IPv4 address
- One public IPv4 address
- One or more IPv6 addresses
- One or more security groups
- A MAC address
- A source/destination check flag
- A description

You can create and configure network interfaces and attach them to instances in the same Availability Zone. Your account might also have *requester-managed* network interfaces, which are created and managed by AWS services to enable you to use other resources and services. You cannot manage these network interfaces yourself. For more information, see [Requester-managed network interfaces \(p. 1121\)](#).

This AWS resource is referred to as a *network interface* in the AWS Management Console and the Amazon EC2 API. Therefore, we use "network interface" in this documentation instead of "elastic network interface". The term "network interface" in this documentation always means "elastic network interface".

Contents

- [Network interface basics \(p. 1091\)](#)
- [Network cards \(p. 1093\)](#)
- [IP addresses per network interface per instance type \(p. 1093\)](#)

- [Best practices for configuring network interfaces \(p. 1118\)](#)
- [Scenarios for network interfaces \(p. 1119\)](#)
- [Requester-managed network interfaces \(p. 1121\)](#)

Network interface basics

You can create a network interface, attach it to an instance, detach it from an instance, and attach it to another instance. The attributes of a network interface follow it as it's attached or detached from an instance and reattached to another instance. When you move a network interface from one instance to another, network traffic is redirected to the new instance.

Primary network interface

Each instance has a default network interface, called the *primary network interface*. You cannot detach a primary network interface from an instance. You can create and attach additional network interfaces. The maximum number of network interfaces that you can use varies by instance type. For more information, see [IP addresses per network interface per instance type \(p. 1093\)](#).

Public IPv4 addresses for network interfaces

In a VPC, all subnets have a modifiable attribute that determines whether network interfaces created in that subnet (and therefore instances launched into that subnet) are assigned a public IPv4 address. For more information, see [IP addressing behavior for your subnet](#) in the *Amazon VPC User Guide*. The public IPv4 address is assigned from Amazon's pool of public IPv4 addresses. When you launch an instance, the IP address is assigned to the primary network interface that's created.

When you create a network interface, it inherits the public IPv4 addressing attribute from the subnet. If you later modify the public IPv4 addressing attribute of the subnet, the network interface keeps the setting that was in effect when it was created. If you launch an instance and specify an existing network interface as the primary network interface, the public IPv4 address attribute is determined by this network interface.

For more information, see [Public IPv4 addresses \(p. 1038\)](#).

Elastic IP addresses for network interface

If you have an Elastic IP address, you can associate it with one of the private IPv4 addresses for the network interface. You can associate one Elastic IP address with each private IPv4 address.

If you disassociate an Elastic IP address from a network interface, you can release it back to the address pool. This is the only way to associate an Elastic IP address with an instance in a different subnet or VPC, as network interfaces are specific to subnets.

IPv6 addresses for network interfaces

If you associate IPv6 CIDR blocks with your VPC and subnet, you can assign one or more IPv6 addresses from the subnet range to a network interface. Each IPv6 address can be assigned to one network interface.

All subnets have a modifiable attribute that determines whether network interfaces created in that subnet (and therefore instances launched into that subnet) are automatically assigned an IPv6 address from the range of the subnet. For more information, see [IP addressing behavior for your subnet](#) in the *Amazon VPC User Guide*. When you launch an instance, the IPv6 address is assigned to the primary network interface that's created.

For more information, see [IPv6 addresses \(p. 1039\)](#).

Prefix Delegation

A Prefix Delegation prefix is a reserved private IPv4 or IPv6 CIDR range that you allocate for automatic or manual assignment to network interfaces that are associated with an instance. By using Delegated Prefixes, you can launch services faster by assigning a range of IP addresses as a single prefix.

Termination behavior

You can set the termination behavior for a network interface that's attached to an instance. You can specify whether the network interface should be automatically deleted when you terminate the instance to which it's attached.

Source/destination checking

You can enable or disable source/destination checks, which ensure that the instance is either the source or the destination of any traffic that it receives. Source/destination checks are enabled by default. You must disable source/destination checks if the instance runs services such as network address translation, routing, or firewalls.

Monitoring IP traffic

You can enable a VPC flow log on your network interface to capture information about the IP traffic going to and from a network interface. After you've created a flow log, you can view and retrieve its data in Amazon CloudWatch Logs. For more information, see [VPC Flow Logs](#) in the *Amazon VPC User Guide*.

Network cards

Instances with multiple network cards provide higher network performance, including bandwidth capabilities above 100 Gbps and improved packet rate performance. Each network interface is attached to a network card. The primary network interface must be assigned to network card index 0.

If you enable Elastic Fabric Adapter (EFA) when you launch an instance that supports multiple network cards, all network cards are available. You can assign up to one EFA per network card. An EFA counts as a network interface.

The following instances support multiple network cards. All other instance types support one network card.

Instance type	Number of network cards
d11.24xlarge	4
p4d.24xlarge	4

IP addresses per network interface per instance type

The following table lists the maximum number of network interfaces per instance type, and the maximum number of private IPv4 addresses and IPv6 addresses per network interface. The limit for IPv6 addresses is separate from the limit for private IPv4 addresses per network interface. Not all instance types support IPv6 addressing.

Instance type	Maximum network interfaces	Private IPv4 addresses per interface	IPv6 addresses per interface
a1.medium	2	4	4

You can use the [describe-instance-types](#) AWS CLI command to display information about an instance type, such as the supported network interfaces and IP addresses per interface. The following example displays this information for all C5 instances.

```
aws ec2 describe-instance-types --filters "Name=instance-type,Values=c5.*" --query "InstanceTypes[ ].{Type: InstanceType, MaxENI: NetworkInfo.MaximumNetworkInterfaces, IPv4addr: NetworkInfo.Ipv4AddressesPerInterface}" --output table
-----
|           DescribeInstanceTypes           |
+---+---+---+
| IPv4addr | MaxENI |     Type   |
+---+---+---+
| 30       | 8      | c5.4xlarge |
| 50       | 15     | c5.24xlarge|
| 15       | 4      | c5.xlarge  |
| 30       | 8      | c5.12xlarge|
| 10       | 3      | c5.large   |
| 15       | 4      | c5.2xlarge |
| 50       | 15     | c5.metal   |
| 30       | 8      | c5.9xlarge |
| 50       | 15     | c5.18xlarge|
+---+---+---+
```

Work with network interfaces

You can work with network interfaces using the Amazon EC2 console or the command line.

Contents

- [Create a network interface \(p. 1110\)](#)
- [View details about a network interface \(p. 1111\)](#)
- [Attach a network interface to an instance \(p. 1112\)](#)
- [Detach a network interface from an instance \(p. 1113\)](#)
- [Manage IP addresses \(p. 1114\)](#)
- [Modify network interface attributes \(p. 1115\)](#)
- [Add or edit tags \(p. 1116\)](#)
- [Delete a network interface \(p. 1117\)](#)

Create a network interface

You can create a network interface in a subnet. You can't move the network interface to another subnet after it's created. You must attach a network interface to an instance in the same Availability Zone.

New console

To create a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Choose **Create network interface**.
4. (Optional) For **Description**, enter a descriptive name.
5. For **Subnet**, select a subnet. The options available in the subsequent steps change depending on the type of subnet you select (IPv4-only, IPv6-only, or dual-stack (IPv4 and IPv6)).
6. For **Private IPv4 address**, do one of the following:
 - Choose **Auto-assign** to allow Amazon EC2 to select an IPv4 address from the subnet.
 - Choose **Custom** and enter an IPv4 address that you select from the subnet.

7. (Subnets with IPv6 addresses only) For **IPv6 address**, do one of the following:
 - Choose **None** if you do not want to assign an IPv6 address to the network interface.
 - Choose **Auto-assign** to allow Amazon EC2 to select an IPv6 address from the subnet.
 - Choose **Custom** and enter an IPv6 address that you select from the subnet.
8. (Optional) To create an Elastic Fabric Adapter, choose **Elastic Fabric Adapter, Enable**.
9. For **Security groups**, select one or more security groups.
10. (Optional) For each tag, choose **Add new tag** and enter a tag key and an optional tag value.
11. Choose **Create network interface**.

Old console

To create a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Choose **Create Network Interface**.
4. For **Description**, enter a descriptive name.
5. For **Subnet**, select the subnet.
6. For **Private IP (or IPv4 Private IP)**, enter the primary private IPv4 address. If you don't specify an IPv4 address, we select an available private IPv4 address from within the selected subnet.
7. (IPv6 only) If you selected a subnet that has an associated IPv6 CIDR block, you can optionally specify an IPv6 address in the **IPv6 IP** field.
8. To create an Elastic Fabric Adapter, select **Elastic Fabric Adapter**.
9. For **Security groups**, select one or more security groups.
10. (Optional) Choose **Add Tag** and enter a tag key and a tag value.
11. Choose **Yes, Create**.

To create a network interface using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [create-network-interface](#) (AWS CLI)
- [New-EC2NetworkInterface](#) (AWS Tools for Windows PowerShell)

View details about a network interface

You can view all the network interfaces in your account.

New console

To describe a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. To view the details page for a network interface, select the ID of the network interface. Alternatively, to view information without leaving the network interfaces page, select the checkbox for the network interface.

Old console

To describe a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface.
4. To view the details, choose **Details**.

To describe a network interface using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [describe-network-interfaces](#) (AWS CLI)
- [Get-EC2NetworkInterface](#) (AWS Tools for Windows PowerShell)

To describe a network interface attribute using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [describe-network-interface-attribute](#) (AWS CLI)
- [Get-EC2NetworkInterfaceAttribute](#) (AWS Tools for Windows PowerShell)

Attach a network interface to an instance

You can attach a network interface to any instance in the same Availability Zone as the network interface, using either the **Instances** or **Network Interfaces** page of the Amazon EC2 console. Alternatively, you can specify existing network interfaces when you [launch instances \(p. 580\)](#).

Important

For EC2 instances in an IPv6-only subnet, if you attach a secondary network interface to the instance, the private DNS hostname of the second network interface will resolve to the first IPv6 address on the instance's first network interface. For more information about EC2 instance private DNS hostnames, see [Amazon EC2 instance hostname types \(p. 1053\)](#).

If the public IPv4 address on your instance is released, it does not receive a new one if there is more than one network interface attached to the instance. For more information about the behavior of public IPv4 addresses, see [Public IPv4 addresses \(p. 1038\)](#).

Instances page

To attach a network interface to an instance using the Instances page

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the checkbox for the instance.
4. Choose **Actions, Networking, Attach network interface**.
5. Select a network interface. If the instance supports multiple network cards, you can choose a network card.
6. Choose **Attach**.

Network Interfaces page

To attach a network interface to an instance using the Network Interfaces page

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions, Attach**.
5. Choose an instance. If the instance supports multiple network cards, you can choose a network card.
6. Choose **Attach**.

To attach a network interface to an instance using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [attach-network-interface \(AWS CLI\)](#)
- [Add-EC2NetworkInterface \(AWS Tools for Windows PowerShell\)](#)

Detach a network interface from an instance

You can detach a secondary network interface that is attached to an EC2 instance at any time, using either the **Instances** or **Network Interfaces** page of the Amazon EC2 console.

If you try to detach a network interface that is attached to a resource from another service, such as an Elastic Load Balancing load balancer, a Lambda function, a WorkSpace, or a NAT gateway, you get an error that you do not have permission to access the resource. To find which service created the resource attached to a network interface, check the description of the network interface. If you delete the resource, then its network interface is deleted.

Instances page

To detach a network interface from an instance using the Instances page

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the checkbox for the instance. Check the **Network interfaces** section of the **Networking** tab to verify that the network interface is attached to an instance as a secondary network interface.
4. Choose **Actions, Networking, Detach network interface**.
5. Select the network interface and choose **Detach**.

Network Interfaces page

To detach a network interface from an instance using the Network Interfaces page

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface. Check the **Instance details** section of the **Details** tab to verify that the network interface is attached to an instance as a secondary network interface.

4. Choose **Actions, Detach**.
5. When prompted for confirmation, choose **Detach**.
6. If the network interface fails to detach from the instance, choose **Force detachment, Enable** and then try again. We recommend that force detachment only as a last resort. Forcing a detachment can prevent you from attaching a different network interface on the same index until you restart the instance. It can also prevent the instance metadata from reflecting that the network interface was detached until you restart the instance.

To detach a network interface using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [detach-network-interface](#) (AWS CLI)
- [Dismount-EC2NetworkInterface](#) (AWS Tools for Windows PowerShell)

Manage IP addresses

You can manage the following IP addresses for your network interfaces:

- Elastic IP addresses (one per private IPv4 address)
- IPv4 addresses
- IPv6 addresses

To manage the Elastic IP addresses of a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. To associate an Elastic IP address, do the following:
 - a. Choose **Actions, Associate address**.
 - b. For **Elastic IP address**, select the Elastic IP address.
 - c. For **Private IPv4 address**, select the private IPv4 address to associate with the Elastic IP address.
 - d. (Optional) Choose **Allow the Elastic IP address to be reassociated** if the network interface is currently associated with another instance or network interface.
 - e. Choose **Associate**.
5. To disassociate an Elastic IP address, do the following:
 - a. Choose **Actions, Disassociate address**.
 - b. For **Public IP address**, select the Elastic IP address.
 - c. Choose **Disassociate**.

To manage the IPv4 and IPv6 addresses of a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface.
4. Choose **Actions, Manage IP addresses**.
5. Expand the network interface.

6. For **IPv4 addresses**, modify the IP addresses as needed. To assign an IPv4 address, choose **Assign new IP address** and then specify an IPv4 address from the subnet range or let AWS choose one for you. To unassign an IPv4 address, choose **Unassign** next to the address.
7. For **IPv6 addresses**, modify the IP addresses as needed. To assign an IPv6 address, choose **Assign new IP address** and then specify an IPv6 address from the subnet range or let AWS choose one for you. To unassign an IPv6 address, choose **Unassign** next to the address.
8. Choose **Save**.

To manage the IP addresses of a network interface using the AWS CLI

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [assign-ipv6-addresses](#)
- [associate-address](#)
- [disassociate-address](#)
- [unassign-ipv6-addresses](#)

To manage the IP addresses of a network interface using the Tools for Windows PowerShell

You can use one of the following commands.

- [Register-EC2Address](#)
- [Register-EC2Ipv6AddressList](#)
- [Unregister-EC2Address](#)
- [Unregister-EC2Ipv6AddressList](#)

Modify network interface attributes

You can change the following network interface attributes:

- [Description \(p. 1115\)](#)
- [Security groups \(p. 1115\)](#)
- [Delete on termination \(p. 1116\)](#)
- [Source/destination check \(p. 1116\)](#)

To change the description of a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions, Change description**.
5. For **Description**, enter a description for the network interface.
6. Choose **Save**.

To change the security groups of a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions, Change security groups**.
5. For **Associated security groups**, select the security groups to use, and then choose **Save**.

The security group and network interface must be created for the same VPC. To change the security group for interfaces owned by other services, such as Elastic Load Balancing, do so through that service.

To change the termination behavior of a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions, Change termination behavior**.
5. Select or clear **Delete on termination, Enable** as needed, and then choose **Save**.

To change source/destination checking for a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions, Change source/dest check**.
5. Select or clear **Source/destination check, Enable** as needed, and then choose **Save**.

To modify network interface attributes using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [modify-network-interface-attribute](#) (AWS CLI)
- [Edit-EC2NetworkInterfaceAttribute](#) (AWS Tools for Windows PowerShell)

Add or edit tags

Tags are metadata that you can add to a network interface. Tags are private and are only visible to your account. Each tag consists of a key and an optional value. For more information about tags, see [Tag your Amazon EC2 resources \(p. 1692\)](#).

New console

To add or edit tags for a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. In **Tags tab**, choose **Manage tags**.
5. For each tag to create, choose **Add new tag** and enter a key and optional value. When you're done, choose **Save**.

Old console

To add or edit tags for a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface.
4. In the details pane, choose **Tags, Add/Edit Tags**.
5. In the **Add/Edit Tags** dialog box, choose **Create Tag** for each tag to create, and enter a key and optional value. When you're done, choose **Save**.

To add or edit tags for a network interface using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [create-tags](#) (AWS CLI)
- [New-EC2Tag](#) (AWS Tools for Windows PowerShell)

Delete a network interface

Deleting a network interface releases all attributes associated with the interface and releases any private IP addresses or Elastic IP addresses to be used by another instance.

You cannot delete a network interface that is in use. First, you must [detach the network interface \(p. 1113\)](#).

New console

To delete a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface, and then choose **Actions, Delete**.
4. When prompted for confirmation, choose **Delete**.

Old console

To delete a network interface using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Select a network interface and choose **Delete**.
4. In the **Delete Network Interface** dialog box, choose **Yes, Delete**.

To delete a network interface using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [delete-network-interface](#) (AWS CLI)

- [Remove-EC2NetworkInterface](#) (AWS Tools for Windows PowerShell)

Best practices for configuring network interfaces

- You can attach a network interface to an instance when it's running (hot attach), when it's stopped (warm attach), or when the instance is being launched (cold attach).
- You can detach secondary network interfaces when the instance is running or stopped. However, you can't detach the primary network interface.
- You can move a network interface from one instance to another, if the instances are in the same Availability Zone and VPC but in different subnets.
- When launching an instance using the CLI, API, or an SDK, you can specify the primary network interface and additional network interfaces.
- Launching an Amazon Linux or Windows Server instance with multiple network interfaces automatically configures interfaces, private IPv4 addresses, and route tables on the operating system of the instance.
- A warm or hot attach of an additional network interface might require you to manually bring up the second interface, configure the private IPv4 address, and modify the route table accordingly. Instances running Amazon Linux or Windows Server automatically recognize the warm or hot attach and configure themselves.
- You cannot attach another network interface to an instance (for example, a NIC teaming configuration) to increase or double the network bandwidth to or from the dual-homed instance.
- If you attach two or more network interfaces from the same subnet to an instance, you might encounter networking issues such as asymmetric routing. If possible, use a secondary private IPv4 address on the primary network interface instead.

Configure your network interface using ec2-net-utils

Amazon Linux AMIs may contain additional scripts installed by AWS, known as ec2-net-utils. These scripts optionally automate the configuration of your network interfaces. These scripts are available for Amazon Linux only.

Use the following command to install the package on Amazon Linux if it's not already installed, or update it if it's installed and additional updates are available:

```
$ yum install ec2-net-utils
```

The following components are part of ec2-net-utils:

udev rules (/etc/udev/rules.d)

Identifies network interfaces when they are attached, detached, or reattached to a running instance, and ensures that the hotplug script runs (`53-ec2-network-interfaces.rules`). Maps the MAC address to a device name (`75-persistent-net-generator.rules`, which generates `70-persistent-net.rules`).

hotplug script

Generates an interface configuration file suitable for use with DHCP (/etc/sysconfig/network-scripts/ifcfg-ethN). Also generates a route configuration file (/etc/sysconfig/network-scripts/route-ethN).

DHCP script

Whenever the network interface receives a new DHCP lease, this script queries the instance metadata for Elastic IP addresses. For each Elastic IP address, it adds a rule to the routing policy

database to ensure that outbound traffic from that address uses the correct network interface. It also adds each private IP address to the network interface as a secondary address.

ec2ifup ethN

Extends the functionality of the standard **ifup**. After this script rewrites the configuration files **ifcfg-ethN** and **route-ethN**, it runs **ifup**.

ec2ifdown ethN

Extends the functionality of the standard **ifdown**. After this script removes any rules for the network interface from the routing policy database, it runs **ifdown**.

ec2ifscan

Checks for network interfaces that have not been configured and configures them.

This script isn't available in the initial release of ec2-net-utils.

To list any configuration files that were generated by ec2-net-utils, use the following command:

```
$ ls -l /etc/sysconfig/network-scripts/*-eth?
```

To disable the automation, you can add **EC2SYNC=no** to the corresponding **ifcfg-ethN** file. For example, use the following command to disable the automation for the **eth1** interface:

```
$ sed -i -e 's/^EC2SYNC=yes/EC2SYNC=no/' /etc/sysconfig/network-scripts/ifcfg-eth1
```

To disable the automation completely, you can remove the package using the following command:

```
$ yum remove ec2-net-utils
```

Scenarios for network interfaces

Attaching multiple network interfaces to an instance is useful when you want to:

- Create a management network.
- Use network and security appliances in your VPC.
- Create dual-homed instances with workloads/roles on distinct subnets.
- Create a low-budget, high-availability solution.

Create a management network

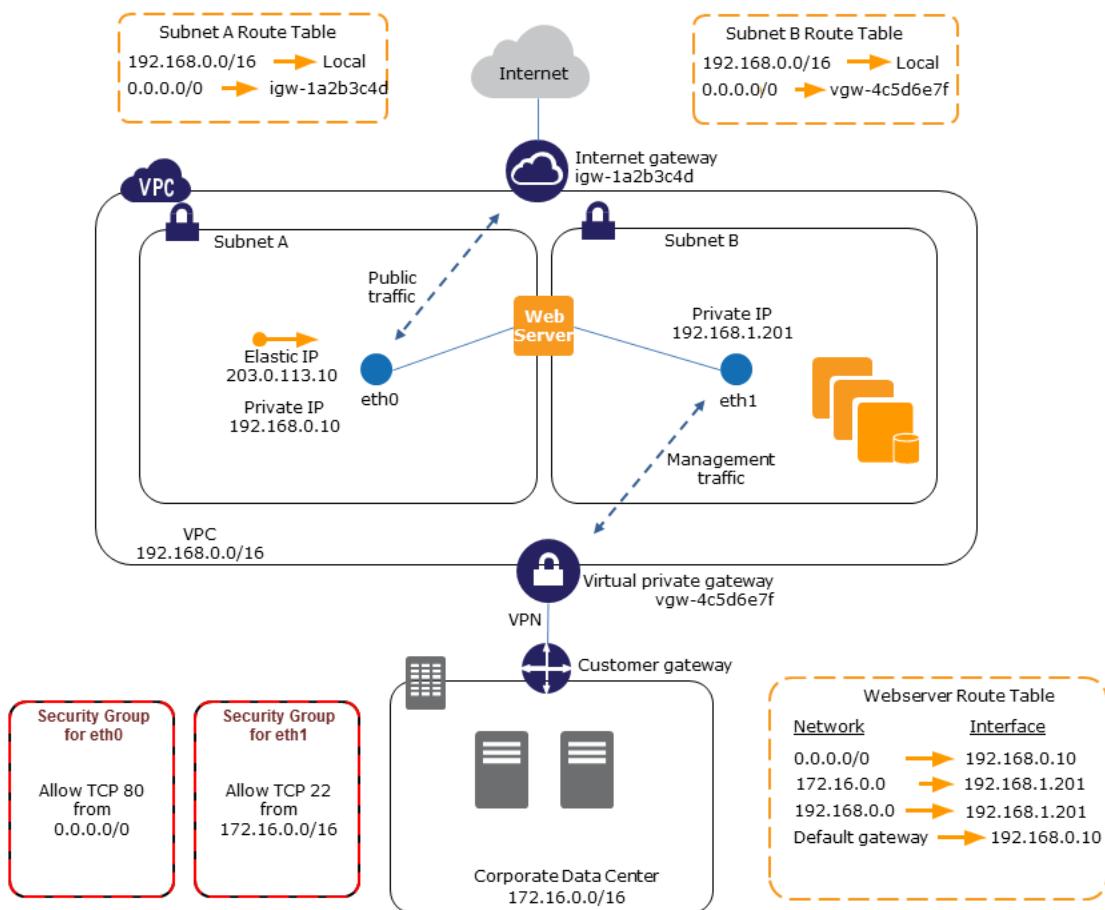

You can create a management network using network interfaces. In this scenario, as illustrated in the following image:

- The primary network interface (**eth0**) on the instance handles public traffic.
- The secondary network interface (**eth1**) handles backend management traffic, and is connected to a separate subnet in your VPC that has more restrictive access controls.

The public interface, which may or may not be behind a load balancer, has an associated security group that allows access to the server from the internet (for example, allow TCP port 80 and 443 from 0.0.0.0/0, or from the load balancer).

The private facing interface has an associated security group allowing SSH access only from an allowed range of IP addresses, either within the VPC, or from the internet, a private subnet within the VPC, or a virtual private gateway.

To ensure failover capabilities, consider using a secondary private IPv4 for incoming traffic on a network interface. In the event of an instance failure, you can move the interface and/or secondary private IPv4 address to a standby instance.

Use network and security appliances in your VPC

Some network and security appliances, such as load balancers, network address translation (NAT) servers, and proxy servers prefer to be configured with multiple network interfaces. You can create and attach secondary network interfaces to instances that are running these types of applications and configure the additional interfaces with their own public and private IP addresses, security groups, and source/destination checking.

Creating dual-homed instances with workloads/roles on distinct subnets

You can place a network interface on each of your web servers that connects to a mid-tier network where an application server resides. The application server can also be dual-homed to a backend network (subnet) where the database server resides. Instead of routing network packets through the dual-homed instances, each dual-homed instance receives and processes requests on the front end, initiates a connection to the backend, and then sends requests to the servers on the backend network.

Create a low budget high availability solution

If one of your instances serving a particular function fails, its network interface can be attached to a replacement or hot standby instance pre-configured for the same role in order to rapidly recover the service. For example, you can use a network interface as your primary or secondary network interface to a critical service such as a database instance or a NAT instance. If the instance fails, you (or more likely, the code running on your behalf) can attach the network interface to a hot standby instance. Because the interface maintains its private IP addresses, Elastic IP addresses, and MAC address, network traffic begins flowing to the standby instance as soon as you attach the network interface to the replacement instance. Users experience a brief loss of connectivity between the time the instance fails and the time that the network interface is attached to the standby instance, but no changes to the route table or your DNS server are required.

Requester-managed network interfaces

A requester-managed network interface is a network interface that an AWS service creates in your VPC on your behalf. The network interface is associated with a resource for another service, such as a DB instance from Amazon RDS, a NAT gateway, or an interface VPC endpoint from AWS PrivateLink.

Considerations

- You can't modify or detach a requester-managed network interface.
- You can view the requester-managed network interfaces in your account and add or remove tags.
- When you delete the resource associated with the network interface, the AWS service detaches the network interface and deletes it.

To view requester-managed network interfaces using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network & Security Network Interfaces**.
3. Select the ID of the network interface to open its details page.
4. The following are the key fields that you can use to determine the purpose of the network interface:
 - **Description:** A description provided by the AWS service that created the interface. For example, "VPC Endpoint Interface vpce-089f2123488812123".
 - **Requester-managed:** Indicates whether the network interface is managed by AWS.
 - **Requester ID:** The alias of AWS account ID of the principal or service that created the network interface. If you created the network interface, this is your AWS account ID. Otherwise, another principal or service created it.

To view requester-managed network interfaces using the AWS CLI

Use the [describe-network-interfaces](#) command as follows.

```
aws ec2 describe-network-interfaces --filters Name=requester-managed,Values=true
```

The following is example output that shows the key fields that you can use to determine the purpose of the network interface: **Description** and **InterfaceType**.

```
{  
    ...  
    "Description": "VPC Endpoint Interface vpce-089f2123488812123",  
    ...  
    "InterfaceType": "vpc_endpoint",  
}
```

```
...  
"NetworkInterfaceId": "eni-0d11e3ccd2c0e6c57",  
...  
"RequesterId": "727180483921",  
"RequesterManaged": true,  
...  
}
```

To view requester-managed network interfaces using the Tools for Windows PowerShell

Use the [Get-EC2NetworkInterface](#) cmdlet as follows.

```
Get-EC2NetworkInterface -Filter @{ Name="requester-managed"; Values="true" }
```

The following is example output that shows the key fields that you can use to determine the purpose of the network interface: `Description` and `InterfaceType`.

```
Description      : VPC Endpoint Interface vpce-089f2123488812123  
...  
InterfaceType   : vpc_endpoint  
...  
NetworkInterfaceId : eni-0d11e3ccd2c0e6c57  
...  
RequesterId     : 727180483921  
RequesterManaged : True  
...
```

Amazon EC2 instance network bandwidth

The network bandwidth available to an EC2 instance depends on several factors.

Bandwidth for aggregate multi-flow traffic available to an instance depends on the destination of the traffic.

Within the Region

Traffic can utilize the full network bandwidth available to the instance.

To other Regions, an internet gateway, or Direct Connect

Traffic can utilize up to 50% of the network bandwidth available to a [current generation instance \(p. 241\)](#) with a minimum of 32 vCPUs. Bandwidth for a current generation instance with less than 32 vCPUs is limited to 5 Gbps.

Bandwidth for single-flow (5-tuple) traffic is limited to 5 Gbps when instances are not in the same [cluster placement group \(p. 1191\)](#). For use cases that require low latency and high single-flow bandwidth, use a cluster placement group to achieve up to 10 Gbps for instances in the same placement group. Alternatively, set up multiple paths between two endpoints to achieve higher bandwidth using Multipath TCP (MPTCP).

Available instance bandwidth

The available network bandwidth of an instance depends on the number of vCPUs that it has. For example, an `m5.8xlarge` instance has 32 vCPUs and 10 Gbps network bandwidth, and an `m5.16xlarge` instance has 64 vCPUs and 20 Gbps network bandwidth. However, instances might not achieve this bandwidth; for example, if they exceed network allowances at the instance level, such

as packet per second or number of tracked connections. How much of the available bandwidth the traffic can utilize depends on the number of vCPUs and the destination. For example, an `m5.16xlarge` instance has 64 vCPUs, so traffic to another instance in the Region can utilize the full bandwidth available (20 Gbps). However, traffic to another instance in a different Region can utilize only 50% of the bandwidth available (10 Gbps).

Typically, instances with 16 vCPUs or fewer (size `4xlarge` and smaller) are documented as having "up to" a specified bandwidth; for example, "up to 10 Gbps". These instances have a baseline bandwidth. To meet additional demand, they can use a network I/O credit mechanism to burst beyond their baseline bandwidth. Instances can use burst bandwidth for a limited time, typically from 5 to 60 minutes, depending on the instance size.

An instance receives the maximum number of network I/O credits at launch. If the instance exhausts its network I/O credits, it returns to its baseline bandwidth. A running instance earns network I/O credits whenever it uses less network bandwidth than its baseline bandwidth. A stopped instance does not earn network I/O credits. Instance burst is on a best effort basis, even when the instance has credits available, as burst bandwidth is a shared resource.

The following documentation describes the network performance for all instances, plus the baseline network bandwidth available for instances that can use burst bandwidth.

- [General purpose instances \(p. 258\)](#)
- [Compute optimized instances \(p. 308\)](#)
- [Memory optimized instances \(p. 319\)](#)
- [Storage optimized instances \(p. 335\)](#)
- [Accelerated computing instances \(p. 351\)](#)

To view network performance using the AWS CLI

You can use the `describe-instance-types` AWS CLI command to display information about an instance type. The following example displays network performance information for all C5 instances.

```
aws ec2 describe-instance-types --filters "Name=instance-type,Values=c5.*" --query
"InstanceTypes[].[InstanceType, NetworkInfo.NetworkPerformance]" --output table
-----
|   DescribeInstanceTypes   |
+-----+-----+
| c5.4xlarge | Up to 10 Gigabit |
| c5.xlarge  | Up to 10 Gigabit |
| c5.12xlarge| 12 Gigabit   |
| c5.24xlarge| 25 Gigabit   |
| c5.9xlarge | 10 Gigabit   |
| c5.2xlarge | Up to 10 Gigabit |
| c5.large   | Up to 10 Gigabit |
| c5.metal   | 25 Gigabit   |
| c5.18xlarge| 25 Gigabit   |
+-----+-----+
```

Monitor instance bandwidth

You can use CloudWatch metrics to monitor instance network bandwidth and the packets sent and received. You can use the network performance metrics provided by the Elastic Network Adapter (ENA) driver to monitor when traffic exceeds the network allowances that Amazon EC2 defines at the instance level.

You can configure whether Amazon EC2 sends metric data for the instance to CloudWatch using one-minute periods or five-minute periods. It is possible that the network performance metrics would show

that an allowance was exceeded and packets were dropped while the CloudWatch instance metrics do not. This can happen when the instance has a short spike in demand for network resources (known as a microburst), but the CloudWatch metrics are not granular enough to reflect these microsecond spikes.

Learn more

- [Instance metrics \(p. 978\)](#)
- [Network performance metrics \(p. 1140\)](#)

Enhanced networking on Linux

Enhanced networking uses single root I/O virtualization (SR-IOV) to provide high-performance networking capabilities on [supported instance types \(p. 1124\)](#). SR-IOV is a method of device virtualization that provides higher I/O performance and lower CPU utilization when compared to traditional virtualized network interfaces. Enhanced networking provides higher bandwidth, higher packet per second (PPS) performance, and consistently lower inter-instance latencies. There is no additional charge for using enhanced networking.

For information about the supported network speed for each instance type, see [Amazon EC2 Instance Types](#).

Contents

- [Enhanced networking support \(p. 1124\)](#)
- [Enable enhanced networking on your instance \(p. 1125\)](#)
- [Enable enhanced networking with the Elastic Network Adapter \(ENA\) on Linux instances \(p. 1125\)](#)
- [Enable enhanced networking with the Intel 82599 VF interface on Linux instances \(p. 1134\)](#)
- [Operating system optimizations \(p. 1140\)](#)
- [Monitor network performance for your EC2 instance \(p. 1140\)](#)
- [Troubleshoot the Elastic Network Adapter \(ENA\) \(p. 1144\)](#)

Enhanced networking support

All [current generation \(p. 241\)](#) instance types support enhanced networking, except for T2 instances.

You can enable enhanced networking using one of the following mechanisms:

Elastic Network Adapter (ENA)

The Elastic Network Adapter (ENA) supports network speeds of up to 100 Gbps for supported instance types.

The current generation instances use ENA for enhanced networking, except for C4, D2, and M4 instances smaller than m4.16xlarge.

Intel 82599 Virtual Function (VF) interface

The Intel 82599 Virtual Function interface supports network speeds of up to 10 Gbps for supported instance types.

The following instance types use the Intel 82599 VF interface for enhanced networking: C3, C4, D2, I2, M4 (excluding m4.16xlarge), and R3.

For a summary of the enhanced networking mechanisms by instance type, see [Summary of networking and storage features \(p. 248\)](#).

Enable enhanced networking on your instance

If your instance type supports the Elastic Network Adapter for enhanced networking, follow the procedures in [Enable enhanced networking with the Elastic Network Adapter \(ENA\) on Linux instances \(p. 1125\)](#).

If your instance type supports the Intel 82599 VF interface for enhanced networking, follow the procedures in [Enable enhanced networking with the Intel 82599 VF interface on Linux instances \(p. 1134\)](#).

Enable enhanced networking with the Elastic Network Adapter (ENA) on Linux instances

Amazon EC2 provides enhanced networking capabilities through the Elastic Network Adapter (ENA). To use enhanced networking, you must install the required ENA module and enable ENA support.

Contents

- [Requirements \(p. 1125\)](#)
- [Enhanced networking performance \(p. 1125\)](#)
- [Test whether enhanced networking is enabled \(p. 1126\)](#)
- [Enable enhanced networking on the Amazon Linux AMI \(p. 1128\)](#)
- [Enable enhanced networking on Ubuntu \(p. 1129\)](#)
- [Enable enhanced networking on Linux \(p. 1130\)](#)
- [Enable enhanced networking on Ubuntu with DKMS \(p. 1132\)](#)
- [Driver release notes \(p. 1134\)](#)
- [Troubleshoot \(p. 1134\)](#)

Requirements

To prepare for enhanced networking using the ENA, set up your instance as follows:

- Launch the instance using a [current generation \(p. 241\)](#) instance type, other than C4, D2, M4 instances smaller than `m4.16xlarge`, or T2.
- Launch the instance using a supported version of the Linux kernel and a supported distribution, so that ENA enhanced networking is enabled for your instance automatically. For more information, see [ENA Linux Kernel Driver Release Notes](#).
- Ensure that the instance has internet connectivity.
- Use [AWS CloudShell](#) from the AWS Management Console, or install and configure the [AWS CLI](#) or the [AWS Tools for Windows PowerShell](#) on any computer you choose, preferably your local desktop or laptop. For more information, see [Access Amazon EC2 \(p. 3\)](#) or the [AWS CloudShell User Guide](#). Enhanced networking cannot be managed from the Amazon EC2 console.
- If you have important data on the instance that you want to preserve, you should back that data up now by creating an AMI from your instance. Updating kernels and kernel modules, as well as enabling the `enaSupport` attribute, might render incompatible instances or operating systems unreachable. If you have a recent backup, your data will still be retained if this happens.

Enhanced networking performance

The following documentation provides a summary of the network performance for the instance types that support ENA enhanced networking:

- Network Performance for Accelerated Computing Instances (p. 351)
- Network Performance for Compute Optimized Instances (p. 313)
- Network Performance for General Purpose Instances (p. 258)
- Network Performance for Memory Optimized Instances (p. 326)
- Network Performance for Storage Optimized Instances (p. 339)

Test whether enhanced networking is enabled

The following AMIs include the required ENA module and have ENA support enabled:

- Amazon Linux 2
- Amazon Linux AMI 2018.03
- Ubuntu 14.04 (with `linux-aws` kernel) or later
- Red Hat Enterprise Linux 7.4 or later
- SUSE Linux Enterprise Server 12 SP2 or later
- CentOS 7.4.1708 or later
- FreeBSD 11.1 or later
- Debian GNU/Linux 9 or later

To test whether enhanced networking is already enabled, verify that the `ena` module is installed on your instance and that the `enaSupport` attribute is set. If your instance satisfies these two conditions, then the `ethtool -i ethn` command should show that the module is in use on the network interface.

Kernel module (`ena`)

To verify that the `ena` module is installed, use the `modinfo` command as shown in the following example.

```
[ec2-user ~]$ modinfo ena
filename:      /lib/modules/4.14.33-59.37.amzn2.x86_64/kernel/drivers/amazon/net/ena/
ena.ko
version:       1.5.0g
license:        GPL
description:   Elastic Network Adapter (ENA)
author:         Amazon.com, Inc. or its affiliates
srcversion:    692C7C68B8A9001CB3F31D0
alias:          pci:v00001D0Fd0000EC21sv*sd*bc*sc*i*
alias:          pci:v00001D0Fd0000EC20sv*sd*bc*sc*i*
alias:          pci:v00001D0Fd00001EC2sv*sd*bc*sc*i*
alias:          pci:v00001D0Fd00000EC2sv*sd*bc*sc*i*
depends:
retpoline:     Y
intree:        Y
name:          ena
...
```

In the above Amazon Linux case, the `ena` module is installed.

```
ubuntu:~$ modinfo ena
ERROR: modinfo: could not find module ena
```

In the above Ubuntu instance, the module is not installed, so you must first install it. For more information, see [Enable enhanced networking on Ubuntu \(p. 1129\)](#).

Instance attribute (enaSupport)

To check whether an instance has the enhanced networking enaSupport attribute set, use one of the following commands. If the attribute is set, the response is true.

- [describe-instances](#) (AWS CLI/AWS CloudShell)

```
aws ec2 describe-instances --instance-ids instance_id --query "Reservations[].[Instances[]].EnaSupport"
```

- [Get-EC2Instance](#) (Tools for Windows PowerShell)

```
(Get-EC2Instance -InstanceId instance-id).Instances.EnaSupport
```

Image attribute (enaSupport)

To check whether an AMI has the enhanced networking enaSupport attribute set, use one of the following commands. If the attribute is set, the response is true.

- [describe-images](#) (AWS CLI/AWS CloudShell)

```
aws ec2 describe-images --image-id ami_id --query "Images[].[EnaSupport]"
```

- [Get-EC2Image](#) (Tools for Windows PowerShell)

```
(Get-EC2Image -ImageId ami_id).EnaSupport
```

Network interface driver

Use the following command to verify that the ena module is being used on a particular interface, substituting the interface name that you want to check. If you are using a single interface (default), it this is eth0. If the operating system supports [predictable network names \(p. 1131\)](#), this could be a name like ens5.

In the following example, the ena module is not loaded, because the listed driver is vif.

```
[ec2-user ~]$ ethtool -i eth0
driver: vif
version:
firmware-version:
bus-info: vif-0
supports-statistics: yes
supports-test: no
supports-eeprom-access: no
supports-register-dump: no
supports-priv-flags: no
```

In this example, the ena module is loaded and at the minimum recommended version. This instance has enhanced networking properly configured.

```
[ec2-user ~]$ ethtool -i eth0
driver: ena
version: 1.5.0g
firmware-version:
expansion-rom-version:
bus-info: 0000:00:05.0
supports-statistics: yes
```

```
supports-test: no
supports-eeprom-access: no
supports-register-dump: no
supports-priv-flags: no
```

Enable enhanced networking on the Amazon Linux AMI

Amazon Linux 2 and the latest versions of the Amazon Linux AMI include the module required for enhanced networking with ENA installed and have ENA support enabled. Therefore, if you launch an instance with an HVM version of Amazon Linux on a supported instance type, enhanced networking is already enabled for your instance. For more information, see [Test whether enhanced networking is enabled \(p. 1126\)](#).

If you launched your instance using an older Amazon Linux AMI and it does not have enhanced networking enabled already, use the following procedure to enable enhanced networking.

To enable enhanced networking on Amazon Linux AMI

1. Connect to your instance.
2. From the instance, run the following command to update your instance with the newest kernel and kernel modules, including ena:

```
[ec2-user ~]$ sudo yum update
```

3. From your local computer, reboot your instance using the Amazon EC2 console or one of the following commands: [reboot-instances](#) (AWS CLI), [Restart-EC2Instance](#) (AWS Tools for Windows PowerShell).
4. Connect to your instance again and verify that the ena module is installed and at the minimum recommended version using the **modinfo ena** command from [Test whether enhanced networking is enabled \(p. 1126\)](#).
5. [EBS-backed instance] From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: [stop-instances](#) (AWS CLI), [Stop-EC2Instance](#) (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should stop the instance in the AWS OpsWorks console so that the instance state remains in sync.

[Instance store-backed instance] You can't stop the instance to modify the attribute. Instead, proceed to this procedure: [To enable enhanced networking on Amazon Linux AMI \(instance store-backed instances\) \(p. 1129\)](#).

6. From your local computer, enable the enhanced networking attribute using one of the following commands:

- [modify-instance-attribute](#) (AWS CLI)

```
aws ec2 modify-instance-attribute --instance-id instance_id --ena-support
```

- [Edit-EC2InstanceAttribute](#) (Tools for Windows PowerShell)

```
Edit-EC2InstanceAttribute -InstanceId instance_id -EnaSupport $true
```

7. (Optional) Create an AMI from the instance, as described in [Create an Amazon EBS-backed Linux AMI \(p. 144\)](#). The AMI inherits the enhanced networking enaSupport attribute from the instance. Therefore, you can use this AMI to launch another instance with enhanced networking enabled by default.
8. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: [start-instances](#) (AWS CLI), [Start-EC2Instance](#) (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should start the instance in the AWS OpsWorks console so that the instance state remains in sync.

9. Connect to your instance and verify that the ena module is installed and loaded on your network interface using the `ethtool -i ethn` command from [Test whether enhanced networking is enabled \(p. 1126\)](#).

If you are unable to connect to your instance after enabling enhanced networking, see [Troubleshoot the Elastic Network Adapter \(ENA\) \(p. 1144\)](#).

To enable enhanced networking on Amazon Linux AMI (instance store-backed instances)

Follow the previous procedure until the step where you stop the instance. Create a new AMI as described in [Create an instance store-backed Linux AMI \(p. 149\)](#), making sure to enable the enhanced networking attribute when you register the AMI.

- [register-image](#) (AWS CLI)

```
aws ec2 register-image --ena-support ...
```

- [Register-EC2Image](#) (AWS Tools for Windows PowerShell)

```
Register-EC2Image -EnaSupport $true ...
```

Enable enhanced networking on Ubuntu

The latest Ubuntu HVM AMIs include the module required for enhanced networking with ENA installed and have ENA support enabled. Therefore, if you launch an instance with the latest Ubuntu HVM AMI on a supported instance type, enhanced networking is already enabled for your instance. For more information, see [Test whether enhanced networking is enabled \(p. 1126\)](#).

If you launched your instance using an older AMI and it does not have enhanced networking enabled already, you can install the `linux-aws` kernel package to get the latest enhanced networking drivers and update the required attribute.

To install the `linux-aws` kernel package (Ubuntu 16.04 or later)

Ubuntu 16.04 and 18.04 ship with the Ubuntu custom kernel (`linux-aws` kernel package). To use a different kernel, contact [AWS Support](#).

To install the `linux-aws` kernel package (Ubuntu Trusty 14.04)

1. Connect to your instance.
2. Update the package cache and packages.

```
ubuntu:~$ sudo apt-get update && sudo apt-get upgrade -y linux-aws
```

Important

If during the update process you are prompted to install grub, use `/dev/xvda` to install grub onto, and then choose to keep the current version of `/boot/grub/menu.lst`.

3. [EBS-backed instance] From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: [stop-instances](#) (AWS CLI), [Stop-EC2Instance](#) (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should stop the instance in the AWS OpsWorks console so that the instance state remains in sync.

[Instance store-backed instance] You can't stop the instance to modify the attribute. Instead, proceed to this procedure: [To enable enhanced networking on Ubuntu \(instance store-backed instances\) \(p. 1130\)](#).

4. From your local computer, enable the enhanced networking attribute using one of the following commands:

- [modify-instance-attribute \(AWS CLI\)](#)

```
aws ec2 modify-instance-attribute --instance-id instance_id --ena-support
```

- [Edit-EC2InstanceAttribute \(Tools for Windows PowerShell\)](#)

```
Edit-EC2InstanceAttribute -InstanceId instance_id -EnaSupport $true
```

5. (Optional) Create an AMI from the instance, as described in [Create an Amazon EBS-backed Linux AMI \(p. 144\)](#). The AMI inherits the enhanced networking enaSupport attribute from the instance. Therefore, you can use this AMI to launch another instance with enhanced networking enabled by default.
6. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: [start-instances \(AWS CLI\)](#), [Start-EC2Instance \(AWS Tools for Windows PowerShell\)](#). If your instance is managed by AWS OpsWorks, you should start the instance in the AWS OpsWorks console so that the instance state remains in sync.

To enable enhanced networking on Ubuntu (instance store-backed instances)

Follow the previous procedure until the step where you stop the instance. Create a new AMI as described in [Create an instance store-backed Linux AMI \(p. 149\)](#), making sure to enable the enhanced networking attribute when you register the AMI.

- [register-image \(AWS CLI\)](#)

```
aws ec2 register-image --ena-support ...
```

- [Register-EC2Image \(AWS Tools for Windows PowerShell\)](#)

```
Register-EC2Image -EnaSupport $true ...
```

Enable enhanced networking on Linux

The latest AMIs for Red Hat Enterprise Linux, SUSE Linux Enterprise Server, and CentOS include the module required for enhanced networking with ENA and have ENA support enabled. Therefore, if you launch an instance with the latest AMI on a supported instance type, enhanced networking is already enabled for your instance. For more information, see [Test whether enhanced networking is enabled \(p. 1126\)](#).

The following procedure provides the general steps for enabling enhanced networking on a Linux distribution other than Amazon Linux AMI or Ubuntu. For more information, such as detailed syntax for commands, file locations, or package and tool support, see the documentation for your Linux distribution.

To enable enhanced networking on Linux

1. Connect to your instance.
2. Clone the source code for the ena module on your instance from GitHub at <https://github.com/amzn/amzn-drivers>. (SUSE Linux Enterprise Server 12 SP2 and later include ENA 2.02 by default, so you are not required to download and compile the ENA driver. For SUSE Linux Enterprise Server 12 SP2 and later, you should file a request to add the driver version you want to the stock kernel).

```
git clone https://github.com/amzn/amzn-drivers
```

3. Compile and install the ena module on your instance. These steps depend on the Linux distribution. For more information about compiling the module on Red Hat Enterprise Linux, see the [AWS Knowledge Center article](#).
4. Run the **sudo depmod** command to update module dependencies.
5. Update **initramfs** on your instance to ensure that the new module loads at boot time. For example, if your distribution supports **dracut**, you can use the following command.

```
dracut -f -v
```

6. Determine if your system uses predictable network interface names by default. Systems that use **systemd** or **udev** versions 197 or greater can rename Ethernet devices and they do not guarantee that a single network interface will be named **eth0**. This behavior can cause problems connecting to your instance. For more information and to see other configuration options, see [Predictable Network Interface Names](#) on the freedesktop.org website.

- a. You can check the **systemd** or **udev** versions on RPM-based systems with the following command.

```
rpm -qa | grep -e '^systemd-[0-9]+\+'|^udev-[0-9]+\+'  
systemd-208-11.el7_0.2.x86_64
```

In the above Red Hat Enterprise Linux 7 example, the **systemd** version is 208, so predictable network interface names must be disabled.

- b. Disable predictable network interface names by adding the **net.ifnames=0** option to the **GRUB_CMDLINE_LINUX** line in **/etc/default/grub**.

```
sudo sed -i '/^GRUB_CMDLINE_LINUX/s/"$/ net.ifnames=0"/' /etc/default/grub
```

- c. Rebuild the grub configuration file.

```
sudo grub2-mkconfig -o /boot/grub2/grub.cfg
```

7. [EBS-backed instance] From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: **stop-instances** (AWS CLI), **Stop-EC2Instance** (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should stop the instance in the AWS OpsWorks console so that the instance state remains in sync.

[Instance store-backed instance] You can't stop the instance to modify the attribute. Instead, proceed to this procedure: [To enable enhanced networking on Linux \(instance store-backed instances\) \(p. 1132\)](#).

8. From your local computer, enable the enhanced networking **enaSupport** attribute using one of the following commands:

- [modify-instance-attribute](#) (AWS CLI)

```
aws ec2 modify-instance-attribute --instance-id instance_id --ena-support
```

- [Edit-EC2InstanceAttribute](#) (Tools for Windows PowerShell)

```
Edit-EC2InstanceAttribute -InstanceId instance_id -EnaSupport $true
```

9. (Optional) Create an AMI from the instance, as described in [Create an Amazon EBS-backed Linux AMI \(p. 144\)](#). The AMI inherits the enhanced networking **enaSupport** attribute from the instance.

Therefore, you can use this AMI to launch another instance with enhanced networking enabled by default.

Important

If your instance operating system contains an `/etc/udev/rules.d/70-persistent-net.rules` file, you must delete it before creating the AMI. This file contains the MAC address for the Ethernet adapter of the original instance. If another instance boots with this file, the operating system will be unable to find the device and `eth0` might fail, causing boot issues. This file is regenerated at the next boot cycle, and any instances launched from the AMI create their own version of the file.

10. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: [start-instances \(AWS CLI\)](#), [Start-EC2Instance \(AWS Tools for Windows PowerShell\)](#). If your instance is managed by AWS OpsWorks, you should start the instance in the AWS OpsWorks console so that the instance state remains in sync.
11. (Optional) Connect to your instance and verify that the module is installed.

If you are unable to connect to your instance after enabling enhanced networking, see [Troubleshoot the Elastic Network Adapter \(ENA\) \(p. 1144\)](#).

To enable enhanced networking on Linux (instance store-backed instances)

Follow the previous procedure until the step where you stop the instance. Create a new AMI as described in [Create an instance store-backed Linux AMI \(p. 149\)](#), making sure to enable the enhanced networking attribute when you register the AMI.

- [register-image \(AWS CLI\)](#)

```
aws ec2 register-image --ena-support ...
```

- [Register-EC2Image \(AWS Tools for Windows PowerShell\)](#)

```
Register-EC2Image -EnaSupport ...
```

Enable enhanced networking on Ubuntu with DKMS

This method is for testing and feedback purposes only. It is not intended for use with production deployments. For production deployments, see [Enable enhanced networking on Ubuntu \(p. 1129\)](#).

Important

Using DKMS voids the support agreement for your subscription. It should not be used for production deployments.

To enable enhanced networking with ENA on Ubuntu (EBS-backed instances)

1. Follow steps 1 and 2 in [Enable enhanced networking on Ubuntu \(p. 1129\)](#).
2. Install the `build-essential` packages to compile the kernel module and the `dkms` package so that your `ena` module is rebuilt every time your kernel is updated.

```
ubuntu:~$ sudo apt-get install -y build-essential dkms
```

3. Clone the source for the `ena` module on your instance from GitHub at <https://github.com/amzn/amzn-drivers>.

```
ubuntu:~$ git clone https://github.com/amzn/amzn-drivers
```

4. Move the `amzn-drivers` package to the `/usr/src/` directory so DKMS can find it and build it for each kernel update. Append the version number (you can find the current version number in the release notes) of the source code to the directory name. For example, version 1.0.0 is shown in the following example.

```
ubuntu:~$ sudo mv amzn-drivers /usr/src/amzn-drivers-1.0.0
```

5. Create the DKMS configuration file with the following values, substituting your version of ena.

Create the file.

```
ubuntu:~$ sudo touch /usr/src/amzn-drivers-1.0.0/dkms.conf
```

Edit the file and add the following values.

```
ubuntu:~$ sudo vim /usr/src/amzn-drivers-1.0.0/dkms.conf
PACKAGE_NAME="ena"
PACKAGE_VERSION="1.0.0"
CLEAN="make -C kernel/linux/ena clean"
MAKE="make -C kernel/linux/ena/ BUILD_KERNEL=${kernelver}"
BUILT_MODULE_NAME[0]="ena"
BUILT_MODULE_LOCATION="kernel/linux/ena"
DEST_MODULE_LOCATION[0]="/updates"
DEST_MODULE_NAME[0]="ena"
AUTOINSTALL="yes"
```

6. Add, build, and install the ena module on your instance using DKMS.

Add the module to DKMS.

```
ubuntu:~$ sudo dkms add -m amzn-drivers -v 1.0.0
```

Build the module using the `dkms` command.

```
ubuntu:~$ sudo dkms build -m amzn-drivers -v 1.0.0
```

Install the module using `dkms`.

```
ubuntu:~$ sudo dkms install -m amzn-drivers -v 1.0.0
```

7. Rebuild initramfs so the correct module is loaded at boot time.

```
ubuntu:~$ sudo update-initramfs -u -k all
```

8. Verify that the ena module is installed using the `modinfo ena` command from [Test whether enhanced networking is enabled \(p. 1126\)](#).

```
ubuntu:~$ modinfo ena
filename:      /lib/modules/3.13.0-74-generic/updates/dkms/ena.ko
version:       1.0.0
license:        GPL
description:   Elastic Network Adapter (ENA)

```

9. Continue with Step 3 in [Enable enhanced networking on Ubuntu \(p. 1129\)](#).

Driver release notes

For information about the versions of the Linux ENA driver, see the [ENA Linux kernel driver release notes](#).

Troubleshoot

For troubleshooting information, see [Troubleshoot the Elastic Network Adapter \(ENA\) \(p. 1144\)](#).

Enable enhanced networking with the Intel 82599 VF interface on Linux instances

Amazon EC2 provides enhanced networking capabilities through the Intel 82599 VF interface, which uses the Intel ixgbevf driver.

Contents

- [Requirements \(p. 1134\)](#)
- [Test whether enhanced networking is enabled \(p. 1135\)](#)
- [Enable enhanced networking on Amazon Linux \(p. 1136\)](#)
- [Enable enhanced networking on Ubuntu \(p. 1137\)](#)
- [Enable enhanced networking on other Linux distributions \(p. 1138\)](#)
- [Troubleshoot connectivity issues \(p. 1140\)](#)

Requirements

To prepare for enhanced networking using the Intel 82599 VF interface, set up your instance as follows:

- Select from the following supported instance types: C3, C4, D2, I2, M4 (excluding m4.16xlarge), and R3.
- Launch the instance from an HVM AMI using Linux kernel version of 2.6.32 or later. The latest Amazon Linux HVM AMIs have the modules required for enhanced networking installed and have the required attributes set. Therefore, if you launch an Amazon EBS-backed, enhanced networking-supported instance using a current Amazon Linux HVM AMI, enhanced networking is already enabled for your instance.

Warning

Enhanced networking is supported only for HVM instances. Enabling enhanced networking with a PV instance can make it unreachable. Setting this attribute without the proper module or module version can also make your instance unreachable.

- Ensure that the instance has internet connectivity.
- Use [AWS CloudShell](#) from the AWS Management Console, or install and configure the [AWS CLI](#) or the [AWS Tools for Windows PowerShell](#) on any computer you choose, preferably your local desktop or laptop. For more information, see [Access Amazon EC2 \(p. 3\)](#) or the [AWS CloudShell User Guide](#). Enhanced networking cannot be managed from the Amazon EC2 console.
- If you have important data on the instance that you want to preserve, you should back that data up now by creating an AMI from your instance. Updating kernels and kernel modules, as well as enabling the `sriovNetSupport` attribute, might render incompatible instances or operating systems unreachable. If you have a recent backup, your data will still be retained if this happens.

Test whether enhanced networking is enabled

Enhanced networking with the Intel 82599 VF interface is enabled if the `ixgbevf` module is installed on your instance and the `sriovNetSupport` attribute is set.

Instance attribute (`sriovNetSupport`)

To check whether an instance has the enhanced networking `sriovNetSupport` attribute set, use one of the following commands:

- [describe-instance-attribute](#) (AWS CLI/AWS CloudShell)

```
aws ec2 describe-instance-attribute --instance-id instance_id --attribute sriovNetSupport
```

- [Get-EC2InstanceAttribute](#) (AWS Tools for Windows PowerShell)

```
Get-EC2InstanceAttribute -InstanceId instance-id -Attribute sriovNetSupport
```

If the attribute isn't set, `SriovNetSupport` is empty. If the attribute is set, the value is simple, as shown in the following example output.

```
"SriovNetSupport": {  
    "Value": "simple"  
},
```

Image attribute (`sriovNetSupport`)

To check whether an AMI already has the enhanced networking `sriovNetSupport` attribute set, use one of the following commands:

- [describe-images](#) (AWS CLI/AWS CloudShell)

```
aws ec2 describe-images --image-id ami_id --query "Images[ ].SriovNetSupport"
```

- [Get-EC2Image](#) (AWS Tools for Windows PowerShell)

```
(Get-EC2Image -ImageId ami-id).SriovNetSupport
```

If the attribute isn't set, `SriovNetSupport` is empty. If the attribute is set, the value is simple.

Network interface driver

Use the following command to verify that the module is being used on a particular interface, substituting the interface name that you want to check. If you are using a single interface (default), this is `eth0`. If the operating system supports [predictable network names \(p. 1138\)](#), this could be a name like `ens5`.

In the following example, the `ixgbevf` module is not loaded, because the listed driver is `vif`.

```
[ec2-user ~]$ ethtool -i eth0
driver: vif
version:
firmware-version:
bus-info: vif-0
supports-statistics: yes
supports-test: no
supports-eeprom-access: no
supports-register-dump: no
supports-priv-flags: no
```

In this example, the `ixgbevf` module is loaded. This instance has enhanced networking properly configured.

```
[ec2-user ~]$ ethtool -i eth0
driver: ixgbevf
version: 4.0.3
firmware-version: N/A
bus-info: 0000:00:03.0
supports-statistics: yes
supports-test: yes
supports-eeprom-access: no
supports-register-dump: yes
supports-priv-flags: no
```

Enable enhanced networking on Amazon Linux

The latest Amazon Linux HVM AMIs have the `ixgbevf` module required for enhanced networking installed and have the required `sriovNetSupport` attribute set. Therefore, if you launch an instance type using a current Amazon Linux HVM AMI, enhanced networking is already enabled for your instance. For more information, see [Test whether enhanced networking is enabled \(p. 1135\)](#).

If you launched your instance using an older Amazon Linux AMI and it does not have enhanced networking enabled already, use the following procedure to enable enhanced networking.

Warning

There is no way to disable the enhanced networking attribute after you've enabled it.

To enable enhanced networking

1. Connect to your instance.
2. From the instance, run the following command to update your instance with the newest kernel and kernel modules, including `ixgbevf`:

```
[ec2-user ~]$ sudo yum update
```

3. From your local computer, reboot your instance using the Amazon EC2 console or one of the following commands: [reboot-instances](#) (AWS CLI), [Restart-EC2Instance](#) (AWS Tools for Windows PowerShell).

4. Connect to your instance again and verify that the `ixgbevf` module is installed and at the minimum recommended version using the `modinfo ixgbevf` command from [Test whether enhanced networking is enabled \(p. 1135\)](#).
5. [EBS-backed instance] From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: `stop-instances` (AWS CLI), `Stop-EC2Instance` (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should stop the instance in the AWS OpsWorks console so that the instance state remains in sync.

[Instance store-backed instance] You can't stop the instance to modify the attribute. Instead, proceed to this procedure: [To enable enhanced networking \(instance store-backed instances\) \(p. 1137\)](#).
6. From your local computer, enable the enhanced networking attribute using one of the following commands:
 - [modify-instance-attribute](#) (AWS CLI/AWS CloudShell)

```
aws ec2 modify-instance-attribute --instance-id instance_id --srivnet-support simple
```
 - [Edit-EC2InstanceAttribute](#) (AWS Tools for Windows PowerShell)

```
Edit-EC2InstanceAttribute -InstanceId instance_id -SriovNetSupport "simple"
```
7. (Optional) Create an AMI from the instance, as described in [Create an Amazon EBS-backed Linux AMI \(p. 144\)](#). The AMI inherits the enhanced networking attribute from the instance. Therefore, you can use this AMI to launch another instance with enhanced networking enabled by default.
8. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: `start-instances` (AWS CLI), `Start-EC2Instance` (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should start the instance in the AWS OpsWorks console so that the instance state remains in sync.
9. Connect to your instance and verify that the `ixgbevf` module is installed and loaded on your network interface using the `ethtool -i ethn` command from [Test whether enhanced networking is enabled \(p. 1135\)](#).

To enable enhanced networking (instance store-backed instances)

Follow the previous procedure until the step where you stop the instance. Create a new AMI as described in [Create an instance store-backed Linux AMI \(p. 149\)](#), making sure to enable the enhanced networking attribute when you register the AMI.

- [register-image](#) (AWS CLI/AWS CloudShell)

```
aws ec2 register-image --srivnet-support simple ...
```
- [Register-EC2Image](#) (AWS Tools for Windows PowerShell)

```
Register-EC2Image -SriovNetSupport "simple" ...
```

Enable enhanced networking on Ubuntu

Before you begin, [check if enhanced networking is already enabled \(p. 1135\)](#) on your instance.

The Quick Start Ubuntu HVM AMIs include the necessary drivers for enhanced networking. If you have a version of `ixgbevf` earlier than 2.16.4, you can install the `linux-aws` kernel package to get the latest enhanced networking drivers.

The following procedure provides the general steps for compiling the `ixgbevf` module on an Ubuntu instance.

To install the `linux-aws` kernel package

1. Connect to your instance.
2. Update the package cache and packages.

```
ubuntu:~$ sudo apt-get update && sudo apt-get upgrade -y linux-aws
```

Important

If during the update process, you are prompted to install `grub`, use `/dev/xvda` to install `grub`, and then choose to keep the current version of `/boot/grub/menu.lst`.

Enable enhanced networking on other Linux distributions

Before you begin, [check if enhanced networking is already enabled \(p. 1135\)](#) on your instance. The latest Quick Start HVM AMIs include the necessary drivers for enhanced networking, therefore you do not need to perform additional steps.

The following procedure provides the general steps if you need to enable enhanced networking with the Intel 82599 VF interface on a Linux distribution other than Amazon Linux or Ubuntu. For more information, such as detailed syntax for commands, file locations, or package and tool support, see the specific documentation for your Linux distribution.

To enable enhanced networking on Linux

1. Connect to your instance.
2. Download the source for the `ixgbevf` module on your instance from Sourceforge at <https://sourceforge.net/projects/e1000/files/ixgbevf%20stable/>.

Versions of `ixgbevf` earlier than 2.16.4, including version 2.14.2, do not build properly on some Linux distributions, including certain versions of Ubuntu.

3. Compile and install the `ixgbevf` module on your instance.

Warning

If you compile the `ixgbevf` module for your current kernel and then upgrade your kernel without rebuilding the driver for the new kernel, your system might revert to the distribution-specific `ixgbevf` module at the next reboot. This could make your system unreachable if the distribution-specific version is incompatible with enhanced networking.

4. Run the `sudo depmod` command to update module dependencies.
5. Update `initramfs` on your instance to ensure that the new module loads at boot time.
6. Determine if your system uses predictable network interface names by default. Systems that use `systemd` or `udev` versions 197 or greater can rename Ethernet devices and they do not guarantee that a single network interface will be named `eth0`. This behavior can cause problems connecting to your instance. For more information and to see other configuration options, see [Predictable Network Interface Names](#) on the freedesktop.org website.
 - a. You can check the `systemd` or `udev` versions on RPM-based systems with the following command:

```
[ec2-user ~]$ rpm -qa | grep -e '^systemd-[0-9]+\+|udev-[0-9]+\+'  
systemd-208-11.el7_0.2.x86_64
```

In the above Red Hat Enterprise Linux 7 example, the **systemd** version is 208, so predictable network interface names must be disabled.

- b. Disable predictable network interface names by adding the `net.ifnames=0` option to the `GRUB_CMDLINE_LINUX` line in `/etc/default/grub`.

```
[ec2-user ~]$ sudo sed -i '/^GRUB_CMDLINE_LINUX/s/"$/ net.ifnames=0"/' /etc/default/grub
```

- c. Rebuild the grub configuration file.

```
[ec2-user ~]$ sudo grub2-mkconfig -o /boot/grub2/grub.cfg
```

7. [EBS-backed instance] From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: [stop-instances](#) (AWS CLI/AWS CloudShell), [Stop-EC2Instance](#) (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should stop the instance in the AWS OpsWorks console so that the instance state remains in sync.

[Instance store-backed instance] You can't stop the instance to modify the attribute. Instead, proceed to this procedure: [To enable enhanced networking \(instance store-backed instances\) \(p. 1139\)](#).

8. From your local computer, enable the enhanced networking attribute using one of the following commands:

- [modify-instance-attribute](#) (AWS CLI/AWS CloudShell)

```
aws ec2 modify-instance-attribute --instance-id instance_id --srivnet-support simple
```

- [Edit-EC2InstanceAttribute](#) (AWS Tools for Windows PowerShell)

```
Edit-EC2InstanceAttribute -InstanceId instance_id -SriovNetSupport "simple"
```

9. (Optional) Create an AMI from the instance, as described in [Create an Amazon EBS-backed Linux AMI \(p. 144\)](#). The AMI inherits the enhanced networking attribute from the instance. Therefore, you can use this AMI to launch another instance with enhanced networking enabled by default.

Important

If your instance operating system contains an `/etc/udev/rules.d/70-persistent-net.rules` file, you must delete it before creating the AMI. This file contains the MAC address for the Ethernet adapter of the original instance. If another instance boots with this file, the operating system will be unable to find the device and `eth0` might fail, causing boot issues. This file is regenerated at the next boot cycle, and any instances launched from the AMI create their own version of the file.

10. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: [start-instances](#) (AWS CLI), [Start-EC2Instance](#) (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should start the instance in the AWS OpsWorks console so that the instance state remains in sync.
11. (Optional) Connect to your instance and verify that the module is installed.

To enable enhanced networking (instance store-backed instances)

Follow the previous procedure until the step where you stop the instance. Create a new AMI as described in [Create an instance store-backed Linux AMI \(p. 149\)](#), making sure to enable the enhanced networking attribute when you register the AMI.

- [register-image](#) (AWS CLI/AWS CloudShell)

```
aws ec2 register-image --srivnet-support simple ...
```

- [Register-EC2Image \(AWS Tools for Windows PowerShell\)](#)

```
Register-EC2Image -SriovNetSupport "simple" ...
```

Troubleshoot connectivity issues

If you lose connectivity while enabling enhanced networking, the `ixgbevf` module might be incompatible with the kernel. Try installing the version of the `ixgbevf` module included with the distribution of Linux for your instance.

If you enable enhanced networking for a PV instance or AMI, this can make your instance unreachable.

For more information, see [How do I enable and configure enhanced networking on my EC2 instances?](#).

Operating system optimizations

To achieve the maximum network performance on instances with enhanced networking, you might need to modify the default operating system configuration. For more information, see [ENAv Linux Driver Best Practices and Performance Optimization Guide](#) on GitHub.

Monitor network performance for your EC2 instance

The Elastic Network Adapter (ENA) driver publishes network performance metrics from the instances where they are enabled. You can use these metrics to troubleshoot instance performance issues, choose the right instance size for a workload, plan scaling activities proactively, and benchmark applications to determine whether they maximize the performance available on an instance.

Amazon EC2 defines network maximums at the instance level to ensure a high-quality networking experience, including consistent network performance across instance sizes. AWS provides maximums for the following for each instance:

- **Bandwidth capability** – Each EC2 instance has a maximum bandwidth for aggregate inbound and outbound traffic, based on instance type and size. Some instances use a network I/O credit mechanism to allocate network bandwidth based on average bandwidth utilization. Amazon EC2 also has maximum bandwidth for traffic to AWS Direct Connect and the internet.
- **Packet-per-second (PPS) performance** – Each EC2 instance has a maximum PPS performance, based on instance type and size.
- **Connections tracked** – The security group tracks each connection established to ensure that return packets are delivered as expected. There is a maximum number of connections that can be tracked per instance.
- **Link-local service access** – Amazon EC2 provides a maximum PPS per network interface for traffic to services such as the DNS service, the Instance Metadata Service, and the Amazon Time Sync Service.

When the network traffic for an instance exceeds a maximum, AWS shapes the traffic that exceeds the maximum by queueing and then dropping network packets. You can monitor when traffic exceeds a maximum using the network performance metrics. These metrics inform you, in real time, of impact to network traffic and possible network performance issues.

Contents

- [Requirements \(p. 1141\)](#)
- [Metrics for the ENA driver \(p. 1141\)](#)
- [View the network performance metrics for your Linux instance \(p. 1142\)](#)
- [Network performance metrics with the DPDK driver for ENA \(p. 1142\)](#)
- [Metrics on instances running FreeBSD \(p. 1143\)](#)

Requirements

The following requirements apply to Linux instances.

- Install ENA driver version 2.2.10 or later. To verify the installed version, use the **ethtool** command. In the following example, the version meets the minimum requirement.

```
[ec2-user ~]$ ethtool -i eth0 | grep version
version: 2.2.10
```

To upgrade your ENA driver, see [Enhanced networking \(p. 1125\)](#).

- To import these metrics to Amazon CloudWatch, install the CloudWatch agent. For more information, see [Collect network performance metrics](#) in the *Amazon CloudWatch User Guide*.

Metrics for the ENA driver

The ENA driver delivers the following metrics to the instance in real time. They provide the cumulative number of packets queued or dropped on each network interface since the last driver reset.

The following metrics are available on Linux instances, FreeBSD instances, and DPDK environments.

Metric	Description
bw_in_allowance_exceeded	The number of packets queued or dropped because the inbound aggregate bandwidth exceeded the maximum for the instance.
bw_out_allowance_exceeded	The number of packets queued or dropped because the outbound aggregate bandwidth exceeded the maximum for the instance.
conntrack_allowance_exceeded	The number of packets dropped because connection tracking exceeded the maximum for the instance and new connections could not be established. This can result in packet loss for traffic to or from the instance.
linklocal_allowance_exceeded	The number of packets dropped because the PPS of the traffic to local proxy services exceeded the maximum for the network interface. This impacts traffic to the DNS service, the Instance Metadata Service, and the Amazon Time Sync Service.
pps_allowance_exceeded	The number of packets queued or dropped because the bidirectional PPS exceeded the maximum for the instance.

View the network performance metrics for your Linux instance

You can publish metrics to your favorite tools to visualize the metric data. For example, you can publish the metrics to Amazon CloudWatch using the CloudWatch agent. The agent enables you to select individual metrics and control publication.

You can also use the **ethtool** to retrieve the metrics for each network interface, such as eth0, as follows.

```
[ec2-user ~]$ ethtool -S eth0
bw_in_allowance_exceeded: 0
bw_out_allowance_exceeded: 0
pps_allowance_exceeded: 0
conntrack_allowance_exceeded: 0
linklocal_allowance_exceeded: 0
```

Network performance metrics with the DPDK driver for ENA

The ENA driver version 2.2.0 and later supports network metrics reporting. DPDK 20.11 includes the ENA driver 2.2.0 and is the first DPDK version to support this feature.

You can use an example application to view DPDK statistics. To start an interactive version of the example application, run the following command.

```
./app/dpdk-testpmd -- -i
```

Within this interactive session, you can enter a command to retrieve extended statistics for a port. The following example command retrieves the statistics for port 0.

```
show port xstats 0
```

The following is an example of an interactive session with the DPDK example application.

```
[root@ip-192.0.2.0 build]# ./app/dpdk-testpmd -- -i

For more information about the example application and using it to retrieve extended statistics, see [Testpmd Application User Guide](#) in the DPDK documentation.

Metrics on instances running FreeBSD

Starting with version 2.3.0, the ENA FreeBSD driver supports collecting network performance metrics on instances running FreeBSD. To enable the collection of FreeBSD metrics, enter the following command and set *interval* to a value between 1 and 3600. This specifies how often, in seconds, to collect FreeBSD metrics.

```
sysctl dev.ena.network_interface.eni_metrics.sample_interval=interval
```

For example, the following command sets the driver to collect FreeBSD metrics on network interface 1 every 10 seconds:

```
sysctl dev.ena.1.eni_metrics.sample_interval=10
```

To turn off the collection of FreeBSD metrics, you can run the preceding command and specify 0 as the *interval*.

Once you are collecting FreeBSD metrics, you can retrieve the latest set of collected metrics by running the following command.

```
sysctl dev.ena.network_interface.en1_metrics
```

Troubleshoot the Elastic Network Adapter (ENA)

The Elastic Network Adapter (ENA) is designed to improve operating system health and reduce the chances of long-term disruption because of unexpected hardware behavior and or failures. The ENA architecture keeps device or driver failures as transparent to the system as possible. This topic provides troubleshooting information for ENA.

If you are unable to connect to your instance, start with the [Troubleshoot connectivity issues \(p. 1144\)](#) section.

If you are able to connect to your instance, you can gather diagnostic information by using the failure detection and recovery mechanisms that are covered in the later sections of this topic.

Contents

- [Troubleshoot connectivity issues \(p. 1144\)](#)
- [Keep-alive mechanism \(p. 1145\)](#)
- [Register read timeout \(p. 1146\)](#)
- [Statistics \(p. 1146\)](#)
- [Driver error logs in syslog \(p. 1151\)](#)

Troubleshoot connectivity issues

If you lose connectivity while enabling enhanced networking, the `ena` module might be incompatible with your instance's current running kernel. This can happen if you install the module for a specific kernel version (without `dkms`, or with an improperly configured `dkms.conf` file) and then your instance kernel is updated. If the instance kernel that is loaded at boot time does not have the `ena` module properly installed, your instance will not recognize the network adapter and your instance becomes unreachable.

If you enable enhanced networking for a PV instance or AMI, this can also make your instance unreachable.

If your instance becomes unreachable after enabling enhanced networking with ENA, you can disable the `enaSupport` attribute for your instance and it will fall back to the stock network adapter.

To disable enhanced networking with ENA (EBS-backed instances)

1. From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: `stop-instances` (AWS CLI), `Stop-EC2Instance` (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should stop the instance in the AWS OpsWorks console so that the instance state remains in sync.

Important

If you are using an instance store-backed instance, you can't stop the instance.

Instead, proceed to [To disable enhanced networking with ENA \(instance store-backed instances\) \(p. 1145\)](#).

2. From your local computer, disable the enhanced networking attribute using the following command.
 - `modify-instance-attribute` (AWS CLI)

```
$ aws ec2 modify-instance-attribute --instance-id instance_id --no-ena-support
```

3. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: [start-instances \(AWS CLI\)](#), [Start-EC2Instance \(AWS Tools for Windows PowerShell\)](#). If your instance is managed by AWS OpsWorks, you should start the instance in the AWS OpsWorks console so that the instance state remains in sync.
4. (Optional) Connect to your instance and try reinstalling the ena module with your current kernel version by following the steps in [Enable enhanced networking with the Elastic Network Adapter \(ENA\) on Linux instances \(p. 1125\)](#).

To disable enhanced networking with ENA (instance store-backed instances)

If your instance is an instance store-backed instance, create a new AMI as described in [Create an instance store-backed Linux AMI \(p. 149\)](#). Be sure to disable the enhanced networking enaSupport attribute when you register the AMI.

- [register-image \(AWS CLI\)](#)

```
$ aws ec2 register-image --no-ena-support ...
```

- [Register-EC2Image \(AWS Tools for Windows PowerShell\)](#)

```
C:\> Register-EC2Image -EnaSupport $false ...
```

Keep-alive mechanism

The ENA device posts keep-alive events at a fixed rate (usually once every second). The ENA driver implements a watchdog mechanism, which checks for the presence of these keep-alive messages. If a message or messages are present, the watchdog is rearmed, otherwise the driver concludes that the device experienced a failure and then does the following:

- Dumps its current statistics to syslog
- Resets the ENA device
- Resets the ENA driver state

The above reset procedure may result in some traffic loss for a short period of time (TCP connections should be able to recover), but should not otherwise affect the user.

The ENA device may also indirectly request a device reset procedure, by not sending a keep-alive notification, for example, if the ENA device reaches an unknown state after loading an irrecoverable configuration.

Below is an example of the reset procedure:

```
[18509.800135] ena 0000:00:07.0 eth1: Keep alive watchdog timeout. // The watchdog process initiates a reset
[18509.815244] ena 0000:00:07.0 eth1: Trigger reset is on

```

Register read timeout

The ENA architecture suggests a limited usage of memory mapped I/O (MMIO) read operations. MMIO registers are accessed by the ENA device driver only during its initialization procedure.

If the driver logs (available in **dmesg** output) indicate failures of read operations, this may be caused by an incompatible or incorrectly compiled driver, a busy hardware device, or hardware failure.

Intermittent log entries that indicate failures on read operations should not be considered an issue; the driver will retry them in this case. However, a sequence of log entries containing read failures indicate a driver or hardware problem.

Below is an example of driver log entry indicating a read operation failure due to a timeout:

```
[ 47.113698] [ENA_COM: ena_com_reg_bar_read32] reading reg failed for timeout. expected:
req id[1] offset[88] actual: req id[57006] offset[0]
[ 47.333715] [ENA_COM: ena_com_reg_bar_read32] reading reg failed for timeout. expected:
req id[2] offset[8] actual: req id[57007] offset[0]
[ 47.346221] [ENA_COM: ena_com_dev_reset] Reg read32 timeout occurred
```

Statistics

If you experience insufficient network performance or latency issues, you should retrieve the device statistics and examine them. These statistics can be obtained using **ethtool** as follows.

```
[ec2-user ~]$ ethtool -S ethN
NIC statistics:
tx_timeout: 0
suspend: 0
resume: 0
wd_expired: 0
interface_up: 1
interface_down: 0
admin_q_pause: 0
```

```
bw_in_allowance_exceeded: 0
bw_out_allowance_exceeded: 0
pps_allowance_exceeded: 0
conntrack_allowance_exceeded: 0
linklocal_allowance_exceeded: 0
queue_0_tx_cnt: 4329
queue_0_tx_bytes: 1075749
queue_0_tx_queue_stop: 0
...
```

The following command output parameters are described below:

`tx_timeout: N`

The number of times that the Netdev watchdog was activated.

`suspend: N`

The number of times the driver performed a suspend operation.

`resume: N`

The number of times the driver performed a resume operation.

`wd_expired: N`

The number of times that the driver did not receive the keep-alive event in the preceding three seconds.

`interface_up: N`

The number of times that the ENA interface was brought up.

`interface_down: N`

The number of times that the ENA interface was brought down.

`admin_q_pause: N`

The number of times the admin queue was not found in a running state.

`bw_in_allowance_exceeded: N`

The number of rx packets dropped because the bandwidth allowance limit was exceeded.

`bw_out_allowance_exceeded: N`

The number of tx packets dropped because the bandwidth allowance limit was exceeded.

`pps_allowance_exceeded: N`

The number of packets dropped because the pps (packets per second) allowance limit was exceeded.

`conntrack_allowance_exceeded: N`

The number of packets dropped because the connection count allowance limit was exceeded.

`linklocal_allowance_exceeded: N`

The number of proxy packets dropped because the pps (packets per second) allowance limit was exceeded.

`queue_N_tx_cnt: N`

The number of transmitted packets for this queue.

`queue_N_tx_bytes: N`

The number of transmitted bytes for this queue.

queue_ *N*_tx_queue_stop: *N*

The number of times that queue *N* was full and stopped.

queue_ *N*_tx_queue_wakeup: *N*

The number of times that queue *N* resumed after being stopped.

queue_ *N*_tx_dma_mapping_err: *N*

Direct memory access error count. If this value is not 0, it indicates low system resources.

queue_ *N*_tx_linearize: *N*

The number of times SKB linearization was attempted for this queue.

queue_ *N*_tx_linearize_failed: *N*

The number of times SKB linearization failed for this queue.

queue_ *N*_tx_napi_comp: *N*

The number of times the napi handler called napi_complete for this queue.

queue_ *N*_tx_tx_poll: *N*

The number of times the napi handler was scheduled for this queue.

queue_ *N*_tx_doorbells: *N*

The number of transmission doorbells for this queue.

queue_ *N*_tx_prepare_ctx_err: *N*

The number of times ena_com_prepare_tx failed for this queue.

queue_ *N*_tx_bad_req_id: *N*

Invalid req_id for this queue. The valid req_id is zero, minus the queue_size, minus 1.

queue_ *N*_tx_llq_buffer_copy: *N*

The number of packets whose headers size are larger than llq entry for this queue.

queue_ *N*_tx_missed_tx: *N*

The number of packets that were left uncompleted for this queue.

queue_ *N*_tx_unmask_interrupt: *N*

The number of times the tx interrupt was unmasks for this queue.

queue_ *N*_rx_cnt: *N*

The number of received packets for this queue.

queue_ *N*_rx_bytes: *N*

The number of received bytes for this queue.

queue_ *N*_rx_rx_copybreak_pkt: *N*

The number of times the rx queue received a packet that is less than the rx_copybreak packet size for this queue.

queue_ *N*_rx_csum_good: *N*

The number of times the rx queue received a packet where the checksum was checked and was correct for this queue.

`queue_N_rx_refil_partial: N`

The number of times the driver did not succeed in refilling the empty portion of the rx queue with the buffers for this queue. If this value is not zero, it indicates low memory resources.

`queue_N_rx_bad_csum: N`

The number of times the rx queue had a bad checksum for this queue (only if rx checksum offload is supported).

`queue_N_rx_page_alloc_fail: N`

The number of time that page allocation failed for this queue. If this value is not zero, it indicates low memory resources.

`queue_N_rx_skb_alloc_fail: N`

The number of time that SKB allocation failed for this queue. If this value is not zero, it indicates low system resources.

`queue_N_rx_dma_mapping_err: N`

Direct memory access error count. If this value is not 0, it indicates low system resources.

`queue_N_rx_bad_desc_num: N`

Too many buffers per packet. If this value is not 0, it indicates the use of very small buffers.

`queue_N_rx_bad_req_id: N`

The req_id for this queue is not valid. The valid req_id is from [0, queue_size - 1].

`queue_N_rx_empty_rx_ring: N`

The number of times the rx queue was empty for this queue.

`queue_N_rx_csum_unchecked: N`

The number of times the rx queue received a packet whose checksum wasn't checked for this queue.

`queue_N_rx_xdp_aborted: N`

The number of times that an XDP packet was classified as XDP_ABORT.

`queue_N_rx_xdp_drop: N`

The number of times that an XDP packet was classified as XDP_DROP.

`queue_N_rx_xdp_pass: N`

The number of times that an XDP packet was classified as XDP_PASS.

`queue_N_rx_xdp_tx: N`

The number of times that an XDP packet was classified as XDP_TX.

`queue_N_rx_xdp_invalid: N`

The number of times that the XDP return code for the packet was not valid.

`queue_N_rx_xdp_redirect: N`

The number of times that an XDP packet was classified as XDP_REDIRECT.

`queue_N_xdp_tx_cnt: N`

The number of transmitted packets for this queue.

`queue_N_xdp_tx_bytes: N`

The number of transmitted bytes for this queue.

`queue_N_xdp_tx_queue_stop: N`

The number of times that this queue was full and stopped.

`queue_N_xdp_tx_queue_wakeup: N`

The number of times that this queue resumed after being stopped.

`queue_N_xdp_tx_dma_mapping_err: N`

Direct memory access error count. If this value is not 0, it indicates low system resources.

`queue_N_xdp_tx_linearize: N`

The number of times XDP buffer linearization was attempted for this queue.

`queue_N_xdp_tx_linearize_failed: N`

The number of times XDP buffer linearization failed for this queue.

`queue_N_xdp_tx_napi_comp: N`

The number of times the napi handler called napi_complete for this queue.

`queue_N_xdp_tx_tx_poll: N`

The number of times the napi handler was scheduled for this queue.

`queue_N_xdp_tx_doorbells: N`

The number of transmission doorbells for this queue.

`queue_N_xdp_tx_prepare_ctx_err: N`

The number of times ena_com_prepare_tx failed for this queue. This value should always be zero; if not, see the driver logs.

`queue_N_xdp_tx_bad_req_id: N`

The req_id for this queue is not valid. The valid req_id is from [0, queue_size - 1].

`queue_N_xdp_tx_llq_buffer_copy: N`

The number of packets that had their headers copied using llq buffer copy for this queue.

`queue_N_xdp_tx_missed_tx: N`

The number of times a tx queue entry missed a completion timeout for this queue.

`queue_N_xdp_tx_unmask_interrupt: N`

The number of times the tx interrupt was unmasked for this queue.

`ena_admin_q_aborted_cmd: N`

The number of admin commands that were aborted. This usually happens during the auto-recovery procedure.

`ena_admin_q_submitted_cmd: N`

The number of admin queue doorbells.

`ena_admin_q_completed_cmd: N`

The number of admin queue completions.

ena_admin_q_out_of_space: N

The number of times that the driver tried to submit new admin command, but the queue was full.

ena_admin_q_no_completion: N

The number of times that the driver did not get an admin completion for a command.

Driver error logs in syslog

The ENA driver writes log messages to **syslog** during system boot. You can examine these logs to look for errors if you are experiencing issues. Below is an example of information logged by the ENA driver in **syslog** during system boot, along with some annotations for select messages.

```
Jun  3 22:37:46 ip-172-31-2-186 kernel: [ 478.416939] [ENA_COM: ena_com_validate_version]
ena device version: 0.10
Jun  3 22:37:46 ip-172-31-2-186 kernel: [ 478.420915] [ENA_COM: ena_com_validate_version]
ena controller version: 0.0.1 implementation version 1

Which errors can I ignore?

The following warnings that may appear in your system's error logs can be ignored for the Elastic Network Adapter:

Set host attribute isn't supported

Host attributes are not supported for this device.

Failed to alloc buffer for rx queue

This is a recoverable error, and it indicates that there may have been a memory pressure issue when the error was thrown.

Feature X isn't supported

The referenced feature is not supported by the Elastic Network Adapter. Possible values for X include:

- 10: RSS Hash function configuration is not supported for this device.
- 12: RSS Indirection table configuration is not supported for this device.

- **18:** RSS Hash Input configuration is not supported for this device.
- **20:** Interrupt moderation is not supported for this device.
- **27:** The Elastic Network Adapter driver does not support polling the Ethernet capabilities from snmpd.

Failed to config AENQ

The Elastic Network Adapter does not support AENQ configuration.

Trying to set unsupported AENQ events

This error indicates an attempt to set an AENQ events group that is not supported by the Elastic Network Adapter.

Elastic Fabric Adapter

An Elastic Fabric Adapter (EFA) is a network device that you can attach to your Amazon EC2 instance to accelerate High Performance Computing (HPC) and machine learning applications. EFA enables you to achieve the application performance of an on-premises HPC cluster, with the scalability, flexibility, and elasticity provided by the AWS Cloud.

EFA provides lower and more consistent latency and higher throughput than the TCP transport traditionally used in cloud-based HPC systems. It enhances the performance of inter-instance communication that is critical for scaling HPC and machine learning applications. It is optimized to work on the existing AWS network infrastructure and it can scale depending on application requirements.

EFA integrates with Libfabric 1.7.0 and later and it supports Open MPI 3.1.3 and later and Intel MPI 2019 Update 5 and later for HPC applications, and Nvidia Collective Communications Library (NCCL) for machine learning applications.

Note

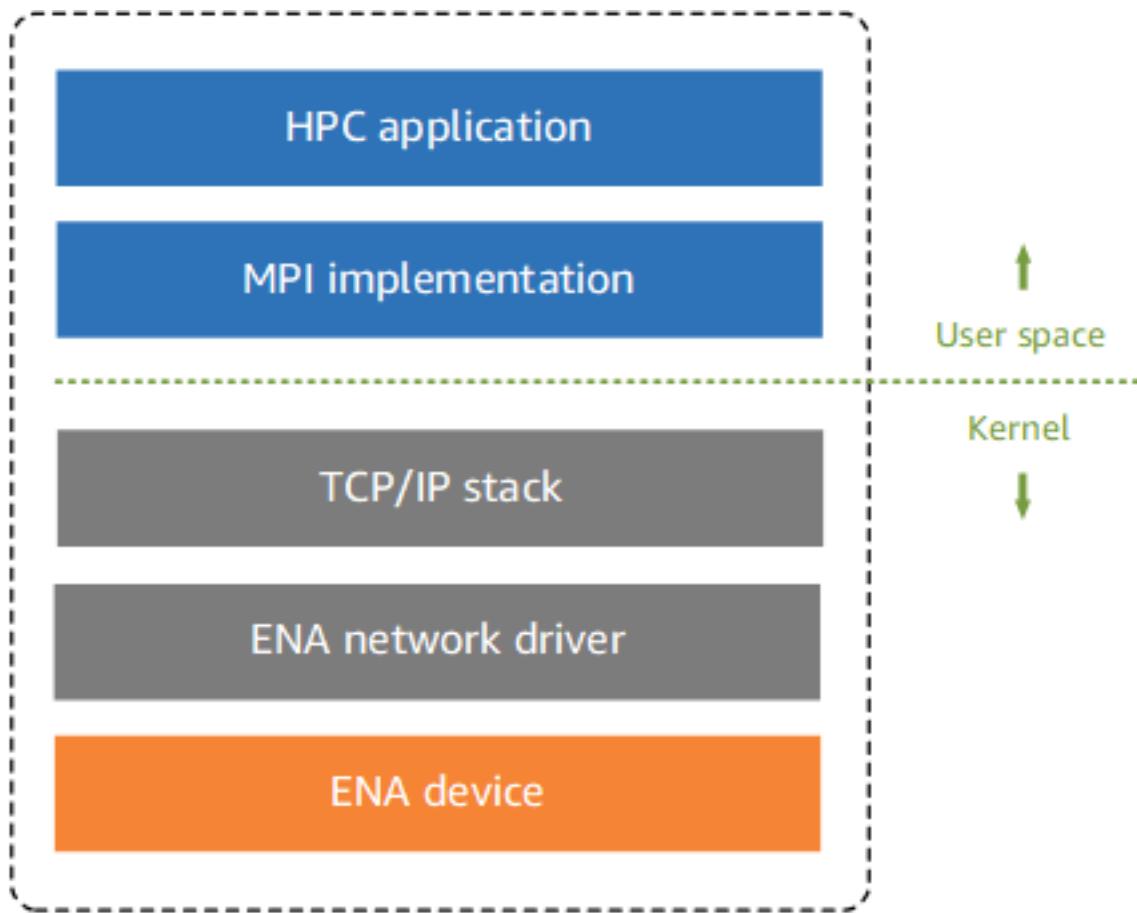

The OS-bypass capabilities of EFAs are not supported on Windows instances. If you attach an EFA to a Windows instance, the instance functions as an Elastic Network Adapter, without the added EFA capabilities.

Contents

- [EFA basics \(p. 1152\)](#)

- [Monitor an EFA \(p. 1187\)](#)
- [Verify the EFA installer using a checksum \(p. 1188\)](#)

EFA basics

An EFA is an Elastic Network Adapter (ENA) with added capabilities. It provides all of the functionality of an ENA, with an additional OS-bypass functionality. OS-bypass is an access model that allows HPC and machine learning applications to communicate directly with the network interface hardware to provide low-latency, reliable transport functionality.

Traditional HPC software stack in EC2

Traditionally, HPC applications use the Message Passing Interface (MPI) to interface with the system's network transport. In the AWS Cloud, this has meant that applications interface with MPI, which then uses the operating system's TCP/IP stack and the ENA device driver to enable network communication between instances.

With an EFA, HPC applications use MPI or NCCL to interface with the *Libfabric* API. The *Libfabric* API bypasses the operating system kernel and communicates directly with the EFA device to put packets on the network. This reduces overhead and enables the HPC application to run more efficiently.

Note

Libfabric is a core component of the OpenFabrics Interfaces (OFI) framework, which defines and exports the user-space API of OFI. For more information, see the [Libfabric OpenFabrics](#) website.

Differences between EFAs and ENAs

Elastic Network Adapters (ENAs) provide traditional IP networking features that are required to support VPC networking. EFAs provide all of the same traditional IP networking features as ENAs, and they also support OS-bypass capabilities. OS-bypass enables HPC and machine learning applications to bypass the operating system kernel and to communicate directly with the EFA device.

Supported interfaces and libraries

EFA supports the following interfaces and libraries:

- Open MPI 3.1.3 and later
- Intel MPI 2019 Update 5 and later
- NVIDIA Collective Communications Library (NCCL) 2.4.2 and later

Supported instance types

The following instance types support EFAs:

- General purpose: m5dn.24xlarge | m5dn.metal | m5n.24xlarge | m5zn.12xlarge | m5zn.metal | m6a.48xlarge | m6i.32xlarge | m6i.metal
- Compute optimized: c5n.18xlarge | c5n.9xlarge | c5n.metal | c6a.48xlarge | c6gn.16xlarge | c6i.32xlarge | c6i.metal | hpc6a.48xlarge
- Memory optimized: r5dn.24xlarge | r5dn.metal | r5n.24xlarge | r5n.metal | r6i.32xlarge | r6i.metal | x2iezn.12xlarge | x2iezn.metal
- Storage optimized: i3en.24xlarge | i3en.12xlarge | i3en.metal | im4gn.16xlarge
- Accelerated computing: dl1.24xlarge | g4dn.8xlarge | g4dn.12xlarge | g4dn.metal | g5.48xlarge | inf1.24xlarge | p3dn.24xlarge | p4d.24xlarge

The available instance types vary by Region. To see the available instance types that support EFA in a Region, use the [describe-instance-types](#) command with the --region option and the appropriate Region code.

```
aws ec2 describe-instance-types
--region us-east-2
--filters Name=network-info.efa-supported,Values=true
--query "InstanceTypes[*].[InstanceType]"
--output text | sort
```

The following is example output for us-east-1.

```
c5n.18xlarge
c5n.9xlarge
c5n.metal
c6gn.16xlarge
c6i.32xlarge
c6i.metal
dl1.24xlarge
g4dn.12xlarge
g4dn.8xlarge
g4dn.metal
g5.48xlarge
...
```

Supported AMIs

The following AMIs support EFA with Intel x86-based instance types:

- Amazon Linux 2
- CentOS 7

- RHEL 7 and 8
- Ubuntu 18.04 and 20.04
- SUSE Linux Enterprise 15 SP2 and later
- openSUSE Leap 15.3 and later

The following AMIs support EFA with Arm-based (Graviton 2) instance types:

- Amazon Linux 2
- RHEL 8
- Ubuntu 18.04 and 20.04
- SUSE Linux Enterprise 15 SP2 and later

EFA limitations

EFA has the following limitations:

- p4d.24xlarge instances support up to four EFAs. All other supported instance types support only one EFA per instance.
- EFA OS-bypass traffic is limited to a single subnet. In other words, EFA traffic cannot be sent from one subnet to another. Normal IP traffic from the EFA can be sent from one subnet to another.
- EFA OS-bypass traffic is not routable. Normal IP traffic from the EFA remains routable.
- The EFA must be a member of a security group that allows all inbound and outbound traffic to and from the security group itself.
- EFA traffic between C6gn instances and other EFA-enabled instances is not supported.

Get started with EFA and MPI

This tutorial helps you to launch an EFA and MPI-enabled instance cluster for HPC workloads. In this tutorial, you will perform the following steps:

Contents

- [Step 1: Prepare an EFA-enabled security group \(p. 1155\)](#)
- [Step 2: Launch a temporary instance \(p. 1156\)](#)
- [Step 3: Install the EFA software \(p. 1157\)](#)
- [Step 4: Disable ptrace protection \(p. 1159\)](#)
- [Step 5: \(Optional\) Install Intel MPI \(p. 1160\)](#)
- [Step 6: Install your HPC application \(p. 1160\)](#)
- [Step 7: Create an EFA-enabled AMI \(p. 1161\)](#)
- [Step 8: Launch EFA-enabled instances into a cluster placement group \(p. 1161\)](#)
- [Step 9: Terminate the temporary instance \(p. 1162\)](#)
- [Step 10: Enable passwordless SSH \(p. 1162\)](#)

Step 1: Prepare an EFA-enabled security group

An EFA requires a security group that allows all inbound and outbound traffic to and from the security group itself. The following procedure allows all inbound and outbound traffic for testing purposes only. For other scenarios, see [Security group rules for different use cases \(p. 1340\)](#).

To create an EFA-enabled security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups** and then choose **Create security group**.
3. In the **Create security group** window, do the following:
 - a. For **Security group name**, enter a descriptive name for the security group, such as EFA-enabled security group.
 - b. (Optional) For **Description**, enter a brief description of the security group.
 - c. For **VPC**, select the VPC into which you intend to launch your EFA-enabled instances.
 - d. Choose **Create security group**.
4. Select the security group that you created, and on the **Details** tab, copy the **Security group ID**.
5. With the security group still selected, choose **Actions, Edit inbound rules**, and then do the following:
 - a. Choose **Add rule**.
 - b. For **Type**, choose **All traffic**.
 - c. For **Source type**, choose **Custom** and paste the security group ID that you copied into the field.
 - d. Choose **Save rules**.
6. With the security group still selected, choose **Actions, Edit outbound rules**, and then do the following:
 - a. Choose **Add rule**.
 - b. For **Type**, choose **All traffic**.
 - c. For **Destination type**, choose **Custom** and paste the security group ID that you copied into the field.
 - d. Choose **Save rules**.

Step 2: Launch a temporary instance

Launch a temporary instance that you can use to install and configure the EFA software components. You use this instance to create an EFA-enabled AMI from which you can launch your EFA-enabled instances.

To launch a temporary instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Launch Instance**.
3. On the **Choose an AMI** page, choose **Select** for one of the supported AMIs (p. 1154).
4. On the **Choose an Instance Type** page, select one of the supported instance types (p. 1154) and then choose **Next: Configure Instance Details**.
5. On the **Configure Instance Details** page, do the following:
 - a. For **Subnet**, choose the subnet in which to launch the instance. If you do not select a subnet, you can't enable the instance for EFA.
 - b. For **Elastic Fabric Adapter**, choose **Enable**.
 - c. In the **Network Interfaces** section, for device **eth0**, choose **New network interface**.
 - d. Choose **Next: Add Storage**.
6. On the **Add Storage** page, specify the volumes to attach to the instances in addition to the volumes that are specified by the AMI (such as the root device volume). Then choose **Next: Add Tags**.
7. On the **Add Tags** page, specify a tag that you can use to identify the temporary instance, and then choose **Next: Configure Security Group**.

8. On the **Configure Security Group** page, for **Assign a security group**, select **Select an existing security group**, and then select the security group that you created in **Step 1**.
9. On the **Review Instance Launch** page, review the settings, and then choose **Launch** to choose a key pair and to launch your instance.

Step 3: Install the EFA software

Install the EFA-enabled kernel, EFA drivers, Libfabric, and Open MPI stack that is required to support EFA on your temporary instance.

The steps differ depending on whether you intend to use EFA with Open MPI, with Intel MPI, or with Open MPI and Intel MPI.

To install the EFA software

1. Connect to the instance you launched. For more information, see [Connect to your Linux instance \(p. 611\)](#).
2. To ensure that all of your software packages are up to date, perform a quick software update on your instance. This process may take a few minutes.

- Amazon Linux 2, RHEL 7/8, and CentOS 7

```
$ sudo yum update -y
```

- Ubuntu 18.04 and 20.04

```
$ sudo apt-get update
```

```
$ sudo apt-get upgrade -y
```

- SUSE Linux Enterprise

```
$ sudo zypper update -y
```

3. Download the EFA software installation files. The software installation files are packaged into a compressed tarball (.tar.gz) file. To download the latest *stable* version, use the following command.

```
$ curl -O https://efa-installer.amazonaws.com/aws-efa-installer-1.15.0.tar.gz
```

You can also get the latest version by replacing the version number with `latest` in the preceding command.

4. (Optional) Verify the authenticity and integrity of the EFA tarball (.tar.gz) file. We recommend that you do this to verify the identity of the software publisher and to check that the file has not been altered or corrupted since it was published. If you do not want to verify the tarball file, skip this step.

Note

Alternatively, if you prefer to verify the tarball file by using an MD5 or SHA256 checksum instead, see [Verify the EFA installer using a checksum \(p. 1188\)](#).

- a. Download the public GPG key and import it into your keyring.

```
$ wget https://efa-installer.amazonaws.com/aws-efa-installer.key && gpg --import aws-efa-installer.key
```

The command should return a key value. Make a note of the key value, because you need it in the next step.

- b. Verify the GPG key's fingerprint. Run the following command and specify the key value from the previous step.

```
$ gpg --fingerprint key_value
```

The command should return a fingerprint that is identical to 4E90 91BC BB97 A96B 26B1 5E59 A054 80B1 DD2D 3CCC. If the fingerprint does not match, don't run the EFA installation script, and contact AWS Support.

- c. Download the signature file and verify the signature of the EFA tarball file.

```
$ wget https://efa-installer.amazonaws.com/aws-efa-installer-1.15.0.tar.gz.sig && gpg --verify ./aws-efa-installer-1.15.0.tar.gz.sig
```

The following shows example output.

```
gpg: Signature made Wed 29 Jul 2020 12:50:13 AM UTC using RSA key ID DD2D3CCC
gpg: Good signature from "Amazon EC2 EFA <ec2-efa-maintainers@amazon.com>"
gpg: WARNING: This key is not certified with a trusted signature!
gpg:           There is no indication that the signature belongs to the owner.
Primary key fingerprint: 4E90 91BC BB97 A96B 26B1 5E59 A054 80B1 DD2D 3CCC
```

If the result includes **Good signature**, and the fingerprint matches the fingerprint returned in the previous step, proceed to the next step. If not, don't run the EFA installation script, and contact AWS Support.

5. Extract the files from the compressed .tar.gz file and navigate into the extracted directory.

```
$ tar -xf aws-efa-installer-1.15.0.tar.gz && cd aws-efa-installer
```

6. Install the EFA software. Do one of the following depending on your use case.

Note

If you are using a SUSE Linux operating system, you must additionally specify the **--skip-kmod** option to prevent kmod installation. By default, SUSE Linux does not allow out-of-tree kernel modules. As a result, EFA and NVIDIA GPUDirect support is currently not supported with SUSE Linux.

- **Open MPI and Intel MPI**

If you intend to use EFA with Open MPI and Intel MPI, you must install the EFA software with Libfabric and Open MPI, and you must complete Step 5: (Optional) Install Intel MPI. To install the EFA software with Libfabric and Open MPI, run the following command.

```
$ sudo ./efa_installer.sh -y
```

Libfabric is installed in the /opt/amazon/efa directory, while Open MPI is installed in the /opt/amazon/openmpi directory.

- **Open MPI only**

If you intend to use EFA with Open MPI only, you must install the EFA software with Libfabric and Open MPI, and you can skip Step 5: (Optional) Install Intel MPI. To install the EFA software with Libfabric and Open MPI, run the following command.

```
$ sudo ./efa_installer.sh -y
```

Libfabric is installed in the /opt/amazon/efa directory, while Open MPI is installed in the /opt/amazon/openmpi directory.

- **Intel MPI only**

If you intend to use EFA with Intel MPI only, you can install the EFA software without Libfabric and Open MPI. In this case, Intel MPI uses its embedded Libfabric. If you choose to do this, you must complete Step 5: (Optional) Install Intel MPI.

To install the EFA software without Libfabric and Open MPI, run the following command.

```
$ sudo ./efa_installer.sh -y --minimal
```

7. If the EFA installer prompts you to reboot the instance, do so and then reconnect to the instance. Otherwise, log out of the instance and then log back in to complete the installation.
8. Confirm that the EFA software components were successfully installed.

```
$ fi_info -p efa -t FI_EP_RDM
```

The command should return information about the Libfabric EFA interfaces. The following example shows the command output.

```
provider: efa
fabric: EFA-fe80::94:3dff:fe89:1b70
domain: efa_0-rdm
version: 2.0
type: FI_EP_RDM
protocol: FI_PROTO_EFA
```

Step 4: Disable ptrace protection

To improve your HPC application's performance, Libfabric uses the instance's local memory for interprocess communications when the processes are running on the same instance.

The shared memory feature uses Cross Memory Attach (CMA), which is not supported with *ptrace protection*. If you are using a Linux distribution that has ptrace protection enabled by default, such as Ubuntu, you must disable it. If your Linux distribution does not have ptrace protection enabled by default, skip this step.

To disable ptrace protection

Do one of the following:

- To temporarily disable ptrace protection for testing purposes, run the following command.

```
$ sudo sysctl -w kernel.yama.ptrace_scope=0
```

- To permanently disable ptrace protection, add `kernel.yama.ptrace_scope = 0` to `/etc/sysctl.d/10-ptrace.conf` and reboot the instance.

Step 5: (Optional) Install Intel MPI

Important

If you intend to only use Open MPI, skip this step. Perform this step only if you intend to use Intel MPI.

Intel MPI requires an additional installation and environment variable configuration.

Prerequisites

Ensure that the user performing the following steps has sudo permissions.

To install Intel MPI

1. To download the Intel MPI installation script, do the following
 - a. Visit the [Intel website](#).
 - b. In the **Intel MPI Library** section of the webpage, choose the link for the **Intel MPI Library for Linux Offline** installer.
2. Run the installation script that you downloaded in the previous step.

```
$ sudo bash installation_script_name.sh
```

3. In the installer, choose **Accept & install**.
4. Read the Intel Improvement Program, choose the appropriate option, and then choose **Begin Installation**.
5. When the installation completes, choose **Close**.
6. Add the Intel MPI environment variables to the corresponding shell startup scripts to ensure that they are set each time that the instance starts. Do one of the following depending on your shell.
 - For **bash**, add the following environment variable to `/home/username/ .bashrc` and `/home/username/ .bash_profile`.

```
source /opt/intel/oneapi/mpi/latest/env/vars.sh
```

- For **csh** and **tcsh**, add the following environment variable to `/home/username/ .cshrc`.

```
source /opt/intel/oneapi/mpi/latest/env/vars.csh
```

7. Log out of the instance and then log back in.
8. Run the following command to confirm that Intel MPI was successfully installed.

```
$ which mpicc
```

Ensure that the returned path includes the `/opt/intel/` subdirectory.

Note

If you no longer want to use Intel MPI, remove the environment variables from the shell startup scripts.

Step 6: Install your HPC application

Install the HPC application on the temporary instance. The installation procedure varies depending on the specific HPC application. For more information, see [Manage software on your Amazon Linux instance \(p. 670\)](#).

Note

You might need to refer to your HPC application's documentation for installation instructions.

Step 7: Create an EFA-enabled AMI

After you have installed the required software components, you create an AMI that you can reuse to launch your EFA-enabled instances.

To create an AMI from your temporary instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the temporary instance that you created and choose **Actions, Image, Create image**.
4. For **Create image**, do the following:
 - a. For **Image name**, enter a descriptive name for the AMI.
 - b. (Optional) For **Image description**, enter a brief description of the purpose of the AMI.
 - c. Choose **Create image**.
5. In the navigation pane, choose **AMIs**.
6. Locate the AMI that you created in the list. Wait for the status to change from pending to available before continuing to the next step.

Step 8: Launch EFA-enabled instances into a cluster placement group

Launch your EFA-enabled instances into a cluster placement group using the EFA-enabled AMI that you created in **Step 7**, and the EFA-enabled security group that you created in **Step 1**.

Note

- It is not an absolute requirement to launch your EFA-enabled instances into a cluster placement group. However, we do recommend running your EFA-enabled instances in a cluster placement group as it launches the instances into a low-latency group in a single Availability Zone.
- To ensure that capacity is available as you scale your cluster's instances, you can create a Capacity Reservation for your cluster placement group. For more information, see [Capacity Reservations in cluster placement groups \(p. 551\)](#).

To launch your EFA-enabled instances into a cluster placement group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Launch Instance**.
3. On the **Choose an AMI** page, choose **My AMIs**, find the AMI that you created in **Step 7**, and then choose **Select**.
4. On the **Choose an Instance Type** page, select one of the [supported instance types \(p. 1154\)](#) and then choose **Next: Configure Instance Details**.
5. On the **Configure Instance Details** page, do the following:
 - a. For **Number of instances**, enter the number of EFA-enabled instances that you want to launch.
 - b. For **Network and Subnet**, select the VPC and subnet into which to launch the instances.
 - c. For **Placement group**, select **Add instance to placement group**.

- d. For **Placement group name**, select **Add to a new placement group**, enter a descriptive name for the placement group, and then for **Placement group strategy**, select **cluster**.
- e. For **EFA**, choose **Enable**.
- f. In the **Network Interfaces** section, for device **eth0**, choose **New network interface**. You can optionally specify a primary IPv4 address and one or more secondary IPv4 addresses. If you're launching the instance into a subnet that has an associated IPv6 CIDR block, you can optionally specify a primary IPv6 address and one or more secondary IPv6 addresses.
- g. Choose **Next: Add Storage**.
6. On the **Add Storage** page, specify the volumes to attach to the instances in addition to the volumes specified by the AMI (such as the root device volume), and then choose **Next: Add Tags**.
7. On the **Add Tags** page, specify tags for the instances, such as a user-friendly name, and then choose **Next: Configure Security Group**.
8. On the **Configure Security Group** page, for **Assign a security group**, select **Select an existing security group**, and then select the security group that you created in **Step 1**.
9. Choose **Review and Launch**.
10. On the **Review Instance Launch** page, review the settings, and then choose **Launch** to choose a key pair and to launch your instances.

Step 9: Terminate the temporary instance

At this point, you no longer need the temporary instance that you launched. You can terminate the instance to stop incurring charges for it.

To terminate the temporary instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the temporary instance that you created and then choose **Actions, Instance state, Terminate instance**.
4. When prompted for confirmation, choose **Terminate**.

Step 10: Enable passwordless SSH

To enable your applications to run across all of the instances in your cluster, you must enable passwordless SSH access from the leader node to the member nodes. The leader node is the instance from which you run your applications. The remaining instances in the cluster are the member nodes.

To enable passwordless SSH between the instances in the cluster

1. Select one instance in the cluster as the leader node, and connect to it.
2. Disable `strictHostKeyChecking` and enable `ForwardAgent` on the leader node. Open `~/.ssh/config` using your preferred text editor and add the following.

```
Host *
  ForwardAgent yes
Host *
  StrictHostKeyChecking no
```

3. Generate an RSA key pair.

```
$ ssh-keygen -t rsa -N "" -f ~/.ssh/id_rsa
```

The key pair is created in the `$HOME/.ssh/` directory.

4. Change the permissions of the private key on the leader node.

```
$ chmod 600 ~/.ssh/id_rsa
chmod 600 ~/.ssh/config
```

5. Open `~/.ssh/id_rsa.pub` using your preferred text editor and copy the key.
6. For each member node in the cluster, do the following:
 - a. Connect to the instance.
 - b. Open `~/.ssh/authorized_keys` using your preferred text editor and add the public key that you copied earlier.
7. To test that the passwordless SSH is functioning as expected, connect to your leader node and run the following command.

```
$ ssh member_node_private_ip
```

You should connect to the member node without being prompted for a key or password.

Get started with EFA and NCCL

The NVIDIA Collective Communications Library (NCCL) is a library of standard collective communication routines for multiple GPUs across a single node or multiple nodes. NCCL can be used together with EFA, Libfabric, and MPI to support various machine learning workloads. For more information, see the [NCCL](#) website.

Note

- NCCL with EFA is supported with `p3dn.24xlarge` and `p4d.24xlarge` instances only.
- Only NCCL 2.4.2 and later is supported with EFA.

The following tutorials help you to launch an EFA and NCCL-enabled instance cluster for machine learning workloads.

- [Use a base AMI \(p. 1163\)](#)
- [Use an AWS Deep Learning AMI \(p. 1180\)](#)

Use a base AMI

The following steps help you to get started with Elastic Fabric Adapter using one of the [supported base AMIs \(p. 1154\)](#).

Note

- Only the `p3dn.24xlarge` and `p4d.24xlarge` instance types are supported.
- Only Amazon Linux 2, RHEL 7/8, CentOS 7, and Ubuntu 18.04 base AMIs are supported.

Contents

- [Step 1: Prepare an EFA-enabled security group \(p. 1164\)](#)
- [Step 2: Launch a temporary instance \(p. 1164\)](#)
- [Step 3: Install Nvidia GPU drivers, Nvidia CUDA toolkit, and cuDNN \(p. 1165\)](#)

- Step 4: Install the EFA software (p. 1172)
- Step 5: Install NCCL (p. 1175)
- Step 6: Install the aws-ofi-nccl plugin (p. 1175)
- Step 7: Install the NCCL tests (p. 1176)
- Step 8: Test your EFA and NCCL configuration (p. 1176)
- Step 9: Install your machine learning applications (p. 1177)
- Step 10: Create an EFA and NCCL-enabled AMI (p. 1178)
- Step 11: Terminate the temporary instance (p. 1178)
- Step 12: Launch EFA and NCCL-enabled instances into a cluster placement group (p. 1178)
- Step 13: Enable passwordless SSH (p. 1179)

Step 1: Prepare an EFA-enabled security group

An EFA requires a security group that allows all inbound and outbound traffic to and from the security group itself. The following procedure allows all inbound and outbound traffic for testing purposes only. For other scenarios, see [Security group rules for different use cases \(p. 1340\)](#).

To create an EFA-enabled security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups** and then choose **Create security group**.
3. In the **Create security group** window, do the following:
 - a. For **Security group name**, enter a descriptive name for the security group, such as **EFA-enabled security group**.
 - b. (Optional) For **Description**, enter a brief description of the security group.
 - c. For **VPC**, select the VPC into which you intend to launch your EFA-enabled instances.
 - d. Choose **Create security group**.
4. Select the security group that you created, and on the **Details** tab, copy the **Security group ID**.
5. With the security group still selected, choose **Actions**, **Edit inbound rules**, and then do the following:
 - a. Choose **Add rule**.
 - b. For **Type**, choose **All traffic**.
 - c. For **Source type**, choose **Custom** and paste the security group ID that you copied into the field.
 - d. Choose **Save rules**.
6. With the security group still selected, choose **Actions**, **Edit outbound rules**, and then do the following:
 - a. Choose **Add rule**.
 - b. For **Type**, choose **All traffic**.
 - c. For **Destination type**, choose **Custom** and paste the security group ID that you copied into the field.
 - d. Choose **Save rules**.

Step 2: Launch a temporary instance

Launch a temporary instance that you can use to install and configure the EFA software components. You use this instance to create an EFA-enabled AMI from which you can launch your EFA-enabled instances.

To launch a temporary instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Launch Instance**.
3. On the **Choose an AMI** page, choose one of the supported AMIs.
4. On the **Choose an Instance Type** page, select `p3dn.24xlarge` or `p4d.24xlarge` and then choose **Next: Configure Instance Details**.
5. On the **Configure Instance Details** page, do the following:
 - a. For **Subnet**, choose the subnet in which to launch the instance. If you do not select a subnet, you can't enable the instance for EFA.
 - b. For **Elastic Fabric Adapter**, choose **Enable**.
 - c. In the **Network Interfaces** section, for device `eth0`, choose **New network interface**.
 - d. Choose **Next: Add Storage**.
6. On the **Add Storage** page, specify the volumes to attach to the instances, in addition to the volumes specified by the AMI (such as the root device volume). Ensure that you provision enough storage for the Nvidia CUDA Toolkit. Then choose **Next: Add Tags**.

Note

You must provision an additional 10 to 20 GiB of storage for the Nvidia CUDA Toolkit. If you do not provision enough storage, you will receive an *insufficient disk space* error when attempting to install the Nvidia drivers and CUDA toolkit.

7. On the **Add Tags** page, specify a tag that you can use to identify the temporary instance, and then choose **Next: Configure Security Group**.
8. On the **Configure Security Group** page, for **Assign a security group**, select **Select an existing security group**. Then select the security group that you created in **Step 1**.
9. On the **Review Instance Launch** page, review the settings, and then choose **Launch** to choose a key pair and to launch your instance.

Step 3: Install Nvidia GPU drivers, Nvidia CUDA toolkit, and cuDNN

Amazon Linux 2

To install the Nvidia GPU drivers, Nvidia CUDA toolkit, and cuDNN

1. Install the utilities that are needed to install the Nvidia GPU drivers and the Nvidia CUDA toolkit.

```
$ sudo yum groupinstall 'Development Tools' -y
```

2. To use the Nvidia GPU driver, you must first disable the nouveau open source drivers.

- a. Install the required utilities and the kernel headers package for the version of the kernel that you are currently running.

```
$ sudo yum install -y wget kernel-devel-$(uname -r) kernel-headers-$(uname -r)
```

- b. Add nouveau to the `/etc/modprobe.d/blacklist.conf` deny list file.

```
$ cat << EOF | sudo tee --append /etc/modprobe.d/blacklist.conf
blacklist vga16fb
blacklist nouveau
blacklist rivafb
blacklist nvidiafb
blacklist rivatv
```

```
EOF
```

- c. Open `/etc/default/grub` using your preferred text editor and add the following.

```
GRUB_CMDLINE_LINUX="rdblacklist=nouveau"
```

- d. Rebuild the Grub configuration.

```
$ sudo grub2-mkconfig -o /boot/grub2/grub.cfg
```

3. Reboot the instance and reconnect to it.

4. Install the Nvidia GPU drivers, NVIDIA CUDA toolkit, and cuDNN.

- a. Install the EPEL repository for DKMS and enable any optional repos for your Linux distribution.

```
$ sudo yum install -y https://dl.fedoraproject.org/pub/epel/epel-release-latest-7.noarch.rpm
```

- b. Install the CUDA repository public GPG key.

```
$ distribution='rhel7'
```

- c. Set up the CUDA network repository and update the repository cache.

```
$ ARCH=$( /bin/arch ) \
&& sudo yum-config-manager --add-repo http://developer.download.nvidia.com/compute/cuda/repos/$distribution/${ARCH}/cuda-$distribution.repo \
&& sudo yum clean expire-cache
```

- d. Install the NVIDIA, CUDA drivers and cuDNN.

```
$ sudo yum clean all \
&& sudo yum -y install cuda-drivers-fabricmanager cuda libcuda8-devel
```

5. Reboot the instance and reconnect to it.

6. (p4d.24xlarge instances only) Start the Nvidia Fabric Manager service, and ensure that it starts automatically when the instance starts. Nvidia Fabric Manager is required for NV Switch Management.

```
$ sudo systemctl enable nvidia-fabricmanager && sudo systemctl start nvidia-fabricmanager
```

7. Ensure that the CUDA paths are set each time that the instance starts.

- For `bash` shells, add the following statements to `/home/username/.bashrc` and `/home/username/.bash_profile`.

```
export PATH=/usr/local/cuda/bin:$PATH
export LD_LIBRARY_PATH=/usr/local/cuda/lib64:/usr/local/cuda/extras/CUPTI/lib64:
$LD_LIBRARY_PATH
```

- For `tcsh` shells, add the following statements to `/home/username/.cshrc`.

```
setenv PATH=/usr/local/cuda/bin:$PATH
setenv LD_LIBRARY_PATH=/usr/local/cuda/lib64:/usr/local/cuda/extras/CUPTI/lib64:
$LD_LIBRARY_PATH
```

8. To confirm that the Nvidia GPU drivers are functional, run the following command.

```
$ nvidia-smi -q | head
```

The command should return information about the Nvidia GPUs, Nvidia GPU drivers, and Nvidia CUDA toolkit.

CentOS 7

To install the Nvidia GPU drivers, Nvidia CUDA toolkit, and cuDNN

1. To ensure that all of your software packages are up to date, perform a quick software update on your instance.

```
$ sudo yum upgrade -y && sudo reboot
```

After the instance has rebooted, reconnect to it.

2. Install the utilities that are needed to install the Nvidia GPU drivers and the Nvidia CUDA toolkit.

```
$ sudo yum groupinstall 'Development Tools' -y \
&& sudo yum install -y tar bzip2 make automake pciutils elfutils-libelf-devel
libglvnd-devel iptables firewalld vim bind-utils
```

3. To use the Nvidia GPU driver, you must first disable the nouveau open source drivers.

- a. Install the required utilities and the kernel headers package for the version of the kernel that you are currently running.

```
$ sudo yum install -y wget kernel-devel-$(uname -r) kernel-headers-$(uname -r)
```

- b. Add nouveau to the /etc/modprobe.d/blacklist.conf deny list file.

```
$ cat << EOF | sudo tee --append /etc/modprobe.d/blacklist.conf
blacklist vga16fb
blacklist nouveau
blacklist rivafb
blacklist nvidiafb
blacklist rivatv
EOF
```

- c. Open /etc/default/grub using your preferred text editor and add the following.

```
GRUB_CMDLINE_LINUX="rdblacklist=nouveau"
```

- d. Rebuild the Grub configuration.

```
$ sudo grub2-mkconfig -o /boot/grub2/grub.cfg
```

4. Reboot the instance and reconnect to it.

5. Install the Nvidia GPU drivers, NVIDIA CUDA toolkit, and cuDNN.

- a. Install the EPEL repository for DKMS and enable any optional repos for your Linux distribution.

```
$ sudo yum install -y https://dl.fedoraproject.org/pub/epel/epel-release-latest-7.noarch.rpm
```

- b. Install the CUDA repository public GPG key.

```
$ distribution='rhel7'
```

- c. Set up the CUDA network repository and update the repository cache.

```
$ ARCH=$( /bin/arch ) \
&& sudo yum-config-manager --add-repo http://developer.download.nvidia.com/compute/cuda/repos/$distribution/${ARCH}/cuda-$distribution.repo \
&& sudo yum clean expire-cache
```

- d. Install the NVIDIA, CUDA drivers and cuDNN.

```
$ sudo yum clean all \
&& sudo yum -y install cuda-drivers-fabricmanager cuda libcudnn8-devel
```

6. Reboot the instance and reconnect to it.

7. (p4d.24xlarge instances only) Start the Nvidia Fabric Manager service, and ensure that it starts automatically when the instance starts. Nvidia Fabric Manager is required for NV Switch Management.

```
$ sudo systemctl start nvidia-fabricmanager \
&& sudo systemctl enable nvidia-fabricmanager
```

8. Ensure that the CUDA paths are set each time that the instance starts.

- For *bash* shells, add the following statements to `/home/username/.bashrc` and `/home/username/.bash_profile`.

```
export PATH=/usr/local/cuda/bin:$PATH
export LD_LIBRARY_PATH=/usr/local/cuda/lib64:/usr/local/cuda/extras/CUPTI/lib64:
$LD_LIBRARY_PATH
```

- For *tcsh* shells, add the following statements to `/home/username/.cshrc`.

```
setenv PATH=/usr/local/cuda/bin:$PATH
setenv LD_LIBRARY_PATH=/usr/local/cuda/lib64:/usr/local/cuda/extras/CUPTI/lib64:
$LD_LIBRARY_PATH
```

9. To confirm that the Nvidia GPU drivers are functional, run the following command.

```
$ nvidia-smi -q | head
```

The command should return information about the Nvidia GPUs, Nvidia GPU drivers, and Nvidia CUDA toolkit.

RHEL 7/8

To install the Nvidia GPU drivers, Nvidia CUDA toolkit, and cuDNN

1. Install the utilities that are needed to install the Nvidia GPU drivers and the Nvidia CUDA toolkit.

```
$ sudo yum groupinstall 'Development Tools' -y
```

2. To use the Nvidia GPU driver, you must first disable the nouveau open source drivers.
 - a. Install the required utilities and the kernel headers package for the version of the kernel that you are currently running.

```
$ sudo yum install -y wget kernel-devel-$(uname -r) kernel-headers-$(uname -r)
```

- b. Add nouveau to the /etc/modprobe.d/blacklist.conf deny list file.

```
$ cat << EOF | sudo tee --append /etc/modprobe.d/blacklist.conf
blacklist vga16fb
blacklist nouveau
blacklist rivafb
blacklist nvidiafb
blacklist rivatv
EOF
```

- c. Open /etc/default/grub using your preferred text editor and add the following.

```
GRUB_CMDLINE_LINUX="rdblacklist=nouveau"
```

- d. Rebuild the Grub configuration.

```
$ sudo grub2-mkconfig -o /boot/grub2/grub.cfg
```

3. Reboot the instance and reconnect to it.
4. Install the Nvidia GPU drivers, NVIDIA CUDA toolkit, and cuDNN.

- a. Install the EPEL repository for DKMS and enable any optional repos for your Linux distribution.

- RHEL 7

```
$ sudo yum install -y https://dl.fedoraproject.org/pub/epel/epel-release-latest-7.noarch.rpm
```

- RHEL 8

```
$ sudo yum install -y https://dl.fedoraproject.org/pub/epel/epel-release-latest-8.noarch.rpm
```

- b. Install the CUDA repository public GPG key.

```
$ distribution=$( . /etc/os-release;echo $ID`rpm -E "%{?rhel}%{?fedora}"` )
```

- c. Set up the CUDA network repository and update the repository cache.

```
$ ARCH=$( /bin/arch ) \
&& sudo yum-config-manager --add-repo http://developer.download.nvidia.com/compute/cuda/repos/$distribution/${ARCH}/cuda-$distribution.repo \
&& sudo yum clean expire-cache
```

- d. Install the NVIDIA, CUDA drivers and cuDNN.

```
$ sudo yum clean all \
```

```
&& sudo yum -y install cuda-drivers-fabricmanager cuda libcudnn8-devel
```

5. Reboot the instance and reconnect to it.
6. (p4d.24xlarge instances only) Start the Nvidia Fabric Manager service, and ensure that it starts automatically when the instance starts. Nvidia Fabric Manager is required for NV Switch Management.

```
$ sudo systemctl start nvidia-fabricmanager \
&& sudo systemctl enable nvidia-fabricmanager
```

7. Ensure that the CUDA paths are set each time that the instance starts.
 - For *bash* shells, add the following statements to `/home/username/.bashrc` and `/home/username/.bash_profile`.

```
export PATH=/usr/local/cuda/bin:$PATH
export LD_LIBRARY_PATH=/usr/local/cuda/lib64:/usr/local/cuda/extras/CUPTI/lib64:
$LD_LIBRARY_PATH
```

- For *tcsh* shells, add the following statements to `/home/username/.cshrc`.

```
setenv PATH=/usr/local/cuda/bin:$PATH
setenv LD_LIBRARY_PATH=/usr/local/cuda/lib64:/usr/local/cuda/extras/CUPTI/lib64:
$LD_LIBRARY_PATH
```

8. To confirm that the Nvidia GPU drivers are functional, run the following command.

```
$ nvidia-smi -q | head
```

The command should return information about the Nvidia GPUs, Nvidia GPU drivers, and Nvidia CUDA toolkit.

Ubuntu 18.04/20.04

To install the Nvidia GPU drivers, Nvidia CUDA toolkit, and cuDNN

1. Install the utilities that are needed to install the Nvidia GPU drivers and the Nvidia CUDA toolkit.

```
$ sudo apt-get update \
&& sudo apt-get install build-essential -y
```

2. To use the Nvidia GPU driver, you must first disable the *nouveau* open source drivers.

- a. Install the required utilities and the kernel headers package for the version of the kernel that you are currently running.

```
$ sudo apt-get install -y gcc make linux-headers-$(uname -r)
```

- b. Add *nouveau* to the `/etc/modprobe.d/blacklist.conf` deny list file.

```
$ cat << EOF | sudo tee --append /etc/modprobe.d/blacklist.conf
blacklist vga16fb
blacklist nouveau
blacklist rivafb
blacklist nvidiafb
blacklist rivatv
EOF
```

- c. Open `/etc/default/grub` using your preferred text editor and add the following.

```
GRUB_CMDLINE_LINUX="rdblacklist=nouveau"
```

- d. Rebuild the Grub configuration.

```
$ sudo update-grub
```

3. Reboot the instance and reconnect to it.
4. Install the Nvidia GPU drivers, NVIDIA CUDA toolkit, and cuDNN.

- a. Download and install the additional dependencies and add the CUDA repository.

- Ubuntu 18.04

```
$ sudo apt-key adv --fetch-keys http://developer.download.nvidia.com/compute/machine-learning/repos/ubuntu1804/x86_64/7fa2af80.pub \
&& wget -O /tmp/deeplearning.deb http://developer.download.nvidia.com/compute/machine-learning/repos/ubuntu1804/x86_64/nvidia-machine-learning-repo-ubuntu1804_1.0.0-1_amd64.deb \
&& sudo dpkg -i /tmp/deeplearning.deb \
&& wget -O /tmp/cuda.pin https://developer.download.nvidia.com/compute/cuda/repos/ubuntu1804/x86_64/cuda-ubuntu1804.pin \
&& sudo mv /tmp/cuda.pin /etc/apt/preferences.d/cuda-repository-pin-600 \
&& sudo apt-key adv --fetch-keys https://developer.download.nvidia.com/compute/cuda/repos/ubuntu1804/x86_64/7fa2af80.pub \
&& sudo add-apt-repository 'deb http://developer.download.nvidia.com/compute/cuda/repos/ubuntu1804/x86_64/ /' \
&& sudo apt update
```

- Ubuntu 20.04

```
$ sudo apt-key adv --fetch-keys http://developer.download.nvidia.com/compute/machine-learning/repos/ubuntu2004/x86_64/7fa2af80.pub \
&& wget -O /tmp/deeplearning.deb http://developer.download.nvidia.com/compute/machine-learning/repos/ubuntu2004/x86_64/nvidia-machine-learning-repo-ubuntu2004_1.0.0-1_amd64.deb \
&& sudo dpkg -i /tmp/deeplearning.deb \
&& wget -O /tmp/cuda.pin https://developer.download.nvidia.com/compute/cuda/repos/ubuntu2004/x86_64/cuda-ubuntu2004.pin \
&& sudo mv /tmp/cuda.pin /etc/apt/preferences.d/cuda-repository-pin-600 \
&& sudo apt-key adv --fetch-keys https://developer.download.nvidia.com/compute/cuda/repos/ubuntu2004/x86_64/7fa2af80.pub \
&& sudo add-apt-repository 'deb http://developer.download.nvidia.com/compute/cuda/repos/ubuntu2004/x86_64/ /' \
&& sudo apt update
```

- b. Install the NVIDIA, CUDA drivers and cuDNN.

```
$ sudo apt install -o Dpkg::Options::='--force-overwrite' cuda-drivers cuda-toolkit-11-0 libcuda8 libcuda8-dev -y
```

5. Reboot the instance and reconnect to it.
6. (p4d.24xlarge instances only) Install the Nvidia Fabric Manager.
 - a. You must install the version of the Nvidia Fabric Manager that matches the version of the Nvidia kernel module that you installed in the previous step.

Run the following command to determine the version of the Nvidia kernel module.

```
$ cat /proc/driver/nvidia/version | grep "Kernel Module"
```

The following is example output.

```
NVRM version: NVIDIA UNIX x86_64 Kernel Module 450.42.01 Tue Jun 15 21:26:37  
UTC 2021
```

In the example above, major version 450 of the kernel module was installed. This means that you need to install Nvidia Fabric Manager version 450.

- b. Install the Nvidia Fabric Manager. Run the following command and specify the major version identified in the previous step.

```
$ sudo apt install -o Dpkg::Options::='--force-overwrite' nvidia-fabricmanager-  
major_version_number
```

For example, if major version 450 of the kernel module was installed, use the following command to install the matching version of Nvidia Fabric Manager.

```
$ sudo apt install -o Dpkg::Options::='--force-overwrite' nvidia-fabricmanager-450
```

- c. Start the service, and ensure that it starts automatically when the instance starts. Nvidia Fabric Manager is required for NV Switch Management.

```
$ sudo systemctl start nvidia-fabricmanager \  
&& sudo systemctl enable nvidia-fabricmanager
```

7. Ensure that the CUDA paths are set each time that the instance starts.

- For *bash* shells, add the following statements to `/home/username/.bashrc` and `/home/username/.bash_profile`.

```
export PATH=/usr/local/cuda/bin:$PATH  
export LD_LIBRARY_PATH=/usr/local/cuda/lib64:/usr/local/cuda/extras/CUPTI/lib64:  
$LD_LIBRARY_PATH
```

- For *tcsh* shells, add the following statements to `/home/username/.cshrc`.

```
setenv PATH=/usr/local/cuda/bin:$PATH  
setenv LD_LIBRARY_PATH=/usr/local/cuda/lib64:/usr/local/cuda/extras/CUPTI/lib64:  
$LD_LIBRARY_PATH
```

8. To confirm that the Nvidia GPU drivers are functional, run the following command.

```
$ nvidia-smi -q | head
```

The command should return information about the Nvidia GPUs, Nvidia GPU drivers, and Nvidia CUDA toolkit.

Step 4: Install the EFA software

Install the EFA-enabled kernel, EFA drivers, Libfabric, and Open MPI stack that is required to support EFA on your temporary instance.

To install the EFA software

1. Connect to the instance you launched. For more information, see [Connect to your Linux instance \(p. 611\)](#).
2. To ensure that all of your software packages are up to date, perform a quick software update on your instance. This process may take a few minutes.
 - Amazon Linux 2, RHEL 7/8, and CentOS 7

```
$ sudo yum update -y
```

- Ubuntu 18.04

```
$ sudo apt-get update && sudo apt-get upgrade -y
```

3. Download the EFA software installation files. The software installation files are packaged into a compressed tarball (.tar.gz) file. To download the latest *stable* version, use the following command.

```
$ curl -O https://efa-installer.amazonaws.com/aws-efa-installer-1.15.0.tar.gz
```

You can also get the latest version by replacing the version number with `latest` in the preceding command.

4. (Optional) Verify the authenticity and integrity of the EFA tarball (.tar.gz) file. We recommend that you do this to verify the identity of the software publisher and to check that the file has not been altered or corrupted since it was published. If you do not want to verify the tarball file, skip this step.

Note

Alternatively, if you prefer to verify the tarball file by using an MD5 or SHA256 checksum instead, see [Verify the EFA installer using a checksum \(p. 1188\)](#).

- a. Download the public GPG key and import it into your keyring.

```
$ wget https://efa-installer.amazonaws.com/aws-efa-installer.key && gpg --import aws-efa-installer.key
```

The command should return a key value. Make a note of the key value, because you need it in the next step.

- b. Verify the GPG key's fingerprint. Run the following command and specify the key value from the previous step.

```
$ gpg --fingerprint key_value
```

The command should return a fingerprint that is identical to `4E90 91BC BB97 A96B 26B1 5E59 A054 80B1 DD2D 3CCC`. If the fingerprint does not match, don't run the EFA installation script, and contact AWS Support.

- c. Download the signature file and verify the signature of the EFA tarball file.

```
$ wget https://efa-installer.amazonaws.com/aws-efa-installer-1.15.0.tar.gz.sig && gpg --verify ./aws-efa-installer-1.15.0.tar.gz.sig
```

The following shows example output.

```
gpg: Signature made Wed 29 Jul 2020 12:50:13 AM UTC using RSA key ID DD2D3CCC
gpg: Good signature from "Amazon EC2 EFA <ec2-efa-maintainers@amazon.com>"
gpg: WARNING: This key is not certified with a trusted signature!
gpg:                 There is no indication that the signature belongs to the owner.
Primary key fingerprint: 4E90 91BC BB97 A96B 26B1 5E59 A054 80B1 DD2D 3CCC
```

If the result includes `Good signature`, and the fingerprint matches the fingerprint returned in the previous step, proceed to the next step. If not, don't run the EFA installation script, and contact AWS Support.

5. Extract the files from the compressed `.tar.gz` file and navigate into the extracted directory.

```
$ tar -xf aws-efa-installer-1.15.0.tar.gz && cd aws-efa-installer
```

6. Run the EFA software installation script.

```
$ sudo ./efa_installer.sh -y
```

Libfabric is installed in the `/opt/amazon/efa` directory, while Open MPI is installed in the `/opt/amazon/openmpi` directory.

7. If the EFA installer prompts you to reboot the instance, do so and then reconnect to the instance. Otherwise, log out of the instance and then log back in to complete the installation.
8. Confirm that the EFA software components were successfully installed.

```
$ fi_info -p efa -t FI_EP_RDM
```

The command should return information about the Libfabric EFA interfaces. The following example shows the command output.

- p3dn.24xlarge with single network interface

```
provider: efa
fabric: EFA-fe80::94:3dff:fe89:1b70
domain: efa_0-rdm
version: 2.0
type: FI_EP_RDM
protocol: FI_PROTO_EFA
```

- p4d.24xlarge with multiple network interfaces

```
provider: efa
fabric: EFA-fe80::c6e:8fff:fef6:e7ff
domain: efa_0-rdm
version: 111.0
type: FI_EP_RDM
protocol: FI_PROTO_EFA
provider: efa
fabric: EFA-fe80::c34:3eff:feb2:3c35
domain: efa_1-rdm
version: 111.0
type: FI_EP_RDM
protocol: FI_PROTO_EFA
provider: efa
fabric: EFA-fe80::c0f:7bff:fe68:a775
domain: efa_2-rdm
version: 111.0
type: FI_EP_RDM
protocol: FI_PROTO_EFA
```

```
provider: efa
fabric: EFA-fe80::ca7:b0ff:fea6:5e99
domain: efa_3-rdm
version: 111.0
type: FI_EP_RDM
protocol: FI_PROTO_EFA
```

Step 5: Install NCCL

Install NCCL. For more information about NCCL, see the [NCCL repository](#).

To install NCCL

1. Navigate to the /opt directory.

```
$ cd /opt
```

2. Clone the official NCCL repository to the instance and navigate into the local cloned repository.

```
$ sudo git clone https://github.com/NVIDIA/nccl.git && cd nccl
```

3. Build and install NCCL and specify the CUDA installation directory.

```
$ sudo make -j src.build CUDA_HOME=/usr/local/cuda
```

Step 6: Install the aws-ofi-nccl plugin

The aws-ofi-nccl plugin maps NCCL's connection-oriented transport APIs to Libfabric's connection-less reliable interface. This enables you to use Libfabric as a network provider while running NCCL-based applications. For more information about the aws-ofi-nccl plugin, see the [aws-ofi-nccl repository](#).

To install the aws-ofi-nccl plugin

1. Navigate to your home directory.

```
$ cd $HOME
```

2. (Ubuntu only) Install the utilities that are required to install the **aws-ofi-nccl** plugin. To install the required utilities, run the following command.

```
$ sudo apt-get install libtool autoconf -y
```

3. Clone the aws branch of the official AWS aws-ofi-nccl repository to the instance and navigate into the local cloned repository.

```
$ git clone https://github.com/aws/aws-ofi-nccl.git -b aws && cd aws-ofi-nccl
```

4. To generate the `configure` script, run the `autogen.sh` script.

```
$ ./autogen.sh
```

5. To generate the `make` files, run the `configure` script and specify the MPI, Libfabric, NCCL, and CUDA installation directories.

```
$ ./configure --prefix=/opt/aws-ofi-nccl --with-mpi=/opt/amazon/openmpi \
```

```
--with-libfabric=/opt/amazon/efa --with-nccl=/opt/nccl/build \
--with-cuda=/usr/local/cuda
```

6. Add the Open MPI directory to the `PATH` variable.

```
$ export PATH=/opt/amazon/openmpi/bin/:$PATH
```

7. Install the aws-ofi-nccl plugin.

```
$ make \
&& sudo make install
```

Step 7: Install the NCCL tests

Install the NCCL tests. The NCCL tests enable you to confirm that NCCL is properly installed and that it is operating as expected. For more information about the NCCL tests, see the [nccl-tests repository](#).

To install the NCCL tests

1. Navigate to your home directory.

```
$ cd $HOME
```

2. Clone the official nccl-tests repository to the instance and navigate into the local cloned repository.

```
$ git clone https://github.com/NVIDIA/nccl-tests.git && cd nccl-tests
```

3. Add the Libfabric directory to the `LD_LIBRARY_PATH` variable.

- Amazon Linux, Amazon Linux 2, RHEL , and CentOS

```
$ export LD_LIBRARY_PATH=/opt/amazon/efa/lib64:$LD_LIBRARY_PATH
```

- Ubuntu 18.04

```
$ export LD_LIBRARY_PATH=/opt/amazon/efa/lib:$LD_LIBRARY_PATH
```

4. Install the NCCL tests and specify the MPI, NCCL, and CUDA installation directories.

```
$ make MPI=1 MPI_HOME=/opt/amazon/openmpi NCCL_HOME=/opt/nccl/build CUDA_HOME=/usr/local/cuda
```

Step 8: Test your EFA and NCCL configuration

Run a test to ensure that your temporary instance is properly configured for EFA and NCCL.

To test your EFA and NCCL configuration

1. Create a host file that specifies the hosts on which to run the tests. The following command creates a host file named `my-hosts` that includes a reference to the instance itself.

IMDSv2

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
```

```
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" -v http://169.254.169.254/latest/meta-data/local-ipv4 >> my-hosts
```

IMDSv1

```
[ec2-user ~]$ curl http://169.254.169.254/latest/meta-data/local-ipv4 >> my-hosts
```

- Run the test and specify the host file (--hostfile) and the number of GPUs to use (-n). The following command runs the all_reduce_perf test on 8 GPUs on the instance itself, and specifies the following environment variables.

- FI_PROVIDER="efa"—specifies the fabric interface provider. This must be set to "efa".
- FI_EFA_USE_DEVICE_RDMA=1—uses the device's RDMA functionality for one-sided and two-sided transfer.
- NCCL_DEBUG=INFO—enables detailed debugging output. You can also specify VERSION to print only the NCCL version at the start of the test, or WARN to receive only error messages.
- NCCL_ALGO=ring—enables ring algorithm for collective operations.
- NCCL_PROTO=simple—instructs NCCL to use a simple protocol for communication. Currently, the EFA provider does not support LL protocols. Enabling them could lead to data corruption.

For more information about the NCCL test arguments, see the [NCCL Tests README](#) in the official nccl-tests repository.

```
$ /opt/amazon/openmpi/bin/mpirun \
-x FI_PROVIDER="efa" \
-x FI_EFA_USE_DEVICE_RDMA=1 \
-x LD_LIBRARY_PATH=/opt/nccl/build/lib:/usr/local/cuda/lib64:/opt/amazon/efa/
lib64:/opt/amazon/openmpi/lib64:/opt/aws-ofi-nccl/lib:$LD_LIBRARY_PATH \
-x NCCL_DEBUG=INFO \
-x NCCL_ALGO=ring \
-x NCCL_PROTO=simple \
--hostfile my-hosts -n 8 -N 8 \
--mca pml ^cm --mca btl tcp,self --mca btl_tcp_if_exclude lo,docker0 --bind-to none \
$HOME/nccl-tests/build/all_reduce_perf -b 8 -e 1G -f 2 -g 1 -c 1 -n 100
```

- You can confirm that EFA is active as the underlying provider for NCCL when the NCCL_DEBUG log is printed.

```
ip-192-168-2-54:14:14 [0] NCCL INFO NET/OFI Selected Provider is efa*
```

The following additional information is displayed when using a p4d.24xlarge instance.

```
ip-192-168-2-54:14:14 [0] NCCL INFO NET/OFI Running on P4d platform, Setting
NCCL_TOPO_FILE environment variable to /home/ec2-user/install/plugin/share/aws-ofi-
nccl/xml/p4d-24x1-topo.xml
```

Step 9: Install your machine learning applications

Install the machine learning applications on the temporary instance. The installation procedure varies depending on the specific machine learning application. For more information about installing software on your Linux instance, see [Managing Software on Your Linux Instance](#).

Note

You might need to refer to your machine learning application's documentation for installation instructions.

Step 10: Create an EFA and NCCL-enabled AMI

After you have installed the required software components, you create an AMI that you can reuse to launch your EFA-enabled instances.

To create an AMI from your temporary instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the temporary instance that you created and choose **Actions, Image, Create image**.
4. For **Create image**, do the following:
 - a. For **Image name**, enter a descriptive name for the AMI.
 - b. (Optional) For **Image description**, enter a brief description of the purpose of the AMI.
 - c. Choose **Create image**.
5. In the navigation pane, choose **AMIs**.
6. Locate the AMI that you created in the list. Wait for the status to change from pending to available before continuing to the next step.

Step 11: Terminate the temporary instance

At this point, you no longer need the temporary instance that you launched. You can terminate the instance to stop incurring charges for it.

To terminate the temporary instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the temporary instance that you created and then choose **Actions, Instance state, Terminate instance**.
4. When prompted for confirmation, choose **Terminate**.

Step 12: Launch EFA and NCCL-enabled instances into a cluster placement group

Launch your EFA and NCCL-enabled instances into a cluster placement group using the EFA-enabled AMI and the EFA-enabled security group that you created earlier.

Note

- It is not an absolute requirement to launch your EFA-enabled instances into a cluster placementgroup. However, we do recommend running your EFA-enabled instances in a cluster placement group as it launches the instances into a low-latency group in a single Availability Zone.
- To ensure that capacity is available as you scale your cluster's instances, you can create a Capacity Reservation for your cluster placement group. For more information, see [Capacity Reservations in cluster placement groups \(p. 551\)](#).

To launch your EFA and NCCL-enabled instances into a cluster placement group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Launch Instance**.
3. On the **Choose an AMI** page, choose **My AMIs**, find the AMI that you created earlier, and then choose **Select**.

4. On the **Choose an Instance Type** page, select **p3dn.24xlarge** and then choose **Next: Configure Instance Details**.
5. On the **Configure Instance Details** page, do the following:
 - a. For **Number of instances**, enter the number of EFA and NCCL-enabled instances that you want to launch.
 - b. For **Network** and **Subnet**, select the VPC and subnet into which to launch the instances.
 - c. For **Placement group**, select **Add instance to placement group**.
 - d. For **Placement group name**, select **Add to a new placement group**, and then enter a descriptive name for the placement group. Then for **Placement group strategy**, select **cluster**.
 - e. For **EFA**, choose **Enable**.
 - f. In the **Network Interfaces** section, for device **eth0**, choose **New network interface**. You can optionally specify a primary IPv4 address and one or more secondary IPv4 addresses. If you are launching the instance into a subnet that has an associated IPv6 CIDR block, you can optionally specify a primary IPv6 address and one or more secondary IPv6 addresses.
 - g. Choose **Next: Add Storage**.
6. On the **Add Storage** page, specify the volumes to attach to the instances in addition to the volumes specified by the AMI (such as the root device volume). Then choose **Next: Add Tags**.
7. On the **Add Tags** page, specify tags for the instances, such as a user-friendly name, and then choose **Next: Configure Security Group**.
8. On the **Configure Security Group** page, for **Assign a security group**, select **Select an existing security group**, and then select the security group that you created earlier.
9. Choose **Review and Launch**.
10. On the **Review Instance Launch** page, review the settings, and then choose **Launch** to choose a key pair and to launch your instances.

Step 13: Enable passwordless SSH

To enable your applications to run across all of the instances in your cluster, you must enable passwordless SSH access from the leader node to the member nodes. The leader node is the instance from which you run your applications. The remaining instances in the cluster are the member nodes.

To enable passwordless SSH between the instances in the cluster

1. Select one instance in the cluster as the leader node, and connect to it.
2. Disable `strictHostKeyChecking` and enable `ForwardAgent` on the leader node. Open `~/.ssh/config` using your preferred text editor and add the following.

```
Host *
  ForwardAgent yes
Host *
  StrictHostKeyChecking no
```

3. Generate an RSA key pair.

```
$ ssh-keygen -t rsa -N "" -f ~/.ssh/id_rsa
```

The key pair is created in the `$HOME/.ssh/` directory.

4. Change the permissions of the private key on the leader node.

```
$ chmod 600 ~/.ssh/id_rsa
chmod 600 ~/.ssh/config
```

5. Open `~/.ssh/id_rsa.pub` using your preferred text editor and copy the key.
6. For each member node in the cluster, do the following:
 - a. Connect to the instance.
 - b. Open `~/.ssh/authorized_keys` using your preferred text editor and add the public key that you copied earlier.
7. To test that the passwordless SSH is functioning as expected, connect to your leader node and run the following command.

```
$ ssh member_node_private_ip
```

You should connect to the member node without being prompted for a key or password.

Use an AWS Deep Learning AMI

The following steps help you to get started with one of the following AWS Deep Learning AMIs:

- Deep Learning AMI (Amazon Linux 2) Version 25.0 and later
- Deep Learning AMI (Amazon Linux) Version 25.0 and later
- Deep Learning AMI (Ubuntu 18.04) Version 25.0 and later
- Deep Learning AMI (Ubuntu 16.04) Version 25.0 and later

For more information, see the [AWS Deep Learning AMI User Guide](#).

Note

Only the `p3dn.24xlarge` and `p4d.24xlarge` instance types are supported.

Contents

- [Step 1: Prepare an EFA-enabled security group \(p. 1180\)](#)
- [Step 2: Launch a temporary instance \(p. 1181\)](#)
- [Step 3: Test your EFA and NCCL configuration \(p. 1181\)](#)
- [Step 4: Install your machine learning applications \(p. 1183\)](#)
- [Step 5: Create an EFA and NCCL-enabled AMI \(p. 1183\)](#)
- [Step 6: Terminate the temporary instance \(p. 1183\)](#)
- [Step 7: Launch EFA and NCCL-enabled instances into a cluster placement group \(p. 1183\)](#)
- [Step 8: Enable passwordless SSH \(p. 1184\)](#)

Step 1: Prepare an EFA-enabled security group

An EFA requires a security group that allows all inbound and outbound traffic to and from the security group itself. The following procedure allows all inbound and outbound traffic for testing purposes only. For other scenarios, see [Security group rules for different use cases \(p. 1340\)](#).

To create an EFA-enabled security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups** and then choose **Create security group**.
3. In the **Create security group** window, do the following:
 - a. For **Security group name**, enter a descriptive name for the security group, such as `EFA-enabled security group`.

- b. (Optional) For **Description**, enter a brief description of the security group.
 - c. For **VPC**, select the VPC into which you intend to launch your EFA-enabled instances.
 - d. Choose **Create security group**.
4. Select the security group that you created, and on the **Details** tab, copy the **Security group ID**.
 5. With the security group still selected, choose **Actions, Edit inbound rules**, and then do the following:
 - a. Choose **Add rule**.
 - b. For **Type**, choose **All traffic**.
 - c. For **Source type**, choose **Custom** and paste the security group ID that you copied into the field.
 - d. Choose **Save rules**.
 6. With the security group still selected, choose **Actions, Edit outbound rules**, and then do the following:
 - a. Choose **Add rule**.
 - b. For **Type**, choose **All traffic**.
 - c. For **Destination type**, choose **Custom** and paste the security group ID that you copied into the field.
 - d. Choose **Save rules**.

Step 2: Launch a temporary instance

Launch a temporary instance that you can use to install and configure the EFA software components. You use this instance to create an EFA-enabled AMI from which you can launch your EFA-enabled instances.

To launch a temporary instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Launch Instance**.
3. On the **Choose an AMI** page, choose a supported **AWS Deep Learning AMI Version 25.0** or later.
4. On the **Choose an Instance Type** page, select **p3dn.24xlarge** or **p4d.24xlarge** and then choose **Next: Configure Instance Details**.
5. On the **Configure Instance Details** page, do the following:
 - a. For **Subnet**, choose the subnet in which to launch the instance. If you do not select a subnet, you can't enable the instance for EFA.
 - b. For **Elastic Fabric Adapter**, choose **Enable**.
 - c. In the **Network Interfaces** section, for device **eth0**, choose **New network interface**.
 - d. Choose **Next: Add Storage**.
6. On the **Add Storage** page, specify the volumes to attach to the instances, in addition to the volumes specified by the AMI (such as the root device volume). Then choose **Next: Add Tags**.
7. On the **Add Tags** page, specify a tag that you can use to identify the temporary instance, and then choose **Next: Configure Security Group**.
8. On the **Configure Security Group** page, for **Assign a security group**, select **Select an existing security group**. Then select the security group that you created in **Step 1**.
9. On the **Review Instance Launch** page, review the settings, and then choose **Launch** to choose a key pair and to launch your instance.

Step 3: Test your EFA and NCCL configuration

Run a test to ensure that your temporary instance is properly configured for EFA and NCCL.

To test your EFA and NCCL configuration

1. Create a host file that specifies the hosts on which to run the tests. The following command creates a host file named my-hosts that includes a reference to the instance itself.

IMDSv2

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" -v http://169.254.169.254/latest/meta-data/local-ipv4 >> my-hosts
```

IMDSv1

```
[ec2-user ~]$ curl http://169.254.169.254/latest/meta-data/local-ipv4 >> my-hosts
```

2. Run the test and specify the host file (--hostfile) and the number of GPUs to use (-n). The following command runs the all_reduce_perf test on 8 GPUs on the instance itself, and specifies the following environment variables.

- `FI_PROVIDER="efa"`—specifies the fabric interface provider. This must be set to "efa".
- `FI_EFA_USE_DEVICE_RDMA=1`—uses the device's RDMA functionality for one-sided and two-sided transfer.
- `NCCL_DEBUG=INFO`—enables detailed debugging output. You can also specify `VERSION` to print only the NCCL version at the start of the test, or `WARN` to receive only error messages.
- `NCCL_ALGO=ring`—enables ring algorithm for collective operations.
- `NCCL_PROTO=simple`—instructs NCCL to use a simple protocol for communication. Currently, the EFA provider does not support LL protocols. Enabling them could lead to data corruption.

For more information about the NCCL test arguments, see the [NCCL Tests README](#) in the official nccl-tests repository.

```
$ /opt/amazon/openmpi/bin/mpirun \
-x FI_PROVIDER="efa" \
-x FI_EFA_USE_DEVICE_RDMA=1 \
-x LD_LIBRARY_PATH=/opt/nccl/build/lib:/usr/local/cuda/lib64:/opt/amazon/efa/
lib64:/opt/amazon/openmpi/lib64:/usr/local/cuda/efa/lib:$LD_LIBRARY_PATH \
-x NCCL_DEBUG=INFO \
-x NCCL_ALGO=ring \
-x NCCL_PROTO=simple \
--hostfile my-hosts -n 8 -N 8 \
--mca pml ^cm --mca btl tcp,self --mca btl_tcp_if_exclude lo,docker0 --bind-to none \
$HOME/src/bin/efa-tests/efa-cuda-10.0/all_reduce_perf -b 8 -e 1G -f 2 -g 1 -c 1 -n
100
```

3. You can confirm that EFA is active as the underlying provider for NCCL when the `NCCL_DEBUG` log is printed.

```
ip-192-168-2-54:14:14 [0] NCCL INFO NET/OFI Selected Provider is efa*
```

The following additional information is displayed when using a p4d.24xlarge instance.

```
ip-192-168-2-54:14:14 [0] NCCL INFO NET/OFI Running on P4d platform, Setting
NCCL_TOPO_FILE environment variable to /home/ec2-user/install/plugin/share/aws-ofi-
nccl/xml/p4d-24xl-topo.xml
```

Step 4: Install your machine learning applications

Install the machine learning applications on the temporary instance. The installation procedure varies depending on the specific machine learning application. For more information about installing software on your Linux instance, see [Managing Software on Your Linux Instance](#).

Note

You might need to refer to your machine learning application's documentation for installation instructions.

Step 5: Create an EFA and NCCL-enabled AMI

After you have installed the required software components, you create an AMI that you can reuse to launch your EFA-enabled instances.

To create an AMI from your temporary instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the temporary instance that you created and choose **Actions, Image, Create image**.
4. For **Create image**, do the following:
 - a. For **Image name**, enter a descriptive name for the AMI.
 - b. (Optional) For **Image description**, enter a brief description of the purpose of the AMI.
 - c. Choose **Create image**.
5. In the navigation pane, choose **AMIs**.
6. Locate the AMI that you created in the list. Wait for the status to change from pending to available before continuing to the next step.

Step 6: Terminate the temporary instance

At this point, you no longer need the temporary instance that you launched. You can terminate the instance to stop incurring charges for it.

To terminate the temporary instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the temporary instance that you created and then choose **Actions, Instance state, Terminate instance**.
4. When prompted for confirmation, choose **Terminate**.

Step 7: Launch EFA and NCCL-enabled instances into a cluster placement group

Launch your EFA and NCCL-enabled instances into a cluster placement group using the EFA-enabled AMI and the EFA-enabled security group that you created earlier.

Note

- It is not an absolute requirement to launch your EFA-enabled instances into a cluster placement group. However, we do recommend running your EFA-enabled instances in a cluster placement group as it launches the instances into a low-latency group in a single Availability Zone.

- To ensure that capacity is available as you scale your cluster's instances, you can create a Capacity Reservation for your cluster placement group. For more information, see [Capacity Reservations in cluster placement groups \(p. 551\)](#).

To launch your EFA and NCCL-enabled instances into a cluster placement group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Launch Instance**.
3. On the **Choose an AMI** page, choose **My AMIs**, find the AMI that you created earlier, and then choose **Select**.
4. On the **Choose an Instance Type** page, select **p3dn.24xlarge** and then choose **Next: Configure Instance Details**.
5. On the **Configure Instance Details** page, do the following:
 - a. For **Number of instances**, enter the number of EFA and NCCL-enabled instances that you want to launch.
 - b. For **Network** and **Subnet**, select the VPC and subnet into which to launch the instances.
 - c. For **Placement group**, select **Add instance to placement group**.
 - d. For **Placement group name**, select **Add to a new placement group**, and then enter a descriptive name for the placement group. Then for **Placement group strategy**, select **cluster**.
 - e. For **EFA**, choose **Enable**.
 - f. In the **Network Interfaces** section, for device **eth0**, choose **New network interface**. You can optionally specify a primary IPv4 address and one or more secondary IPv4 addresses. If you are launching the instance into a subnet that has an associated IPv6 CIDR block, you can optionally specify a primary IPv6 address and one or more secondary IPv6 addresses.
 - g. Choose **Next: Add Storage**.
6. On the **Add Storage** page, specify the volumes to attach to the instances in addition to the volumes specified by the AMI (such as the root device volume). Then choose **Next: Add Tags**.
7. On the **Add Tags** page, specify tags for the instances, such as a user-friendly name, and then choose **Next: Configure Security Group**.
8. On the **Configure Security Group** page, for **Assign a security group**, select **Select an existing security group**, and then select the security group that you created earlier.
9. Choose **Review and Launch**.
10. On the **Review Instance Launch** page, review the settings, and then choose **Launch** to choose a key pair and to launch your instances.

Step 8: Enable passwordless SSH

To enable your applications to run across all of the instances in your cluster, you must enable passwordless SSH access from the leader node to the member nodes. The leader node is the instance from which you run your applications. The remaining instances in the cluster are the member nodes.

To enable passwordless SSH between the instances in the cluster

1. Select one instance in the cluster as the leader node, and connect to it.
2. Disable `strictHostKeyChecking` and enable `ForwardAgent` on the leader node. Open `~/.ssh/config` using your preferred text editor and add the following.

```
Host *
  ForwardAgent yes
Host *
  StrictHostKeyChecking no
```

3. Generate an RSA key pair.

```
$ ssh-keygen -t rsa -N "" -f ~/.ssh/id_rsa
```

The key pair is created in the `$HOME/.ssh/` directory.

4. Change the permissions of the private key on the leader node.

```
$ chmod 600 ~/.ssh/id_rsa
chmod 600 ~/.ssh/config
```

5. Open `~/.ssh/id_rsa.pub` using your preferred text editor and copy the key.
6. For each member node in the cluster, do the following:
 - a. Connect to the instance.
 - b. Open `~/.ssh/authorized_keys` using your preferred text editor and add the public key that you copied earlier.
7. To test that the passwordless SSH is functioning as expected, connect to your leader node and run the following command.

```
$ ssh member_node_private_ip
```

You should connect to the member node without being prompted for a key or password.

Work with EFA

You can create, use, and manage an EFA much like any other elastic network interface in Amazon EC2. However, unlike elastic network interfaces, EFAs cannot be attached to or detached from an instance in a running state.

EFA requirements

To use an EFA, you must do the following:

- Choose one of the [supported instance types \(p. 1154\)](#).
- Use one of the [supported AMIs \(p. 1154\)](#).
- Install the EFA software components. For more information, see [Step 3: Install the EFA software \(p. 1157\)](#) and [Step 5: \(Optional\) Install Intel MPI \(p. 1160\)](#).
- Use a security group that allows all inbound and outbound traffic to and from the security group itself. For more information, see [Step 1: Prepare an EFA-enabled security group \(p. 1155\)](#).

Contents

- [Create an EFA \(p. 1186\)](#)
- [Attach an EFA to a stopped instance \(p. 1186\)](#)
- [Attach an EFA when launching an instance \(p. 1186\)](#)
- [Add an EFA to a launch template \(p. 1187\)](#)
- [Manage IP addresses for an EFA \(p. 1187\)](#)
- [Change the security group for an EFA \(p. 1187\)](#)
- [Detach an EFA \(p. 1187\)](#)
- [View EFAs \(p. 1187\)](#)
- [Delete an EFA \(p. 1187\)](#)

Create an EFA

You can create an EFA in a subnet in a VPC. You can't move the EFA to another subnet after it's created, and you can only attach it to stopped instances in the same Availability Zone.

To create a new EFA using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Choose **Create Network Interface**.
4. For **Description**, enter a descriptive name for the EFA.
5. For **Subnet**, select the subnet in which to create the EFA.
6. For **Private IP**, enter the primary private IPv4 address. If you don't specify an IPv4 address, we select an available private IPv4 address from the selected subnet.
7. (IPv6 only) If you selected a subnet that has an associated IPv6 CIDR block, you can optionally specify an IPv6 address in the **IPv6 IP** field.
8. For **Security groups**, select one or more security groups.
9. For **EFA**, choose **Enabled**.
10. Choose **Yes, Create**.

To create a new EFA using the AWS CLI

Use the `create-network-interface` command and for `interface-type`, specify `efa`, as shown in the following example.

```
aws ec2 create-network-interface --subnet-id subnet-01234567890 --description example_efa  
--interface-type efa
```

Attach an EFA to a stopped instance

You can attach an EFA to any supported instance that is in the `stopped` state. You cannot attach an EFA to an instance that is in the `running` state. For more information about the supported instance types, see [Supported instance types \(p. 1154\)](#).

You attach an EFA to an instance in the same way that you attach a network interface to an instance. For more information, see [Attach a network interface to an instance \(p. 1112\)](#).

Attach an EFA when launching an instance

To attach an existing EFA when launching an instance (AWS CLI)

Use the `run-instances` command and for `NetworkInterfaceId`, specify the ID of the EFA, as shown in the following example.

```
aws ec2 run-instances --image-id ami_id --count 1 --instance-type c5n.18xlarge --key-name my_key_pair --network-interfaces DeviceIndex=0,NetworkInterfaceId=efa_id,Groups=sg_id,SubnetId=subnet_id
```

To attach a new EFA when launching an instance (AWS CLI)

Use the `run-instances` command and for `InterfaceType`, specify `efa`, as shown in the following example.

```
aws ec2 run-instances --image-id ami_id --count 1 --instance-type c5n.18xlarge --key-name my_key_pair --network-interfaces DeviceIndex=0,InterfaceType=efa,Groups=sg_id,SubnetId=subnet_id
```

Add an EFA to a launch template

You can create a launch template that contains the configuration information needed to launch EFA-enabled instances. To create an EFA-enabled launch template, create a new launch template and specify a supported instance type, your EFA-enabled AMI, and an EFA-enabled security group. For more information, see [Get started with EFA and MPI \(p. 1155\)](#).

You can leverage launch templates to launch EFA-enabled instances with other AWS services, such as AWS Batch.

For more information about creating launch templates, see [Create a launch template \(p. 596\)](#).

Manage IP addresses for an EFA

You can change the IP addresses associated with an EFA. If you have an Elastic IP address, you can associate it with an EFA. If your EFA is provisioned in a subnet that has an associated IPv6 CIDR block, you can assign one or more IPv6 addresses to the EFA.

You assign an Elastic IP (IPv4) and IPv6 address to an EFA in the same way that you assign an IP address to an elastic network interface. For more information, see [Managing IP addresses \(p. 1114\)](#).

Change the security group for an EFA

You can change the security group that is associated with an EFA. To enable OS-bypass functionality, the EFA must be a member of a security group that allows all inbound and outbound traffic to and from the security group itself.

You change the security group that is associated with an EFA in the same way that you change the security group that is associated with an elastic network interface. For more information, see [Changing the security group \(p. 1115\)](#).

Detach an EFA

To detach an EFA from an instance, you must first stop the instance. You cannot detach an EFA from an instance that is in the running state.

You detach an EFA from an instance in the same way that you detach an elastic network interface from an instance. For more information, see [Detach a network interface from an instance \(p. 1113\)](#).

View EFAs

You can view all of the EFAs in your account.

You view EFAs in the same way that you view elastic network interfaces. For more information, see [View details about a network interface \(p. 1111\)](#).

Delete an EFA

To delete an EFA, you must first detach it from the instance. You cannot delete an EFA while it is attached to an instance.

You delete EFAs in the same way that you delete elastic network interfaces. For more information, see [Delete a network interface \(p. 1117\)](#).

Monitor an EFA

You can use the following features to monitor the performance of your Elastic Fabric Adapters.

Amazon VPC flow logs

You can create an Amazon VPC Flow Log to capture information about the traffic going to and from an EFA. Flow log data can be published to Amazon CloudWatch Logs and Amazon S3. After you create a flow log, you can retrieve and view its data in the chosen destination. For more information, see [VPC Flow Logs](#) in the *Amazon VPC User Guide*.

You create a flow log for an EFA in the same way that you create a flow log for an elastic network interface. For more information, see [Creating a Flow Log](#) in the *Amazon VPC User Guide*.

In the flow log entries, EFA traffic is identified by the `srcAddress` and `destAddress`, which are both formatted as MAC addresses, as shown in the following example.

```
version accountId eniId      srcAddress      destAddress      sourcePort destPort
  protocol packets bytes start    end      action log-status
2          3794735123 eni-10000001 01:23:45:67:89:ab 05:23:45:67:89:ab -           -
9          5689     1521232534 1524512343 ACCEPT OK
```

Amazon CloudWatch

Amazon CloudWatch provides metrics that enable you to monitor your EFAs in real time. You can collect and track metrics, create customized dashboards, and set alarms that notify you or take actions when a specified metric reaches a threshold that you specify. For more information, see [Monitor your instances using CloudWatch \(p. 975\)](#).

Verify the EFA installer using a checksum

You can optionally verify the EFA tarball (.tar.gz file) using an MD5 or SHA256 checksum. We recommend that you do this to verify the identity of the software publisher and to check that the application has not been altered or corrupted since it was published.

To verify the tarball

Use the **md5sum** utility for the MD5 checksum, or the **sha256sum** utility for the SHA256 checksum, and specify the tarball filename. You must run the command from the directory in which you saved the tarball file.

- MD5

```
$ md5sum tarball_filename.tar.gz
```

- SHA256

```
$ sha256sum tarball_filename.tar.gz
```

The commands should return a checksum value in the following format.

```
checksum_value tarball_filename.tar.gz
```

Compare the checksum value returned by the command with the checksum value provided in the table below. If the checksums match, then it is safe to run the installation script. If the checksums do not match, do not run the installation script, and contact AWS Support.

For example, the following command verifies the EFA 1.9.4 tarball using the SHA256 checksum.

Amazon Elastic Compute Cloud
User Guide for Linux Instances
Verify the EFA installer using a checksum

```
$ sha256sum aws-efa-installer-1.9.4.tar.gz
```

```
1009b5182693490d908ef0ed2c1dd4f813cc310a5d2062ce9619c4c12b5a7f14 aws-efa-
installer-1.9.4.tar.gz
```

The following table lists the checksums for recent versions of EFA.

Version	Download URL	Checksums
EFA 1.15.0	https://efa-installer.amazonaws.com/ aws-efa-installer-1.15.0.tar.gz	MD5: 9861694e1cc00d884fadac07d22898be SHA256: b329862dd5729d2d098d0507fb486bf859d7c70ce

Placement groups

When you launch a new EC2 instance, the EC2 service attempts to place the instance in such a way that all of your instances are spread out across underlying hardware to minimize correlated failures. You can use *placement groups* to influence the placement of a group of *interdependent* instances to meet the

needs of your workload. Depending on the type of workload, you can create a placement group using one of the following placement strategies:

- *Cluster* – packs instances close together inside an Availability Zone. This strategy enables workloads to achieve the low-latency network performance necessary for tightly-coupled node-to-node communication that is typical of HPC applications. For more information, see [Cluster placement groups \(p. 1191\)](#).
- *Partition* – spreads your instances across logical partitions such that groups of instances in one partition do not share the underlying hardware with groups of instances in different partitions. This strategy is typically used by large distributed and replicated workloads, such as Hadoop, Cassandra, and Kafka. For more information, see [Partition placement groups \(p. 1192\)](#).
- *Spread* – strictly places a small group of instances across distinct underlying hardware to reduce correlated failures. For more information, see [Spread placement groups \(p. 1193\)](#).

There is no charge for creating a placement group.

- [Working with placement groups \(p. 1195\)](#)

Placement group strategies

You can create a placement group using one of the following placement strategies:

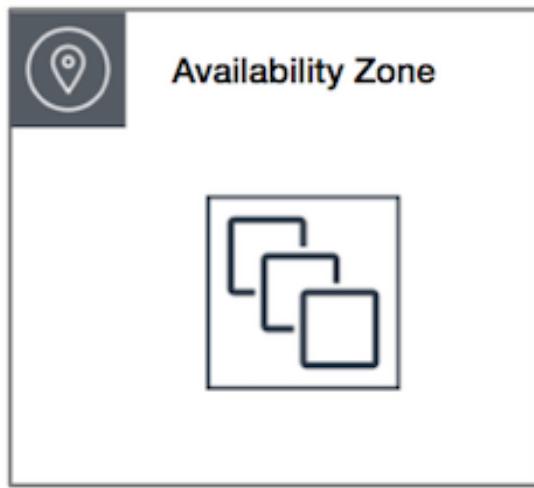

Topics

- [Cluster placement groups \(p. 1191\)](#)
- [Partition placement groups \(p. 1192\)](#)
- [Spread placement groups \(p. 1193\)](#)

Cluster placement groups

A cluster placement group is a logical grouping of instances within a single Availability Zone. A cluster placement group can span peered VPCs in the same Region. Instances in the same cluster placement group enjoy a higher per-flow throughput limit for TCP/IP traffic and are placed in the same high-bisection bandwidth segment of the network.

The following image shows instances that are placed into a cluster placement group.

Cluster placement groups are recommended for applications that benefit from low network latency, high network throughput, or both. They are also recommended when the majority of the network traffic is between the instances in the group. To provide the lowest latency and the highest packet-per-second network performance for your placement group, choose an instance type that supports enhanced networking. For more information, see [Enhanced Networking \(p. 1124\)](#).

We recommend that you launch your instances in the following way:

- Either use a single launch request to launch the number of instances that you need in the placement group, or create a Capacity Reservation in the placement group to reserve capacity for your entire workload. For more information, see [Work with Capacity Reservations in cluster placement groups \(p. 551\)](#).
- Use the same instance type for all instances in the placement group.

If you try to add more instances to the placement group later, or if you try to launch more than one instance type in the placement group, you increase your chances of getting an insufficient capacity error.

If you stop an instance in a placement group and then start it again, it still runs in the placement group. However, if you are not using a Capacity Reservation for your cluster placement group, the instance start fails if there is insufficient capacity.

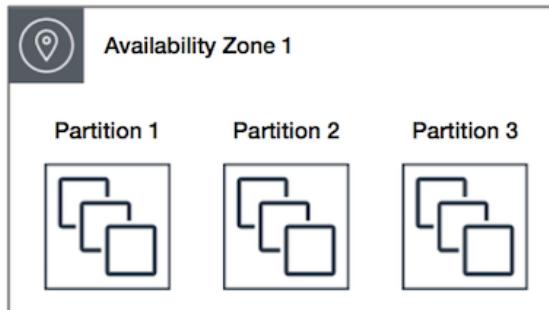

If you receive a capacity error when launching an instance in a placement group that already has running instances, stop and start all of the instances in the placement group, and try the launch again. Starting the instances may migrate them to hardware that has capacity for all of the requested instances.

Partition placement groups

Partition placement groups help reduce the likelihood of correlated hardware failures for your application. When using partition placement groups, Amazon EC2 divides each group into logical segments called partitions. Amazon EC2 ensures that each partition within a placement group has its own set of racks. Each rack has its own network and power source. No two partitions within a placement group share the same racks, allowing you to isolate the impact of hardware failure within your application.

The following image is a simple visual representation of a partition placement group in a single Availability Zone. It shows instances that are placed into a partition placement group with three partitions—**Partition 1**, **Partition 2**, and **Partition 3**. Each partition comprises multiple instances. The

instances in a partition do not share racks with the instances in the other partitions, allowing you to contain the impact of a single hardware failure to only the associated partition.

Partition placement groups can be used to deploy large distributed and replicated workloads, such as HDFS, HBase, and Cassandra, across distinct racks. When you launch instances into a partition placement group, Amazon EC2 tries to distribute the instances evenly across the number of partitions that you specify. You can also launch instances into a specific partition to have more control over where the instances are placed.

A partition placement group can have partitions in multiple Availability Zones in the same Region. A partition placement group can have a maximum of seven partitions per Availability Zone. The number of instances that can be launched into a partition placement group is limited only by the limits of your account.

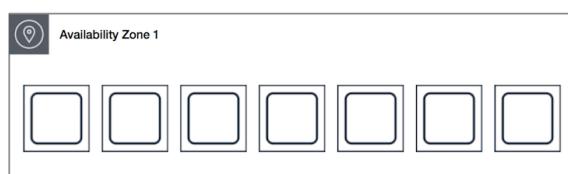

In addition, partition placement groups offer visibility into the partitions — you can see which instances are in which partitions. You can share this information with topology-aware applications, such as HDFS, HBase, and Cassandra. These applications use this information to make intelligent data replication decisions for increasing data availability and durability.

If you start or launch an instance in a partition placement group and there is insufficient unique hardware to fulfill the request, the request fails. Amazon EC2 makes more distinct hardware available over time, so you can try your request again later.

Spread placement groups

A spread placement group is a group of instances that are each placed on distinct racks, with each rack having its own network and power source.

The following image shows seven instances in a single Availability Zone that are placed into a spread placement group. The seven instances are placed on seven different racks.

Spread placement groups are recommended for applications that have a small number of critical instances that should be kept separate from each other. Launching instances in a spread placement group reduces the risk of simultaneous failures that might occur when instances share the same racks. Spread placement groups provide access to distinct racks, and are therefore suitable for mixing instance types or launching instances over time.

A spread placement group can span multiple Availability Zones in the same Region. You can have a maximum of seven running instances per Availability Zone per group.

If you start or launch an instance in a spread placement group and there is insufficient unique hardware to fulfill the request, the request fails. Amazon EC2 makes more distinct hardware available over time, so you can try your request again later.

Placement group rules and limitations

General rules and limitations

Before you use placement groups, be aware of the following rules:

- You can create a maximum of 500 placement groups per account in each Region.
- The name that you specify for a placement group must be unique within your AWS account for the Region.
- You can't merge placement groups.
- An instance can be launched in one placement group at a time; it cannot span multiple placement groups.
- [Zonal Reserved Instances \(p. 398\)](#) provide a capacity reservation for Amazon EC2 instances in a specific Availability Zone. The capacity reservation can be used by instances in a placement group, but it does not explicitly reserve capacity in a placement group.
- You cannot launch Dedicated Hosts in placement groups.

Cluster placement group rules and limitations

The following rules apply to cluster placement groups:

- The following instance types are supported:
 - [Current generation \(p. 241\)](#) instances, except for [burstable performance \(p. 266\)](#) instances (for example, T2) and [Mac1 instances \(p. 300\)](#).
 - The following [previous generation \(p. 245\)](#) instances: A1, C3, cc2.8xlarge, cr1.8xlarge, G2, hs1.8xlarge, I2, and R3.
- A cluster placement group can't span multiple Availability Zones.
- The maximum network throughput speed of traffic between two instances in a cluster placement group is limited by the slower of the two instances. For applications with high-throughput requirements, choose an instance type with network connectivity that meets your requirements.
- For instances that are enabled for enhanced networking, the following rules apply:
 - Instances within a cluster placement group can use up to 10 Gbps for single-flow traffic. Instances that are not within a cluster placement group can use up to 5 Gbps for single-flow traffic.
 - Traffic to and from Amazon S3 buckets within the same Region over the public IP address space or through a VPC endpoint can use all available instance aggregate bandwidth.
- You can launch multiple instance types into a cluster placement group. However, this reduces the likelihood that the required capacity will be available for your launch to succeed. We recommend using the same instance type for all instances in a cluster placement group.
- Network traffic to the internet and over an AWS Direct Connect connection to on-premises resources is limited to 5 Gbps.
- You can create On-Demand Capacity Reservations in a cluster placement group to explicitly reserve capacity in that placement group. For more information, see [Work with Capacity Reservations in cluster placement groups \(p. 551\)](#).

Partition placement group rules and limitations

The following rules apply to partition placement groups:

- A partition placement group supports a maximum of seven partitions per Availability Zone. The number of instances that you can launch in a partition placement group is limited only by your account limits.
- When instances are launched into a partition placement group, Amazon EC2 tries to evenly distribute the instances across all partitions. Amazon EC2 doesn't guarantee an even distribution of instances across all partitions.
- A partition placement group with Dedicated Instances can have a maximum of two partitions.
- On-Demand Capacity Reservations provide a capacity reservation for Amazon EC2 instances in a specific Availability Zone. The Capacity Reservation can be used by instances in a partition placement group, but it does not explicitly reserve capacity in the partition placement group.

Spread placement group rules and limitations

The following rules apply to spread placement groups:

- A spread placement group supports a maximum of seven running instances per Availability Zone. For example, in a Region with three Availability Zones, you can run a total of 21 instances in the group (seven per zone). If you try to start an eighth instance in the same Availability Zone and in the same spread placement group, the instance will not launch. If you need to have more than seven instances in an Availability Zone, then the recommendation is to use multiple spread placement groups. Using multiple spread placement groups does not provide guarantees about the spread of instances between groups, but it does ensure the spread for each group, thus limiting impact from certain classes of failures.
- Spread placement groups are not supported for Dedicated Instances.
- On-Demand Capacity Reservations provide a capacity reservation for Amazon EC2 instances in a specific Availability Zone. The Capacity Reservation can be used by instances in a spread placement group, but it does not explicitly reserve capacity in the spread placement group.

Working with placement groups

Topics

- [Create a placement group \(p. 1195\)](#)
- [Tag a placement group \(p. 1196\)](#)
- [Launch instances in a placement group \(p. 1198\)](#)
- [Describe instances in a placement group \(p. 1199\)](#)
- [Describe a placement group \(p. 1201\)](#)
- [Change the placement group for an instance \(p. 1202\)](#)
- [Delete a placement group \(p. 1203\)](#)

Create a placement group

You can create a placement group using one of the following methods.

Note

You can tag a placement group on creation using the command line tools only.

Console

To create a placement group using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Placement Groups**, **Create placement group**.
3. Specify a name for the group.
4. Choose the placement strategy for the group. If you choose **Partition**, choose the number of partitions within the group.
5. Choose **Create group**.

AWS CLI

To create a placement group using the AWS CLI

Use the [create-placement-group](#) command. The following example creates a placement group named `my-cluster` that uses the `cluster` placement strategy, and it applies a tag with a key of `purpose` and a value of `production`.

```
aws ec2 create-placement-group --group-name my-cluster --strategy cluster --tag-specifications 'ResourceType=placement-group,Tags={Key=purpose,Value=production}'
```

To create a partition placement group using the AWS CLI

Use the [create-placement-group](#) command. Specify the `--strategy` parameter with the value `partition`, and specify the `--partition-count` parameter with the desired number of partitions. In this example, the partition placement group is named `HDFS-Group-A` and is created with five partitions.

```
aws ec2 create-placement-group --group-name HDFS-Group-A --strategy partition --partition-count 5
```

PowerShell

To create a placement group using the AWS Tools for Windows PowerShell

Use the [New-EC2PlacementGroup](#) command.

Tag a placement group

To help categorize and manage your existing placement groups, you can tag them with custom metadata. For more information about how tags work, see [Tag your Amazon EC2 resources \(p. 1692\)](#).

When you tag a placement group, the instances that are launched into the placement group are not automatically tagged. You need to explicitly tag the instances that are launched into the placement group. For more information, see [Add a tag when you launch an instance \(p. 1700\)](#).

You can view, add, and delete tags using the *new* console and the command line tools.

Console

To view, add, or delete a tag for an existing placement group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Placement Groups**.
3. Select a placement group, and then choose **Actions**, **Manage tags**.

4. The **Manage tags** section displays any tags that are assigned to the placement group. Do the following to add or remove tags:
 - To add a tag, choose **Add tag**, and then enter the tag key and value. You can add up to 50 tags per placement group. For more information, see [Tag restrictions \(p. 1696\)](#).
 - To delete a tag, choose **Remove** next to the tag that you want to delete.
5. Choose **Save changes**.

AWS CLI

To view placement group tags

Use the [describe-tags](#) command to view the tags for the specified resource. In the following example, you describe the tags for all of your placement groups.

```
aws ec2 describe-tags \
--filters Name=resource-type,Values=placement-group
```

```
{
    "Tags": [
        {
            "Key": "Environment",
            "ResourceId": "pg-0123456789EXAMPLE",
            "ResourceType": "placement-group",
            "Value": "Production"
        },
        {
            "Key": "Environment",
            "ResourceId": "pg-9876543210EXAMPLE",
            "ResourceType": "placement-group",
            "Value": "Production"
        }
    ]
}
```

You can also use the [describe-tags](#) command to view the tags for a placement group by specifying its ID. In the following example, you describe the tags for pg-0123456789EXAMPLE.

```
aws ec2 describe-tags \
--filters Name=resource-id,Values=pg-0123456789EXAMPLE
```

```
{
    "Tags": [
        {
            "Key": "Environment",
            "ResourceId": "pg-0123456789EXAMPLE",
            "ResourceType": "placement-group",
            "Value": "Production"
        }
    ]
}
```

You can also view the tags of a placement group by describing the placement group.

Use the [describe-placement-groups](#) command to view the configuration of the specified placement group, which includes any tags that were specified for the placement group.

```
aws ec2 describe-placement-groups \
```

```
--group-name my-cluster
```

```
{  
    "PlacementGroups": [  
        {  
            "GroupName": "my-cluster",  
            "State": "available",  
            "Strategy": "cluster",  
            "GroupId": "pg-0123456789EXAMPLE",  
            "Tags": [  
                {  
                    "Key": "Environment",  
                    "Value": "Production"  
                }  
            ]  
        }  
    ]  
}
```

To tag an existing placement group using the AWS CLI

You can use the [create-tags](#) command to tag existing resources. In the following example, the existing placement group is tagged with Key=Cost-Center and Value=CC-123.

```
aws ec2 create-tags \  
    --resources pg-0123456789EXAMPLE \  
    --tags Key=Cost-Center,Value=CC-123
```

To delete a tag from a placement group using the AWS CLI

You can use the [delete-tags](#) command to delete tags from existing resources. For examples, see [Examples](#) in the *AWS CLI Command Reference*.

PowerShell

To view placement group tags

Use the [Get-EC2Tag](#) command.

To describe the tags for a specific placement group

Use the [Get-EC2PlacementGroup](#) command.

To tag an existing placement group

Use the [New-EC2Tag](#) command.

To delete a tag from a placement group

Use the [Remove-EC2Tag](#) command.

Launch instances in a placement group

You can launch an instance into a placement group if the [placement group rules and limitations are met](#) ([p. 1194](#)) using one of the following methods.

Console

To launch instances into a placement group using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Instances**.
3. Choose **Launch Instance**. Complete the wizard as directed, taking care to do the following:
 - On the **Choose an Instance Type** page, select an instance type that can be launched into a placement group.
 - On the **Configure Instance Details** page, the following fields are applicable to placement groups:
 - For **Number of instances**, enter the total number of instances that you need in this placement group, because you might not be able to add instances to the placement group later.
 - For **Placement group**, select the **Add instance to placement group** check box. If you do not see **Placement group** on this page, verify that you have selected an instance type that can be launched into a placement group. Otherwise, this option is not available.
 - For **Placement group name**, you can choose to add the instances to an existing placement group or to a new placement group that you create.
 - For **Placement group strategy**, choose the appropriate strategy. If you choose **partition**, for **Target partition**, choose **Auto distribution** to have Amazon EC2 do a best effort to distribute the instances evenly across all the partitions in the group. Alternatively, specify the partition in which to launch the instances.

AWS CLI

To launch instances into a placement group using the AWS CLI

Use the [run-instances](#) command and specify the placement group name using the `--placement "GroupName = my-cluster"` parameter. In this example, the placement group is named `my-cluster`.

```
aws ec2 run-instances --placement "GroupName = my-cluster"
```

To launch instances into a specific partition of a partition placement group using the AWS CLI

Use the [run-instances](#) command and specify the placement group name and partition using the `--placement "GroupName = HDFS-Group-A, PartitionNumber = 3"` parameter. In this example, the placement group is named `HDFS-Group-A` and the partition number is 3.

```
aws ec2 run-instances --placement "GroupName = HDFS-Group-A, PartitionNumber = 3"
```

PowerShell

To launch instances into a placement group using AWS Tools for Windows PowerShell

Use the [New-EC2Instance](#) command and specify the placement group name using the `-Placement_GroupName` parameter.

Describe instances in a placement group

You can view the placement information of your instances using one of the following methods. You can also filter partition placement groups by the partition number using the AWS CLI.

New console

To view the placement group and partition number of an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Instances**.
3. Select the instance.
4. On the **Details** tab, under **Host and placement group**, find **Placement group**. If the instance is not in a placement group, the field is empty. Otherwise, it contains the name of the placement group name. If the placement group is a partition placement group, **Partition number** contains the partition number for the instance.

Old console

To view the placement group and partition number of an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance.
4. In the **Description** tab, find **Placement group**. If the instance is not in a placement group, the field is empty. Otherwise, it contains the name of the placement group name. If the placement group is a partition placement group, **Partition number** contains the partition number for the instance.

AWS CLI

To view the partition number for an instance in a partition placement group using the AWS CLI

Use the `describe-instances` command and specify the `--instance-id` parameter.

```
aws ec2 describe-instances --instance-id i-0123a456700123456
```

The response contains the placement information, which includes the placement group name and the partition number for the instance.

```
"Placement": {  
    "AvailabilityZone": "us-east-1c",  
    "GroupName": "HDFS-Group-A",  
    "PartitionNumber": 3,  
    "Tenancy": "default"  
}
```

To filter instances for a specific partition placement group and partition number using the AWS CLI

Use the `describe-instances` command and specify the `--filters` parameter with the `placement-group-name` and `placement-partition-number` filters. In this example, the placement group is named HDFS-Group-A and the partition number is 7.

```
aws ec2 describe-instances --filters "Name = placement-group-name, Values = HDFS-Group-A" "Name = placement-partition-number, Values = 7"
```

The response lists all the instances that are in the specified partition within the specified placement group. The following is example output showing only the instance ID, instance type, and placement information for the returned instances.

```
"Instances": [
```

```
{  
    "InstanceId": "i-0a1bc23d4567e8f90",  
    "InstanceType": "r4.large",  
},  
  
    "Placement": {  
        "AvailabilityZone": "us-east-1c",  
        "GroupName": "HDFS-Group-A",  
        "PartitionNumber": 7,  
        "Tenancy": "default"  
    }  
  
{  
    "InstanceId": "i-0a9b876cd5d4ef321",  
    "InstanceType": "r4.large",  
},  
  
    "Placement": {  
        "AvailabilityZone": "us-east-1c",  
        "GroupName": "HDFS-Group-A",  
        "PartitionNumber": 7,  
        "Tenancy": "default"  
    }  
],
```

Describe a placement group

You can view information about your placement groups using one of the following methods.

Console

To view information about your placement groups using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Placement Groups**.
3. The grid lists all of your placement groups in the selected Region.

AWS CLI

To view information about all of your placement groups using the AWS CLI

Use the [describe-placement-groups](#) command.

```
$ aws ec2 describe-placement-groups
```

To view information about a specific placement group using the AWS CLI

Use the [describe-placement-groups](#) command and specify the `--group-names` parameter.

```
$ aws ec2 describe-placement-groups --group-names placement_group_name
```

Example output

The following is example output for a cluster placement group.

```
{
```

```
"PlacementGroups": [  
    {  
        "GroupName": "MyClusterPG",  
        "GroupArn": "arn:aws:ec2:us-east-1:123456789012:placement-group/  
MyClusterPG",  
        "State": "available",  
        "Strategy": "cluster"  
    }  
]
```

Change the placement group for an instance

You can change the placement group for an instance in any of the following ways:

- Move an existing instance to a placement group
- Move an instance from one placement group to another
- Remove an instance from a placement group

Before you move or remove the instance, the instance must be in the stopped state. You can move or remove an instance using the AWS CLI or an AWS SDK.

AWS CLI

To move an instance to a placement group using the AWS CLI

1. Stop the instance using the [stop-instances](#) command.
2. Use the [modify-instance-placement](#) command and specify the name of the placement group to which to move the instance.

```
aws ec2 modify-instance-placement --instance-id i-0123a456700123456 --group-  
name MySpreadGroup
```

3. Start the instance using the [start-instances](#) command.

PowerShell

To move an instance to a placement group using the AWS Tools for Windows PowerShell

1. Stop the instance using the [Stop-EC2Instance](#) command.
2. Use the [Edit-EC2InstancePlacement](#) command and specify the name of the placement group to which to move the instance.
3. Start the instance using the [Start-EC2Instance](#) command.

AWS CLI

To remove an instance from a placement group using the AWS CLI

1. Stop the instance using the [stop-instances](#) command.
2. Use the [modify-instance-placement](#) command and specify an empty string for the placement group name.

```
aws ec2 modify-instance-placement --instance-id i-0123a456700123456 --group-name ""
```

3. Start the instance using the [start-instances](#) command.

PowerShell

To remove an instance from a placement group using the AWS Tools for Windows PowerShell

1. Stop the instance using the [Stop-EC2Instance](#) command.
2. Use the [Edit-EC2InstancePlacement](#) command and specify an empty string for the placement group name.
3. Start the instance using the [Start-EC2Instance](#) command.

Delete a placement group

If you need to replace a placement group or no longer need one, you can delete it. You can delete a placement group using one of the following methods.

Before you can delete a placement group

- (*All placement groups*) Ensure that it has no instances. You must [terminate \(p. 663\)](#) all instances that you launched into the placement group, [move \(p. 1202\)](#) them to another placement group, or [remove \(p. 1202\)](#) them from the placement group.
- (*Cluster placement groups only*) Ensure that it has no active Capacity Reservations. You must [cancel \(p. 547\)](#) all Capacity Reservations that you created in the cluster placement group.

Console

To delete a placement group using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Placement Groups**.
3. Select the placement group and choose **Actions, Delete**.
4. When prompted for confirmation, enter **Delete** and then choose **Delete**.

AWS CLI

To delete a placement group using the AWS CLI

Use the [delete-placement-group](#) command and specify the placement group name to delete the placement group. In this example, the placement group name is `my-cluster`.

```
aws ec2 delete-placement-group --group-name my-cluster
```

PowerShell

To delete a placement group using the AWS Tools for Windows PowerShell

Use the [Remove-EC2PlacementGroup](#) command to delete the placement group.

Network maximum transmission unit (MTU) for your EC2 instance

The maximum transmission unit (MTU) of a network connection is the size, in bytes, of the largest permissible packet that can be passed over the connection. The larger the MTU of a connection, the more data that can be passed in a single packet. Ethernet packets consist of the frame, or the actual data you are sending, and the network overhead information that surrounds it.

Ethernet frames can come in different formats, and the most common format is the standard Ethernet v2 frame format. It supports 1500 MTU, which is the largest Ethernet packet size supported over most of the internet. The maximum supported MTU for an instance depends on its instance type. All Amazon EC2 instance types support 1500 MTU, and many current instance sizes support 9001 MTU, or jumbo frames.

The following rules apply to instances that are in Wavelength Zones:

- Traffic that goes from one instance to another within a VPC in the same Wavelength Zone has an MTU of 1300.
- Traffic that goes from one instance to another that uses the carrier IP within a Wavelength Zone has an MTU of 1500.
- Traffic that goes from one instance to another between a Wavelength Zone and the Region that uses a public IP address has an MTU of 1500.
- Traffic that goes from one instance to another between a Wavelength Zone and the Region that uses a private IP address has an MTU of 1300.

To see Network MTU information for Windows instances, switch to this page in the *Amazon EC2 User Guide for Windows Instances* guide: [Network maximum transmission unit \(MTU\) for your EC2 instance](#).

Contents

- [Jumbo frames \(9001 MTU\) \(p. 1204\)](#)
- [Path MTU Discovery \(p. 1205\)](#)
- [Check the path MTU between two hosts \(p. 1205\)](#)
- [Check and set the MTU on your Linux instance \(p. 1206\)](#)
- [Troubleshoot \(p. 1207\)](#)

Jumbo frames (9001 MTU)

Jumbo frames allow more than 1500 bytes of data by increasing the payload size per packet, and thus increasing the percentage of the packet that is not packet overhead. Fewer packets are needed to send the same amount of usable data. However, traffic is limited to a maximum MTU of 1500 in the following cases:

- Traffic over an internet gateway
- Traffic over an inter-region VPC peering connection
- Traffic over VPN connections
- Traffic outside of a given AWS Region for EC2-Classic

If packets are over 1500 bytes, they are fragmented, or they are dropped if the `Don't Fragment` flag is set in the IP header.

Jumbo frames should be used with caution for internet-bound traffic or any traffic that leaves a VPC. Packets are fragmented by intermediate systems, which slows down this traffic. To use jumbo frames

inside a VPC and not slow traffic that's bound for outside the VPC, you can configure the MTU size by route, or use multiple elastic network interfaces with different MTU sizes and different routes.

For instances that are collocated inside a cluster placement group, jumbo frames help to achieve the maximum network throughput possible, and they are recommended in this case. For more information, see [Placement groups \(p. 1190\)](#).

You can use jumbo frames for traffic between your VPCs and your on-premises networks over AWS Direct Connect. For more information, and for how to verify Jumbo Frame capability, see [Setting Network MTU](#) in the [AWS Direct Connect User Guide](#).

All [current generation instances \(p. 248\)](#) support jumbo frames. The following previous generation instances support jumbo frames: A1, C3, G2, I2, M3, and R3.

For more information about supported MTU sizes for transit gateways, see [MTU in Amazon VPC Transit Gateways](#).

Path MTU Discovery

Path MTU Discovery (PMTUD) is used to determine the path MTU between two devices. The path MTU is the maximum packet size that's supported on the path between the originating host and the receiving host. When there is a difference in the MTU size in the network between two hosts, PMTUD enables the receiving host to respond to the originating host with an ICMP message. This ICMP message instructs the originating host to use the lowest MTU size along the network path and to resend the request. Without this negotiation, packet drop can occur because the request is too large for the receiving host to accept.

For IPv4, when a host sends a packet that's larger than the MTU of the receiving host or that's larger than the MTU of a device along the path, the receiving host or device drops the packet, and then returns the following ICMP message: `Destination Unreachable: Fragmentation Needed and Don't Fragment was Set (Type 3, Code 4)`. This instructs the transmitting host to split the payload into multiple smaller packets, and then retransmit them.

The IPv6 protocol does not support fragmentation in the network. When a host sends a packet that's larger than the MTU of the receiving host or that's larger than the MTU of a device along the path, the receiving host or device drops the packet, and then returns the following ICMP message: `ICMPv6 Packet Too Big (PTB) (Type 2)`. This instructs the transmitting host to split the payload into multiple smaller packets, and then retransmit them.

By default, security groups do not allow any inbound ICMP traffic. If you don't explicitly configure an ICMP inbound rule for your security group, PMTUD is blocked. For more information about configuring ICMP rules in a network ACL, see [Path MTU Discovery](#) in the [Amazon VPC User Guide](#).

Important

Path MTU Discovery does not guarantee that jumbo frames will not be dropped by some routers. An internet gateway in your VPC will forward packets up to 1500 bytes only. 1500 MTU packets are recommended for internet traffic.

Check the path MTU between two hosts

You can check the path MTU between two hosts using the `traceroute` command, which is part of the `iputils` package that is available by default on many Linux distributions, including Amazon Linux.

To check path MTU using traceroute

Use the following command to check the path MTU between your EC2 instance and another host. You can use a DNS name or an IP address as the destination. If the destination is another EC2 instance, verify that the security group allows inbound UDP traffic. This example checks the path MTU between an EC2 instance and `amazon.com`.

```
[ec2-user ~]$ tracepath amazon.com
1?: [LOCALHOST]          pmtu 9001
1:  ip-172-31-16-1.us-west-1.compute.internal (172.31.16.1)    0.187ms pmtu 1500
1:  no reply
2:  no reply
3:  no reply
4:  100.64.16.241 (100.64.16.241)                                0.574ms
5:  72.21.222.221 (72.21.222.221)                                84.447ms asymm 21
6:  205.251.229.97 (205.251.229.97)                            79.970ms asymm 19
7:  72.21.222.194 (72.21.222.194)                                96.546ms asymm 16
8:  72.21.222.239 (72.21.222.239)                            79.244ms asymm 15
9:  205.251.225.73 (205.251.225.73)                            91.867ms asymm 16
...
31:  no reply
Too many hops: pmtu 1500
Resume: pmtu 1500
```

In this example, the path MTU is 1500.

Check and set the MTU on your Linux instance

Some instances are configured to use jumbo frames, and others are configured to use standard frame sizes. You may want to use jumbo frames for network traffic within your VPC or you may want to use standard frames for internet traffic. Whatever your use case, we recommend verifying that your instance will behave the way you expect it to. You can use the procedures in this section to check your network interface's MTU setting and modify it if needed.

To check the MTU setting on a Linux instance

You can check the current MTU value using the following `ip` command. Note that in the example output, `mtu 9001` indicates that this instance uses jumbo frames.

```
[ec2-user ~]$ ip link show eth0
2: eth0: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 9001 qdisc pfifo_fast state UP mode DEFAULT
    group default qlen 1000
        link/ether 02:90:c0:b7:9e:d1 brd ff:ff:ff:ff:ff:ff
```

To set the MTU value on a Linux instance

1. You can set the MTU value using the `ip` command. The following command sets the desired MTU value to 1500, but you could use 9001 instead.

```
[ec2-user ~]$ sudo ip link set dev eth0 mtu 1500
```

2. (Optional) To persist your network MTU setting after a reboot, modify the following configuration files, based on your operating system type.

- For Amazon Linux 2, add the following line to the `/etc/sysconfig/network-scripts/ifcfg-eth0` file:

```
MTU=1500
```

Add the following line to the `/etc/dhcp/dhclient.conf` file:

```
request subnet-mask, broadcast-address, time-offset, routers, domain-name, domain-search, domain-name-servers, host-name, nis-domain, nis-servers, ntp-servers;
```

- For Amazon Linux, add the following lines to your `/etc/dhcp/dhclient-eth0.conf` file.

```
interface "eth0" {  
    supersede interface-mtu 1500;  
}
```

- For other Linux distributions, consult their specific documentation.
3. (Optional) Reboot your instance and verify that the MTU setting is correct.

Troubleshoot

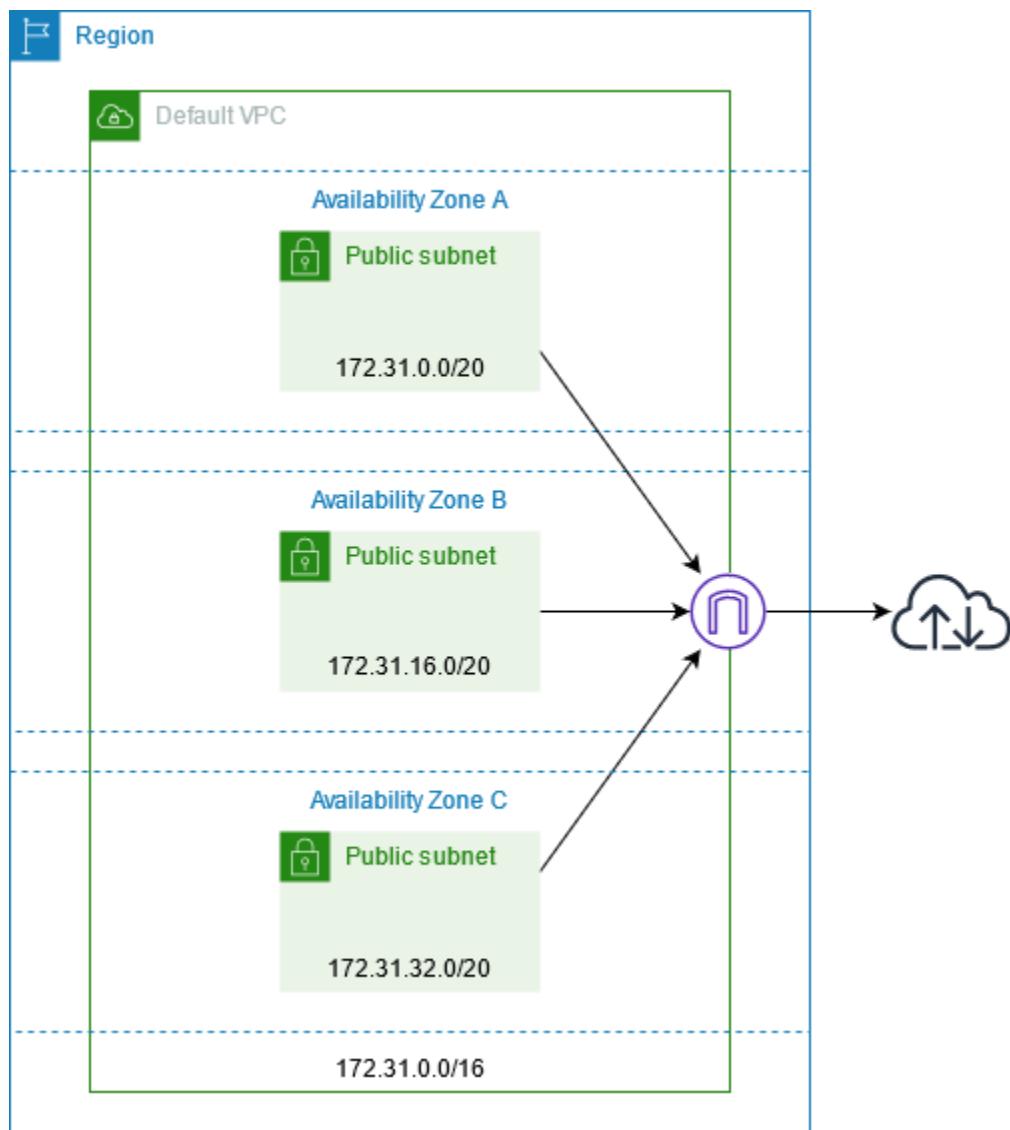

If you experience connectivity issues between your EC2 instance and an Amazon Redshift cluster when using jumbo frames, see [Queries Appear to Hang](#) in the *Amazon Redshift Cluster Management Guide*

Virtual private clouds

Amazon Virtual Private Cloud (Amazon VPC) enables you to define a virtual network in your own logically isolated area within the AWS cloud, known as a *virtual private cloud* or *VPC*. You can create AWS resources, such as Amazon EC2 instances, into the subnets of your VPC. Your VPC closely resembles a traditional network that you might operate in your own data center, with the benefits of using scalable infrastructure from AWS. You can configure your VPC; you can select its IP address range, create subnets, and configure route tables, network gateways, and security settings. You can connect instances in your VPC to the internet or to your own data center.

Default VPCs

When you create your AWS account, we create a *default VPC* in each Region. A default VPC is a VPC that is already configured and ready for you to use. For example, there is a default subnet for each Availability Zone in each default VPC, an internet gateway attached to the VPC, and there's a route in the main route table that sends all traffic (0.0.0.0/0) to the internet gateway. Alternatively, you can create your own nondefault VPC and configure the VPC, subnets, and routing to meet your needs.

Accessing the internet from instances in your VPCs

Instances launched into a default subnet have access to the internet, as the VPC is configured to assign public IP addresses and DNS hostnames, and the main route table is configured with a route to an internet gateway attached to the VPC.

For the subnets that you create in your VPCs, do one of the following to ensure that instances that you launch in these subnets have access to the internet:

- Configure an internet gateway. For more information, see [Connect subnets to the internet using an internet gateway](#) in the *Amazon VPC User Guide*.
- Configure a public NAT gateway. For more information, see [Access the internet from a private subnet](#) in the *Amazon VPC User Guide*.

To connect to an instance, you must also authorize the traffic to the instance and specify a key pair when you launch the instance. For more information, see [General prerequisites for connecting to your instance \(p. 611\)](#).

EC2-Classic

We are retiring EC2-Classic on August 15, 2022. We recommend that you [migrate from EC2-Classic to a VPC \(p. 1226\)](#).

With EC2-Classic, your instances run in a single, flat network that you share with other customers. With Amazon VPC, your instances run in a virtual private cloud (VPC) that's logically isolated to your AWS account.

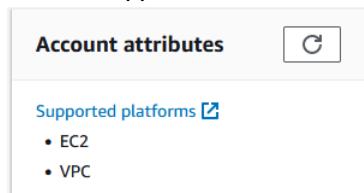

The EC2-Classic platform was introduced in the original release of Amazon EC2. If you created your AWS account after 2013-12-04, it does not support EC2-Classic, so you must launch your Amazon EC2 instances in a VPC.

Detect supported platforms

The Amazon EC2 console indicates which platforms you can launch instances into for the selected region, and whether you have a default VPC in that Region. Alternatively, you can use the [describe-account-attributes](#) command from the AWS CLI.

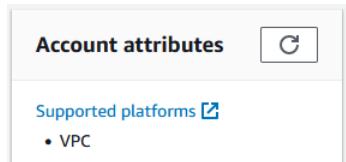

Accounts that support EC2-Classic

Select the Region and locate **Account attributes** on the dashboard. The following indicates that the account supports EC2-Classic.

Accounts that require a VPC

Select the Region and locate **Account attributes** on the dashboard. The following indicates that the account does not support EC2-Classic.

Instance types available in EC2-Classic

Most of the newer instance types require a VPC. The following are the only instance types supported in EC2-Classic:

- General purpose: M1, M3, and T1
- Compute optimized: C1, C3, and CC2
- Memory optimized: CR1, M2, and R3
- Storage optimized: D2, HS1, and I2
- Accelerated computing: G2

If your account supports EC2-Classic but you have not created a nondefault VPC, you can do one of the following to launch instances that require a VPC:

- Create a nondefault VPC and launch your VPC-only instance into it by specifying a subnet ID or a network interface ID in the request. Note that you must create a nondefault VPC if you do not have a default VPC and you are using the AWS CLI, Amazon EC2 API, or AWS SDK to launch a VPC-only instance.
- Launch your VPC-only instance using the Amazon EC2 console. The Amazon EC2 console creates a nondefault VPC in your account and launches the instance into the subnet in the first Availability Zone. The console creates the VPC with the following attributes:
 - One subnet in each Availability Zone, with the public IPv4 addressing attribute set to `true` so that instances receive a public IPv4 address. For more information, see [IP Addressing in Your VPC](#) in the *Amazon VPC User Guide*.
 - An Internet gateway, and a main route table that routes traffic in the VPC to the Internet gateway. This enables the instances you launch in the VPC to communicate over the Internet. For more information, see [Internet Gateways](#) in the *Amazon VPC User Guide*.
 - A default security group for the VPC and a default network ACL that is associated with each subnet. For more information, see [Security Groups for Your VPC](#) in the *Amazon VPC User Guide*.

If you have other resources in EC2-Classic, you can take steps to migrate them to a VPC. For more information, see [Migrate from EC2-Classic to a VPC \(p. 1226\)](#).

Differences between instances in EC2-Classic and a VPC

The following table summarizes the differences between instances launched in EC2-Classic, instances launched in a default VPC, and instances launched in a nondefault VPC.

Characteristic	EC2-Classic	Default VPC	Nondefault VPC
Public IPv4 address (from Amazon's public IP address pool)	Your instance receives a public IPv4 address from the EC2-Classic public IPv4 address pool.	Your instance launched in a default subnet receives a public IPv4 address by default, unless you specify otherwise during launch, or you modify the subnet's public IPv4 address attribute.	Your instance doesn't receive a public IPv4 address by default, unless you specify otherwise during launch, or you modify the subnet's public IPv4 address attribute.
Private IPv4 address	Your instance receives a private IPv4 address from the EC2-Classic range each time it's started.	Your instance receives a static private IPv4 address from the address range of your default VPC.	Your instance receives a static private IPv4 address from the address range of your VPC.
Multiple private IPv4 addresses	We select a single private IP address for your instance; multiple IP addresses are not supported.	You can assign multiple private IPv4 addresses to your instance.	You can assign multiple private IPv4 addresses to your instance.
Elastic IP address (IPv4)	An Elastic IP is disassociated from your instance when you stop it.	An Elastic IP remains associated with your instance when you stop it.	An Elastic IP remains associated with your instance when you stop it.

Characteristic	EC2-Classic	Default VPC	Nondefault VPC
Associating an Elastic IP address	You associate an Elastic IP address with an instance.	An Elastic IP address is a property of a network interface. You associate an Elastic IP address with an instance by updating the network interface attached to the instance.	An Elastic IP address is a property of a network interface. You associate an Elastic IP address with an instance by updating the network interface attached to the instance.
Reassociating an Elastic IP address	If the Elastic IP address is already associated with another instance, the address is automatically associated with the new instance.	If the Elastic IP address is already associated with another instance, the address is automatically associated with the new instance.	If the Elastic IP address is already associated with another instance, it succeeds only if you allowed reassociation.
Tagging Elastic IP addresses	You cannot apply tags to an Elastic IP address.	You can apply tags to an Elastic IP address.	You can apply tags to an Elastic IP address.
DNS hostnames	DNS hostnames are enabled by default.	DNS hostnames are enabled by default.	DNS hostnames are disabled by default.
Security group	A security group can reference security groups that belong to other AWS accounts.	A security group can reference security groups for your VPC, or for a peer VPC in a VPC peering connection.	A security group can reference security groups for your VPC only.
Security group association	You can't change the security groups of your running instance. You can either modify the rules of the assigned security groups, or replace the instance with a new one (create an AMI from the instance, launch a new instance from this AMI with the security groups that you need, disassociate any Elastic IP address from the original instance and associate it with the new instance, and then terminate the original instance).	You can assign up to 5 security groups to an instance. You can assign security groups to your instance when you launch it and while it's running.	You can assign up to 5 security groups to an instance. You can assign security groups to your instance when you launch it and while it's running.
Security group rules	You can add rules for inbound traffic only.	You can add rules for inbound and outbound traffic.	You can add rules for inbound and outbound traffic.
Tenancy	Your instance runs on shared hardware.	You can run your instance on shared hardware or single-tenant hardware.	You can run your instance on shared hardware or single-tenant hardware.

Characteristic	EC2-Classic	Default VPC	Nondefault VPC
Accessing the Internet	Your instance can access the Internet. Your instance automatically receives a public IP address, and can access the Internet directly through the AWS network edge.	By default, your instance can access the Internet. Your instance receives a public IP address by default. An Internet gateway is attached to your default VPC, and your default subnet has a route to the Internet gateway.	By default, your instance cannot access the Internet. Your instance doesn't receive a public IP address by default. Your VPC may have an Internet gateway, depending on how it was created.
IPv6 addressing	IPv6 addressing is not supported. You cannot assign IPv6 addresses to your instances.	You can optionally associate an IPv6 CIDR block with your VPC, and assign IPv6 addresses to instances in your VPC.	You can optionally associate an IPv6 CIDR block with your VPC, and assign IPv6 addresses to instances in your VPC.

Security groups for EC2-Classic

If you're using EC2-Classic, you must use security groups created specifically for EC2-Classic. When you launch an instance in EC2-Classic, you must specify a security group in the same Region as the instance. You can't specify a security group that you created for a VPC when you launch an instance in EC2-Classic.

After you launch an instance in EC2-Classic, you can't change its security groups. However, you can add rules to or remove rules from a security group, and those changes are automatically applied to all instances that are associated with the security group after a short period.

Your AWS account automatically has a default security group per Region for EC2-Classic. If you try to delete the default security group, you'll get the following error: Client.InvalidGroup.Reserved: The security group 'default' is reserved.

You can create custom security groups. The security group name must be unique within your account for the Region. To create a security group for use in EC2-Classic, choose **No VPC** for the VPC.

You can add inbound rules to your default and custom security groups. You can't change the outbound rules for an EC2-Classic security group. When you create a security group rule, you can use a different security group for EC2-Classic in the same Region as the source or destination. To specify a security group for another AWS account, add the AWS account ID as a prefix; for example, 111122223333/sg-edcd9784.

In EC2-Classic, you can have up to 500 security groups in each Region for each account. You can add up to 100 rules to a security group. You can have up to 800 security group rules per instance. This is calculated as the multiple of rules per security group and security groups per instance. If you reference other security groups in your security group rules, we recommend that you use security group names that are 22 characters or less in length.

IP addressing and DNS

Amazon provides a DNS server that resolves Amazon-provided IPv4 DNS hostnames to IPv4 addresses. In EC2-Classic, the Amazon DNS server is located at 172.16.0.23.

If you create a custom firewall configuration in EC2-Classic, you must create a rule in your firewall that allows inbound traffic from port 53 (DNS)—with a destination port from the ephemeral range—from the address of the Amazon DNS server; otherwise, internal DNS resolution from your instances fails. If your firewall doesn't automatically allow DNS query responses, then you need to allow traffic from the IP address of the Amazon DNS server. To get the IP address of the Amazon DNS server, use the following command from within your instance:

```
grep nameserver /etc/resolv.conf
```

Elastic IP addresses

If your account supports EC2-Classic, there's one pool of Elastic IP addresses for use with the EC2-Classic platform and another for use with your VPCs. You can't associate an Elastic IP address that you allocated for use with a VPC with an instance in EC2-Classic, or vice-versa.

To allocate an Elastic IP address for use in EC2-Classic

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Choose **Allocate Elastic IP address**.
4. For **Scope**, select **EC2-Classic**.
5. Choose **Allocate**.

Share and access resources between EC2-Classic and a VPC

Some resources and features in your AWS account can be shared or accessed between EC2-Classic and a VPC, for example, through ClassicLink. For more information, see [ClassicLink \(p. 1214\)](#).

If your account supports EC2-Classic, you might have set up resources for use in EC2-Classic. If you want to migrate from EC2-Classic to a VPC, you must recreate those resources in your VPC. For more information about migrating from EC2-Classic to a VPC, see [Migrate from EC2-Classic to a VPC \(p. 1226\)](#).

The following resources can be shared or accessed between EC2-Classic and a VPC.

Resource	Notes
AMI	
Bundle task	
EBS volume	
Elastic IP address (IPv4)	You can migrate an Elastic IP address from EC2-Classic to a VPC. You can't migrate an Elastic IP address that was originally allocated for use in a VPC to EC2-Classic. For more information, see the section called "Elastic IP addresses" (p. 1227) .
Instance	An EC2-Classic instance can communicate with instances in a VPC using public IPv4 addresses, or you can use ClassicLink to enable communication over private IPv4 addresses. You can't migrate an instance from EC2-Classic to a VPC. However, you can migrate your application from an instance in EC2-Classic to an instance in a VPC. For more information, see Migrate from EC2-Classic to a VPC (p. 1226) .

Resource	Notes
Key pair	
Load balancer	If you're using ClassicLink, you can register a linked EC2-Classic instance with a load balancer in a VPC, provided that the VPC has a subnet in the same Availability Zone as the instance. You can't migrate a load balancer from EC2-Classic to a VPC. You can't register an instance in a VPC with a load balancer in EC2-Classic.
Placement group	
Reserved Instance	You can change the network platform for your Reserved Instances from EC2-Classic to a VPC. For more information, see Modify Reserved Instances (p. 426) .
Security group	A linked EC2-Classic instance can use a VPC security groups through ClassicLink to control traffic to and from the VPC. VPC instances can't use EC2-Classic security groups. You can't migrate a security group from EC2-Classic to a VPC. You can copy rules from a security group for EC2-Classic to a security group for a VPC. For more information, see Create a security group (p. 1331) .
Snapshot	

The following resources can't be shared or moved between EC2-Classic and a VPC:

- Spot Instances

ClassicLink

We are retiring EC2-Classic on August 15, 2022. We recommend that you [migrate from EC2-Classic to a VPC \(p. 1226\)](#).

ClassicLink allows you to link EC2-Classic instances to a VPC in your account, within the same Region. If you associate the VPC security groups with a EC2-Classic instance, this enables communication between your EC2-Classic instance and instances in your VPC using private IPv4 addresses. ClassicLink removes the need to make use of public IPv4 addresses or Elastic IP addresses to enable communication between instances in these platforms.

ClassicLink is available to all users with accounts that support the EC2-Classic platform, and can be used with any EC2-Classic instance. There is no additional charge for using ClassicLink. Standard charges for data transfer and instance usage apply.

Contents

- [ClassicLink basics \(p. 1215\)](#)

- [ClassicLink limitations \(p. 1217\)](#)
- [Work with ClassicLink \(p. 1218\)](#)
- [Example IAM policies for ClassicLink \(p. 1221\)](#)
- [Example: ClassicLink security group configuration for a three-tier web application \(p. 1223\)](#)

ClassicLink basics

There are two steps to linking an EC2-Classic instance to a VPC using ClassicLink. First, you must enable the VPC for ClassicLink. By default, all VPCs in your account are not enabled for ClassicLink, to maintain their isolation. After you've enabled the VPC for ClassicLink, you can then link any running EC2-Classic instance in the same Region in your account to that VPC. Linking your instance includes selecting security groups from the VPC to associate with your EC2-Classic instance. After you've linked the instance, it can communicate with instances in your VPC using their private IP addresses, provided the VPC security groups allow it. Your EC2-Classic instance does not lose its private IP address when linked to the VPC.

Linking your instance to a VPC is sometimes referred to as *attaching* your instance.

A linked EC2-Classic instance can communicate with instances in a VPC, but it does not form part of the VPC. If you list your instances and filter by VPC, for example, through the `DescribeInstances` API request, or by using the **Instances** screen in the Amazon EC2 console, the results do not return any EC2-Classic instances that are linked to the VPC. For more information about viewing your linked EC2-Classic instances, see [View your ClassicLink-enabled VPCs and linked instances \(p. 1220\)](#).

By default, if you use a public DNS hostname to address an instance in a VPC from a linked EC2-Classic instance, the hostname resolves to the instance's public IP address. The same occurs if you use a public DNS hostname to address a linked EC2-Classic instance from an instance in the VPC. If you want the public DNS hostname to resolve to the private IP address, you can enable ClassicLink DNS support for the VPC. For more information, see [Enable ClassicLink DNS support \(p. 1220\)](#).

If you no longer require a ClassicLink connection between your instance and the VPC, you can unlink the EC2-Classic instance from the VPC. This disassociates the VPC security groups from the EC2-Classic instance. A linked EC2-Classic instance is automatically unlinked from a VPC when it's stopped. After you've unlinked all linked EC2-Classic instances from the VPC, you can disable ClassicLink for the VPC.

Use other AWS services in your VPC with ClassicLink

Linked EC2-Classic instances can access the following AWS services in the VPC: Amazon Redshift, Amazon ElastiCache, Elastic Load Balancing, and Amazon RDS. However, instances in the VPC cannot access the AWS services provisioned by the EC2-Classic platform using ClassicLink.

If you use Elastic Load Balancing, you can register your linked EC2-Classic instances with the load balancer. You must create your load balancer in the ClassicLink-enabled VPC and enable the Availability Zone in which the instance runs. If you terminate the linked EC2-Classic instance, the load balancer deregisters the instance.

If you use Amazon EC2 Auto Scaling, you can create an Amazon EC2 Auto Scaling group with instances that are automatically linked to a specified ClassicLink-enabled VPC at launch. For more information, see [Linking EC2-Classic Instances to a VPC](#) in the *Amazon EC2 Auto Scaling User Guide*.

If you use Amazon RDS instances or Amazon Redshift clusters in your VPC, and they are publicly accessible (accessible from the Internet), the endpoint you use to address those resources from a linked EC2-Classic instance by default resolves to a public IP address. If those resources are not publicly accessible, the endpoint resolves to a private IP address. To address a publicly accessible RDS instance or Redshift cluster over private IP using ClassicLink, you must use their private IP address or private DNS hostname, or you must enable ClassicLink DNS support for the VPC.

If you use a private DNS hostname or a private IP address to address an RDS instance, the linked EC2-Classic instance cannot use the failover support available for Multi-AZ deployments.

You can use the Amazon EC2 console to find the private IP addresses of your Amazon Redshift, Amazon ElastiCache, or Amazon RDS resources.

To locate the private IP addresses of AWS resources in your VPC

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Network Interfaces**.
3. Check the descriptions of the network interfaces in the **Description** column. A network interface that's used by Amazon Redshift, Amazon ElastiCache, or Amazon RDS will have the name of the service in the description. For example, a network interface that's attached to an Amazon RDS instance will have the following description: `RDSNetworkInterface`.
4. Select the required network interface.
5. In the details pane, get the private IP address from the **Primary private IPv4 IP** field.

Control the use of ClassicLink

By default, IAM users do not have permission to work with ClassicLink. You can create an IAM policy that grants users permissions to enable or disable a VPC for ClassicLink, link or unlink an instance to a ClassicLink-enabled VPC, and to view ClassicLink-enabled VPCs and linked EC2-Classic instances. For more information about IAM policies for Amazon EC2, see [IAM policies for Amazon EC2 \(p. 1242\)](#).

For more information about policies for working with ClassicLink, see the following example: [Example IAM policies for ClassicLink \(p. 1221\)](#).

Security groups in ClassicLink

Linking your EC2-Classic instance to a VPC does not affect your EC2-Classic security groups. They continue to control all traffic to and from the instance. This excludes traffic to and from instances in the VPC, which is controlled by the VPC security groups that you associated with the EC2-Classic instance. EC2-Classic instances that are linked to the same VPC cannot communicate with each other through the VPC; regardless of whether they are associated with the same VPC security group. Communication between EC2-Classic instances is controlled by the EC2-Classic security groups associated with those instances. For an example of a security group configuration, see [Example: ClassicLink security group configuration for a three-tier web application \(p. 1223\)](#).

After you've linked your instance to a VPC, you cannot change which VPC security groups are associated with the instance. To associate different security groups with your instance, you must first unlink the instance, and then link it to the VPC again, choosing the required security groups.

Routing for ClassicLink

When you enable a VPC for ClassicLink, a static route is added to all of the VPC route tables with a destination of `10.0.0.0/8` and a target of `local`. This allows communication between instances in the VPC and any EC2-Classic instances that are then linked to the VPC. If you add a custom route table to a ClassicLink-enabled VPC, a static route is automatically added with a destination of `10.0.0.0/8` and a target of `local`. When you disable ClassicLink for a VPC, this route is automatically deleted in all of the VPC route tables.

VPCs that are in the `10.0.0.0/16` and `10.1.0.0/16` IP address ranges can be enabled for ClassicLink only if they do not have any existing static routes in route tables in the `10.0.0.0/8` IP address range, excluding the local routes that were automatically added when the VPC was created. Similarly, if you've enabled a VPC for ClassicLink, you may not be able to add any more specific routes to your route tables within the `10.0.0.0/8` IP address range.

Important

If your VPC CIDR block is a publicly routable IP address range, consider the security implications before you link an EC2-Classic instance to your VPC. For example, if your linked EC2-Classic instance receives an incoming Denial of Service (DoS) request flood attack from a source IP address that falls within the VPC's IP address range, the response traffic is sent into your VPC. We strongly recommend that you create your VPC using a private IP address range as specified in [RFC 1918](#).

For more information about route tables and routing in your VPC, see [Route Tables in the Amazon VPC User Guide](#).

Enable a VPC peering connection for ClassicLink

If you have a VPC peering connection between two VPCs, and there are one or more EC2-Classic instances that are linked to one or both of the VPCs via ClassicLink, you can extend the VPC peering connection to enable communication between the EC2-Classic instances and the instances in the VPC on the other side of the VPC peering connection. This enables the EC2-Classic instances and the instances in the VPC to communicate using private IP addresses. To do this, you can enable a local VPC to communicate with a linked EC2-Classic instance in a peer VPC, or you can enable a local linked EC2-Classic instance to communicate with instances in a peer VPC.

If you enable a local VPC to communicate with a linked EC2-Classic instance in a peer VPC, a static route is automatically added to your route tables with a destination of 10.0.0.0/8 and a target of local.

For more information and examples, see [Configurations With ClassicLink in the Amazon VPC Peering Guide](#).

ClassicLink limitations

To use the ClassicLink feature, you need to be aware of the following limitations:

- You can link an EC2-Classic instance to only one VPC at a time.
- If you stop your linked EC2-Classic instance, it's automatically unlinked from the VPC and the VPC security groups are no longer associated with the instance. You can link your instance to the VPC again after you've restarted it.
- You cannot link an EC2-Classic instance to a VPC that's in a different Region or a different AWS account.
- You cannot use ClassicLink to link a VPC instance to a different VPC, or to a EC2-Classic resource. To establish a private connection between VPCs, you can use a VPC peering connection. For more information, see the [Amazon VPC Peering Guide](#).
- You cannot associate a VPC Elastic IP address with a linked EC2-Classic instance.
- You cannot enable EC2-Classic instances for IPv6 communication. You can associate an IPv6 CIDR block with your VPC and assign IPv6 address to resources in your VPC, however, communication between a ClassicLinked instance and resources in the VPC is over IPv4 only.
- VPCs with routes that conflict with the EC2-Classic private IP address range of 10/8 cannot be enabled for ClassicLink. This does not include VPCs with 10.0.0.0/16 and 10.1.0.0/16 IP address ranges that already have local routes in their route tables. For more information, see [Routing for ClassicLink \(p. 1216\)](#).
- VPCs configured for dedicated hardware tenancy cannot be enabled for ClassicLink. Contact Amazon Web Services Support to request that your dedicated tenancy VPC be allowed to be enabled for ClassicLink.

Important

EC2-Classic instances are run on shared hardware. If you've set the tenancy of your VPC to dedicated because of regulatory or security requirements, then linking an EC2-Classic

instance to your VPC might not conform to those requirements, as this allows a shared tenancy resource to address your isolated resources directly using private IP addresses. If you need to enable your dedicated VPC for ClassicLink, provide a detailed reason in your request to Amazon Web Services Support.

- If you link your EC2-Classic instance to a VPC in the 172.16.0.0/16 range, and you have a DNS server running on the 172.16.0.23/32 IP address within the VPC, then your linked EC2-Classic instance can't access the VPC DNS server. To work around this issue, run your DNS server on a different IP address within the VPC.
- ClassicLink doesn't support transitive relationships out of the VPC. Your linked EC2-Classic instance doesn't have access to any VPN connection, VPC gateway endpoint, NAT gateway, or Internet gateway associated with the VPC. Similarly, resources on the other side of a VPN connection or an Internet gateway don't have access to a linked EC2-Classic instance.

Work with ClassicLink

You can use the Amazon EC2 and Amazon VPC consoles to work with the ClassicLink feature. You can enable or disable a VPC for ClassicLink, and link and unlink EC2-Classic instances to a VPC.

Note

The ClassicLink features are only visible in the consoles for accounts and Regions that support EC2-Classic.

Tasks

- [Enable a VPC for ClassicLink \(p. 1218\)](#)
- [Create a VPC with ClassicLink enabled \(p. 1219\)](#)
- [Link an instance to a VPC \(p. 1219\)](#)
- [Link an instance to a VPC at launch \(p. 1219\)](#)
- [View your ClassicLink-enabled VPCs and linked instances \(p. 1220\)](#)
- [Enable ClassicLink DNS support \(p. 1220\)](#)
- [Disable ClassicLink DNS support \(p. 1220\)](#)
- [Unlink an instance from a VPC \(p. 1221\)](#)
- [Disable ClassicLink for a VPC \(p. 1221\)](#)

Enable a VPC for ClassicLink

To link an EC2-Classic instance to a VPC, you must first enable the VPC for ClassicLink. You cannot enable a VPC for ClassicLink if the VPC has routing that conflicts with the EC2-Classic private IP address range. For more information, see [Routing for ClassicLink \(p. 1216\)](#).

To enable a VPC for ClassicLink

1. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. In the navigation pane, choose **Your VPCs**.
3. Select the VPC.
4. Choose **Actions, Enable ClassicLink**.
5. When prompted for confirmation, choose **Enable ClassicLink**.
6. (Optional) If you want the public DNS hostname to resolve to the private IP address, enable ClassicLink DNS support for the VPC before you link any instances. For more information, see [Enable ClassicLink DNS support \(p. 1220\)](#).

Create a VPC with ClassicLink enabled

You can create a new VPC and immediately enable it for ClassicLink by using the VPC wizard in the Amazon VPC console.

To create a VPC with ClassicLink enabled

1. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. From the Amazon VPC dashboard, choose **Launch VPC Wizard**.
3. Select one of the VPC configuration options and choose **Select**.
4. On the next page of the wizard, choose **Yes** for **Enable ClassicLink**. Complete the rest of the steps in the wizard to create your VPC. For more information about using the VPC wizard, see [Scenarios for Amazon VPC](#) in the *Amazon VPC User Guide*.
5. (Optional) If you want the public DNS hostname to resolve to the private IP address, enable ClassicLink DNS support for the VPC before you link any instances. For more information, see [Enable ClassicLink DNS support \(p. 1220\)](#).

Link an instance to a VPC

After you've enabled a VPC for ClassicLink, you can link an EC2-Classic instance to it. The instance must be in the `running` state.

If you want the public DNS hostname to resolve to the private IP address, enable ClassicLink DNS support for the VPC before you link the instance. For more information, see [Enable ClassicLink DNS support \(p. 1220\)](#).

To link an instance to a VPC

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select one or more running EC2-Classic instances.
4. Choose **Actions, ClassicLink, Link to VPC**.
5. Choose the VPC. The console displays only VPCs that are enabled for ClassicLink.
6. Select one or more security groups to associate with your instances. The console displays security groups only for VPCs enabled for ClassicLink.
7. Choose **Link**.

Link an instance to a VPC at launch

You can use the launch wizard in the Amazon EC2 console to launch an EC2-Classic instance and immediately link it to a ClassicLink-enabled VPC.

To link an instance to a VPC at launch

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the Amazon EC2 dashboard, choose **Launch Instance**.
3. Select an AMI, and then choose an instance type that is supported on EC2-Classic. For more information, see [Instance types available in EC2-Classic \(p. 1209\)](#).
4. On the **Configure Instance Details** page, do the following:
 - a. For **Network**, choose **Launch into EC2-Classic**. If this option is disabled, then the instance type is not supported on EC2-Classic.

- b. Expand **Link to VPC (ClassicLink)** and choose a VPC from **Link to VPC**. The console displays only VPCs with ClassicLink enabled.
5. Complete the rest of the steps in the wizard to launch your instance. For more information, see [Launch an instance using the Launch Instance Wizard \(p. 580\)](#).

View your ClassicLink-enabled VPCs and linked instances

You can view all of your ClassicLink-enabled VPCs in the Amazon VPC console, and your linked EC2-Classic instances in the Amazon EC2 console.

To view your ClassicLink-enabled VPCs

1. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. In the navigation pane, choose **Your VPCs**.
3. Select the VPC.
4. If the value of **ClassicLink** is **Enabled**, then the VPC is enabled for ClassicLink.

Enable ClassicLink DNS support

You can enable ClassicLink DNS support for your VPC so that DNS hostnames that are addressed between linked EC2-Classic instances and instances in the VPC resolve to private IP addresses and not public IP addresses. For this feature to work, your VPC must be enabled for DNS hostnames and DNS resolution.

Note

If you enable ClassicLink DNS support for your VPC, your linked EC2-Classic instance can access any private hosted zone associated with the VPC. For more information, see [Working with Private Hosted Zones](#) in the *Amazon Route 53 Developer Guide*.

To enable ClassicLink DNS support

1. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. In the navigation pane, choose **Your VPCs**.
3. Select the VPC.
4. Choose **Actions, Edit ClassicLink DNS Support**.
5. For **ClassicLink DNS support**, select **Enable**.
6. Choose **Save changes**.

Disable ClassicLink DNS support

You can disable ClassicLink DNS support for your VPC so that DNS hostnames that are addressed between linked EC2-Classic instances and instances in the VPC resolve to public IP addresses and not private IP addresses.

To disable ClassicLink DNS support

1. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. In the navigation pane, choose **Your VPCs**.
3. Select the VPC.
4. Choose **Actions, Edit ClassicLink DNS Support**.
5. For **ClassicLink DNS Support**, clear **Enable**.

6. Choose **Save changes**.

Unlink an instance from a VPC

If you no longer require a ClassicLink connection between your EC2-Classic instance and your VPC, you can unlink the instance from the VPC. Unlinking the instance disassociates the VPC security groups from the instance.

A stopped instance is automatically unlinked from a VPC.

To unlink an instance from a VPC

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select one or more of your instances.
4. Choose **Actions, ClassicLink, Unlink from VPC**.
5. When prompted for confirmation, choose **Unlink**.

Disable ClassicLink for a VPC

If you no longer require a connection between EC2-Classic instances and your VPC, you can disable ClassicLink on the VPC. You must first unlink all linked EC2-Classic instances that are linked to the VPC.

To disable ClassicLink for a VPC

1. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. In the navigation pane, choose **Your VPCs**.
3. Select your VPC.
4. Choose **Actions, Disable ClassicLink**.
5. When prompted for confirmation, choose **Disable ClassicLink**.

Example IAM policies for ClassicLink

You can enable a VPC for ClassicLink and then link an EC2-Classic instance to the VPC. You can also view your ClassicLink-enabled VPCs, and all of your EC2-Classic instances that are linked to a VPC. You can create policies with resource-level permission for the `ec2:EnableVpcClassicLink`, `ec2:DisableVpcClassicLink`, `ec2:AttachClassicLinkVpc`, and `ec2:DetachClassicLinkVpc` actions to control how users are able to use those actions. Resource-level permissions are not supported for `ec2:Describe*` actions.

Examples

- [Full permissions to work with ClassicLink \(p. 1221\)](#)
- [Enable and disable a VPC for ClassicLink \(p. 1222\)](#)
- [Link instances \(p. 1222\)](#)
- [Unlink instances \(p. 1223\)](#)

Full permissions to work with ClassicLink

The following policy grants users permissions to view ClassicLink-enabled VPCs and linked EC2-Classic instances, to enable and disable a VPC for ClassicLink, and to link and unlink instances from a ClassicLink-enabled VPC.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DescribeClassicLinkInstances", "ec2:DescribeVpcClassicLink",  
                "ec2:EnableVpcClassicLink", "ec2:DisableVpcClassicLink",  
                "ec2:AttachClassicLinkVpc", "ec2:DetachClassicLinkVpc"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

Enable and disable a VPC for ClassicLink

The following policy allows user to enable and disable VPCs for ClassicLink that have the specific tag 'purpose=classiclink'. Users cannot enable or disable any other VPCs for ClassicLink.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:*VpcClassicLink",  
            "Resource": "arn:aws:ec2:region:account:vpc/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:ResourceTag/purpose": "classiclink"  
                }  
            }  
        }  
    ]  
}
```

Link instances

The following policy grants users permissions to link instances to a VPC only if the instance is an m3.large instance type. The second statement allows users to use the VPC and security group resources, which are required to link an instance to a VPC.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:AttachClassicLinkVpc",  
            "Resource": "arn:aws:ec2:region:account:instance/*",  
            "Condition": {  
                "StringEquals": {  
                    "ec2:InstanceType": "m3.large"  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:AttachClassicLinkVpc",  
            "Resource": [  
                "arn:aws:ec2:region:account:vpc/*",  
                "arn:aws:ec2:region:account:security-group/*"  
            ]  
        }  
    ]  
}
```

```
        ]  
    }  
}
```

The following policy grants users permissions to link instances to a specific VPC (`vpc-1a2b3c4d`) only, and to associate only specific security groups from the VPC to the instance (`sg-1122aabb` and `sg-aabb2233`). Users cannot link an instance to any other VPC, and they cannot specify any other of the VPC security groups to associate with the instance in the request.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:AttachClassicLinkVpc",  
            "Resource": [  
                "arn:aws:ec2:region:account:vpc/vpc-1a2b3c4d",  
                "arn:aws:ec2:region:account:instance/*",  
                "arn:aws:ec2:region:account:security-group/sg-1122aabb",  
                "arn:aws:ec2:region:account:security-group/sg-aabb2233"  
            ]  
        }  
    ]  
}
```

Unlink instances

The following grants users permission to unlink any linked EC2-Classic instance from a VPC, but only if the instance has the tag "`unlink=true`". The second statement grants users permissions to use the VPC resource, which is required to unlink an instance from a VPC.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:DetachClassicLinkVpc",  
            "Resource": [  
                "arn:aws:ec2:region:account:instance/*"  
            ],  
            "Condition": {  
                "StringEquals": {  
                    "aws:ResourceTag/unlink": "true"  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:DetachClassicLinkVpc",  
            "Resource": [  
                "arn:aws:ec2:region:account:vpc/*"  
            ]  
        }  
    ]  
}
```

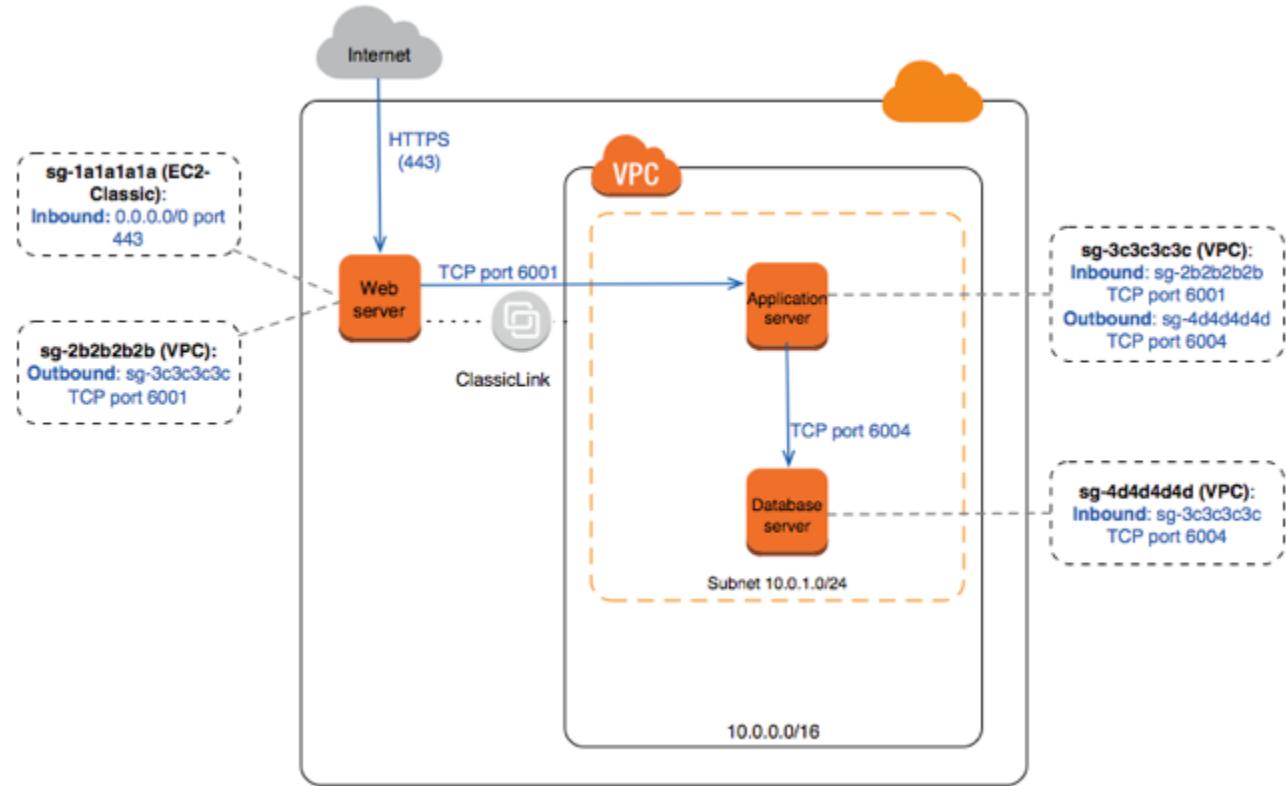

Example: ClassicLink security group configuration for a three-tier web application

In this example, you have an application with three instances: a public-facing web server, an application server, and a database server. Your web server accepts HTTPS traffic from the Internet, and then

communicates with your application server over TCP port 6001. Your application server then communicates with your database server over TCP port 6004. You're in the process of migrating your entire application to a VPC in your account. You've already migrated your application server and your database server to your VPC. Your web server is still in EC2-Classic and linked to your VPC via ClassicLink.

You want a security group configuration that allows traffic to flow only between these instances. You have four security groups: two for your web server (`sg-1a1a1a1a` and `sg-2b2b2b2b`), one for your application server (`sg-3c3c3c3c`), and one for your database server (`sg-4d4d4d4d`).

The following diagram displays the architecture of your instances, and their security group configuration.

Security groups for your web server (`sg-1a1a1a1a` and `sg-2b2b2b2b`)

You have one security group in EC2-Classic, and the other in your VPC. You associated the VPC security group with your web server instance when you linked the instance to your VPC via ClassicLink. The VPC security group enables you to control the outbound traffic from your web server to your application server.

The following are the security group rules for the EC2-Classic security group (`sg-1a1a1a1a`).

Inbound			
Source	Type	Port Range	Comments
0.0.0.0/0	HTTPS	443	Allows Internet traffic to reach your web server.

The following are the security group rules for the VPC security group (`sg-2b2b2b2b`).

Outbound			
Destination	Type	Port Range	Comments
sg-3c3c3c3c	TCP	6001	Allows outbound traffic from your web server to your application server in your VPC (or to any other instance associated with sg-3c3c3c3c).

Security group for your application server (sg-3c3c3c3c)

The following are the security group rules for the VPC security group that's associated with your application server.

Inbound			
Source	Type	Port Range	Comments
sg-2b2b2b2b	TCP	6001	Allows the specified type of traffic from your web server (or any other instance associated with sg-2b2b2b2b) to reach your application server.

Outbound			
Destination	Type	Port Range	Comments
sg-4d4d4d4d	TCP	6004	Allows outbound traffic from the application server to the database server (or to any other instance associated with sg-4d4d4d4d).

Security group for your database server (sg-4d4d4d4d)

The following are the security group rules for the VPC security group that's associated with your database server.

Inbound			
Source	Type	Port Range	Comments
sg-3c3c3c3c	TCP	6004	Allows the specified type of traffic from your application server (or any other instance associated with sg-3c3c3c3c) to reach your database server.

Migrate from EC2-Classic to a VPC

We are retiring EC2-Classic on August 15, 2022. To avoid interruptions to your workloads, we recommend that you migrate from EC2-Classic to a VPC prior to August 15, 2022. For more information, see the blog post [EC2-Classic Networking is Retiring - Here's How to Prepare](#).

To migrate from EC2-Classic to a VPC, you must migrate or recreate your EC2-Classic resources in a VPC.

Contents

- [Migrate your resources to a VPC \(p. 1226\)](#)
- [Use the AWSSupport-MigrateEC2ClassicToVPC runbook \(p. 1230\)](#)
- [Example: Migrate a simple web application \(p. 1230\)](#)

Migrate your resources to a VPC

You can migrate or move some of your resources to a VPC. Some resources can only be migrated from EC2-Classic to a VPC that's in the same Region and in the same AWS account. If the resource cannot be migrated, you must create a new resource for use in your VPC.

Prerequisites

Before you begin, you must have a VPC. If you don't have a default VPC, you can create a nondefault VPC using one of these methods:

- In the Amazon VPC console, use the VPC wizard to create a new VPC. For more information, see [Amazon VPC Console Wizard Configurations](#). Use this option if you want to set up a VPC quickly, using one of the available configuration options.
- In the Amazon VPC console, set up the components of a VPC according to your requirements. For more information, see [VPCs and Subnets](#). Use this option if you have specific requirements for your VPC, such as a particular number of subnets.

Resources

- [Security groups \(p. 1226\)](#)
- [Elastic IP addresses \(p. 1227\)](#)
- [AMIs and instances \(p. 1227\)](#)
- [Amazon RDS DB instances \(p. 1230\)](#)
- [Classic Load Balancers \(p. 1230\)](#)

Security groups

If you want your instances in your VPC to have the same security group rules as your EC2-Classic instances, you can use the Amazon EC2 console to copy your existing EC2-Classic security group rules (including default ones) to a new VPC security group. Default security groups cannot be deleted and will be removed on your behalf once EC2-Classic is retired.

You can only copy security group rules to a new security group in the same AWS account in the same Region. If you are using a different Region or a different AWS account, you must create a new security group and manually add the rules yourself. For more information, see [Amazon EC2 security groups for Linux instances \(p. 1325\)](#).

To copy your security group rules to a new security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group that's associated with your EC2-Classic instance, then choose **Actions**, and select **Copy to new**.

Note

To identify an EC2-Classic security group, check the **VPC ID** column. For each EC2-Classic security group, the value in the column is blank or a – symbol.

4. In the **Create Security Group** dialog box, specify a name and description for your new security group. Select your VPC from the **VPC** list.
5. The **Inbound** tab is populated with the rules from your EC2-Classic security group. You can modify the rules as required. In the **Outbound** tab, a rule that allows all outbound traffic has automatically been created for you. For more information about modifying security group rules, see [Amazon EC2 security groups for Linux instances \(p. 1325\)](#).

Note

If you've defined a rule in your EC2-Classic security group that references another security group, you cannot use the same rule in your VPC security group. Modify the rule to reference a security group in the same VPC.

6. Choose **Create**.

Elastic IP addresses

You can migrate an Elastic IP address that is allocated for use in EC2-Classic for use with a VPC. You cannot migrate an Elastic IP address to another Region or AWS account. You cannot migrate an Elastic IP address that has been allocated to your account for less than 24 hours.

When you migrate an Elastic IP address, it counts against your Elastic IP address limit for VPCs. You cannot migrate an Elastic IP address if it results in you exceeding your limit. To migrate an Elastic IP address, it must not be associated with an instance. For more information about disassociating an Elastic IP address from an instance, see [Disassociate an Elastic IP address \(p. 1087\)](#).

After you've performed the command to move or restore your Elastic IP address, the process of migrating the Elastic IP address can take a few minutes. Use the [describe-moving-addresses](#) command to check whether your Elastic IP address is still moving, or has completed moving. After the moved is complete, you can view the allocation ID for the Elastic IP address on the [Elastic IPs](#) page. If the Elastic IP address is in a moving state for longer than 5 minutes, contact [AWS Support](#).

To identify an Elastic IP address that is allocated for use in EC2-Classic

Open the Amazon EC2 console. Choose **Elastic IPs** in the navigation pane and the select the checkbox for the Elastic IP address. On the **Summary** page, check whether **Scope** is **EC2-Classic** or **VPC**.

To move an Elastic IP address using the Amazon EC2 console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address, and choose **Actions**, **Move to VPC scope**.
4. In the confirmation dialog box, choose **Move Elastic IP**.

AMIs and instances

An AMI is a template for launching your Amazon EC2 instance. You can create your own AMI based on an existing EC2-Classic instance, then use that AMI to launch instances into your VPC.

Contents

- [Identify EC2-Classic instances \(p. 1228\)](#)
- [Create an AMI \(p. 1228\)](#)
- [\(Optional\) Share or copy your AMI \(p. 1229\)](#)
- [\(Optional\) Store your data on Amazon EBS volumes \(p. 1229\)](#)
- [Launch an instance into your VPC \(p. 1229\)](#)

Identify EC2-Classic instances

If you have instances running in both EC2-Classic and a VPC, you can identify your EC2-Classic instances.

Amazon EC2 console

Choose **Instances** in the navigation pane. In the **VPC ID** column, the value for each EC2-Classic instance is blank or a – symbol. If the **VPC ID** column is not present, choose the gear icon and make the column visible.

AWS CLI

Use the following [describe-instances](#) AWS CLI command. The --query parameter displays only instances where the value for `VpcId` is null.

```
aws ec2 describe-instances --query 'Reservations[*].Instances[?VpcId==`null`]'
```

Create an AMI

After you've identified your EC2-Classic instance, you can create an AMI from it.

To create a Windows AMI

For more information, see [Creating a custom Windows AMI](#).

To create a Linux AMI

The method that you use to create your Linux AMI depends on the root device type of your instance, and the operating system platform on which your instance runs. To find out the root device type of your instance, go to the **Instances** page, select your instance, and look at the information in the **Root device type** field in the **Description** tab. If the value is `ebs`, then your instance is EBS-backed. If the value is `instance-store`, then your instance is instance store-backed. You can also use the [describe-instances](#) AWS CLI command to find out the root device type.

The following table provides options for you to create your Linux AMI based on the root device type of your instance, and the software platform.

Important

Some instance types support both PV and HVM virtualization, while others support only one or the other. If you plan to use your AMI to launch a different instance type than your current instance type, verify that the instance type supports the type of virtualization that your AMI offers. If your AMI supports PV virtualization, and you want to use an instance type that supports HVM virtualization, you might have to reinstall your software on a base HVM AMI. For more information about PV and HVM virtualization, see [Linux AMI virtualization types](#).

Instance root device type	Action
EBS	Create an EBS-backed AMI from your instance. For more information, see Creating an Amazon EBS-backed Linux AMI .

Instance root device type	Action
Instance store	Create an instance store-backed AMI from your instance using the AMI tools. For more information, see Creating an instance store-backed Linux AMI .
Instance store	Convert your instance store-backed instance to an EBS-backed instance. For more information, see Converting your instance store-backed AMI to an Amazon EBS-backed AMI .

(Optional) Share or copy your AMI

To use your AMI to launch an instance in a new AWS account, you must first share the AMI with your new account. For more information, see [Share an AMI with specific AWS accounts \(p. 133\)](#).

To use your AMI to launch an instance in a VPC in a different Region, you must first copy the AMI to that Region. For more information, see [Copy an AMI \(p. 180\)](#).

(Optional) Store your data on Amazon EBS volumes

You can create an Amazon EBS volume and use it to back up and store the data on your instance—like you would use a physical hard drive. Amazon EBS volumes can be attached and detached from any instance in the same Availability Zone. You can detach a volume from your instance in EC2-Classic, and attach it to a new instance that you launch into your VPC in the same Availability Zone.

For more information about Amazon EBS volumes, see the following topics:

- [Amazon EBS volumes \(p. 1349\)](#)
- [Create an Amazon EBS volume \(p. 1371\)](#)
- [Attach an Amazon EBS volume to an instance \(p. 1375\)](#)

To back up the data on your Amazon EBS volume, you can take periodic snapshots of your volume. For more information, see [Create Amazon EBS snapshots \(p. 1407\)](#). If you need to, you can create an Amazon EBS volume from your snapshot. For more information, see [Create a volume from a snapshot \(p. 1373\)](#).

Launch an instance into your VPC

After you've created an AMI, you can use the Amazon EC2 launch wizard to launch an instance into your VPC. The instance will have the same data and configurations as your existing EC2-Classic instance.

Note

You can use this opportunity to [upgrade to a current generation instance type](#). However, verify that the instance type supports the type of virtualization that your AMI offers (PV or HVM). For more information about PV and HVM virtualization, see [Linux AMI virtualization types \(p. 108\)](#).

To launch an instance into your VPC

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. On the dashboard, choose **Launch instance**.
3. On the **Choose an Amazon Machine Image** page, select the **My AMIs** category, and select the AMI you created. Alternatively, if you shared an AMI from another account, in the **Ownership** filter list, choose **Shared with me**. Select the AMI that you shared from your EC2-Classic account.
4. On the **Choose an Instance Type** page, select the type of instance, and choose **Next: Configure Instance Details**.

5. On the **Configure Instance Details** page, select your VPC from the **Network** list. Select the required subnet from the **Subnet** list. Configure any other details that you require, then go through the next pages of the wizard until you reach the **Configure Security Group** page.
6. Select **Select an existing group**, and select the security group that you created for your VPC. Choose **Review and Launch**.
7. Review your instance details, then choose **Launch** to specify a key pair and launch your instance.

For more information about the parameters that you can configure in each step of the wizard, see [Launch an instance using the Launch Instance Wizard \(p. 580\)](#).

Amazon RDS DB instances

You can move your EC2-Classic DB instance to a VPC in the same Region, in the same account. For more information, see [Updating the VPC for a DB Instance](#) in the *Amazon RDS User Guide*.

Classic Load Balancers

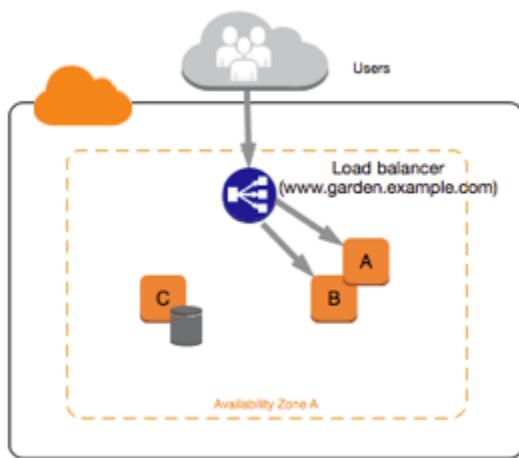

You can migrate your Classic Load Balancer in EC2-Classic to a Classic Load Balancer in a VPC, or you can migrate your Classic Load Balancer to an Application Load Balancer or a Network Load Balancer. For more information, see [Migrate your Classic Load Balancer](#) in the *Elastic Load Balancing User Guide*.

Use the AWSSupport-MigrateEC2ClassicToVPC runbook

The [AWSSupport-MigrateEC2ClassicToVPC](#) runbook migrates an EC2-Classic instance to a VPC. For more information, see [How do I migrate an EC2-Classic instance to a VPC?](#)

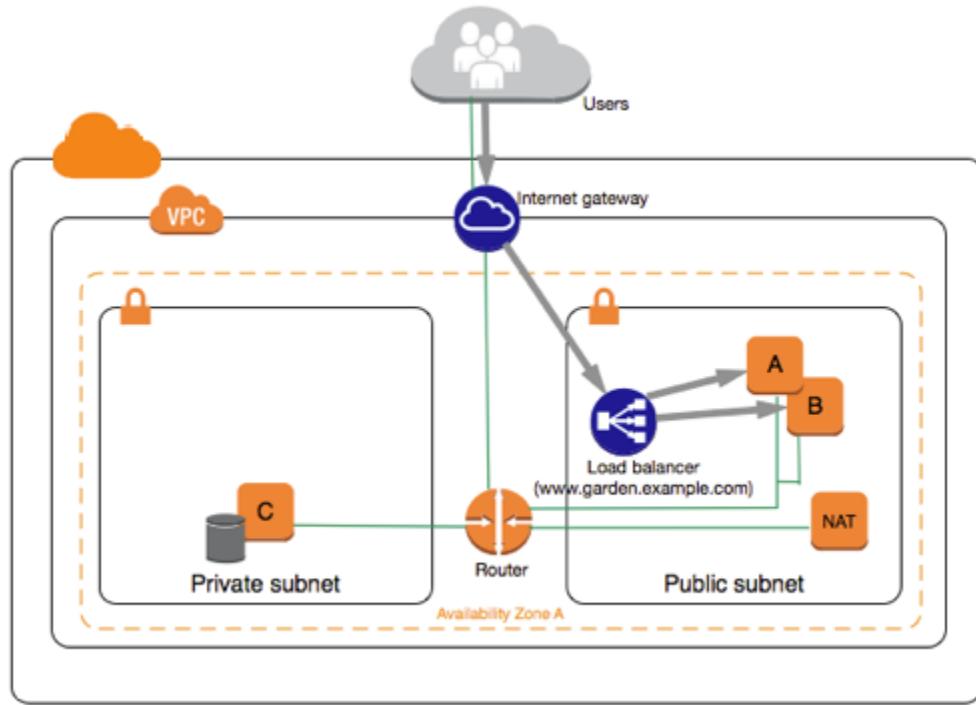

Example: Migrate a simple web application

In this example, you use AWS to host your gardening website. To manage your website, you have three running instances in EC2-Classic. Instances A and B host your public-facing web application, and you use Elastic Load Balancing to load balance the traffic between these instances. You've assigned Elastic IP addresses to instances A and B so that you have static IP addresses for configuration and administration tasks on those instances. Instance C holds your MySQL database for your website. You've registered the domain name `www.garden.example.com`, and you've used Route 53 to create a hosted zone with an alias record set that's associated with the DNS name of your load balancer.

The first part of migrating to a VPC is deciding what kind of VPC architecture suits your needs. In this case, you've decided on the following: one public subnet for your web servers, and one private subnet for your database server. As your website grows, you can add more web servers and database servers to your

subnets. By default, instances in the private subnet cannot access the internet; however, you can enable internet access through a Network Address Translation (NAT) device in the public subnet. You might want to set up a NAT device to support periodic updates and patches from the internet for your database server. You'll migrate your Elastic IP addresses to a VPC, and create a load balancer in your public subnet to load balance the traffic between your web servers.

To migrate your web application to a VPC, you can follow these steps:

- **Create a VPC:** In this case, you can use the VPC wizard in the Amazon VPC console to create your VPC and subnets. The second wizard configuration creates a VPC with one private and one public subnet, and launches and configures a NAT device in your public subnet for you. For more information, see [VPC with public and private subnets \(NAT\)](#) in the *Amazon VPC User Guide*.
- **Configure your security groups:** In your EC2-Classic environment, you have one security group for your web servers, and another security group for your database server. You can use the Amazon EC2 console to copy the rules from each security group into new security groups for your VPC. For more information, see [Security groups \(p. 1226\)](#).

Tip

Create the security groups that are referenced by other security groups first.

- **Create AMIs and launch new instances:** Create an AMI from one of your web servers, and a second AMI from your database server. Then, launch replacement web servers into your public subnet, and launch your replacement database server into your private subnet. For more information, see [Create an AMI \(p. 1228\)](#).
- **Configure your NAT device:** If you are using a NAT instance, you must create a security group for it that allows HTTP and HTTPS traffic from your private subnet. For more information, see [NAT instances](#). If you are using a NAT gateway, traffic from your private subnet is automatically allowed.
- **Configure your database:** When you created an AMI from your database server in EC2-Classic, all of the configuration information that was stored in that instance was copied to the AMI. You might have to connect to your new database server and update the configuration details. For example, if you configured your database to grant full read, write, and modification permissions to your web servers in EC2-Classic, you need to update the configuration files to grant the same permissions to your new VPC web servers instead.

- **Configure your web servers:** Your web servers will have the same configuration settings as your instances in EC2-Classic. For example, if you configured your web servers to use the database in EC2-Classic, update your web servers' configuration settings to point to your new database instance.

Note

By default, instances launched into a nondefault subnet are not assigned a public IP address, unless you specify otherwise at launch. Your new database server might not have a public IP address. In this case, you can update your web servers' configuration file to use your new database server's private DNS name. Instances in the same VPC can communicate with each other via private IP address.

- **Migrate your Elastic IP addresses:** Disassociate your Elastic IP addresses from your web servers in EC2-Classic, and then migrate them to a VPC. After you've migrated them, you can associate them with your new web servers in your VPC. For more information, see [the section called "Elastic IP addresses" \(p. 1227\)](#).
- **Create a new load balancer:** To continue using Elastic Load Balancing to load balance the traffic to your instances, make sure you understand the various ways to configure your load balancer in VPC. For more information, see the [Elastic Load Balancing User Guide](#).
- **Update your DNS records:** After you've set up your load balancer in your public subnet, verify that your `www.garden.example.com` domain points to your new load balancer. To do this, update your DNS records and your alias record set in Route 53. For more information about using Route 53, see [Getting Started with Route 53](#).
- **Shut down your EC2-Classic resources:** After you've verified that your web application is working from within the VPC architecture, you can shut down your EC2-Classic resources to stop incurring charges for them.

Security in Amazon EC2

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from a data center and network architecture that are built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The [shared responsibility model](#) describes this as security of the cloud and security in the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the [AWS Compliance Programs](#). To learn about the compliance programs that apply to Amazon EC2, see [AWS Services in Scope by Compliance Program](#).
- **Security in the cloud** – Your responsibility includes the following areas:
 - Controlling network access to your instances, for example, through configuring your VPC and security groups. For more information, see [Controlling network traffic \(p. 1234\)](#).
 - Managing the credentials used to connect to your instances.
 - Managing the guest operating system and software deployed to the guest operating system, including updates and security patches. For more information, see [Update management in Amazon EC2 \(p. 1345\)](#).
 - Configuring the IAM roles that are attached to the instance and the permissions associated with those roles. For more information, see [IAM roles for Amazon EC2 \(p. 1297\)](#).

This documentation helps you understand how to apply the shared responsibility model when using Amazon EC2. It shows you how to configure Amazon EC2 to meet your security and compliance objectives. You also learn how to use other AWS services that help you to monitor and secure your Amazon EC2 resources.

Contents

- [Infrastructure security in Amazon EC2 \(p. 1233\)](#)
- [Amazon EC2 and interface VPC endpoints \(p. 1235\)](#)
- [Resilience in Amazon EC2 \(p. 1236\)](#)
- [Data protection in Amazon EC2 \(p. 1237\)](#)
- [Identity and access management for Amazon EC2 \(p. 1240\)](#)
- [Amazon EC2 key pairs and Linux instances \(p. 1310\)](#)
- [Amazon EC2 security groups for Linux instances \(p. 1325\)](#)
- [Update management in Amazon EC2 \(p. 1345\)](#)
- [Compliance validation for Amazon EC2 \(p. 1345\)](#)

Infrastructure security in Amazon EC2

You use AWS published API calls to access Amazon EC2 through the network. Clients must support Transport Layer Security (TLS) 1.0 or later. We recommend TLS 1.2 or later. Clients must also support

cipher suites with perfect forward secrecy (PFS) such as Ephemeral Diffie-Hellman (DHE) or Elliptic Curve Ephemeral Diffie-Hellman (ECDHE). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the [AWS Security Token Service](#) (AWS STS) to generate temporary security credentials to sign requests.

For more information, see [Infrastructure Protection in the Security Pillar - AWS-Well-Architected Framework](#).

Network isolation

A virtual private cloud (VPC) is a virtual network in your own logically isolated area in the AWS Cloud. Use separate VPCs to isolate infrastructure by workload or organizational entity.

A subnet is a range of IP addresses in a VPC. When you launch an instance, you launch it into a subnet in your VPC. Use subnets to isolate the tiers of your application (for example, web, application, and database) within a single VPC. Use private subnets for your instances if they should not be accessed directly from the internet.

To call the Amazon EC2 API from your VPC without sending traffic over the public internet, use AWS PrivateLink.

Isolation on physical hosts

Different EC2 instances on the same physical host are isolated from each other as though they are on separate physical hosts. The hypervisor isolates CPU and memory, and the instances are provided virtualized disks instead of access to the raw disk devices.

When you stop or terminate an instance, the memory allocated to it is scrubbed (set to zero) by the hypervisor before it is allocated to a new instance, and every block of storage is reset. This ensures that your data is not unintentionally exposed to another instance.

Network MAC addresses are dynamically assigned to instances by the AWS network infrastructure. IP addresses are either dynamically assigned to instances by the AWS network infrastructure, or assigned by an EC2 administrator through authenticated API requests. The AWS network allows instances to send traffic only from the MAC and IP addresses assigned to them. Otherwise, the traffic is dropped.

By default, an instance cannot receive traffic that is not specifically addressed to it. If you need to run network address translation (NAT), routing, or firewall services on your instance, you can disable source/destination checking for the network interface.

Controlling network traffic

Consider the following options for controlling network traffic to your EC2 instances:

- Restrict access to your instances using [security groups \(p. 1325\)](#). For example, you can allow traffic only from the address ranges for your corporate network.
- Use private subnets for your instances if they should not be accessed directly from the internet. Use a bastion host or NAT gateway for internet access from an instance in a private subnet.
- Use AWS Virtual Private Network or AWS Direct Connect to establish private connections from your remote networks to your VPCs. For more information, see [Network-to-Amazon VPC Connectivity Options](#).
- Use [VPC Flow Logs](#) to monitor the traffic that reaches your instances.
- Use [AWS Security Hub](#) to check for unintended network accessibility from your instances.

- Use [EC2 Instance Connect \(p. 617\)](#) to connect to your instances using Secure Shell (SSH) without the need to share and manage SSH keys.
- Use [AWS Systems Manager Session Manager](#) to access your instances remotely instead of opening inbound SSH ports and managing SSH keys.
- Use [AWS Systems Manager Run Command](#) to automate common administrative tasks instead of opening inbound SSH ports and managing SSH keys.

In addition to restricting network access to each Amazon EC2 instance, Amazon VPC supports implementing additional network security controls like in-line gateways, proxy servers, and various network monitoring options.

Amazon EC2 and interface VPC endpoints

You can improve the security posture of your VPC by configuring Amazon EC2 to use an interface VPC endpoint. Interface endpoints are powered by AWS PrivateLink, a technology that enables you to privately access Amazon EC2 APIs by restricting all network traffic between your VPC and Amazon EC2 to the Amazon network. With interface endpoints, you also don't need an internet gateway, a NAT device, or a virtual private gateway.

You are not required to configure AWS PrivateLink, but it's recommended. For more information about AWS PrivateLink and VPC endpoints, see [Interface VPC Endpoints \(AWS PrivateLink\)](#).

Topics

- [Create an interface VPC endpoint \(p. 1235\)](#)
- [Create an interface VPC endpoint policy \(p. 1235\)](#)

Create an interface VPC endpoint

Create an endpoint for Amazon EC2 using the following service name:

- `com.amazonaws.region.ec2` — Creates an endpoint for the Amazon EC2 API actions.

For more information, see [Creating an Interface Endpoint](#) in the *Amazon VPC User Guide*.

Create an interface VPC endpoint policy

You can attach a policy to your VPC endpoint to control access to the Amazon EC2 API. The policy specifies:

- The principal that can perform actions.
- The actions that can be performed.
- The resource on which the actions can be performed.

Important

When a non-default policy is applied to an interface VPC endpoint for Amazon EC2, certain failed API requests, such as those failing from `RequestLimitExceeded`, might not be logged to AWS CloudTrail or Amazon CloudWatch.

For more information, see [Controlling Access to Services with VPC Endpoints](#) in the *Amazon VPC User Guide*.

The following example shows a VPC endpoint policy that denies permission to create unencrypted volumes or to launch instances with unencrypted volumes. The example policy also grants permission to perform all other Amazon EC2 actions.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Action": "ec2:*",  
            "Effect": "Allow",  
            "Resource": "*",  
            "Principal": "*"  
        },  
        {  
            "Action": [  
                "ec2:CreateVolume"  
            ],  
            "Effect": "Deny",  
            "Resource": "*",  
            "Principal": "*",  
            "Condition": {  
                "Bool": {  
                    "ec2:Encrypted": "false"  
                }  
            }  
        },  
        {  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Effect": "Deny",  
            "Resource": "*",  
            "Principal": "*",  
            "Condition": {  
                "Bool": {  
                    "ec2:Encrypted": "false"  
                }  
            }  
        }  
    ]  
}
```

Resilience in Amazon EC2

The AWS global infrastructure is built around AWS Regions and Availability Zones. Regions provide multiple physically separated and isolated Availability Zones, which are connected through low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

If you need to replicate your data or applications over greater geographic distances, use AWS Local Zones. An AWS Local Zone is an extension of an AWS Region in geographic proximity to your users. Local Zones have their own connections to the internet and support AWS Direct Connect. Like all AWS Regions, AWS Local Zones are completely isolated from other AWS Zones.

If you need to replicate your data or applications in an AWS Local Zone, AWS recommends that you use one of the following zones as the failover zone:

- Another Local Zone

- An Availability Zone in the Region that is not the parent zone. You can use the [describe-availability-zones](#) command to view the parent zone.

For more information about AWS Regions and Availability Zones, see [AWS Global Infrastructure](#).

In addition to the AWS global infrastructure, Amazon EC2 offers the following features to support your data resiliency:

- Copying AMIs across Regions
- Copying EBS snapshots across Regions
- Automating EBS-backed AMIs using Amazon Data Lifecycle Manager
- Automating EBS snapshots using Amazon Data Lifecycle Manager
- Maintaining the health and availability of your fleet using Amazon EC2 Auto Scaling
- Distributing incoming traffic across multiple instances in a single Availability Zone or multiple Availability Zones using Elastic Load Balancing

Data protection in Amazon EC2

The AWS [shared responsibility model](#) applies to data protection in Amazon Elastic Compute Cloud. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. This content includes the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see the [Data Privacy FAQ](#). For information about data protection in Europe, see the [AWS Shared Responsibility Model and GDPR](#) blog post on the [AWS Security Blog](#).

For data protection purposes, we recommend that you protect AWS account credentials and set up individual user accounts with AWS Identity and Access Management (IAM). That way each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We recommend TLS 1.2 or later.
- Set up API and user activity logging with AWS CloudTrail.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing personal data that is stored in Amazon S3.
- If you require FIPS 140-2 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see [Federal Information Processing Standard \(FIPS\) 140-2](#).

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form fields such as a **Name** field. This includes when you work with Amazon EC2 or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Topics

- [Amazon EBS data security \(p. 1238\)](#)

- [Encryption at rest \(p. 1238\)](#)
- [Encryption in transit \(p. 1238\)](#)

Amazon EBS data security

Amazon EBS volumes are presented to you as raw, unformatted block devices. These devices are logical devices that are created on the EBS infrastructure and the Amazon EBS service ensures that the devices are logically empty (that is, the raw blocks are zeroed or they contain cryptographically pseudorandom data) prior to any use or re-use by a customer.

If you have procedures that require that all data be erased using a specific method, either after or before use (or both), such as those detailed in [DoD 5220.22-M](#) (National Industrial Security Program Operating Manual) or [NIST 800-88](#) (Guidelines for Media Sanitization), you have the ability to do so on Amazon EBS. That block-level activity will be reflected down to the underlying storage media within the Amazon EBS service.

Encryption at rest

EBS volumes

Amazon EBS encryption is an encryption solution for your EBS volumes and snapshots. It uses AWS KMS keys. For more information, see [Amazon EBS encryption \(p. 1542\)](#).

Instance store volumes

The data on NVMe instance store volumes is encrypted using an XTS-AES-256 cipher, implemented on a hardware module on the instance. The keys used to encrypt data that's written to locally-attached NVMe storage devices are per-customer, and per volume. The keys are generated by, and only reside within, the hardware module, which is inaccessible to AWS personnel. The encryption keys are destroyed when the instance is stopped or terminated and cannot be recovered. You cannot disable this encryption and you cannot provide your own encryption key.

The data on HDD instance store volumes on H1, D3, and D3en instances is encrypted using XTS-AES-256 and one-time keys.

When you stop, hibernate, or terminate an instance, every block of storage in the instance store volume is reset. Therefore, your data cannot be accessed through the instance store of another instance.

Memory

Memory encryption is enabled on the following instances:

- Instances with AWS Graviton 2 processors, such as M6g instances. These processors support always-on memory encryption. The encryption keys are securely generated within the host system, do not leave the host system, and are destroyed when the host is rebooted or powered down.
- Instances with Intel Xeon Scalable processors (Ice Lake), such as M6i instances. These processors support always-on memory encryption using Intel Total Memory Encryption (TME).
- Instances with 3rd generation AMD EPYC processors (Milan), such as M6a instances. These processors support always-on memory encryption using AMD Transparent Single Key Memory Encryption (TSME).

Encryption in transit

Encryption at the physical layer

All data flowing across AWS Regions over the AWS global network is automatically encrypted at the physical layer before it leaves AWS secured facilities. All traffic between AZs is encrypted. Additional layers of encryption, including those listed in this section, may provide additional protections.

Encryption provided by Amazon VPC and Transit Gateway cross-Region peering

All cross-Region traffic that uses Amazon VPC and Transit Gateway peering is automatically bulk-encrypted when it exits a Region. An additional layer of encryption is automatically provided at the physical layer for all cross-Region traffic, as previously noted in this section.

Encryption between instances

AWS provides secure and private connectivity between EC2 instances of all types. In addition, some instance types use the offload capabilities of the underlying Nitro System hardware to automatically encrypt in-transit traffic between instances, using AEAD algorithms with 256-bit encryption. There is no impact on network performance. To support this additional in-transit traffic encryption between instances, the following requirements must be met:

- The instances use the following instance types:
 - General purpose: M5dn | M5n | M5zn | M6a | M6i
 - Compute optimized: C5a | C5ad | C5n | C6a | C6gn | C6i | Hpc6a
 - Memory optimized: R5dn | R5n | R6i | high memory (u-*), virtualized only | X2iezn
 - Storage optimized: D3 | D3en | I3en | Im4gn | Is4gen
 - Accelerated computing: DL1 | G4ad | G4dn | G5 | Inf1 | P3dn | P4d | VT1
- The instances are in the same Region.
- The instances are in the same VPC or peered VPCs, and the traffic does not pass through a virtual network device or service, such as a load balancer or a transit gateway.

An additional layer of encryption is automatically provided at the physical layer for all traffic before it leaves AWS secured facilities, as previously noted in this section.

To view the instance types that encrypt in-transit traffic between instances using the AWS CLI

Use the following [describe-instance-types](#) command.

```
aws ec2 describe-instance-types \
--filters Name=network-info.encryption-in-transit-supported,Values=true \
--query "InstanceTypes[*].[InstanceType]" --output text | sort
```

Encryption to and from AWS Outposts

An Outpost creates special network connections called *service links* to its AWS home Region and, optionally, private connectivity to a VPC subnet that you specify. All traffic over those connection is fully encrypted. For more information, see [Connectivity through service links](#) and [Encryption in transit](#) in the [AWS Outposts User Guide](#).

Remote access encryption

SSH provides a secure communications channel for remote access to your Linux instances, whether directly or through EC2 Instance Connect. Remote access to your instances using AWS Systems Manager Session Manager or the Run Command is encrypted using TLS 1.2, and requests to create a connection are signed using [SigV4](#) and authenticated and authorized by [AWS Identity and Access Management](#).

It is your responsibility to use an encryption protocol, such as Transport Layer Security (TLS), to encrypt sensitive data in transit between clients and your Amazon EC2 instances.

Identity and access management for Amazon EC2

Your security credentials identify you to services in AWS and grant you unlimited use of your AWS resources, such as your Amazon EC2 resources. You can use features of Amazon EC2 and AWS Identity and Access Management (IAM) to allow other users, services, and applications to use your Amazon EC2 resources without sharing your security credentials. You can use IAM to control how other users use resources in your AWS account, and you can use security groups to control access to your Amazon EC2 instances. You can choose to allow full use or limited use of your Amazon EC2 resources.

Contents

- [Network access to your instance \(p. 1240\)](#)
- [Amazon EC2 permission attributes \(p. 1240\)](#)
- [IAM and Amazon EC2 \(p. 1240\)](#)
- [IAM policies for Amazon EC2 \(p. 1242\)](#)
- [AWS managed policies for Amazon Elastic Compute Cloud \(p. 1296\)](#)
- [IAM roles for Amazon EC2 \(p. 1297\)](#)
- [Authorize inbound traffic for your Linux instances \(p. 1307\)](#)

Network access to your instance

A security group acts as a firewall that controls the traffic allowed to reach one or more instances. When you launch an instance, you assign it one or more security groups. You add rules to each security group that control traffic for the instance. You can modify the rules for a security group at any time; the new rules are automatically applied to all instances to which the security group is assigned.

For more information, see [Authorize inbound traffic for your Linux instances \(p. 1307\)](#).

Amazon EC2 permission attributes

Your organization might have multiple AWS accounts. Amazon EC2 enables you to specify additional AWS accounts that can use your Amazon Machine Images (AMIs) and Amazon EBS snapshots. These permissions work at the AWS account level only; you can't restrict permissions for specific users within the specified AWS account. All users in the AWS account that you've specified can use the AMI or snapshot.

Each AMI has a `LaunchPermission` attribute that controls which AWS accounts can access the AMI. For more information, see [Make an AMI public \(p. 125\)](#).

Each Amazon EBS snapshot has a `createVolumePermission` attribute that controls which AWS accounts can use the snapshot. For more information, see [Share an Amazon EBS snapshot \(p. 1441\)](#).

IAM and Amazon EC2

IAM enables you to do the following:

- Create users and groups under your AWS account
- Assign unique security credentials to each user under your AWS account
- Control each user's permissions to perform tasks using AWS resources
- Allow the users in another AWS account to share your AWS resources
- Create roles for your AWS account and define the users or services that can assume them
- Use existing identities for your enterprise to grant permissions to perform tasks using AWS resources

By using IAM with Amazon EC2, you can control whether users in your organization can perform a task using specific Amazon EC2 API actions and whether they can use specific AWS resources.

This topic helps you answer the following questions:

- How do I create groups and users in IAM?
- How do I create a policy?
- What IAM policies do I need to carry out tasks in Amazon EC2?
- How do I grant permissions to perform actions in Amazon EC2?
- How do I grant permissions to perform actions on specific resources in Amazon EC2?

Create an IAM group and users

To create an IAM group

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Groups** and then choose **Create New Group**.
3. For **Group Name**, enter a name for your group, and then choose **Next Step**.
4. On the **Attach Policy** page, select an AWS managed policy and then choose **Next Step**. For example, for Amazon EC2, one of the following AWS managed policies might meet your needs:
 - PowerUserAccess
 - ReadOnlyAccess
 - AmazonEC2FullAccess
 - AmazonEC2ReadOnlyAccess
5. Choose **Create Group**.

Your new group is listed under **Group Name**.

To create an IAM user, add the user to your group, and create a password for the user

1. In the navigation pane, choose **Users**, **Add user**.
2. For **User name**, enter a user name.
3. For **Access type**, select both **Programmatic access** and **AWS Management Console access**.
4. For **Console password**, choose one of the following:
 - **Autogenerated password**. Each user gets a randomly generated password that meets the current password policy in effect (if any). You can view or download the passwords when you get to the **Final** page.
 - **Custom password**. Each user is assigned the password that you enter in the box.
5. Choose **Next: Permissions**.
6. On the **Set permissions** page, choose **Add user to group**. Select the check box next to the group that you created earlier and choose **Next: Review**.
7. Choose **Create user**.
8. To view the users' access keys (access key IDs and secret access keys), choose **Show** next to each password and secret access key to see. To save the access keys, choose **Download .csv** and then save the file to a safe location.

Important

You cannot retrieve the secret access key after you complete this step; if you misplace it you must create a new one.

9. Choose **Close**.
10. Give each user his or her credentials (access keys and password); this enables them to use services based on the permissions you specified for the IAM group.

IAM policies for Amazon EC2

By default, IAM users don't have permission to create or modify Amazon EC2 resources, or perform tasks using the Amazon EC2 API. (This means that they also can't do so using the Amazon EC2 console or CLI.) To allow IAM users to create or modify resources and perform tasks, you must create IAM policies that grant IAM users permission to use the specific resources and API actions they'll need, and then attach those policies to the IAM users or groups that require those permissions.

When you attach a policy to a user or group of users, it allows or denies the users permission to perform the specified tasks on the specified resources. For more general information about IAM policies, see [Permissions and Policies](#) in the *IAM User Guide*. For more information about managing and creating custom IAM policies, see [Managing IAM Policies](#).

Getting Started

An IAM policy must grant or deny permissions to use one or more Amazon EC2 actions. It must also specify the resources that can be used with the action, which can be all resources, or in some cases, specific resources. The policy can also include conditions that you apply to the resource.

Amazon EC2 partially supports resource-level permissions. This means that for some EC2 API actions, you cannot specify which resource a user is allowed to work with for that action. Instead, you have to allow users to work with all resources for that action.

Task	Topic
Understand the basic structure of a policy	Policy syntax (p. 1243)
Define actions in your policy	Actions for Amazon EC2 (p. 1244)
Define specific resources in your policy	Amazon Resource Names (ARNs) for Amazon EC2 (p. 1244)
Apply conditions to the use of the resources	Condition keys for Amazon EC2 (p. 1245)
Work with the available resource-level permissions for Amazon EC2	Actions, resources, and condition keys for Amazon EC2
Test your policy	Check that users have the required permissions (p. 1247)
Generate an IAM policy	Generate policies based on access activity

Task	Topic
Example policies for a CLI or SDK	Example policies for working with the AWS CLI or an AWS SDK (p. 1250)
Example policies for the Amazon EC2 console	Example policies for working in the Amazon EC2 console (p. 1287)

Policy structure

The following topics explain the structure of an IAM policy.

Contents

- [Policy syntax \(p. 1243\)](#)
- [Actions for Amazon EC2 \(p. 1244\)](#)
- [Supported resource-level permissions for Amazon EC2 API actions \(p. 1244\)](#)
- [Amazon Resource Names \(ARNs\) for Amazon EC2 \(p. 1244\)](#)
- [Condition keys for Amazon EC2 \(p. 1245\)](#)
- [Check that users have the required permissions \(p. 1247\)](#)

Policy syntax

An IAM policy is a JSON document that consists of one or more statements. Each statement is structured as follows.

```
{  
  "Statement": [ {  
    "Effect": "effect",  
    "Action": "action",  
    "Resource": "arn",  
    "Condition": {  
      "condition": {  
        "key": "value"  
      }  
    }  
  }]  
}
```

There are various elements that make up a statement:

- **Effect:** The *effect* can be `Allow` or `Deny`. By default, IAM users don't have permission to use resources and API actions, so all requests are denied. An explicit allow overrides the default. An explicit deny overrides any allows.
- **Action:** The *action* is the specific API action for which you are granting or denying permission. To learn about specifying *action*, see [Actions for Amazon EC2 \(p. 1244\)](#).
- **Resource:** The resource that's affected by the action. Some Amazon EC2 API actions allow you to include specific resources in your policy that can be created or modified by the action. You specify a resource using an Amazon Resource Name (ARN) or using the wildcard (*) to indicate that the statement applies to all resources. For more information, see [Supported resource-level permissions for Amazon EC2 API actions \(p. 1244\)](#).
- **Condition:** Conditions are optional. They can be used to control when your policy is in effect. For more information about specifying conditions for Amazon EC2, see [Condition keys for Amazon EC2 \(p. 1245\)](#).

For more information about example IAM policy statements for Amazon EC2, see [Example policies for working with the AWS CLI or an AWS SDK \(p. 1250\)](#).

Actions for Amazon EC2

In an IAM policy statement, you can specify any API action from any service that supports IAM. For Amazon EC2, use the following prefix with the name of the API action: `ec2:`. For example: `ec2:RunInstances` and `ec2:CreateImage`.

To specify multiple actions in a single statement, separate them with commas as follows:

```
"Action": ["ec2:action1", "ec2:action2"]
```

You can also specify multiple actions using wildcards. For example, you can specify all actions whose name begins with the word "Describe" as follows:

```
"Action": "ec2:Describe*"
```

Note

Currently, the Amazon EC2 `Describe*` API actions do not support resource-level permissions. For more information about resource-level permissions for Amazon EC2, see [IAM policies for Amazon EC2 \(p. 1242\)](#).

To specify all Amazon EC2 API actions, use the `*` wildcard as follows:

```
"Action": "ec2:/*"
```

For a list of Amazon EC2 actions, see [Actions defined by Amazon EC2](#) in the *Service Authorization Reference*.

Supported resource-level permissions for Amazon EC2 API actions

Resource-level permissions refers to the ability to specify which resources users are allowed to perform actions on. Amazon EC2 has partial support for resource-level permissions. This means that for certain Amazon EC2 actions, you can control when users are allowed to use those actions based on conditions that have to be fulfilled, or specific resources that users are allowed to use. For example, you can grant users permissions to launch instances, but only of a specific type, and only using a specific AMI.

To specify a resource in an IAM policy statement, use its Amazon Resource Name (ARN). For more information about specifying the ARN value, see [Amazon Resource Names \(ARNs\) for Amazon EC2 \(p. 1244\)](#). If an API action does not support individual ARNs, you must use a wildcard (*) to specify that all resources can be affected by the action.

To see tables that identify which Amazon EC2 API actions support resource-level permissions, and the ARNs and condition keys that you can use in a policy, see [Actions, resources, and condition keys for Amazon EC2](#).

Keep in mind that you can apply tag-based resource-level permissions in the IAM policies you use for Amazon EC2 API actions. This gives you better control over which resources a user can create, modify, or use. For more information, see [Grant permission to tag resources during creation \(p. 1248\)](#).

Amazon Resource Names (ARNs) for Amazon EC2

Each IAM policy statement applies to the resources that you specify using their ARNs.

An ARN has the following general syntax:

```
arn:[aws]:[service]:[region]:[account-id]:resourceType/resourcePath
```

service

The service (for example, `ec2`).

region

The Region for the resource (for example, `us-east-1`).

account-id

The AWS account ID, with no hyphens (for example, `123456789012`).

resourceType

The type of resource (for example, `instance`).

resourcePath

A path that identifies the resource. You can use the `*` wildcard in your paths.

For example, you can indicate a specific instance (`i-1234567890abcdef0`) in your statement using its ARN as follows.

```
"Resource": "arn:aws:ec2:us-east-1:123456789012:instance/i-1234567890abcdef0"
```

You can specify all instances that belong to a specific account by using the `*` wildcard as follows.

```
"Resource": "arn:aws:ec2:us-east-1:123456789012:instance/*"
```

You can also specify all Amazon EC2 resources that belong to a specific account by using the `*` wildcard as follows.

```
"Resource": "arn:aws:ec2:us-east-1:123456789012:*
```

To specify all resources, or if a specific API action does not support ARNs, use the `*` wildcard in the `Resource` element as follows.

```
"Resource": "*"
```

Many Amazon EC2 API actions involve multiple resources. For example, `AttachVolume` attaches an Amazon EBS volume to an instance, so an IAM user must have permissions to use the volume and the instance. To specify multiple resources in a single statement, separate their ARNs with commas, as follows.

```
"Resource": ["arn1", "arn2"]
```

For a list of ARNs for Amazon EC2 resources, see [Resource types defined by Amazon EC2](#).

Condition keys for Amazon EC2

In a policy statement, you can optionally specify conditions that control when it is in effect. Each condition contains one or more key-value pairs. Condition keys are not case-sensitive. We've defined AWS-wide condition keys, plus additional service-specific condition keys.

For a list of service-specific condition keys for Amazon EC2, see [Condition keys for Amazon EC2](#). Amazon EC2 also implements the AWS-wide condition keys. For more information, see [Information available in all requests](#) in the *IAM User Guide*.

To use a condition key in your IAM policy, use the `Condition` statement. For example, the following policy grants users permission to add and remove inbound and outbound rules for any security group. It uses the `ec2:Vpc` condition key to specify that these actions can only be performed on security groups in a specific VPC.

```
{  
    "Version": "2012-10-17",  
    "Statement": [{  
        "Effect": "Allow",  
        "Action": [  
            "ec2:AuthorizeSecurityGroupIngress",  
            "ec2:AuthorizeSecurityGroupEgress",  
            "ec2:RevokeSecurityGroupIngress",  
            "ec2:RevokeSecurityGroupEgress"],  
        "Resource": "arn:aws:ec2:region:account:security-group/*",  
        "Condition": {  
            "StringEquals": {  
                "ec2:Vpc": "arn:aws:ec2:region:account:vpc/vpc-11223344556677889"  
            }  
        }  
    }]  
}
```

If you specify multiple conditions, or multiple keys in a single condition, we evaluate them using a logical AND operation. If you specify a single condition with multiple values for one key, we evaluate the condition using a logical OR operation. For permissions to be granted, all conditions must be met.

You can also use placeholders when you specify conditions. For example, you can grant an IAM user permission to use resources with a tag that specifies his or her IAM user name. For more information, see [IAM policy elements: Variables and tags](#) in the *IAM User Guide*.

Important

Many condition keys are specific to a resource, and some API actions use multiple resources. If you write a policy with a condition key, use the `Resource` element of the statement to specify the resource to which the condition key applies. If not, the policy may prevent users from performing the action at all, because the condition check fails for the resources to which the condition key does not apply. If you do not want to specify a resource, or if you've written the `Action` element of your policy to include multiple API actions, then you must use the `...IfExists` condition type to ensure that the condition key is ignored for resources that do not use it. For more information, see [...IfExists Conditions](#) in the *IAM User Guide*.

All Amazon EC2 actions support the `aws:RequestedRegion` and `ec2:Region` condition keys. For more information, see [Example: Restrict access to a specific Region \(p. 1251\)](#).

[ec2:SourceInstanceARN](#) condition key

The `ec2:SourceInstanceARN` condition key can be used for conditions that specify the ARN of the instance from which a request is made. This condition key is available AWS-wide and is not service-specific. For policy examples, see [Amazon EC2: Attach or detach volumes to an EC2 instance](#) and [Example: Allow a specific instance to view resources in other AWS services \(p. 1283\)](#). The `ec2:SourceInstanceARN` key cannot be used as a variable to populate the ARN for the `Resource` element in a statement.

For example policy statements for Amazon EC2, see [Example policies for working with the AWS CLI or an AWS SDK \(p. 1250\)](#).

[ec2:Attribute](#) condition key

The `ec2:Attribute` condition key can be used for conditions that filter access by an attribute of a resource. The condition key supports only properties that are of a primitive data type, such as a string

or integer, or complex objects that have only a `Value` property, such as the **Description** object of the [ModifyImageAttribute](#) API action.

For example, the following policy uses the `ec2:Attribute/Description` condition key to filter access by the complex **Description** object of the [ModifyImageAttribute](#) API action. The condition key allows only requests that modify an image's description to either `Production` or `Development`.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:ModifyImageAttribute",  
            "Resource": "arn:aws:ec2:us-east-1::image/ami-*",  
            "Condition": {  
                "StringEquals": {  
                    "ec2:Attribute/Description": [  
                        "Production",  
                        "Development"  
                    ]  
                }  
            }  
        }  
    ]  
}
```

The following example policy uses the `ec2:Attribute` condition key to filter access by the primitive **Attribute** property of the [ModifyImageAttribute](#) API action. The condition key denies all requests that attempt to modify an image's description.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Deny",  
            "Action": "ec2:ModifyImageAttribute",  
            "Resource": "arn:aws:ec2:us-east-1::image/ami-*",  
            "Condition": {  
                "StringEquals": {  
                    "ec2:Attribute": "Description"  
                }  
            }  
        }  
    ]  
}
```

Check that users have the required permissions

After you've created an IAM policy, we recommend that you check whether it grants users the permissions to use the particular API actions and resources they need before you put the policy into production.

First, create an IAM user for testing purposes, and then attach the IAM policy that you created to the test user. Then, make a request as the test user.

If the Amazon EC2 action that you are testing creates or modifies a resource, you should make the request using the `DryRun` parameter (or run the AWS CLI command with the `--dry-run` option). In this case, the call completes the authorization check, but does not complete the operation. For example, you can check whether the user can terminate a particular instance without actually terminating it. If the test user has the required permissions, the request returns `DryRunOperation`; otherwise, it returns `UnauthorizedOperation`.

If the policy doesn't grant the user the permissions that you expected, or is overly permissive, you can adjust the policy as needed and retest until you get the desired results.

Important

It can take several minutes for policy changes to propagate before they take effect. Therefore, we recommend that you allow five minutes to pass before you test your policy updates.

If an authorization check fails, the request returns an encoded message with diagnostic information. You can decode the message using the `DecodeAuthorizationMessage` action. For more information, see `DecodeAuthorizationMessage` in the *AWS Security Token Service API Reference*, and `decode-authorization-message` in the *AWS CLI Command Reference*.

Grant permission to tag resources during creation

Some resource-creating Amazon EC2 API actions enable you to specify tags when you create the resource. You can use resource tags to implement attribute-based control (ABAC). For more information, see [Tag your resources \(p. 1693\)](#) and [Control access to EC2 resources using resource tags \(p. 1250\)](#).

To enable users to tag resources on creation, they must have permissions to use the action that creates the resource, such as `ec2:RunInstances` or `ec2>CreateVolume`. If tags are specified in the resource-creating action, Amazon performs additional authorization on the `ec2:CreateTags` action to verify if users have permissions to create tags. Therefore, users must also have explicit permissions to use the `ec2:CreateTags` action.

In the IAM policy definition for the `ec2:CreateTags` action, use the `Condition` element with the `ec2:CreateAction` condition key to give tagging permissions to the action that creates the resource.

The following example demonstrates a policy that allows users to launch instances and apply any tags to instances and volumes during launch. Users are not permitted to tag any existing resources (they cannot call the `ec2:CreateTags` action directly).

```
{  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateTags"  
            ],  
            "Resource": "arn:aws:ec2:region:account:/*/*",  
            "Condition": {  
                "StringEquals": {  
                    "ec2:CreateAction" : "RunInstances"  
                }  
            }  
        }  
    ]  
}
```

Similarly, the following policy allows users to create volumes and apply any tags to the volumes during volume creation. Users are not permitted to tag any existing resources (they cannot call the `ec2:CreateTags` action directly).

```
{  
    "Statement": [  
        {
```

```
{  
    "Effect": "Allow",  
    "Action": [  
        "ec2:CreateVolume"  
    ],  
    "Resource": "*"  
},  
{  
    "Effect": "Allow",  
    "Action": [  
        "ec2:CreateTags"  
    ],  
    "Resource": "arn:aws:ec2:region:account:*/*",  
    "Condition": {  
        "StringEquals": {  
            "ec2:CreateAction" : "CreateVolume"  
        }  
    }  
}  
]
```

The `ec2:CreateTags` action is only evaluated if tags are applied during the resource-creating action. Therefore, a user that has permissions to create a resource (assuming there are no tagging conditions) does not require permissions to use the `ec2:CreateTags` action if no tags are specified in the request. However, if the user attempts to create a resource with tags, the request fails if the user does not have permissions to use the `ec2:CreateTags` action.

The `ec2:CreateTags` action is also evaluated if tags are provided in a launch template. For an example policy, see [Tags in a launch template \(p. 1271\)](#).

Control access to specific tags

You can use additional conditions in the `Condition` element of your IAM policies to control the tag keys and values that can be applied to resources.

The following condition keys can be used with the examples in the preceding section:

- `aws:RequestTag`: To indicate that a particular tag key or tag key and value must be present in a request. Other tags can also be specified in the request.
 - Use with the `StringEquals` condition operator to enforce a specific tag key and value combination, for example, to enforce the tag `cost-center=cc123`:

```
"StringEquals": { "aws:RequestTag/cost-center": "cc123" }
```

- Use with the `StringLike` condition operator to enforce a specific tag key in the request; for example, to enforce the tag key `purpose`:

```
"StringLike": { "aws:RequestTag/purpose": "*" }
```

- `aws:TagKeys`: To enforce the tag keys that are used in the request.
 - Use with the `ForAllValues` modifier to enforce specific tag keys if they are provided in the request (if tags are specified in the request, only specific tag keys are allowed; no other tags are allowed). For example, the tag keys `environment` or `cost-center` are allowed:

```
"ForAllValues:StringEquals": { "aws:TagKeys": [ "environment", "cost-center" ] }
```

- Use with the `ForAnyValue` modifier to enforce the presence of at least one of the specified tag keys in the request. For example, at least one of the tag keys `environment` or `webserver` must be present in the request:

```
"ForAnyValue:StringEquals": { "aws:TagKeys": ["environment", "webserver"] }
```

These condition keys can be applied to resource-creating actions that support tagging, as well as the `ec2:CreateTags` and `ec2:DeleteTags` actions. To learn whether an Amazon EC2 API action supports tagging, see [Actions, resources, and condition keys for Amazon EC2](#).

To force users to specify tags when they create a resource, you must use the `aws:RequestTag` condition key or the `aws:TagKeys` condition key with the `ForAnyValue` modifier on the resource-creating action. The `ec2:CreateTags` action is not evaluated if a user does not specify tags for the resource-creating action.

For conditions, the condition key is not case-sensitive and the condition value is case-sensitive. Therefore, to enforce the case-sensitivity of a tag key, use the `aws:TagKeys` condition key, where the tag key is specified as a value in the condition.

For example IAM policies, see [Example policies for working with the AWS CLI or an AWS SDK \(p. 1250\)](#). For more information about multi-value conditions, see [Creating a Condition That Tests Multiple Key Values](#) in the *IAM User Guide*.

Control access to EC2 resources using resource tags

When you create an IAM policy that grants IAM users permission to use EC2 resources, you can include tag information in the `Condition` element of the policy to control access based on tags. This is known as attribute-based access control (ABAC). ABAC provides better control over which resources a user can modify, use, or delete. For more information, see [What is ABAC for AWS?](#)

For example, you can create a policy that allows users to terminate an instance, but denies the action if the instance has the tag `environment=production`. To do this, you use the `aws:ResourceTag` condition key to allow or deny access to the resource based on the tags that are attached to the resource.

```
"StringEquals": { "aws:ResourceTag/environment": "production" }
```

To learn whether an Amazon EC2 API action supports controlling access using the `aws:ResourceTag` condition key, see [Actions, resources, and condition keys for Amazon EC2](#). Note that the `Describe` actions do not support resource-level permissions, so you must specify them in a separate statement without conditions.

For example IAM policies, see [Example policies for working with the AWS CLI or an AWS SDK \(p. 1250\)](#).

If you allow or deny users access to resources based on tags, you must consider explicitly denying users the ability to add those tags to or remove them from the same resources. Otherwise, it's possible for a user to circumvent your restrictions and gain access to a resource by modifying its tags.

Example policies for working with the AWS CLI or an AWS SDK

The following examples show policy statements that you could use to control the permissions that IAM users have to Amazon EC2. These policies are designed for requests that are made with the AWS CLI or an AWS SDK. For example policies for working in the Amazon EC2 console, see [Example policies for working in the Amazon EC2 console \(p. 1287\)](#). For examples of IAM policies specific to Amazon VPC, see [Identity and Access Management for Amazon VPC](#).

In the following examples, replace each `user input placeholder` with your own information.

Examples

- [Example: Read-only access \(p. 1251\)](#)
- [Example: Restrict access to a specific Region \(p. 1251\)](#)
- [Work with instances \(p. 1252\)](#)
- [Work with volumes \(p. 1253\)](#)
- [Work with snapshots \(p. 1256\)](#)
- [Launch instances \(RunInstances\) \(p. 1263\)](#)
- [Work with Spot Instances \(p. 1275\)](#)
- [Example: Work with Reserved Instances \(p. 1279\)](#)
- [Example: Tag resources \(p. 1280\)](#)
- [Example: Work with IAM roles \(p. 1282\)](#)
- [Example: Work with route tables \(p. 1283\)](#)
- [Example: Allow a specific instance to view resources in other AWS services \(p. 1283\)](#)
- [Example: Work with launch templates \(p. 1284\)](#)
- [Work with instance metadata \(p. 1285\)](#)

Example: Read-only access

The following policy grants users permissions to use all Amazon EC2 API actions whose names begin with `Describe`. The `Resource` element uses a wildcard to indicate that users can specify all resources with these API actions. The `*` wildcard is also necessary in cases where the API action does not support resource-level permissions. For more information about which ARNs you can use with which Amazon EC2 API actions, see [Actions, resources, and condition keys for Amazon EC2](#).

Users don't have permission to perform any actions on the resources (unless another statement grants them permission to do so) because they're denied permission to use API actions by default.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:Describe*",  
            "Resource": "*"  
        }  
    ]  
}
```

Example: Restrict access to a specific Region

The following policy denies users permission to use all Amazon EC2 API actions unless the Region is Europe (Frankfurt). It uses the global condition key `aws:RequestedRegion`, which is supported by all Amazon EC2 API actions.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Deny",  
            "Action": "ec2:*",  
            "Resource": "*",  
            "Condition": {  
                "StringNotEquals": {  
                    "aws:RequestedRegion": "eu-central-1"  
                }  
            }  
        }  
    ]  
}
```

```
        }
    ]
}
```

Alternatively, you can use the condition key `ec2:Region`, which is specific to Amazon EC2 and is supported by all Amazon EC2 API actions.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Deny",
      "Action": "ec2:*",
      "Resource": "*",
      "Condition": {
        "StringNotEquals": {
          "ec2:Region": "eu-central-1"
        }
      }
    }
  ]
}
```

Work with instances

Examples

- [Example: Describe, launch, stop, start, and terminate all instances \(p. 1252\)](#)
- [Example: Describe all instances, and stop, start, and terminate only particular instances \(p. 1253\)](#)

Example: Describe, launch, stop, start, and terminate all instances

The following policy grants users permissions to use the API actions specified in the `Action` element. The `Resource` element uses a `*` wildcard to indicate that users can specify all resources with these API actions. The `*` wildcard is also necessary in cases where the API action does not support resource-level permissions. For more information about which ARNs you can use with which Amazon EC2 API actions, see [Actions, resources, and condition keys for Amazon EC2](#).

The users don't have permission to use any other API actions (unless another statement grants them permission to do so) because users are denied permission to use API actions by default.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ec2:DescribeInstances",
        "ec2:DescribeImages",
        "ec2:DescribeKeyPairs",
        "ec2:DescribeSecurityGroups",
        "ec2:DescribeAvailabilityZones",
        "ec2:RunInstances",
        "ec2:TerminateInstances",
        "ec2:StopInstances",
        "ec2:StartInstances"
      ],
      "Resource": "*"
    }
  ]
}
```

}

Example: Describe all instances, and stop, start, and terminate only particular instances

The following policy allows users to describe all instances, to start and stop only instances i-1234567890abcdef0 and i-0598c7d356eba48d7, and to terminate only instances in the US East (N. Virginia) Region (us-east-1) with the resource tag "purpose=test".

The first statement uses a * wildcard for the Resource element to indicate that users can specify all resources with the action; in this case, they can list all instances. The * wildcard is also necessary in cases where the API action does not support resource-level permissions (in this case, ec2:DescribeInstances). For more information about which ARNs you can use with which Amazon EC2 API actions, see [Actions, resources, and condition keys for Amazon EC2](#).

The second statement uses resource-level permissions for the StopInstances and StartInstances actions. The specific instances are indicated by their ARNs in the Resource element.

The third statement allows users to terminate all instances in the US East (N. Virginia) Region (us-east-1) that belong to the specified AWS account, but only where the instance has the tag "purpose=test". The Condition element qualifies when the policy statement is in effect.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:DescribeInstances",  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:StopInstances",  
                "ec2:StartInstances"  
            ],  
            "Resource": [  
                "arn:aws:ec2:us-east-1:account-id:instance/i-1234567890abcdef0",  
                "arn:aws:ec2:us-east-1:account-id:instance/i-0598c7d356eba48d7"  
            ]  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:TerminateInstances",  
            "Resource": "arn:aws:ec2:us-east-1:account-id:instance/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:ResourceTag/purpose": "test"  
                }  
            }  
        }  
    ]  
}
```

Work with volumes

Examples

- [Example: Attach and detach volumes \(p. 1254\)](#)
- [Example: Create a volume \(p. 1254\)](#)
- [Example: Create a volume with tags \(p. 1255\)](#)

Example: Attach and detach volumes

When an API action requires a caller to specify multiple resources, you must create a policy statement that allows users to access all required resources. If you need to use a `Condition` element with one or more of these resources, you must create multiple statements as shown in this example.

The following policy allows users to attach volumes with the tag "volume_user=*iam-user-name*" to instances with the tag "department=dev", and to detach those volumes from those instances. If you attach this policy to an IAM group, the `aws:username` policy variable gives each IAM user in the group permission to attach or detach volumes from the instances with a tag named `volume_user` that has his or her IAM user name as a value.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:AttachVolume",  
                "ec2:DetachVolume"  
            ],  
            "Resource": "arn:aws:ec2:us-east-1:account-id:instance/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:ResourceTag/department": "dev"  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:AttachVolume",  
                "ec2:DetachVolume"  
            ],  
            "Resource": "arn:aws:ec2:us-east-1:account-id:volume/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:ResourceTag/volume_user": "${aws:username}"  
                }  
            }  
        }  
    ]  
}
```

Example: Create a volume

The following policy allows users to use the [CreateVolume](#) API action. The user is allowed to create a volume only if the volume is encrypted and only if the volume size is less than 20 GiB.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2>CreateVolume"  
            ],  
            "Resource": "arn:aws:ec2:us-east-1:account-id:volume/*",  
            "Condition": {  
                "NumericLessThan": {  
                    "ec2:VolumeSize" : "20"  
                },  
                "Bool": {  
                    "aws:Encryption": "true"  
                }  
            }  
        }  
    ]  
}
```

```

        "ec2:Encrypted" : "true"
    }
}
]
```

Example: Create a volume with tags

The following policy includes the `aws:RequestTag` condition key that requires users to tag any volumes they create with the tags `costcenter=115` and `stack=prod`. The `aws:TagKeys` condition key uses the `ForAllValues` modifier to indicate that only the keys `costcenter` and `stack` are allowed in the request (no other tags can be specified). If users don't pass these specific tags, or if they don't specify tags at all, the request fails.

For resource-creating actions that apply tags, users must also have permissions to use the `CreateTags` action. The second statement uses the `ec2:CreateAction` condition key to allow users to create tags only in the context of `CreateVolume`. Users cannot tag existing volumes or any other resources. For more information, see [Grant permission to tag resources during creation \(p. 1248\)](#).

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowCreateTaggedVolumes",
            "Effect": "Allow",
            "Action": "ec2:CreateVolume",
            "Resource": "arn:aws:ec2:us-east-1:account-id:volume/*",
            "Condition": {
                "StringEquals": {
                    "aws:RequestTag/costcenter": "115",
                    "aws:RequestTag/stack": "prod"
                },
                "ForAllValues:StringEquals": {
                    "aws:TagKeys": ["costcenter", "stack"]
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:CreateTags"
            ],
            "Resource": "arn:aws:ec2:us-east-1:account-id:volume/*",
            "Condition": {
                "StringEquals": {
                    "ec2:CreateAction" : "CreateVolume"
                }
            }
        }
    ]
}
```

The following policy allows users to create a volume without having to specify tags. The `CreateTags` action is only evaluated if tags are specified in the `CreateVolume` request. If users do specify tags, the tag must be `purpose=test`. No other tags are allowed in the request.

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",

```

```
        "Action": "ec2:CreateVolume",
        "Resource": "*"
    },
{
    "Effect": "Allow",
    "Action": [
        "ec2:CreateTags"
    ],
    "Resource": "arn:aws:ec2:us-east-1:account-id:volume/*",
    "Condition": {
        "StringEquals": {
            "aws:RequestTag/purpose": "test",
            "ec2:CreateAction" : "CreateVolume"
        },
        "ForAllValues:StringEquals": {
            "aws:TagKeys": "purpose"
        }
    }
}
]
```

Work with snapshots

The following are example policies for both `CreateSnapshot` (point-in-time snapshot of an EBS volume) and `CreateSnapshots` (multi-volume snapshots).

Examples

- [Example: Create a snapshot \(p. 1256\)](#)
- [Example: Create snapshots \(p. 1257\)](#)
- [Example: Create a snapshot with tags \(p. 1257\)](#)
- [Example: Create snapshots with tags \(p. 1258\)](#)
- [Example: Copying snapshots \(p. 1262\)](#)
- [Example: Modify permission settings for snapshots \(p. 1263\)](#)

Example: Create a snapshot

The following policy allows customers to use the `CreateSnapshot` API action. The customer can create snapshots only if the volume is encrypted and only if the volume size is less than 20 GiB.

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect":"Allow",
            "Action":"ec2:CreateSnapshot",
            "Resource":"arn:aws:ec2:us-east-1::snapshot/*"
        },
        {
            "Effect":"Allow",
            "Action":"ec2:CreateSnapshot",
            "Resource":"arn:aws:ec2:us-east-1:account-id:volume/*",
            "Condition": {
                "NumericLessThan": {
                    "ec2:VolumeSize": "20"
                },
                "Bool": {
                    "ec2:Encrypted": "true"
                }
            }
        }
    ]
}
```

```
        ]
    }
```

Example: Create snapshots

The following policy allows customers to use the [CreateSnapshots](#) API action. The customer can create snapshots only if all of the volumes on the instance are type GP2.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:CreateSnapshots",
            "Resource": [
                "arn:aws:ec2:us-east-1::snapshot/*",
                "arn:aws:ec2:*:*:instance/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": "ec2:CreateSnapshots",
            "Resource": "arn:aws:ec2:us-east-1*:volume/*",
            "Condition": {
                "StringLikeIfExists": {
                    "ec2:VolumeType": "gp2"
                }
            }
        }
    ]
}
```

Example: Create a snapshot with tags

The following policy includes the `aws:RequestTag` condition key that requires the customer to apply the tags `costcenter=115` and `stack=prod` to any new snapshot. The `aws:TagKeys` condition key uses the `ForAllValues` modifier to indicate that only the keys `costcenter` and `stack` can be specified in the request. The request fails if either of these conditions is not met.

For resource-creating actions that apply tags, customers must also have permissions to use the `CreateTags` action. The third statement uses the `ec2:CreateAction` condition key to allow customers to create tags only in the context of `CreateSnapshot`. Customers cannot tag existing volumes or any other resources. For more information, see [Grant permission to tag resources during creation \(p. 1248\)](#).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:CreateSnapshot",
            "Resource": "arn:aws:ec2:us-east-1:account-id:volume/*"
        },
        {
            "Sid": "AllowCreateTaggedSnapshots",
            "Effect": "Allow",
            "Action": "ec2:CreateSnapshot",
            "Resource": "arn:aws:ec2:us-east-1::snapshot/*",
            "Condition": {
                "StringEquals": {

```

```
        "aws:RequestTag/costcenter":"115",
        "aws:RequestTag/stack":"prod"
    },
    "ForAllValues:StringEquals":{
        "aws:TagKeys":[
            "costcenter",
            "stack"
        ]
    }
},
{
    "Effect":"Allow",
    "Action":"ec2:CreateTags",
    "Resource":"arn:aws:ec2:us-east-1::snapshot/*",
    "Condition":{
        "StringEquals":{
            "ec2:CreateAction":"CreateSnapshot"
        }
    }
}
]
```

Example: Create snapshots with tags

The following policy includes the `aws:RequestTag` condition key that requires the customer to apply the tags `costcenter=115` and `stack=prod` to any new snapshot. The `aws:TagKeys` condition key uses the `ForAllValues` modifier to indicate that only the keys `costcenter` and `stack` can be specified in the request. The request fails if either of these conditions is not met.

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect":"Allow",
            "Action":"ec2:CreateSnapshots",
            "Resource":[
                "arn:aws:ec2:us-east-1::snapshot/*",
                "arn:aws:ec2:/*:instance/*",
                "arn:aws:ec2:/*:volume/*"
            ]
        },
        {
            "Sid":"AllowCreateTaggedSnapshots",
            "Effect":"Allow",
            "Action":"ec2:CreateSnapshots",
            "Resource":"arn:aws:ec2:us-east-1::snapshot/*",
            "Condition":{
                "StringEquals":{
                    "aws:RequestTag/costcenter":"115",
                    "aws:RequestTag/stack":"prod"
                },
                "ForAllValues:StringEquals":{
                    "aws:TagKeys":[
                        "costcenter",
                        "stack"
                    ]
                }
            }
        },
        {
            "Effect":"Allow",
            "Action":"ec2:CreateTags",
            "Resource":"arn:aws:ec2:us-east-1::snapshot/*",
            "Condition":{
                "StringEquals":{
                    "aws:RequestTag/costcenter":"115",
                    "aws:RequestTag/stack":"prod"
                },
                "ForAllValues:StringEquals":{
                    "aws:TagKeys":[
                        "costcenter",
                        "stack"
                    ]
                }
            }
        }
    ]
}
```

```
"Action":"ec2:CreateTags",
"Resource":"arn:aws:ec2:us-east-1::snapshot/*",
"Condition":{
    "StringEquals":{
        "ec2:CreateAction":"CreateSnapshots"
    }
}
]
```

The following policy allows customers to create a snapshot without having to specify tags. The `CreateTags` action is evaluated only if tags are specified in the `CreateSnapshot` or `CreateSnapshots` request. If a tag is specified, the tag must be `purpose=test`. No other tags are allowed in the request.

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect":"Allow",
            "Action":"ec2:CreateSnapshot",
            "Resource":"*"
        },
        {
            "Effect":"Allow",
            "Action":"ec2:CreateTags",
            "Resource":"arn:aws:ec2:us-east-1::snapshot/*",
            "Condition":{
                "StringEquals":{
                    "aws:RequestTag/purpose":"test",
                    "ec2:CreateAction":"CreateSnapshot"
                },
                "ForAllValues:StringEquals":{
                    "aws:TagKeys":"purpose"
                }
            }
        }
    ]
}
```

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect":"Allow",
            "Action":"ec2:CreateSnapshots",
            "Resource":"*"
        },
        {
            "Effect":"Allow",
            "Action":"ec2:CreateTags",
            "Resource":"arn:aws:ec2:us-east-1::snapshot/*",
            "Condition":{
                "StringEquals":{
                    "aws:RequestTag/purpose":"test",
                    "ec2:CreateAction":"CreateSnapshots"
                },
                "ForAllValues:StringEquals":{
                    "aws:TagKeys":"purpose"
                }
            }
        }
    ]
}
```

```
        ]  
    }
```

The following policy allows snapshots to be created only if the source volume is tagged with `User:username` for the customer, and the snapshot itself is tagged with `Environment:Dev` and `User:username`. The customer can add additional tags to the snapshot.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:CreateSnapshot",  
            "Resource": "arn:aws:ec2:us-east-1:account-id:volume/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:ResourceTag/User": "${aws:username}"  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:CreateSnapshot",  
            "Resource": "arn:aws:ec2:us-east-1::snapshot/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/Environment": "Dev",  
                    "aws:RequestTag/User": "${aws:username}"  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:CreateTags",  
            "Resource": "arn:aws:ec2:us-east-1::snapshot/*"  
        }  
    ]  
}
```

The following policy for `CreateSnapshots` allows snapshots to be created only if the source volume is tagged with `User:username` for the customer, and the snapshot itself is tagged with `Environment:Dev` and `User:username`.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:CreateSnapshots",  
            "Resource": "arn:aws:ec2:us-east-1::*:instance/*",  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:CreateSnapshots",  
            "Resource": "arn:aws:ec2:us-east-1:account-id:volume/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:ResourceTag/User": "${aws:username}"  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:CreateSnapshots",  
            "Resource": "arn:aws:ec2:us-east-1:account-id:snapshot/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/Environment": "Dev",  
                    "aws:RequestTag/User": "${aws:username}"  
                }  
            }  
        }  
    ]  
}
```

```

    "Action": "ec2:CreateSnapshots",
    "Resource": "arn:aws:ec2:us-east-1::snapshot/*",
    "Condition": {
        "StringEquals": {
            "aws:RequestTag/Environment": "Dev",
            "aws:RequestTag/User": "${aws:username}"
        }
    },
    {
        "Effect": "Allow",
        "Action": "ec2:CreateTags",
        "Resource": "arn:aws:ec2:us-east-1::snapshot/*"
    }
]
}

```

The following policy allows deletion of a snapshot only if the snapshot is tagged with User:*username* for the customer.

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2>DeleteSnapshot",
            "Resource": "arn:aws:ec2:us-east-1::snapshot/*",
            "Condition": {
                "StringEquals": {
                    "aws:ResourceTag/User": "${aws:username}"
                }
            }
        }
    ]
}

```

The following policy allows a customer to create a snapshot but denies the action if the snapshot being created has a tag key value=stack.

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2>CreateSnapshot",
                "ec2>CreateTags"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Deny",
            "Action": "ec2>CreateSnapshot",
            "Resource": "arn:aws:ec2:us-east-1::snapshot/*",
            "Condition": {
                "ForAnyValue:StringEquals": {
                    "aws:TagKeys": "stack"
                }
            }
        }
    ]
}

```

The following policy allows a customer to create snapshots but denies the action if the snapshots being created have a tag key value=stack.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateSnapshots",  
                "ec2:CreateTags"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Deny",  
            "Action": "ec2:CreateSnapshots",  
            "Resource": "arn:aws:ec2:us-east-1::snapshot/*",  
            "Condition": {  
                "ForAnyValue:StringEquals": {  
                    "aws:TagKeys": "stack"  
                }  
            }  
        }  
    ]  
}
```

The following policy allows you to combine multiple actions into a single policy. You can only create a snapshot (in the context of `CreateSnapshots`) when the snapshot is created in Region `us-east-1`. You can only create snapshots (in the context of `CreateSnapshots`) when the snapshots are being created in the Region `us-east-1` and when the instance type is `t2*`.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateSnapshots",  
                "ec2:CreateSnapshot",  
                "ec2:CreateTags"  
            ],  
            "Resource": [  
                "arn:aws:ec2:*:*:instance/*",  
                "arn:aws:ec2:*:*:snapshot/*",  
                "arn:aws:ec2:*:*:volume/*"  
            ],  
            "Condition": {  
                "StringEqualsIgnoreCase": {  
                    "ec2:Region": "us-east-1"  
                },  
                "StringLikeIfExists": {  
                    "ec2:InstanceType": ["t2.*"]  
                }  
            }  
        }  
    ]  
}
```

Example: Copying snapshots

Resource-level permissions specified for the `CopySnapshot` action apply to the new snapshot only. They cannot be specified for the source snapshot.

The following example policy allows principals to copy snapshots only if the new snapshot is created with tag key of purpose and a tag value of production (`purpose=production`).

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "AllowCopySnapshotWithTags",  
            "Effect": "Allow",  
            "Action": "ec2:CopySnapshot",  
            "Resource": "arn:aws:ec2:*:account-id:snapshot/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/purpose": "production"  
                }  
            }  
        }  
    ]  
}
```

Example: Modify permission settings for snapshots

The following policy allows modification of a snapshot only if the snapshot is tagged with `User:username`, where `username` is the customer's AWS account user name. The request fails if this condition is not met.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:ModifySnapshotAttribute",  
            "Resource": "arn:aws:ec2:us-east-1::snapshot/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:ResourceTag/user-name": "${aws:username}"  
                }  
            }  
        }  
    ]  
}
```

Launch instances (RunInstances)

The `RunInstances` API action launches one or more On-Demand Instances or one or more Spot Instances. `RunInstances` requires an AMI and creates an instance. Users can specify a key pair and security group in the request. Launching into a VPC requires a subnet, and creates a network interface. Launching from an Amazon EBS-backed AMI creates a volume. Therefore, the user must have permissions to use these Amazon EC2 resources. You can create a policy statement that requires users to specify an optional parameter on `RunInstances`, or restricts users to particular values for a parameter.

For more information about the resource-level permissions that are required to launch an instance, see [Actions, resources, and condition keys for Amazon EC2](#).

By default, users don't have permissions to describe, start, stop, or terminate the resulting instances. One way to grant the users permission to manage the resulting instances is to create a specific tag for each instance, and then create a statement that enables them to manage instances with that tag. For more information, see [Work with instances \(p. 1252\)](#).

AMIs

The following policy allows users to launch instances using only the specified AMIs, `ami-9e1670f7` and `ami-45cf5c3c`. The users can't launch an instance using other AMIs (unless another statement grants the users permission to do so).

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": [  
                "arn:aws:ec2:region::image/ami-9e1670f7",  
                "arn:aws:ec2:region::image/ami-45cf5c3c",  
                "arn:aws:ec2:region:account-id:instance/*",  
                "arn:aws:ec2:region:account-id:volume/*",  
                "arn:aws:ec2:region:account-id:key-pair/*",  
                "arn:aws:ec2:region:account-id:security-group/*",  
                "arn:aws:ec2:region:account-id:subnet/*",  
                "arn:aws:ec2:region:account-id:network-interface/*"  
            ]  
        }  
    ]  
}
```

Alternatively, the following policy allows users to launch instances from all AMIs owned by Amazon. The Condition element of the first statement tests whether `ec2:Owner` is `amazon`. The users can't launch an instance using other AMIs (unless another statement grants the users permission to do so).

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": [  
                "arn:aws:ec2:region::image/ami-*"  
            ],  
            "Condition": {  
                "StringEquals": {  
                    "ec2:Owner": "amazon"  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": [  
                "arn:aws:ec2:region:account-id:instance/*",  
            ]  
        }  
    ]  
}
```

```
        "arn:aws:ec2:region:account-id:subnet/*",
        "arn:aws:ec2:region:account-id:volume/*",
        "arn:aws:ec2:region:account-id:network-interface/*",
        "arn:aws:ec2:region:account-id:key-pair/*",
        "arn:aws:ec2:region:account-id:security-group/*"
    ]
}
]
```

Instance types

The following policy allows users to launch instances using only the `t2.micro` or `t2.small` instance type, which you might do to control costs. The users can't launch larger instances because the `Condition` element of the first statement tests whether `ec2:InstanceType` is either `t2.micro` or `t2.small`.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": [
                "arn:aws:ec2:region:account-id:instance/*"
            ],
            "Condition": {
                "StringEquals": {
                    "ec2:InstanceType": ["t2.micro", "t2.small"]
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": [
                "arn:aws:ec2:region::image/ami-*",
                "arn:aws:ec2:region:account-id:subnet/*",
                "arn:aws:ec2:region:account-id:network-interface/*",
                "arn:aws:ec2:region:account-id:volume/*",
                "arn:aws:ec2:region:account-id:key-pair/*",
                "arn:aws:ec2:region:account-id:security-group/*"
            ]
        }
    ]
}
```

Alternatively, you can create a policy that denies users permissions to launch any instances except `t2.micro` and `t2.small` instance types.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Action": "ec2:RunInstances",
            "Resource": [
                "arn:aws:ec2:region:account-id:instance/*"
            ],
            "Condition": {
                "StringNotEquals": {
                    "ec2:InstanceType": ["t2.micro", "t2.small"]
                }
            }
        }
    ]
}
```

```

    },
    {
        "Effect": "Allow",
        "Action": "ec2:RunInstances",
        "Resource": [
            "arn:aws:ec2:region:image/ami-*",
            "arn:aws:ec2:region:account-id:network-interface/*",
            "arn:aws:ec2:region:account-id:instance/*",
            "arn:aws:ec2:region:account-id:subnet/*",
            "arn:aws:ec2:region:account-id:volume/*",
            "arn:aws:ec2:region:account-id:key-pair/*",
            "arn:aws:ec2:region:account-id:security-group/*"
        ]
    }
}

```

Subnets

The following policy allows users to launch instances using only the specified subnet, subnet-**12345678**. The group can't launch instances into any another subnet (unless another statement grants the users permission to do so).

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": [
                "arn:aws:ec2:region:account-id:subnet/subnet-12345678",
                "arn:aws:ec2:region:account-id:network-interface/*",
                "arn:aws:ec2:region:account-id:instance/*",
                "arn:aws:ec2:region:account-id:volume/*",
                "arn:aws:ec2:region:image/ami-*",
                "arn:aws:ec2:region:account-id:key-pair/*",
                "arn:aws:ec2:region:account-id:security-group/*"
            ]
        }
    ]
}

```

Alternatively, you could create a policy that denies users permissions to launch an instance into any other subnet. The statement does this by denying permission to create a network interface, except where subnet subnet-**12345678** is specified. This denial overrides any other policies that are created to allow launching instances into other subnets.

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Action": "ec2:RunInstances",
            "Resource": [
                "arn:aws:ec2:region:account-id:network-interface/*"
            ],
            "Condition": {
                "ArnNotEquals": {
                    "ec2:Subnet": "arn:aws:ec2:region:account-id:subnet/subnet-12345678"
                }
            }
        },
    ]
}

```

```
{  
    "Effect": "Allow",  
    "Action": "ec2:RunInstances",  
    "Resource": [  
        "arn:aws:ec2:region::image/ami-*",  
        "arn:aws:ec2:region:account-id:network-interface/*",  
        "arn:aws:ec2:region:account-id:instance/*",  
        "arn:aws:ec2:region:account-id:subnet/*",  
        "arn:aws:ec2:region:account-id:volume/*",  
        "arn:aws:ec2:region:account-id:key-pair/*",  
        "arn:aws:ec2:region:account-id:security-group/*"  
    ]  
}  
]  
}
```

EBS volumes

The following policy allows users to launch instances only if the EBS volumes for the instance are encrypted. The user must launch an instance from an AMI that was created with encrypted snapshots, to ensure that the root volume is encrypted. Any additional volume that the user attaches to the instance during launch must also be encrypted.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": [  
                "arn:aws:ec2::::volume/*"  
            ],  
            "Condition": {  
                "Bool": {  
                    "ec2:Encrypted": "true"  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": [  
                "arn:aws:ec2::::image/ami-*",  
                "arn:aws:ec2::::network-interface/*",  
                "arn:aws:ec2::::instance/*",  
                "arn:aws:ec2::::subnet/*",  
                "arn:aws:ec2::::key-pair/*",  
                "arn:aws:ec2::::security-group/*"  
            ]  
        }  
    ]  
}
```

Tags

Tag instances on creation

The following policy allows users to launch instances and tag the instances during creation. For resource-creating actions that apply tags, users must have permissions to use the `CreateTags` action. The second statement uses the `ec2:CreateAction` condition key to allow users to create tags only in the context of `RunInstances`, and only for instances. Users cannot tag existing resources, and users cannot tag volumes using the `RunInstances` request.

For more information, see [Grant permission to tag resources during creation \(p. 1248\)](#).

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateTags"  
            ],  
            "Resource": "arn:aws:ec2:us-east-1:account-id:instance/*",  
            "Condition": {  
                "StringEquals": {  
                    "ec2:CreateAction" : "RunInstances"  
                }  
            }  
        }  
    ]  
}
```

Tag instances and volumes on creation with specific tags

The following policy includes the `aws:RequestTag` condition key that requires users to tag any instances and volumes that are created by `RunInstances` with the tags `environment=production` and `purpose=webserver`. The `aws:TagKeys` condition key uses the `ForAllValues` modifier to indicate that only the keys `environment` and `purpose` are allowed in the request (no other tags can be specified). If no tags are specified in the request, the request fails.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": [  
                "arn:aws:ec2:region::image/*",  
                "arn:aws:ec2:region:account-id:subnet/*",  
                "arn:aws:ec2:region:account-id:network-interface/*",  
                "arn:aws:ec2:region:account-id:security-group/*",  
                "arn:aws:ec2:region:account-id:key-pair/*"  
            ]  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": [  
                "arn:aws:ec2:region:account-id:volume/*",  
                "arn:aws:ec2:region:account-id:instance/*"  
            ],  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/environment": "production" ,  
                    "aws:RequestTag/purpose": "webserver"  
                }  
            }  
        }  
    ]  
}
```

```

        "aws:RequestTag/purpose": "webserver"
    },
    "ForAllValues:StringEquals": {
        "aws:TagKeys": ["environment", "purpose"]
    }
}
{
    "Effect": "Allow",
    "Action": [
        "ec2:CreateTags"
    ],
    "Resource": "arn:aws:ec2:region:account-id:*/*",
    "Condition": {
        "StringEquals": {
            "ec2:CreateAction" : "RunInstances"
        }
    }
}
]
}

```

Tag instances and volumes on creation with at least one specific tag

The following policy uses the `ForAnyValue` modifier on the `aws:TagKeys` condition to indicate that at least one tag must be specified in the request, and it must contain the key `environment` or `webserver`. The tag must be applied to both instances and volumes. Any tag values can be specified in the request.

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": [
                "arn:aws:ec2:region::image/*",
                "arn:aws:ec2:region:account-id:subnet/*",
                "arn:aws:ec2:region:account-id:network-interface/*",
                "arn:aws:ec2:region:account-id:security-group/*",
                "arn:aws:ec2:region:account-id:key-pair/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": [
                "arn:aws:ec2:region:account-id:volume/*",
                "arn:aws:ec2:region:account-id:instance/*"
            ],
            "Condition": {
                "ForAnyValue:StringEquals": {
                    "aws:TagKeys": ["environment", "webserver"]
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:CreateTags"
            ],

```

```
        "Resource": "arn:aws:ec2:region:account-id:*//*",
        "Condition": {
            "StringEquals": {
                "ec2:CreateAction" : "RunInstances"
            }
        }
    ]
}
```

If instances are tagged on creation, they must be tagged with a specific tag

In the following policy, users do not have to specify tags in the request, but if they do, the tag must be `purpose=test`. No other tags are allowed. Users can apply the tags to any taggable resource in the `RunInstances` request.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:CreateTags"
            ],
            "Resource": "arn:aws:ec2:region:account-id:*//*",
            "Condition": {
                "StringEquals": {
                    "aws:RequestTag/purpose": "test",
                    "ec2:CreateAction" : "RunInstances"
                },
                "ForAllValues:StringEquals": {
                    "aws:TagKeys": "purpose"
                }
            }
        }
    ]
}
```

To disallow anyone called tag on create for RunInstances

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowRun",
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": [
                "arn:aws:ec2:us-east-1::image/*",
                "arn:aws:ec2:us-east-1::subnet/*",
                "arn:aws:ec2:us-east-1::network-interface/*",
                "arn:aws:ec2:us-east-1::security-group/*",
                "arn:aws:ec2:us-east-1::key-pair/*",

```

```

        "arn:aws:ec2:us-east-1::volume/*",
        "arn:aws:ec2:us-east-1::instance/*",
        "arn:aws:ec2:us-east-1::spot-instances-request/*"
    ],
},
{
    "Sid": "VisualEditor0",
    "Effect": "Deny",
    "Action": "ec2:CreateTags",
    "Resource": "*"
}
]
}

```

Only allow specific tags for spot-instances-request. Surprise inconsistency number 2 comes into play here. Under normal circumstances, specifying no tags will result in Unauthenticated. In the case of spot-instances-request, this policy will not be evaluated if there are no spot-instances-request tags, so a non-tag Spot on Run request will succeed.

```

                }
            }
        }
    ]
}

```

Tags in a launch template

In the following example, users can launch instances, but only if they use a specific launch template (`lt-09477bcd97b0d310e`). The `ec2:IsLaunchTemplateResource` condition key prevents users from overriding any of the resources specified in the launch template. The second part of the statement allows users to tag instances on creation—this part of the statement is necessary if tags are specified for the instance in the launch template.

```
{
    "Version": "2012-10-17",
```

```

"Statement": [
{
    "Effect": "Allow",
    "Action": "ec2:RunInstances",
    "Resource": "*",
    "Condition": {
        "ArnLike": {
            "ec2:LaunchTemplate": "arn:aws:ec2:region:account-id:launch-template/
lt-09477bcd97b0d310e"
        },
        "Bool": {
            "ec2:IsLaunchTemplateResource": "true"
        }
    }
},
{
    "Effect": "Allow",
    "Action": [
        "ec2>CreateTags"
    ],
    "Resource": "arn:aws:ec2:region:account-id:instance/*",
    "Condition": {
        "StringEquals": {
            "ec2>CreateAction" : "RunInstances"
        }
    }
}
]
}

```

Elastic GPUs

In the following policy, users can launch an instance and specify an elastic GPU to attach to the instance. Users can launch instances in any Region, but they can only attach an elastic GPU during a launch in the us-east-2 Region.

The `ec2:ElasticGpuType` condition key uses the `ForAnyValue` modifier to indicate that only the elastic GPU types `eg1.medium` and `eg1.large` are allowed in the request.

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": [
                "arn:aws:ec2:*:account-id:elastic-gpu/*"
            ],
            "Condition": {
                "StringEquals": {
                    "ec2:Region": "us-east-2"
                },
                "ForAnyValue:StringLike": {
                    "ec2:ElasticGpuType": [
                        "eg1.medium",
                        "eg1.large"
                    ]
                }
            }
        },
        {
            "Effect": "Allow",

```

```
        "Action": "ec2:RunInstances",
        "Resource": [
            "arn:aws:ec2::image/ami-*",
            "arn:aws:ec2::account-id:network-interface/*",
            "arn:aws:ec2::account-id:instance/*",
            "arn:aws:ec2::account-id:subnet/*",
            "arn:aws:ec2::account-id:volume/*",
            "arn:aws:ec2::account-id:key-pair/*",
            "arn:aws:ec2::account-id:security-group/*"
        ]
    }
]
```

Launch templates

In the following example, users can launch instances, but only if they use a specific launch template (lt-09477bcd97b0d310e). Users can override any parameters in the launch template by specifying the parameters in the RunInstances action.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": "*",
            "Condition": {
                "ArnLike": {
                    "ec2:LaunchTemplate": "arn:aws:ec2:region:account-id:launch-template/
lt-09477bcd97b0d310e"
                }
            }
        }
    ]
}
```

In this example, users can launch instances only if they use a launch template. The policy uses the ec2:IsLaunchTemplateResource condition key to prevent users from overriding any pre-existing ARNs in the launch template.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": "*",
            "Condition": {
                "ArnLike": {
                    "ec2:LaunchTemplate": "arn:aws:ec2:region:account-id:launch-template/*"
                },
                "Bool": {
                    "ec2:IsLaunchTemplateResource": "true"
                }
            }
        }
    ]
}
```

The following example policy allows user to launch instances, but only if they use a launch template. Users cannot override the subnet and network interface parameters in the request; these parameters

can only be specified in the launch template. The first part of the statement uses the [NotResource](#) element to allow all other resources except subnets and network interfaces. The second part of the statement allows the subnet and network interface resources, but only if they are sourced from the launch template.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "NotResource": ["arn:aws:ec2:region:account-id:subnet/*",
                           "arn:aws:ec2:region:account-id:network-interface/*"],
            "Condition": {
                "ArnLike": {
                    "ec2:LaunchTemplate": "arn:aws:ec2:region:account-id:launch-template/*"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": ["arn:aws:ec2:region:account-id:subnet/*",
                         "arn:aws:ec2:region:account-id:network-interface/*"],
            "Condition": {
                "ArnLike": {
                    "ec2:LaunchTemplate": "arn:aws:ec2:region:account-id:launch-template/*"
                },
                "Bool": {
                    "ec2:IsLaunchTemplateResource": "true"
                }
            }
        }
    ]
}
```

The following example allows users to launch instances only if they use a launch template, and only if the launch template has the tag `Purpose=Webservers`. Users cannot override any of the launch template parameters in the `RunInstances` action.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "NotResource": "arn:aws:ec2:region:account-id:launch-template/*",
            "Condition": {
                "ArnLike": {
                    "ec2:LaunchTemplate": "arn:aws:ec2:region:account-id:launch-template/*"
                },
                "Bool": {
                    "ec2:IsLaunchTemplateResource": "true"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": "arn:aws:ec2:region:account-id:launch-template/*",
            "Condition": {
                "StringEquals": {
                    "aws:ResourceTag/Purpose": "Webservers"
                }
            }
        }
    ]
}
```

```
        }
    }
}
```

Work with Spot Instances

You can use the RunInstances action to create Spot Instance requests, and tag the Spot Instance requests on create. The resource to specify for RunInstances is spot-instances-request.

The spot-instances-request resource is evaluated in the IAM policy as follows:

- If you don't tag a Spot Instance request on create, Amazon EC2 does not evaluate the spot-instances-request resource in the RunInstances statement.
- If you tag a Spot Instance request on create, Amazon EC2 evaluates the spot-instances-request resource in the RunInstances statement.

Therefore, for the spot-instances-request resource, the following rules apply to the IAM policy:

- If you use RunInstances to create a Spot Instance request and you don't intend to tag the Spot Instance request on create, you don't need to explicitly allow the spot-instances-request resource; the call will succeed.
- If you use RunInstances to create a Spot Instance request and intend to tag the Spot Instance request on create, you must include the spot-instances-request resource in the RunInstances allow statement, otherwise the call will fail.
- If you use RunInstances to create a Spot Instance request and intend to tag the Spot Instance request on create, you must specify the spot-instances-request resource or * wildcard in the CreateTags allow statement, otherwise the call will fail.

You can request Spot Instances using RunInstances or RequestSpotInstances. The following example IAM policies apply only when requesting Spot Instances using RunInstances.

Example: Request Spot Instances using RunInstances

The following policy allows users to request Spot Instances by using the RunInstances action. The spot-instances-request resource, which is created by RunInstances, requests Spot Instances.

Note

To use RunInstances to create Spot Instance requests, you can omit spot-instances-request from the Resource list if you do not intend to tag the Spot Instance requests on create. This is because Amazon EC2 does not evaluate the spot-instances-request resource in the RunInstances statement if the Spot Instance request is not tagged on create.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowRun",
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": [
                "arn:aws:ec2:us-east-1::image/*",
                "arn:aws:ec2:us-east-1::subnet/*",
                "arn:aws:ec2:us-east-1::network-interface/*",
                "arn:aws:ec2:us-east-1::security-group/*",
                "arn:aws:ec2:us-east-1::key-pair/*",
                "arn:aws:ec2:us-east-1::volume/*"
            ]
        }
    ]
}
```

```
        "arn:aws:ec2:us-east-1::volume/*",
        "arn:aws:ec2:us-east-1::instance/*",
        "arn:aws:ec2:us-east-1::spot-instances-request/*"
    ]
}
}
```

Warning

NOT SUPPORTED – Example: Deny users permission to request Spot Instances using RunInstances

The following policy is not supported for the spot-instances-request resource. The following policy is meant to give users the permission to launch On-Demand Instances, but deny users the permission to request Spot Instances. The spot-instances-request resource, which is created by RunInstances, is the resource that requests Spot Instances. The second statement is meant to deny the RunInstances action for the spot-instances-request resource. However, this condition is not supported because Amazon EC2 does not evaluate the spot-instances-request resource in the RunInstances statement if the Spot Instance request is not tagged on create.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowRun",
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": [
                "arn:aws:ec2:us-east-1::image/*",
                "arn:aws:ec2:us-east-1::subnet/*",
                "arn:aws:ec2:us-east-1::network-interface/*",
                "arn:aws:ec2:us-east-1::security-group/*",
                "arn:aws:ec2:us-east-1::key-pair/*",
                "arn:aws:ec2:us-east-1::volume/*",
                "arn:aws:ec2:us-east-1::instance/*"
            ]
        },
        {
            "Sid": "DenySpotInstancesRequests - NOT SUPPORTED - DO NOT USE!",
            "Effect": "Deny",
            "Action": "ec2:RunInstances",
            "Resource": "arn:aws:ec2:us-east-1::spot-instances-request/*"
        }
    ]
}
```

Example: Tag Spot Instance requests on create

The following policy allows users to tag all resources that are created during instance launch. The first statement allows RunInstances to create the listed resources. The spot-instances-request resource, which is created by RunInstances, is the resource that requests Spot Instances. The second statement provides a * wildcard to allow all resources to be tagged when they are created at instance launch.

Note

If you tag a Spot Instance request on create, Amazon EC2 evaluates the spot-instances-request resource in the RunInstances statement. Therefore, you must explicitly allow the spot-instances-request resource for the RunInstances action, otherwise the call will fail.

```
{
    "Version": "2012-10-17",
```

```

"Statement": [
    {
        "Sid": "AllowRun",
        "Effect": "Allow",
        "Action": [
            "ec2:RunInstances"
        ],
        "Resource": [
            "arn:aws:ec2:us-east-1::image/*",
            "arn:aws:ec2:us-east-1::subnet/*",
            "arn:aws:ec2:us-east-1::network-interface/*",
            "arn:aws:ec2:us-east-1::security-group/*",
            "arn:aws:ec2:us-east-1::key-pair/*",
            "arn:aws:ec2:us-east-1::volume/*",
            "arn:aws:ec2:us-east-1::instance/*",
            "arn:aws:ec2:us-east-1::spot-instances-request/*"
        ]
    },
    {
        "Sid": "TagResources",
        "Effect": "Allow",
        "Action": "ec2:CreateTags",
        "Resource": "*"
    }
]
}

```

Example: Deny tag on create for Spot Instance requests

The following policy denies users the permission to tag the resources that are created during instance launch.

The first statement allows RunInstances to create the listed resources. The `spot-instances-request` resource, which is created by RunInstances, is the resource that requests Spot Instances. The second statement provides a `*` wildcard to deny all resources being tagged when they are created at instance launch. If `spot-instances-request` or any other resource is tagged on create, the RunInstances call will fail.

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowRun",
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances"
            ],
            "Resource": [
                "arn:aws:ec2:us-east-1::image/*",
                "arn:aws:ec2:us-east-1::subnet/*",
                "arn:aws:ec2:us-east-1::network-interface/*",
                "arn:aws:ec2:us-east-1::security-group/*",
                "arn:aws:ec2:us-east-1::key-pair/*",
                "arn:aws:ec2:us-east-1::volume/*",
                "arn:aws:ec2:us-east-1::instance/*",
                "arn:aws:ec2:us-east-1::spot-instances-request/*"
            ]
        },
        {
            "Sid": "DenyTagResources",
            "Effect": "Deny",
            "Action": "ec2:CreateTags",
            "Resource": "*"
        }
    ]
}

```

```
    ]  
}
```

Warning

NOT SUPPORTED – Example: Allow creating a Spot Instance request only if it is assigned a specific tag

The following policy is not supported for the spot-instances-request resource.

The following policy is meant to grant RunInstances the permission to create a Spot Instance request only if the request is tagged with a specific tag.

The first statement allows RunInstances to create the listed resources.

The second statement is meant to grant users the permission to create a Spot Instance request only if the request has the tag environment=production. If this condition is applied to other resources created by RunInstances, specifying no tags results in an Unauthenticated error.

However, if no tags are specified for the Spot Instance request, Amazon EC2 does not evaluate the spot-instances-request resource in the RunInstances statement, which results in non-tagged Spot Instance requests being created by RunInstances.

Note that specifying another tag other than environment=production results in an Unauthenticated error, because if a user tags a Spot Instance request, Amazon EC2 evaluates the spot-instances-request resource in the RunInstances statement.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "AllowRun",  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": [  
                "arn:aws:ec2:us-east-1::image/*",  
                "arn:aws:ec2:us-east-1::subnet/*",  
                "arn:aws:ec2:us-east-1::network-interface/*",  
                "arn:aws:ec2:us-east-1::security-group/*",  
                "arn:aws:ec2:us-east-1::key-pair/*",  
                "arn:aws:ec2:us-east-1::volume/*",  
                "arn:aws:ec2:us-east-1::instance/*"  
            ]  
        },  
        {  
            "Sid": "RequestSpotInstancesOnlyIfTagIs_environment=production - NOT  
SUPPORTED - DO NOT USE!",  
            "Effect": "Allow",  
            "Action": "ec2:RunInstances",  
            "Resource": "arn:aws:ec2:us-east-1::spot-instances-request/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/environment": "production"  
                }  
            }  
        },  
        {  
            "Sid": "TagResources",  
            "Effect": "Allow",  
            "Action": "ec2:CreateTags",  
            "Resource": "*"  
        }  
    ]  
}
```

Example: Deny creating a Spot Instance request if it is assigned a specific tag

The following policy denies RunInstances the permission to create a Spot Instance request if the request is tagged with environment=production.

The first statement allows RunInstances to create the listed resources.

The second statement denies users the permission to create a Spot Instance request if the request has the tag environment=production. Specifying environment=production as a tag results in an Unauthenticated error. Specifying other tags or specifying no tags will result in the creation of a Spot Instance request.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "AllowRun",  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances"  
            ],  
            "Resource": [  
                "arn:aws:ec2:us-east-1::image/*",  
                "arn:aws:ec2:us-east-1::subnet/*",  
                "arn:aws:ec2:us-east-1::network-interface/*",  
                "arn:aws:ec2:us-east-1::security-group/*",  
                "arn:aws:ec2:us-east-1::key-pair/*",  
                "arn:aws:ec2:us-east-1::volume/*",  
                "arn:aws:ec2:us-east-1::instance/*",  
                "arn:aws:ec2:us-east-1::spot-instances-request/*"  
            ]  
        },  
        {  
            "Sid": "DenySpotInstancesRequests",  
            "Effect": "Deny",  
            "Action": "ec2:RunInstances",  
            "Resource": "arn:aws:ec2:us-east-1::spot-instances-request/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/environment": "production"  
                }  
            }  
        },  
        {  
            "Sid": "TagResources",  
            "Effect": "Allow",  
            "Action": "ec2:CreateTags",  
            "Resource": "*"  
        }  
    ]  
}
```

Example: Work with Reserved Instances

The following policy gives users permission to view, modify, and purchase Reserved Instances in your account.

It is not possible to set resource-level permissions for individual Reserved Instances. This policy means that users have access to all the Reserved Instances in the account.

The Resource element uses a * wildcard to indicate that users can specify all resources with the action; in this case, they can list and modify all Reserved Instances in the account. They can also purchase Reserved Instances using the account credentials. The * wildcard is also necessary in cases where the API action does not support resource-level permissions.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DescribeReservedInstances",  
                "ec2:ModifyReservedInstances",  
                "ec2:PurchaseReservedInstancesOffering",  
                "ec2:DescribeAvailabilityZones",  
                "ec2:DescribeReservedInstancesOfferings"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

To allow users to view and modify the Reserved Instances in your account, but not purchase new Reserved Instances.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DescribeReservedInstances",  
                "ec2:ModifyReservedInstances",  
                "ec2:DescribeAvailabilityZones"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

Example: Tag resources

The following policy allows users to use the `CreateTags` action to apply tags to an instance only if the tag contains the key `environment` and the value `production`. The `ForAllValues` modifier is used with the `aws:TagKeys` condition key to indicate that only the key `environment` is allowed in the request (no other tags are allowed). The user cannot tag any other resource types.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateTags"  
            ],  
            "Resource": "arn:aws:ec2:region:account-id:instance/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:RequestTag/environment": "production"  
                },  
                "ForAllValues:StringEquals": {  
                    "aws:TagKeys": [  
                        "environment"  
                    ]  
                }  
            }  
        }  
    ]  
}
```

```
        }
    ]  
}
```

The following policy allows users to tag any taggable resource that already has a tag with a key of `owner` and a value of the IAM username. In addition, users must specify a tag with a key of `anycompany:environment-type` and a value of either `test` or `prod` in the request. Users can specify additional tags in the request.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ec2:CreateTags"
      ],
      "Resource": "arn:aws:ec2:region:account-id:/*/*",
      "Condition": {
        "StringEquals": {
          "aws:RequestTag/anycompany:environment-type": ["test", "prod"],
          "aws:ResourceTag/owner": "${aws:username}"
        }
      }
    ]
  }
}
```

You can create an IAM policy that allows users to delete specific tags for a resource. For example, the following policy allows users to delete tags for a volume if the tag keys specified in the request are `environment` or `cost-center`. Any value can be specified for the tag but the tag key must match either of the specified keys.

Note

If you delete a resource, all tags associated with the resource are also deleted. Users do not need permissions to use the `ec2:DeleteTags` action to delete a resource that has tags; they only need permissions to perform the deleting action.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "ec2:DeleteTags",
      "Resource": "arn:aws:ec2:us-east-1:account-id:volume/*",
      "Condition": {
        "ForAllValues:StringEquals": {
          "aws:TagKeys": ["environment", "cost-center"]
        }
      }
    }
  ]
}
```

This policy allows users to delete only the `environment=prod` tag on any resource, and only if the resource is already tagged with a key of `owner` and a value of the IAM username. Users cannot delete any other tags for a resource.

```
{
  "Version": "2012-10-17",
  "Statement": [
```

```
{  
    "Effect": "Allow",  
    "Action": [  
        "ec2:DeleteTags"  
    ],  
    "Resource": "arn:aws:ec2:region:account-id:*/*",  
    "Condition": {  
        "StringEquals": {  
            "aws:RequestTag/environment": "prod",  
            "aws:ResourceTag/owner": "${aws:username}"  
        },  
        "ForAllValues:StringEquals": {  
            "aws:TagKeys": ["environment"]  
        }  
    }  
}
```

Example: Work with IAM roles

The following policy allows users to attach, replace, and detach an IAM role to instances that have the tag `department=test`. Replacing or detaching an IAM role requires an association ID, therefore the policy also grants users permission to use the `ec2:DescribeIamInstanceProfileAssociations` action.

IAM users must have permission to use the `iam:PassRole` action in order to pass the role to the instance.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:AssociateIamInstanceProfile",  
                "ec2:ReplaceIamInstanceProfileAssociation",  
                "ec2:DisassociateIamInstanceProfile"  
            ],  
            "Resource": "arn:aws:ec2:us-east-1:account-id:instance/*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:ResourceTag/department": "test"  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:DescribeIamInstanceProfileAssociations",  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": "iam:PassRole",  
            "Resource": "arn:aws:iam::account-id:role/DevTeam*"  
        }  
    ]  
}
```

The following policy allows users to attach or replace an IAM role for any instance. Users can only attach or replace IAM roles with names that begin with `TestRole-`. For the `iam:PassRole` action, ensure that you specify the name of the IAM role and not the instance profile (if the names are different). For more information, see [Instance profiles \(p. 1298\)](#).

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:AssociateIamInstanceProfile",  
                "ec2:ReplaceIamInstanceProfileAssociation"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2:DescribeIamInstanceProfileAssociations",  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": "iam:PassRole",  
            "Resource": "arn:aws:iam::account-id:role/TestRole-*"  
        }  
    ]  
}
```

Example: Work with route tables

The following policy allows users to add, remove, and replace routes for route tables that are associated with VPC `vpc-ec43eb89` only. To specify a VPC for the `ec2:Vpc` condition key, you must specify the full ARN of the VPC.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DeleteRoute",  
                "ec2>CreateRoute",  
                "ec2:ReplaceRoute"  
            ],  
            "Resource": [  
                "arn:aws:ec2:region:account-id:route-table/*"  
            ],  
            "Condition": {  
                "StringEquals": {  
                    "ec2:Vpc": "arn:aws:ec2:region:account-id:vpc/vpc-ec43eb89"  
                }  
            }  
        }  
    ]  
}
```

Example: Allow a specific instance to view resources in other AWS services

The following is an example of a policy that you might attach to an IAM role. The policy allows an instance to view resources in various AWS services. It uses the `ec2:SourceInstanceARN` condition key to specify that the instance from which the request is made must be instance `i-093452212644b0dd6`. If the same IAM role is associated with another instance, the other instance cannot perform any of these actions.

The `ec2:SourceInstanceARN` key is an AWS-wide condition key, therefore it can be used for other service actions, not just Amazon EC2.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeVolumes",
                "s3>ListAllMyBuckets",
                "dynamodb>ListTables",
                "rds:DescribeDBInstances"
            ],
            "Resource": [
                "*"
            ],
            "Condition": {
                "ArnEquals": {
                    "ec2:SourceInstanceARN": "arn:aws:ec2:region:account-id:instance/i-093452212644b0dd6"
                }
            }
        ]
    }
}
```

Example: Work with launch templates

The following policy allows users to create a launch template version and modify a launch template, but only for a specific launch template (**lt-09477bcd97b0d3abc**). Users cannot work with other launch templates.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Action": [
                "ec2>CreateLaunchTemplateVersion",
                "ec2:ModifyLaunchTemplate"
            ],
            "Effect": "Allow",
            "Resource": "arn:aws:ec2:region:account-id:launch-template/lt-09477bcd97b0d3abc"
        }
    ]
}
```

The following policy allows users to delete any launch template and launch template version, provided that the launch template has the tag **Purpose=Testing**.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Action": [
                "ec2>DeleteLaunchTemplate",
                "ec2>DeleteLaunchTemplateVersions"
            ],
            "Effect": "Allow",
            "Resource": "arn:aws:ec2:region:account-id:launch-template/*",
            "Condition": {
                "StringEquals": {
                    "aws:ResourceTag/Purpose": "Testing"
                }
            }
        }
    ]
}
```

```
}
```

Work with instance metadata

The following policies ensure that users can only retrieve [instance metadata \(p. 726\)](#) using Instance Metadata Service Version 2 (IMDSv2). You can combine the following four policies into one policy with four statements. When combined as one policy, you can use the policy as a service control policy (SCP). It can work equally well as a *deny* policy that you apply to an existing IAM policy (taking away and limiting existing permission), or as an SCP that is applied globally across an account, an organizational unit (OU), or an entire organization.

Note

The following RunInstances metadata options policies must be used in conjunction with a policy that gives the principal permissions to launch an instance with RunInstances. If the principal does not also have RunInstances permissions, it will not be able to launch an instance. For more information, see the policies in [Work with instances \(p. 1252\)](#) and [Launch instances \(RunInstances\) \(p. 1263\)](#).

Important

If you use Auto Scaling groups and you need to require the use of IMDSv2 on all new instances, your Auto Scaling groups must use *launch templates*.

When an Auto Scaling group uses a launch template, the `ec2:RunInstances` permissions of the IAM principal are checked when a new Auto Scaling group is created. They are also checked when an existing Auto Scaling group is updated to use a new launch template or a new version of a launch template.

Restrictions on the use of IMDSv1 on IAM principals for RunInstances are only checked when an Auto Scaling group that is using a launch template, is created or updated. For an Auto Scaling group that is configured to use the `Latest` or `Default` launch template, the permissions are not checked when a new version of the launch template is created. For permissions to be checked, you must configure the Auto Scaling group to use a *specific version* of the launch template.

To enforce the use of IMDSv2 on instances launched by Auto Scaling groups, the following additional steps are required:

1. Disable the use of launch configurations for all accounts in your organization by using either service control policies (SCPs) or IAM permissions boundaries for new principals that are created. For existing IAM principals with Auto Scaling group permissions, update their associated policies with this condition key. To disable the use of launch configurations, create or modify the relevant SCP, permissions boundary, or IAM policy with the "autoscaling:LaunchConfigurationName" condition key with the value specified as null.
2. For new launch templates, configure the instance metadata options in the launch template. For existing launch templates, create a new version of the launch template and configure the instance metadata options in the new version.
3. In the policy that gives any principal the permission to use a launch template, restrict association of `$latest` and `$default` by specifying `"autoscaling:LaunchTemplateVersionSpecified": "true"`. By restricting the use to a specific version of a launch template, you can ensure that new instances will be launched using the version in which the instance metadata options are configured. For more information, see [LaunchTemplateSpecification](#) in the [Amazon EC2 Auto Scaling API Reference](#), specifically the `Version` parameter.
4. For an Auto Scaling group that uses a launch configuration, replace the launch configuration with a launch template. For more information, see [Replacing a Launch Configuration with a Launch Template](#) in the [Amazon EC2 Auto Scaling User Guide](#).

5. For an Auto Scaling group that uses a launch template, make sure that it uses a new launch template with the instance metadata options configured, or uses a new version of the current launch template with the instance metadata options configured. For more information, see [update-auto-scaling-group](#) in the *AWS CLI Command Reference*.

Examples

- [Require the use of IMDSv2 \(p. 1286\)](#)
- [Specify maximum hop limit \(p. 1286\)](#)
- [Limit who can modify the instance metadata options \(p. 1287\)](#)
- [Require role credentials to be retrieved from IMDSv2 \(p. 1287\)](#)

Require the use of IMDSv2

The following policy specifies that you can't call the RunInstances API unless the instance is also opted in to require the use of IMDSv2 (indicated by "ec2:MetadataHttpTokens": "required"). If you do not specify that the instance requires IMDSv2, you get an `UnauthorizedOperation` error when you call the RunInstances API.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "RequireImdsV2",  
            "Effect": "Deny",  
            "Action": "ec2:RunInstances",  
            "Resource": "arn:aws:ec2:*:instance/*",  
            "Condition": {  
                "StringNotEquals": {  
                    "ec2:MetadataHttpTokens": "required"  
                }  
            }  
        }  
    ]  
}
```

Specify maximum hop limit

The following policy specifies that you can't call the RunInstances API unless you also specify a hop limit, and the hop limit can't be more than 3. If you fail to do that, you get an `UnauthorizedOperation` error when you call the RunInstances API.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "MaxImdsHopLimit",  
            "Effect": "Deny",  
            "Action": "ec2:RunInstances",  
            "Resource": "arn:aws:ec2:*:instance/*",  
            "Condition": {  
                "NumericGreaterThanOrEqual": {  
                    "ec2:MetadataHttpPutResponseHopLimit": "3"  
                }  
            }  
        }  
    ]  
}
```

Limit who can modify the instance metadata options

The following policy removes the ability for the general population of administrators to modify instance metadata options, and permits only users with the role `ec2-imds-admins` to make changes. If any principal other than the `ec2-imds-admins` role tries to call the `ModifyInstanceMetadataOptions` API, it will get an `UnauthorizedOperation` error. This statement could be used to control the use of the `ModifyInstanceMetadataOptions` API; there are currently no fine-grained access controls (conditions) for the `ModifyInstanceMetadataOptions` API.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "AllowOnlyImdsAdminsToModifySettings",  
            "Effect": "Deny",  
            "Action": "ec2:ModifyInstanceMetadataOptions",  
            "Resource": "*",  
            "Condition": {  
                "StringNotLike": {  
                    "aws:PrincipalARN": "arn:aws:iam::*:role/ec2-imds-admins"  
                }  
            }  
        }  
    ]  
}
```

Require role credentials to be retrieved from IMDSv2

The following policy specifies that if this policy is applied to a role, and the role is assumed by the EC2 service and the resulting credentials are used to sign a request, then the request must be signed by EC2 role credentials retrieved from IMDSv2. Otherwise, all of its API calls will get an `UnauthorizedOperation` error. This statement/policy can be applied generally because, if the request is not signed by EC2 role credentials, it has no effect.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "RequireAllEc2RolesToUseV2",  
            "Effect": "Deny",  
            "Action": "*",  
            "Resource": "*",  
            "Condition": {  
                "NumericLessThan": {  
                    "ec2:RoleDelivery": "2.0"  
                }  
            }  
        }  
    ]  
}
```

Example policies for working in the Amazon EC2 console

You can use IAM policies to grant users permissions to view and work with specific resources in the Amazon EC2 console. You can use the example policies in the previous section; however, they are designed for requests that are made with the AWS CLI or an AWS SDK. The console uses additional API actions for its features, so these policies may not work as expected. For example, a user that has permission to use only the `DescribeVolumes` API action will encounter errors when trying to view volumes in the console. This section demonstrates policies that enable users to work with specific parts of the console.

Tip

To help you work out which API actions are required to perform tasks in the console, you can use a service such as AWS CloudTrail. For more information, see the [AWS CloudTrail User Guide](#). If your policy does not grant permission to create or modify a specific resource, the console displays an encoded message with diagnostic information. You can decode the message using the [DecodeAuthorizationMessage](#) API action for AWS STS, or the [decode-authorization-message](#) command in the AWS CLI.

Examples

- [Example: Read-only access \(p. 1288\)](#)
- [Example: Use the EC2 launch wizard \(p. 1289\)](#)
- [Example: Work with volumes \(p. 1292\)](#)
- [Example: Work with security groups \(p. 1293\)](#)
- [Example: Work with Elastic IP addresses \(p. 1295\)](#)
- [Example: Work with Reserved Instances \(p. 1295\)](#)

For additional information about creating policies for the Amazon EC2 console, see the following AWS Security Blog post: [Granting Users Permission to Work in the Amazon EC2 Console](#).

Example: Read-only access

To allow users to view all resources in the Amazon EC2 console, you can use the same policy as the following example: [Example: Read-only access \(p. 1251\)](#). Users cannot perform any actions on those resources or create new resources, unless another statement grants them permission to do so.

View instances, AMIs, and snapshots

Alternatively, you can provide read-only access to a subset of resources. To do this, replace the * wildcard in the `ec2:Describe` API action with specific `ec2:Describe` actions for each resource. The following policy allows users to view all instances, AMIs, and snapshots in the Amazon EC2 console. The `ec2:DescribeTags` action allows users to view public AMIs. The console requires the tagging information to display public AMIs; however, you can remove this action to allow users to view only private AMIs.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DescribeInstances",  
                "ec2:DescribeImages",  
                "ec2:DescribeTags",  
                "ec2:DescribeSnapshots"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

Note

The Amazon EC2 `ec2:Describe*` API actions do not support resource-level permissions, so you cannot control which individual resources users can view in the console. Therefore, the * wildcard is necessary in the Resource element of the above statement. For more information about which ARNs you can use with which Amazon EC2 API actions, see [Actions, resources, and condition keys for Amazon EC2](#).

View instances and CloudWatch metrics

The following policy allows users to view instances in the Amazon EC2 console, as well as CloudWatch alarms and metrics in the **Monitoring** tab of the **Instances** page. The Amazon EC2 console uses the CloudWatch API to display the alarms and metrics, so you must grant users permission to use the `cloudwatch:DescribeAlarms` and `cloudwatch:GetMetricStatistics` actions.

```
{  
    "Version": "2012-10-17",  
    "Statement": [{  
        "Effect": "Allow",  
        "Action": [  
            "ec2:DescribeInstances",  
            "cloudwatch:DescribeAlarms",  
            "cloudwatch:GetMetricStatistics"  
        ],  
        "Resource": "*"  
    }]  
}
```

Example: Use the EC2 launch wizard

The Amazon EC2 launch wizard is a series of screens with options to configure and launch an instance. Your policy must include permission to use the API actions that allow users to work with the wizard's options. If your policy does not include permission to use those actions, some items in the wizard cannot load properly, and users cannot complete a launch.

Basic launch wizard access

To complete a launch successfully, users must be given permission to use the `ec2:RunInstances` API action, and at least the following API actions:

- `ec2:DescribeImages`: To view and select an AMI.
- `ec2:DescribeInstanceTypes`: To view and select an instance type.
- `ec2:DescribeVpcs`: To view the available network options.
- `ec2:DescribeSubnets`: To view all available subnets for the chosen VPC.
- `ec2:DescribeSecurityGroups` or `ec2>CreateSecurityGroup`: To view and select an existing security group, or to create a new one.
- `ec2:DescribeKeyPairs` or `ec2>CreateKeyPair`: To select an existing key pair, or to create a new one.
- `ec2:AuthorizeSecurityGroupIngress`: To add inbound rules.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DescribeInstances",  
                "ec2:DescribeImages",  
                "ec2:DescribeInstanceTypes",  
                "ec2:DescribeKeyPairs",  
                "ec2:DescribeVpcs",  
                "ec2:DescribeSubnets",  
                "ec2:DescribeSecurityGroups",  
                "ec2:CreateSecurityGroup",  
                "ec2:AuthorizeSecurityGroupIngress",  
                "ec2>CreateKeyPair"  
            ],  
            "Resource": "*"  
        }]  
}
```

```
        "Resource": "*"
    },
{
    "Effect": "Allow",
    "Action": "ec2:RunInstances",
    "Resource": "*"
}
]
```

You can add API actions to your policy to provide more options for users, for example:

- `ec2:DescribeAvailabilityZones`: To view and select a specific Availability Zone.
- `ec2:DescribeNetworkInterfaces`: To view and select existing network interfaces for the selected subnet.
- To add outbound rules to VPC security groups, users must be granted permission to use the `ec2:AuthorizeSecurityGroupEgress` API action. To modify or delete existing rules, users must be granted permission to use the relevant `ec2:RevokeSecurityGroup*` API action.
- `ec2:CreateTags`: To tag the resources that are created by `RunInstances`. For more information, see [Grant permission to tag resources during creation \(p. 1248\)](#). If users do not have permission to use this action and they attempt to apply tags on the tagging page of the launch wizard, the launch fails.

Important

Be careful about granting users permission to use the `ec2:CreateTags` action, because doing so limits your ability to use the `aws:ResourceTag` condition key to restrict their use of other resources. If you grant users permission to use the `ec2:CreateTags` action, they can change a resource's tag in order to bypass those restrictions. For more information, see [Control access to EC2 resources using resource tags \(p. 1250\)](#).

- To use Systems Manager parameters when selecting an AMI, you must add `ssm:DescribeParameters` and `ssm:GetParameters` to your policy. `ssm:DescribeParameters` grants your IAM users the permission to view and select Systems Manager parameters. `ssm:GetParameters` grants your IAM users the permission to get the values of the Systems Manager parameters. You can also restrict access to specific Systems Manager parameters. For more information, see [Restrict access to specific Systems Manager parameters](#) later in this section.

Currently, the Amazon EC2 `Describe*` API actions do not support resource-level permissions, so you cannot restrict which individual resources users can view in the launch wizard. However, you can apply resource-level permissions on the `ec2:RunInstances` API action to restrict which resources users can use to launch an instance. The launch fails if users select options that they are not authorized to use.

Restrict access to a specific instance type, subnet, and Region

The following policy allows users to launch `t2.micro` instances using AMIs owned by Amazon, and only into a specific subnet (`subnet-1a2b3c4d`). Users can only launch in the `sa-east-1` Region. If users select a different Region, or select a different instance type, AMI, or subnet in the launch wizard, the launch fails.

The first statement grants users permission to view the options in the launch wizard or to create new ones, as explained in the example above. The second statement grants users permission to use the network interface, volume, key pair, security group, and subnet resources for the `ec2:RunInstances` action, which are required to launch an instance into a VPC. For more information about using the `ec2:RunInstances` action, see [Launch instances \(RunInstances\) \(p. 1263\)](#). The third and fourth statements grant users permission to use the instance and AMI resources respectively, but only if the instance is a `t2.micro` instance, and only if the AMI is owned by Amazon.

```
{
    "Version": "2012-10-17",
    "Statement": [{

```

```

    "Effect": "Allow",
    "Action": [
        "ec2:DescribeInstances",
        "ec2:DescribeImages",
        "ec2:DescribeInstanceTypes",
        "ec2:DescribeKeyPairs",
        "ec2:CreateKeyPair",
        "ec2:DescribeVpcs",
        "ec2:DescribeSubnets",
        "ec2:DescribeSecurityGroups",
        "ec2:CreateSecurityGroup",
        "ec2:AuthorizeSecurityGroupIngress"
    ],
    "Resource": "*"
},
{
    "Effect": "Allow",
    "Action": "ec2:RunInstances",
    "Resource": [
        "arn:aws:ec2:sa-east-1:111122223333:network-interface/*",
        "arn:aws:ec2:sa-east-1:111122223333:volume/*",
        "arn:aws:ec2:sa-east-1:111122223333:key-pair/*",
        "arn:aws:ec2:sa-east-1:111122223333:security-group/*",
        "arn:aws:ec2:sa-east-1:111122223333:subnet/subnet-1a2b3c4d"
    ]
},
{
    "Effect": "Allow",
    "Action": "ec2:RunInstances",
    "Resource": [
        "arn:aws:ec2:sa-east-1:111122223333:instance/*"
    ],
    "Condition": {
        "StringEquals": {
            "ec2:InstanceType": "t2.micro"
        }
    }
},
{
    "Effect": "Allow",
    "Action": "ec2:RunInstances",
    "Resource": [
        "arn:aws:ec2:sa-east-1::image/ami-*"
    ],
    "Condition": {
        "StringEquals": {
            "ec2:Owner": "amazon"
        }
    }
}
]
}

```

Restrict access to specific Systems Manager parameters

The following policy grants access to use Systems Manager parameters with a specific name.

The first statement grants users the permission to view Systems Manager parameters when selecting an AMI in the launch wizard. The second statement grants users the permission to only use parameters that are named `prod-*`.

```
{
    "Version": "2012-10-17",
    "Statement": [{
```

```
    "Effect": "Allow",
    "Action": [
        "ssm:DescribeParameters"
    ],
    "Resource": "*"
},
{
    "Effect": "Allow",
    "Action": [
        "ssm:GetParameters"
    ],
    "Resource": "arn:aws:ssm:us-east-2:123456123:parameter/prod-*"
}
]
```

Example: Work with volumes

The following policy grants users permission to view and create volumes, and attach and detach volumes to specific instances.

Users can attach any volume to instances that have the tag "purpose=test", and also detach volumes from those instances. To attach a volume using the Amazon EC2 console, it is helpful for users to have permission to use the ec2:DescribeInstances action, as this allows them to select an instance from a pre-populated list in the **Attach Volume** dialog box. However, this also allows users to view all instances on the **Instances** page in the console, so you can omit this action.

In the first statement, the ec2:DescribeAvailabilityZones action is necessary to ensure that a user can select an Availability Zone when creating a volume.

Users cannot tag the volumes that they create (either during or after volume creation).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeVolumes",
                "ec2:DescribeAvailabilityZones",
                "ec2>CreateVolume",
                "ec2:DescribeInstances"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:AttachVolume",
                "ec2:DetachVolume"
            ],
            "Resource": "arn:aws:ec2:region:111122223333:instance/*",
            "Condition": {
                "StringEquals": {
                    "aws:ResourceTag/purpose": "test"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:AttachVolume",
                "ec2:DetachVolume"
            ],
        }
    ]
}
```

```
        "Resource": "arn:aws:ec2:region:111122223333:volume/*"
    }
]
}
```

Example: Work with security groups

View security groups and add and remove rules

The following policy grants users permission to view security groups in the Amazon EC2 console, to add and remove inbound and outbound rules, and to list and modify rule descriptions for existing security groups that have the tag `Department=Test`.

In the first statement, the `ec2:DescribeTags` action allows users to view tags in the console, which makes it easier for users to identify the security groups that they are allowed to modify.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeSecurityGroups",
                "ec2:DescribeSecurityGroupRules",
                "ec2:DescribeTags"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:AuthorizeSecurityGroupIngress",
                "ec2:RevokeSecurityGroupIngress",
                "ec2:AuthorizeSecurityGroupEgress",
                "ec2:RevokeSecurityGroupEgress",
                "ec2:ModifySecurityGroupRules",
                "ec2:UpdateSecurityGroupRuleDescriptionsIngress",
                "ec2:UpdateSecurityGroupRuleDescriptionsEgress"
            ],
            "Resource": [
                "arn:aws:ec2:region:111122223333:security-group/*"
            ],
            "Condition": {
                "StringEquals": {
                    "aws:ResourceTag/Department": "Test"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:ModifySecurityGroupRules"
            ],
            "Resource": [
                "arn:aws:ec2:region:111122223333:security-group-rule/*"
            ]
        }
    ]
}
```

Work with the Create Security Group dialog box

You can create a policy that allows users to work with the **Create Security Group** dialog box in the Amazon EC2 console. To use this dialog box, users must be granted permission to use at least the following API actions:

- `ec2:CreateSecurityGroup`: To create a new security group.
- `ec2:DescribeVpcs`: To view a list of existing VPCs in the **VPC** list.

With these permissions, users can create a new security group successfully, but they cannot add any rules to it. To work with rules in the **Create Security Group** dialog box, you can add the following API actions to your policy:

- `ec2:AuthorizeSecurityGroupIngress`: To add inbound rules.
- `ec2:AuthorizeSecurityGroupEgress`: To add outbound rules to VPC security groups.
- `ec2:RevokeSecurityGroupIngress`: To modify or delete existing inbound rules. This is useful to allow users to use the **Copy to new** feature in the console. This feature opens the **Create Security Group** dialog box and populates it with the same rules as the security group that was selected.
- `ec2:RevokeSecurityGroupEgress`: To modify or delete outbound rules for VPC security groups. This is useful to allow users to modify or delete the default outbound rule that allows all outbound traffic.
- `ec2>DeleteSecurityGroup`: To cater for when invalid rules cannot be saved. The console first creates the security group, and then adds the specified rules. If the rules are invalid, the action fails, and the console attempts to delete the security group. The user remains in the **Create Security Group** dialog box so that they can correct the invalid rule and try to create the security group again. This API action is not required, but if a user is not granted permission to use it and attempts to create a security group with invalid rules, the security group is created without any rules, and the user must add them afterward.
- `ec2:UpdateSecurityGroupRuleDescriptionsIngress`: To add or update descriptions of ingress (inbound) security group rules.
- `ec2:UpdateSecurityGroupRuleDescriptionsEgress`: To add or update descriptions of egress (outbound) security group rules.
- `ec2:ModifySecurityGroupRules`: To modify security group rules.
- `ec2:DescribeSecurityGroupRules`: To list security group rules.

The following policy grants users permission to use the **Create Security Group** dialog box, and to create inbound and outbound rules for security groups that are associated with a specific VPC (`vpc-1a2b3c4d`). Users can create security groups for EC2-Classic or another VPC, but they cannot add any rules to them. Similarly, users cannot add any rules to any existing security group that's not associated with VPC `vpc-1a2b3c4d`. Users are also granted permission to view all security groups in the console. This makes it easier for users to identify the security groups to which they can add inbound rules. This policy also grants users permission to delete security groups that are associated with VPC `vpc-1a2b3c4d`.

```
{  
    "Version": "2012-10-17",  
    "Statement": [ {  
        "Effect": "Allow",  
        "Action": [  
            "ec2:DescribeSecurityGroups",  
            "ec2:CreateSecurityGroup",  
            "ec2:DescribeVpcs"  
        ],  
        "Resource": "*"  
    },  
    {  
        "Effect": "Allow",  
        "Action": [  
            "ec2>DeleteSecurityGroup",  
            "ec2:AuthorizeSecurityGroupIngress",  
            "ec2:AuthorizeSecurityGroupEgress"  
        ],  
        "Resource": "*"  
    }  
]
```

```
"Resource": "arn:aws:ec2:region:111122223333:security-group/*",
"Condition": {
    "ArnEquals": {
        "ec2:Vpc": "arn:aws:ec2:region:111122223333:vpc/vpc-1a2b3c4d"
    }
}
}
```

Example: Work with Elastic IP addresses

To allow users to view Elastic IP addresses in the Amazon EC2 console, you must grant users permission to use the `ec2:DescribeAddresses` action.

To allow users to work with Elastic IP addresses, you can add the following actions to your policy.

- `ec2:AllocateAddress`: To allocate an Elastic IP address.
- `ec2:ReleaseAddress`: To release an Elastic IP address.
- `ec2:AssociateAddress`: To associate an Elastic IP address with an instance or a network interface.
- `ec2:DescribeNetworkInterfaces` and `ec2:DescribeInstances`: To work with the **Associate address** screen. The screen displays the available instances or network interfaces to which you can associate an Elastic IP address.
- `ec2:DisassociateAddress`: To disassociate an Elastic IP address from an instance or a network interface.

The following policy allows users to view, allocate, and associate Elastic IP addresses with instances. Users cannot associate Elastic IP addresses with network interfaces, disassociate Elastic IP addresses, or release them.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeAddresses",
                "ec2:AllocateAddress",
                "ec2:DescribeInstances",
                "ec2:AssociateAddress"
            ],
            "Resource": "*"
        }
    ]
}
```

Example: Work with Reserved Instances

The following policy can be attached to an IAM user. It gives the user access to view and modify Reserved Instances in your account, as well as purchase new Reserved Instances in the AWS Management Console.

This policy allows users to view all the Reserved Instances, as well as On-Demand Instances, in the account. It's not possible to set resource-level permissions for individual Reserved Instances.

```
{
    "Version": "2012-10-17",
    "Statement": [{
```

```
    "Effect": "Allow",
    "Action": [
        "ec2:DescribeReservedInstances",
        "ec2:ModifyReservedInstances",
        "ec2:PurchaseReservedInstancesOffering",
        "ec2:DescribeInstances",
        "ec2:DescribeInstanceTypes",
        "ec2:DescribeAvailabilityZones",
        "ec2:DescribeReservedInstancesOfferings"
    ],
    "Resource": "*"
}
]
```

The `ec2:DescribeAvailabilityZones` action is necessary to ensure that the Amazon EC2 console can display information about the Availability Zones in which you can purchase Reserved Instances. The `ec2:DescribeInstances` action is not required, but ensures that the user can view the instances in the account and purchase reservations to match the correct specifications.

You can adjust the API actions to limit user access, for example removing `ec2:DescribeInstances` and `ec2:DescribeAvailabilityZones` means the user has read-only access.

AWS managed policies for Amazon Elastic Compute Cloud

To add permissions to users, groups, and roles, it is easier to use AWS managed policies than to write policies yourself. It takes time and expertise to [create IAM customer managed policies](#) that provide your team with only the permissions they need. To get started quickly, you can use our AWS managed policies. These policies cover common use cases and are available in your AWS account. For more information about AWS managed policies, see [AWS managed policies](#) in the *IAM User Guide*.

AWS services maintain and update AWS managed policies. You can't change the permissions in AWS managed policies. Services occasionally add additional permissions to an AWS managed policy to support new features. This type of update affects all identities (users, groups, and roles) where the policy is attached. Services are most likely to update an AWS managed policy when a new feature is launched or when new operations become available. Services do not remove permissions from an AWS managed policy, so policy updates won't break your existing permissions.

Additionally, AWS supports managed policies for job functions that span multiple services. For example, the **ReadOnlyAccess** AWS managed policy provides read-only access to all AWS services and resources. When a service launches a new feature, AWS adds read-only permissions for new operations and resources. For a list and descriptions of job function policies, see [AWS managed policies for job functions](#) in the *IAM User Guide*.

AWS managed policy: AmazonEC2FullAccess

You can attach the `AmazonEC2FullAccess` policy to your IAM identities. This policy grants permissions that allow full access to Amazon EC2.

To view the permissions for this policy, see [AmazonEC2FullAccess](#) in the AWS Management Console.

AWS managed policy: AmazonEC2ReadOnlyAccess

You can attach the `AmazonEC2ReadOnlyAccess` policy to your IAM identities. This policy grants permissions that allow read-only access to Amazon EC2.

To view the permissions for this policy, see [AmazonEC2ReadOnlyAccess](#) in the AWS Management Console.

AWS managed policy: [AWSEC2CapacityReservationFleetRolePolicy](#)

This policy is attached to the service-linked role named **AWSServiceRoleForEC2CapacityReservationFleet** to allow Capacity Reservations to create, modify, and cancel Capacity Reservations on your behalf.

To view the permissions for this policy, see [AWSServiceRoleForEC2CapacityReservationFleet](#) in the AWS Management Console.

AWS managed policy: [AWSEC2FleetServiceRolePolicy](#)

This policy is attached to the service-linked role named **AWSServiceRoleForEC2Fleet** to allow EC2 Fleet to request, launch, terminate, and tag instances on your behalf. For more information, see [Service-linked role for EC2 Fleet \(p. 823\)](#).

AWS managed policy: [AWSEC2SpotFleetServiceRolePolicy](#)

This policy is attached to the service-linked role named **AWSServiceRoleForEC2SpotFleet** to allow Spot Fleet to launch and manage instances on your behalf. For more information, see [Service-linked role for Spot Fleet \(p. 869\)](#).

AWS managed policy: [AWSEC2SpotServiceRolePolicy](#)

This policy is attached to the service-linked role named **AWSServiceRoleForEC2Spot** to allow Amazon EC2 to launch and manage Spot Instances on your behalf. For more information, see [Service-linked role for Spot Instance requests \(p. 451\)](#).

Amazon EC2 updates to AWS managed policies

Change	Description	Date
Amazon EC2 started tracking changes	Amazon EC2 started tracking changes to its AWS managed policies	March 1, 2021

IAM roles for Amazon EC2

Applications must sign their API requests with AWS credentials. Therefore, if you are an application developer, you need a strategy for managing credentials for your applications that run on EC2 instances. For example, you can securely distribute your AWS credentials to the instances, enabling the applications on those instances to use your credentials to sign requests, while protecting your credentials from other users. However, it's challenging to securely distribute credentials to each instance, especially those that AWS creates on your behalf, such as Spot Instances or instances in Auto Scaling groups. You must also be able to update the credentials on each instance when you rotate your AWS credentials.

We designed IAM roles so that your applications can securely make API requests from your instances, without requiring you to manage the security credentials that the applications use. Instead of creating

and distributing your AWS credentials, you can delegate permission to make API requests using IAM roles as follows:

1. Create an IAM role.
2. Define which accounts or AWS services can assume the role.
3. Define which API actions and resources the application can use after assuming the role.
4. Specify the role when you launch your instance, or attach the role to an existing instance.
5. Have the application retrieve a set of temporary credentials and use them.

For example, you can use IAM roles to grant permissions to applications running on your instances that need to use a bucket in Amazon S3. You can specify permissions for IAM roles by creating a policy in JSON format. These are similar to the policies that you create for IAM users. If you change a role, the change is propagated to all instances.

When creating IAM roles, associate least privilege IAM policies that restrict access to the specific API calls the application requires.

You can only attach one IAM role to an instance, but you can attach the same role to many instances. For more information about creating and using IAM roles, see [Roles](#) in the *IAM User Guide*.

You can apply resource-level permissions to your IAM policies to control the users' ability to attach, replace, or detach IAM roles for an instance. For more information, see [Supported resource-level permissions for Amazon EC2 API actions \(p. 1244\)](#) and the following example: [Example: Work with IAM roles \(p. 1282\)](#).

Contents

- [Instance profiles \(p. 1298\)](#)
- [Retrieve security credentials from instance metadata \(p. 1298\)](#)
- [Grant an IAM user permission to pass an IAM role to an instance \(p. 1299\)](#)
- [Work with IAM roles \(p. 1300\)](#)

Instance profiles

Amazon EC2 uses an *instance profile* as a container for an IAM role. When you create an IAM role using the IAM console, the console creates an instance profile automatically and gives it the same name as the role to which it corresponds. If you use the Amazon EC2 console to launch an instance with an IAM role or to attach an IAM role to an instance, you choose the role based on a list of instance profile names.

If you use the AWS CLI, API, or an AWS SDK to create a role, you create the role and instance profile as separate actions, with potentially different names. If you then use the AWS CLI, API, or an AWS SDK to launch an instance with an IAM role or to attach an IAM role to an instance, specify the instance profile name.

An instance profile can contain only one IAM role. This limit cannot be increased.

For more information, see [Instance Profiles](#) in the *IAM User Guide*.

Retrieve security credentials from instance metadata

An application on the instance retrieves the security credentials provided by the role from the instance metadata item `iam/security-credentials/role-name`. The application is granted the permissions for the actions and resources that you've defined for the role through the security credentials associated with the role. These security credentials are temporary and we rotate them automatically. We make new credentials available at least five minutes before the expiration of the old credentials.

Warning

If you use services that use instance metadata with IAM roles, ensure that you don't expose your credentials when the services make HTTP calls on your behalf. The types of services that could expose your credentials include HTTP proxies, HTML/CSS validator services, and XML processors that support XML inclusion.

The following command retrieves the security credentials for an IAM role named s3access.

IMDSv2

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" -v http://169.254.169.254/latest/meta-data/iam/security-credentials/s3access
```

IMDSv1

```
[ec2-user ~]$ curl http://169.254.169.254/latest/meta-data/iam/security-credentials/s3access
```

The following is example output.

```
{  
    "Code" : "Success",  
    "LastUpdated" : "2012-04-26T16:39:16Z",  
    "Type" : "AWS-HMAC",  
    "AccessKeyId" : "ASIAIOSFODNN7EXAMPLE",  
    "SecretAccessKey" : "wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY",  
    "Token" : "token",  
    "Expiration" : "2017-05-17T15:09:54Z"  
}
```

For applications, AWS CLI, and Tools for Windows PowerShell commands that run on the instance, you do not have to explicitly get the temporary security credentials—the AWS SDKs, AWS CLI, and Tools for Windows PowerShell automatically get the credentials from the EC2 instance metadata service and use them. To make a call outside of the instance using temporary security credentials (for example, to test IAM policies), you must provide the access key, secret key, and the session token. For more information, see [Using Temporary Security Credentials to Request Access to AWS Resources](#) in the *IAM User Guide*.

For more information about instance metadata, see [Instance metadata and user data \(p. 726\)](#). For information about the instance metadata IP address, see [Retrieve instance metadata \(p. 734\)](#).

Grant an IAM user permission to pass an IAM role to an instance

To enable an IAM user to launch an instance with an IAM role or to attach or replace an IAM role for an existing instance, you must grant the user permission to use the following API actions:

- `iam:PassRole`
- `ec2:AssociateIamInstanceProfile`
- `ec2:ReplaceIamInstanceProfileAssociation`

For example, the following IAM policy grants users permission to launch instances with an IAM role, or to attach or replace an IAM role for an existing instance using the AWS CLI.

Note

If you want the policy to grant IAM users access to all of your roles, specify the resource as `*` in the policy. However, please consider the principle of [least privilege](#) as a best-practice .

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:RunInstances",  
                "ec2:AssociateIamInstanceProfile",  
                "ec2:ReplaceIamInstanceProfileAssociation"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": "iam:PassRole",  
            "Resource": "arn:aws:iam::123456789012:role/DevTeam"  
        }  
    ]  
}
```

To grant users permission to launch instances with an IAM role, or to attach or replace an IAM role for an existing instance using the Amazon EC2 console, you must grant them permission to use `iam>ListInstanceProfiles`, `iam:PassRole`, `ec2:AssociateIamInstanceProfile`, and `ec2:ReplaceIamInstanceProfileAssociation` in addition to any other permissions they might need. For example policies, see [Example policies for working in the Amazon EC2 console \(p. 1287\)](#).

Work with IAM roles

You can create an IAM role and attach it to an instance during or after launch. You can also replace or detach an IAM role for an instance.

Contents

- [Create an IAM role \(p. 1300\)](#)
- [Launch an instance with an IAM role \(p. 1302\)](#)
- [Attach an IAM role to an instance \(p. 1303\)](#)
- [Replace an IAM role \(p. 1304\)](#)
- [Detach an IAM role \(p. 1306\)](#)
- [Generate a policy for your IAM role based on access activity \(p. 1307\)](#)

Create an IAM role

You must create an IAM role before you can launch an instance with that role or attach it to an instance.

To create an IAM role using the IAM console

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.
2. In the navigation pane, choose **Roles**, **Create role**.
3. On the **Select role type** page, choose **EC2** and the **EC2** use case. Choose **Next: Permissions**.
4. On the **Attach permissions policy** page, select an AWS managed policy that grants your instances access to the resources that they need.
5. On the **Review** page, enter a name for the role and choose **Create role**.

Alternatively, you can use the AWS CLI to create an IAM role. The following example creates an IAM role with a policy that allows the role to use an Amazon S3 bucket.

To create an IAM role and instance profile (AWS CLI)

1. Create the following trust policy and save it in a text file named `ec2-role-trust-policy.json`.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Principal": { "Service": "ec2.amazonaws.com"},  
            "Action": "sts:AssumeRole"  
        }  
    ]  
}
```

2. Create the `s3access` role and specify the trust policy that you created using the [create-role](#) command.

```
aws iam create-role \  
    --role-name s3access \  
    --assume-role-policy-document file://ec2-role-trust-policy.json
```

Example response

```
{  
    "Role": {  
        "AssumeRolePolicyDocument": {  
            "Version": "2012-10-17",  
            "Statement": [  
                {  
                    "Action": "sts:AssumeRole",  
                    "Effect": "Allow",  
                    "Principal": {  
                        "Service": "ec2.amazonaws.com"  
                    }  
                }  
            ]  
        },  
        "RoleId": "AROAIIZKPBKS2LEXAMPLE",  
        "CreateDate": "2013-12-12T23:46:37.247Z",  
        "RoleName": "s3access",  
        "Path": "/",  
        "Arn": "arn:aws:iam::123456789012:role/s3access"  
    }  
}
```

3. Create an access policy and save it in a text file named `ec2-role-access-policy.json`. For example, this policy grants administrative permissions for Amazon S3 to applications running on the instance.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": ["s3:*"],  
            "Resource": ["*"]  
        }  
    ]  
}
```

4. Attach the access policy to the role using the [put-role-policy](#) command.

```
aws iam put-role-policy \  
    --role-name s3access \  
    --policy-name S3-Permissions \  
    --policy-document file://ec2-role-access-policy.json
```

5. Create an instance profile named `s3access-profile` using the [create-instance-profile](#) command.

```
aws iam create-instance-profile --instance-profile-name s3access-profile
```

Example response

```
{  
    "InstanceProfile": {  
        "InstanceProfileId": "AIPAJTLBPJLEGREXAMPLE",  
        "Roles": [],  
        "CreateDate": "2013-12-12T23:53:34.093Z",  
        "InstanceProfileName": "s3access-profile",  
        "Path": "/",  
        "Arn": "arn:aws:iam::123456789012:instance-profile/s3access-profile"  
    }  
}
```

6. Add the `s3access` role to the `s3access-profile` instance profile.

```
aws iam add-role-to-instance-profile \  
    --instance-profile-name s3access-profile \  
    --role-name s3access
```

Alternatively, you can use the following AWS Tools for Windows PowerShell commands:

- [New-IAMRole](#)
- [Register-IAMRolePolicy](#)
- [New-IAMInstanceProfile](#)

Launch an instance with an IAM role

After you've created an IAM role, you can launch an instance, and associate that role with the instance during launch.

Important

After you create an IAM role, it might take several seconds for the permissions to propagate. If your first attempt to launch an instance with a role fails, wait a few seconds before trying again. For more information, see [Troubleshooting Working with Roles](#) in the *IAM User Guide*.

To launch an instance with an IAM role (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. On the dashboard, choose **Launch instance**.
3. Select an AMI and instance type and then choose **Next: Configure Instance Details**.
4. On the **Configure Instance Details** page, for **IAM role**, select the IAM role that you created.

Note

The **IAM role** list displays the name of the instance profile that you created when you created your IAM role. If you created your IAM role using the console, the instance profile

was created for you and given the same name as the role. If you created your IAM role using the AWS CLI, API, or an AWS SDK, you may have named your instance profile differently.

5. Configure any other details, then follow the instructions through the rest of the wizard, or choose **Review and Launch** to accept default settings and go directly to the **Review Instance Launch** page.
6. Review your settings, then choose **Launch** to choose a key pair and launch your instance.
7. If you are using the Amazon EC2 API actions in your application, retrieve the AWS security credentials made available on the instance and use them to sign the requests. The AWS SDK does this for you.

IMDSv2

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" -v http://169.254.169.254/latest/meta-data/iam/security-credentials/role_name
```

IMDSv1

```
[ec2-user ~]$ curl http://169.254.169.254/latest/meta-data/iam/security-credentials/role_name
```

Alternatively, you can use the AWS CLI to associate a role with an instance during launch. You must specify the instance profile in the command.

To launch an instance with an IAM role (AWS CLI)

1. Use the [run-instances](#) command to launch an instance using the instance profile. The following example shows how to launch an instance with the instance profile.

```
aws ec2 run-instances \
--image-id ami-11aa22bb \
--iam-instance-profile Name="s3access-profile" \
--key-name my-key-pair \
--security-groups my-security-group \
--subnet-id subnet-1a2b3c4d
```

Alternatively, use the [New-EC2Instance](#) Tools for Windows PowerShell command.

2. If you are using the Amazon EC2 API actions in your application, retrieve the AWS security credentials made available on the instance and use them to sign the requests. The AWS SDK does this for you.

```
curl http://169.254.169.254/latest/meta-data/iam/security-credentials/role_name
```

Attach an IAM role to an instance

To attach an IAM role to an instance that has no role, the instance can be in the stopped or running state.

New console

To attach an IAM role to an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Instances**.
3. Select the instance, choose **Actions, Security, Modify IAM role**.
4. Select the IAM role to attach to your instance, and choose **Save**.

Old console

To attach an IAM role to an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose **Actions, Instance Settings, Attach/Replace IAM role**.
4. Select the IAM role to attach to your instance, and choose **Apply**.

To attach an IAM role to an instance (AWS CLI)

1. If required, describe your instances to get the ID of the instance to which to attach the role.

```
aws ec2 describe-instances
```

2. Use the **associate-iam-instance-profile** command to attach the IAM role to the instance by specifying the instance profile. You can use the Amazon Resource Name (ARN) of the instance profile, or you can use its name.

```
aws ec2 associate-iam-instance-profile \
--instance-id i-1234567890abcdef0 \
--iam-instance-profile Name="TestRole-1"
```

Example response

```
{
    "IamInstanceProfileAssociation": {
        "InstanceId": "i-1234567890abcdef0",
        "State": "associating",
        "AssociationId": "iip-assoc-0dbd8529a48294120",
        "IamInstanceProfile": {
            "Id": "AIPAJLNLDX3AMYZNWYYAY",
            "Arn": "arn:aws:iam::123456789012:instance-profile/TestRole-1"
        }
    }
}
```

Alternatively, use the following Tools for Windows PowerShell commands:

- [Get-EC2Instance](#)
- [Register-EC2IamInstanceProfile](#)

Replace an IAM role

To replace the IAM role on an instance that already has an attached IAM role, the instance must be in the running state. You can do this if you want to change the IAM role for an instance without detaching the existing one first. For example, you can do this to ensure that API actions performed by applications running on the instance are not interrupted.

New console

To replace an IAM role for an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose **Actions, Security, Modify IAM role**.
4. Select the IAM role to attach to your instance, and choose **Save**.

Old console

To replace an IAM role for an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose **Actions, Instance Settings, Attach/Replace IAM role**.
4. Select the IAM role to attach to your instance, and choose **Apply**.

To replace an IAM role for an instance (AWS CLI)

1. If required, describe your IAM instance profile associations to get the association ID for the IAM instance profile to replace.

```
aws ec2 describe-iam-instance-profile-associations
```

2. Use the [replace-iam-instance-profile-association](#) command to replace the IAM instance profile by specifying the association ID for the existing instance profile and the ARN or name of the instance profile that should replace it.

```
aws ec2 replace-iam-instance-profile-association \
--association-id iip-assoc-0044d817db6c0a4ba \
--iam-instance-profile Name="TestRole-2"
```

Example response

```
{  
    "IamInstanceProfileAssociation": {  
        "InstanceId": "i-087711ddaf98f9489",  
        "State": "associating",  
        "AssociationId": "iip-assoc-09654be48e33b91e0",  
        "IamInstanceProfile": {  
            "Id": "AIPAJCJEDKX7QYHWYK7GS",  
            "Arn": "arn:aws:iam::123456789012:instance-profile/TestRole-2"  
        }  
    }  
}
```

Alternatively, use the following Tools for Windows PowerShell commands:

- [Get-EC2IamInstanceProfileAssociation](#)
- [Set-EC2IamInstanceProfileAssociation](#)

Detach an IAM role

You can detach an IAM role from a running or stopped instance.

New console

To detach an IAM role from an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose **Actions, Security, Modify IAM role**.
4. For **IAM role**, choose **No IAM Role**. Choose **Save**.
5. In the confirmation dialog box, enter **Detach**, and then choose **Detach**.

Old console

To detach an IAM role from an instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose **Actions, Instance Settings, Attach/Replace IAM role**.
4. For **IAM role**, choose **No Role**. Choose **Apply**.
5. In the confirmation dialog box, choose **Yes, Detach**.

To detach an IAM role from an instance (AWS CLI)

1. If required, use [describe-iam-instance-profile-associations](#) to describe your IAM instance profile associations and get the association ID for the IAM instance profile to detach.

```
aws ec2 describe-iam-instance-profile-associations
```

Example response

```
{  
    "IamInstanceProfileAssociations": [  
        {  
            "InstanceId": "i-088ce778fbfeb4361",  
            "State": "associated",  
            "AssociationId": "iip-assoc-0044d817db6c0a4ba",  
            "IamInstanceProfile": {  
                "Id": "AIPAJEDNCAA64SSD265D6",  
                "Arn": "arn:aws:iam::123456789012:instance-profile/TestRole-2"  
            }  
        }  
    ]  
}
```

2. Use the [disassociate-iam-instance-profile](#) command to detach the IAM instance profile using its association ID.

```
aws ec2 disassociate-iam-instance-profile --association-id iip-assoc-0044d817db6c0a4ba
```

Example response

```
{
```

```
"IamInstanceProfileAssociation": {  
    "InstanceId": "i-087711ddaf98f9489",  
    "State": "disassociating",  
    "AssociationId": "iip-assoc-0044d817db6c0a4ba",  
    "IamInstanceProfile": {  
        "Id": "AIPAJEDNCAA64SSD265D6",  
        "Arn": "arn:aws:iam::123456789012:instance-profile/TestRole-2"  
    }  
}
```

Alternatively, use the following Tools for Windows PowerShell commands:

- [Get-EC2IamInstanceProfileAssociation](#)
- [Unregister-EC2IamInstanceProfile](#)

Generate a policy for your IAM role based on access activity

When you first create an IAM role for your applications, you might sometimes grant permissions beyond what is required. Before launching your application in your production environment, you can generate an IAM policy that is based on the access activity for an IAM role. IAM Access Analyzer reviews your AWS CloudTrail logs and generates a policy template that contains the permissions that have been used by the role in your specified date range. You can use the template to create a managed policy with fine-grained permissions and then attach it to the IAM role. That way, you grant only the permissions that the role needs to interact with AWS resources for your specific use case. This helps you adhere to the best practice of [granting least privilege](#). To learn more, see [Generate policies based on access activity](#) in the *IAM User Guide*.

Authorize inbound traffic for your Linux instances

Security groups enable you to control traffic to your instance, including the kind of traffic that can reach your instance. For example, you can allow computers from only your home network to access your instance using SSH. If your instance is a web server, you can allow all IP addresses to access your instance using HTTP or HTTPS, so that external users can browse the content on your web server.

Your default security groups and newly created security groups include default rules that do not enable you to access your instance from the internet. For more information, see [Default security groups \(p. 1329\)](#) and [Custom security groups \(p. 1330\)](#). To enable network access to your instance, you must allow inbound traffic to your instance. To open a port for inbound traffic, add a rule to a security group that you associated with your instance when you launched it.

To connect to your instance, you must set up a rule to authorize SSH traffic from your computer's public IPv4 address. To allow SSH traffic from additional IP address ranges, add another rule for each range you need to authorize.

If you've enabled your VPC for IPv6 and launched your instance with an IPv6 address, you can connect to your instance using its IPv6 address instead of a public IPv4 address. Your local computer must have an IPv6 address and must be configured to use IPv6.

If you need to enable network access to a Windows instance, see [Authorizing inbound traffic for your Windows instances](#) in the *Amazon EC2 User Guide for Windows Instances*.

Before you start

Decide who requires access to your instance; for example, a single host or a specific network that you trust such as your local computer's public IPv4 address. The security group editor in the Amazon EC2 console can automatically detect the public IPv4 address of your local computer for you. Alternatively,

you can use the search phrase "what is my IP address" in an internet browser, or use the following service: [Check IP](#). If you are connecting through an ISP or from behind your firewall without a static IP address, you need to find out the range of IP addresses used by client computers.

Warning

If you use `0.0.0.0/0`, you enable all IPv4 addresses to access your instance using SSH. If you use `::/0`, you enable all IPv6 address to access your instance. This is acceptable for a short time in a test environment, but it's unsafe for production environments. In production, you authorize only a specific IP address or range of addresses to access your instance.

Decide whether you'll support SSH access to your instances using EC2 Instance Connect. If you will not use EC2 Instance Connect, consider uninstalling it or denying the following action in your IAM policies: `ec2-instance-connect:SendSSHPublicKey`. For more information, see [Uninstall EC2 Instance Connect \(p. 627\)](#) and [Configure IAM Permissions for EC2 Instance Connect \(p. 622\)](#).

Add a rule for inbound SSH traffic to a Linux instance

Security groups act as a firewall for associated instances, controlling both inbound and outbound traffic at the instance level. You must add rules to a security group to enable you to connect to your Linux instance from your IP address using SSH.

New console

To add a rule to a security group for inbound SSH traffic over IPv4 (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance and, in bottom half of the screen, choose the **Security** tab. **Security groups** lists the security groups that are associated with the instance. **Inbound rules** displays a list of the inbound rules that are in effect for the instance.
4. For the security group to which you'll add the new rule, choose the security group ID link to open the security group.
5. On the **Inbound rules** tab, choose **Edit inbound rules**.
6. On the **Edit inbound rules** page, do the following:
 - a. Choose **Add rule**.
 - b. For **Type**, choose **SSH**.
 - c. For **Source**, choose **My IP** to automatically populate the field with the public IPv4 address of your local computer.

Alternatively, for **Source**, choose **Custom** and enter the public IPv4 address of your computer or network in CIDR notation. For example, if your IPv4 address is 203.0.113.25, enter `203.0.113.25/32` to list this single IPv4 address in CIDR notation. If your company allocates addresses from a range, enter the entire range, such as `203.0.113.0/24`.

For information about finding your IP address, see [Before you start \(p. 1307\)](#).

- d. Choose **Save rules**.

Old console

To add a rule to a security group for inbound SSH traffic over IPv4 (console)

1. In the navigation pane of the Amazon EC2 console, choose **Instances**. Select your instance and look at the **Description** tab; **Security groups** lists the security groups that are associated with the instance. Choose **view inbound rules** to display a list of the rules that are in effect for the instance.

2. In the navigation pane, choose **Security Groups**. Select one of the security groups associated with your instance.
3. In the details pane, on the **Inbound** tab, choose **Edit**. In the dialog, choose **Add Rule**, and then choose **SSH** from the **Type** list.
4. In the **Source** field, choose **My IP** to automatically populate the field with the public IPv4 address of your local computer. Alternatively, choose **Custom** and specify the public IPv4 address of your computer or network in CIDR notation. For example, if your IPv4 address is 203.0.113.25, specify 203.0.113.25/32 to list this single IPv4 address in CIDR notation. If your company allocates addresses from a range, specify the entire range, such as 203.0.113.0/24.

For information about finding your IP address, see [Before you start \(p. 1307\)](#).

5. Choose **Save**.

If you launched an instance with an IPv6 address and want to connect to your instance using its IPv6 address, you must add rules that allow inbound IPv6 traffic over SSH.

New console

To add a rule to a security group for inbound SSH traffic over IPv6 (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance and, in bottom half of the screen, choose the **Security** tab. **Security groups** lists the security groups that are associated with the instance. **Inbound rules** displays a list of the inbound rules that are in effect for the instance.
4. For the security group to which you'll add the new rule, choose the security group ID link to open the security group.
5. On the **Inbound rules** tab, choose **Edit inbound rules**.
6. On the **Edit inbound rules** page, do the following:
 - a. Choose **Add rule**.
 - b. For **Type**, choose **SSH**.
 - c. For **Source**, choose **Custom** and enter the IPv6 address of your computer in CIDR notation. For example, if your IPv6 address is 2001:db8:1234:1a00:9691:9503:25ad:1761, enter 2001:db8:1234:1a00:9691:9503:25ad:1761/128 to list the single IP address in CIDR notation. If your company allocates addresses from a range, enter the entire range, such as 2001:db8:1234:1a00::/64.
 - d. Choose **Save rules**.

Old console

To add a rule to a security group for inbound SSH traffic over IPv6 (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**. Select the security group for your instance.
3. Choose **Inbound, Edit, Add Rule**.
4. For **Type**, choose **SSH**.
5. In the **Source** field, specify the IPv6 address of your computer in CIDR notation. For example, if your IPv6 address is 2001:db8:1234:1a00:9691:9503:25ad:1761, specify 2001:db8:1234:1a00:9691:9503:25ad:1761/128 to list the single IP address in CIDR notation. If your company allocates addresses from a range, specify the entire range, such as 2001:db8:1234:1a00::/64.

6. Choose **Save**.

Note

Be sure to run the following commands on your local system, not on the instance itself. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

To add a rule to a security group using the command line

1. Find the security group that is associated with your instance using one of the following commands:

- [describe-instance-attribute](#) (AWS CLI)

```
aws ec2 describe-instance-attribute --instance-id instance_id --attribute groupSet
```

- [Get-EC2InstanceAttribute](#) (AWS Tools for Windows PowerShell)

```
PS C:\> (Get-EC2InstanceAttribute -InstanceId instance_id -Attribute groupSet).Groups
```

Both commands return a security group ID, which you use in the next step.

2. Add the rule to the security group using one of the following commands:

- [authorize-security-group-ingress](#) (AWS CLI)

```
aws ec2 authorize-security-group-ingress --group-id security_group_id --protocol tcp  
--port 22 --cidr cidr_ip_range
```

- [Grant-EC2SecurityGroupIngress](#) (AWS Tools for Windows PowerShell)

The `Grant-EC2SecurityGroupIngress` command needs an `IpPermission` parameter, which describes the protocol, port range, and IP address range to be used for the security group rule. The following command creates the `IpPermission` parameter:

```
PS C:\> $ip1 = @{ IpProtocol="tcp"; FromPort="22"; ToPort="22";  
IpRanges="cidr_ip_range" }
```

```
PS C:\> Grant-EC2SecurityGroupIngress -GroupId security_group_id -IpPermission  
@($ip1)
```

Assign a security group to an instance

You can assign a security group to an instance when you launch the instance. When you add or remove rules, those changes are automatically applied to all instances to which you've assigned the security group.

After you launch an instance, you can change its security groups. For more information, see [Changing an instance's security groups](#) in the *Amazon VPC User Guide*.

Amazon EC2 key pairs and Linux instances

A key pair, consisting of a public key and a private key, is a set of security credentials that you use to prove your identity when connecting to an Amazon EC2 instance. Amazon EC2 stores the public key on your instance, and you store the private key. For Linux instances, the private key allows you to securely

SSH into your instance. Anyone who possesses your private key can connect to your instances, so it's important that you store your private key in a secure place.

When you launch an instance, you are [prompted for a key pair \(p. 586\)](#). If you plan to connect to the instance using SSH, you must specify a key pair. You can choose an existing key pair or create a new one. When your instance boots for the first time, the public key that you specified at launch is placed on your Linux instance in an entry within `~/.ssh/authorized_keys`. When you connect to your Linux instance using SSH, to log in you must specify the private key that corresponds to the public key. For more information about connecting to your instance, see [Connect to your Linux instance \(p. 611\)](#). For more information about key pairs and Windows instances, see [Amazon EC2 key pairs and Windows instances](#) in the *Amazon EC2 User Guide for Windows Instances*.

Because Amazon EC2 doesn't keep a copy of your private key, there is no way to recover a private key if you lose it. However, there can still be a way to connect to instances for which you've lost the private key. For more information, see [Connect to your Linux instance if you lose your private key \(p. 1321\)](#).

You can use Amazon EC2 to create your key pairs. You can also use a third-party tool to create your key pairs, and then import the public keys to Amazon EC2.

The keys that Amazon EC2 uses are ED25519 or 2048-bit SSH-2 RSA keys.

You can have up to 5,000 key pairs per Region.

Contents

- [Create a key pair using Amazon EC2 \(p. 1311\)](#)
- [Create a key pair using a third-party tool and import the public key to Amazon EC2 \(p. 1313\)](#)

Create a key pair using Amazon EC2

You can create a key pair using one of the following methods.

Console

To create your key pair

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, under **Network & Security**, choose **Key Pairs**.
3. Choose **Create key pair**.
4. For **Name**, enter a descriptive name for the key pair. Amazon EC2 associates the public key with the name that you specify as the key name. A key name can include up to 255 ASCII characters. It can't include leading or trailing spaces.
5. For **Key pair type**, choose either **RSA** or **ED25519**. Note that **ED25519** keys are not supported for Windows instances.

6. For **Private key file format**, choose the format in which to save the private key. To save the private key in a format that can be used with OpenSSH, choose **pem**. To save the private key in a format that can be used with PuTTY, choose **ppk**.

If you chose **ED25519** in the previous step, the **Private key file format** options do not appear, and the private key format defaults to **pem**.

7. To add a tag to the public key, choose **Add tag**, and enter the key and value for the tag. Repeat for each tag.
8. Choose **Create key pair**.
9. The private key file is automatically downloaded by your browser. The base file name is the name that you specified as the name of your key pair, and the file name extension is determined by the file format that you chose. Save the private key file in a safe place.

Important

This is the only chance for you to save the private key file.

10. If you will use an SSH client on a macOS or Linux computer to connect to your Linux instance, use the following command to set the permissions of your private key file so that only you can read it.

```
chmod 400 my-key-pair.pem
```

If you do not set these permissions, then you cannot connect to your instance using this key pair. For more information, see [Error: Unprotected private key file \(p. 1719\)](#).

AWS CLI

To create your key pair

1. Use the [create-key-pair](#) command as follows to generate the key pair and to save the private key to a .pem file.

For **--key-name**, specify a name for the public key. The name can be up to 255 ASCII characters.

For **--key-type**, specify either **rsa** or **ed25519**. If you do not include the **--key-type** parameter, an **rsa** key is created by default. Note that ED25519 keys are not supported for Windows instances.

--query "KeyMaterial" prints the private key material to the output.

--output text > my-key-pair.pem saves the private key material in a file with the **.pem** extension. The private key can have a name that's different from the public key name, but for ease of use, use the same name.

```
aws ec2 create-key-pair \
--key-name my-key-pair \
--key-type rsa \
--query "KeyMaterial" \
--output text > my-key-pair.pem
```

2. If you will use an SSH client on a macOS or Linux computer to connect to your Linux instance, use the following command to set the permissions of your private key file so that only you can read it.

```
chmod 400 my-key-pair.pem
```

If you do not set these permissions, then you cannot connect to your instance using this key pair.
For more information, see [Error: Unprotected private key file \(p. 1719\)](#).

PowerShell

To create your key pair

Use the [New-EC2KeyPair](#) AWS Tools for Windows PowerShell command as follows to generate the key and save it to a .pem file.

For `-KeyName`, specify a name for the public key. The name can be up to 255 ASCII characters.

For `-KeyType`, specify either `rsa` or `ed25519`. If you do not include the `-KeyType` parameter, an `rsa` key is created by default. Note that ED25519 keys are not supported for Windows instances.

`KeyMaterial` prints the private key material to the output.

`Out-File -Encoding ascii -FilePath C:\path\my-key-pair.pem` saves the private key material in a file with the `.pem` extension. The private key can have a name that's different from the public key name, but for ease of use, use the same name.

```
PS C:\> (New-EC2KeyPair -KeyName "my-key-pair" -KeyType "rsa").KeyMaterial | Out-File -Encoding ascii -FilePath C:\path\my-key-pair.pem
```

Create a key pair using a third-party tool and import the public key to Amazon EC2

Instead of using Amazon EC2 to create your key pair, you can create an RSA or ED25519 key pair by using a third-party tool, and then import the public key to Amazon EC2.

Requirements for key pairs

- Supported types: RSA and ED25519. Amazon EC2 does not accept DSA keys.
 - Note that ED25519 keys are not supported for Windows instances.
- Supported formats:
 - OpenSSH public key format (the format in `~/.ssh/authorized_keys`). If you connect using SSH while using the EC2 Instance Connect API, the SSH2 format is also supported.
 - SSH private key file format must be PEM
 - (RSA only) Base64 encoded DER format
 - (RSA only) SSH public key file format as specified in [RFC 4716](#)
- Supported lengths: 1024, 2048, and 4096. If you connect using SSH while using the EC2 Instance Connect API, the supported lengths are 2048 and 4096.

To create a key pair using a third-party tool

1. Generate a key pair with a third-party tool of your choice. For example, you can use `ssh-keygen` (a tool provided with the standard OpenSSH installation). Alternatively, Java, Ruby, Python, and many other programming languages provide standard libraries that you can use to create an RSA or ED25519 key pair.

Important

The private key must be in the PEM format. For example, use `ssh-keygen -m PEM` to generate the OpenSSH key in the PEM format.

2. Save the public key to a local file. For example, `~/.ssh/my-key-pair.pub`. The file name extension for this file is not important.
3. Save the private key to a local file that has the `.pem` extension. For example, `~/.ssh/my-key-pair.pem`.

Important

Save the private key file in a safe place. You'll need to provide the name of your public key when you launch an instance, and the corresponding private key each time you connect to the instance.

After you have created the key pair, use one of the following methods to import your public key to Amazon EC2.

Console

To import the public key

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Key Pairs**.
3. Choose **Import key pair**.
4. For **Name**, enter a descriptive name for the public key. The name can include up to 255 ASCII characters. It can't include leading or trailing spaces.

Note

When you connect to your instance from the EC2 console, the console suggests this name for the name of your private key file.

5. Either choose **Browse** to navigate to and select your public key, or paste the contents of your public key into the **Public key contents** field.
6. Choose **Import key pair**.
7. Verify that the public key that you imported appears in the list of key pairs.

AWS CLI

To import the public key

Use the [import-key-pair](#) AWS CLI command.

To verify that the key pair was imported successfully

Use the [describe-key-pairs](#) AWS CLI command.

PowerShell

To import the public key

Use the [Import-EC2KeyPair](#) AWS Tools for Windows PowerShell command.

To verify that the key pair was imported successfully

Use the [Get-EC2KeyPair](#) AWS Tools for Windows PowerShell command.

Tag a public key

To help categorize and manage the public keys that you've either created using Amazon EC2 or imported to Amazon EC2, you can tag them with custom metadata. For more information about how tags work, see [Tag your Amazon EC2 resources \(p. 1692\)](#).

You can view, add, and delete tags using one of the following methods.

Console

To view, add, or delete a tag for an existing public key

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Key Pairs**.
3. Select a public key, and then choose **Actions, Manage tags**.
4. The **Manage tags** page displays any tags that are assigned to the public key.
 - To add a tag, choose **Add tag**, and then enter the tag key and value. You can add up to 50 tags per key. For more information, see [Tag restrictions \(p. 1696\)](#).
 - To delete a tag, choose **Remove** next to the tag to delete.
5. Choose **Save**.

AWS CLI

To view public key tags

Use the [describe-tags](#) AWS CLI command. In the following example, you describe the tags for all of your public keys.

```
$ aws ec2 describe-tags --filters "Name=resource-type,Values=key-pair"
```

```
{  
    "Tags": [  
        {  
            "Key": "Environment",  
            "ResourceId": "key-0123456789EXAMPLE",  
            "ResourceType": "key-pair",  
            "Value": "Production"  
        },  
        {  
            "Key": "Environment",  
            "ResourceId": "key-9876543210EXAMPLE",  
            "ResourceType": "key-pair",  
            "Value": "Production"  
        }  
    ]  
}
```

To describe the tags for a specific public key

Use the [describe-key-pairs](#) AWS CLI command.

```
$ aws ec2 describe-key-pairs --key-pair-ids key-0123456789EXAMPLE
```

```
{  
    "KeyPairs": [  
        {  
            "KeyName": "MyKeyPair",  
            "KeyFingerprint":  
                "1f:51:ae:28:bf:89:e9:d8:1f:25:5d:37:2d:7d:b8:ca:9f:f5:f1:6f",  
            "KeyId": "key-0123456789EXAMPLE",  
            "Tags": [  
                {  
                    "Key": "Environment",  
                    "Value": "Production"  
                }  
            ]  
        }  
    ]  
}
```

}

To tag an existing public key

Use the [create-tags](#) AWS CLI command. In the following example, the existing key is tagged with Key=Cost-Center and Value=CC-123.

```
$ aws ec2 create-tags --resources key-0123456789EXAMPLE --tags Key=Cost-Center,Value=CC-123
```

To delete a tag from a public key

Use the [delete-tags](#) AWS CLI command. For examples, see [Examples in the AWS CLI Command Reference](#).

PowerShell

To view public key tags

Use the [Get-EC2Tag](#) command.

To describe the tags for a specific public key

Use the [Get-EC2KeyPair](#) command.

To tag an existing public key

Use the [New-EC2Tag](#) command.

To delete a tag from a public key

Use the [Remove-EC2Tag](#) command.

Retrieve the public key from the private key

On your local Linux or macOS computer, you can use the **ssh-keygen** command to retrieve the public key for your key pair. Specify the path where you downloaded your private key (the .pem file).

```
ssh-keygen -y -f /path_to_key_pair/my-key-pair.pem
```

The command returns the public key, as shown in the following example.

```
ssh-rsa AAAAB3NzaC1yc2EAAAQABAAQClKsfkNkuSevGj3eYhCe53pcjqP3maAhDFcvBS706V
hz2ItxCih+PnDSUaw+WNQn/mZphTk/a/gU8jEzoOWbkM4xyyb/wB96xbiFveSFJuOp/d6RJhJOI0iBXr
lsLnBITntckij7FbtXJMxLvvwJryDUilBMTjYtwB+QhYXUMOzce5Pjz5/i8SeJtjnV3iAoG/cQk+0Fzz
qaeJAAHco+CY+5WrUBkrHmFJr6HcXkvJdWPkyQS3xqC0+FmUZofz221CBt5IMucxXPkX4rWi+z7wB3Rb
BQoQzd8v7yeb7Oz1PnWOyN0qFU0XA246RA8QFYiCNYwI3f05p6KLxEXAMPLE
```

If the command fails, run the following command to ensure that you've changed the permissions on your private key pair file so that only you can view it.

```
chmod 400 my-key-pair.pem
```

Retrieve the public key through instance metadata

The public key that you specified when you launched an instance is also available through the instance metadata. To view the public key that you specified when launching the instance, use the following command from your instance.

IMDSv2

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600" ` && curl -H "X-aws-ec2-metadata-token: $TOKEN" -v http://169.254.169.254/latest/meta-data/public-keys/0/openssh-key
```

The following is an example output.

```
ssh-rsa AAAAB3NzaC1yc2EAAAQABAAQClKsfkNkuSevGj3eYhCe53pcjqP3maAhDFcvBS706V  
hz2ItxCih+PnDSUaw+WNQn/mZphTk/a/gU8jEzoOWbkM4yxyb/wB96xbiFveSFJuOp/d6RJhJOI0iBXr  
lsLnBITntckiJ7FbtJMxLvvwJryDUilBMTjYtwB+QhYXUMOzce5Pjz5/i8SeJtjnV3iAoG/cQk+0Fzz  
qaeJAAHco+CY/5WrUBkrHmFJr6HcXkvJdWPkYQS3xqC0+FmUzofz221CBt5IMucxXPkX4rWi+z7wB3Rb  
BQoQzd8v7yeb7Oz1PnWOyN0qFU0XA246RA8QFYiCNYwI3f05p6KLxEXAMPLE my-key-pair
```

IMDSv1

```
[ec2-user ~]$ curl http://169.254.169.254/latest/meta-data/public-keys/0/openssh-key
```

The following is an example output.

```
ssh-rsa AAAAB3NzaC1yc2EAAAQABAAQClKsfkNkuSevGj3eYhCe53pcjqP3maAhDFcvBS706V  
hz2ItxCih+PnDSUaw+WNQn/mZphTk/a/gU8jEzoOWbkM4yxyb/wB96xbiFveSFJuOp/d6RJhJOI0iBXr  
lsLnBITntckiJ7FbtJMxLvvwJryDUilBMTjYtwB+QhYXUMOzce5Pjz5/i8SeJtjnV3iAoG/cQk+0Fzz  
qaeJAAHco+CY/5WrUBkrHmFJr6HcXkvJdWPkYQS3xqC0+FmUzofz221CBt5IMucxXPkX4rWi+z7wB3Rb  
BQoQzd8v7yeb7Oz1PnWOyN0qFU0XA246RA8QFYiCNYwI3f05p6KLxEXAMPLE my-key-pair
```

If you change the key pair that you use to connect to the instance, we don't update the instance metadata to show the new public key. Instead, the instance metadata continues to show the public key for the key pair that you specified when you launched the instance. For more information, see [Retrieve instance metadata \(p. 734\)](#).

Locate the public key on an instance

When you launch an instance, you are [prompted for a key pair \(p. 586\)](#). If you plan to connect to the instance using SSH, you must specify a key pair. When your instance boots for the first time, the content of the public key that you specified at launch is placed on your Linux instance in an entry within `~/.ssh/authorized_keys`.

To locate the public key on an instance

1. [Connect to your instance. \(p. 611\)](#)
2. In the terminal window, open the `authorized_keys` file using your favorite text editor (such as `vim` or `nano`).

```
[ec2-user ~]$ nano ~/.ssh/authorized_keys
```

The `authorized_keys` file opens, displaying the public key followed by the name of the key pair. The following is an example entry for the key pair named **my-key-pair**.

```
ssh-rsa AAAAB3NzaC1yc2EAAAQABAAQClKsfkNkuSevGj3eYhCe53pcjqP3maAhDFcvBS706V  
hz2ItxCih+PnDSUaw+WNQn/mZphTk/a/gU8jEzoOWbkM4yxyb/wB96xbiFveSFJuOp/d6RJhJOI0iBXr  
lsLnBITntckiJ7FbtJMxLvvwJryDUilBMTjYtwB+QhYXUMOzce5Pjz5/i8SeJtjnV3iAoG/cQk+0Fzz  
qaeJAAHco+CY/5WrUBkrHmFJr6HcXkvJdWPkYQS3xqC0+FmUzofz221CBt5IMucxXPkX4rWi+z7wB3Rb
```

```
BQoQzd8v7yeb70z1PnWOyN0qFU0XA246RA8QFYiCNYwI3f05p6KLxEXAMPLE my-key-pair
```

Identify the key pair that was specified at launch

When you launch an instance, you are [prompted for a key pair \(p. 586\)](#). If you plan to connect to the instance using SSH, you must specify a key pair.

To identify the key pair that was specified at launch

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**, and then select your instance.
3. On the **Details** tab, under **Instance details**, the **Key pair name** field displays the name of the key pair that you specified when you launched the instance.

Note

The value of the **Key pair name** does not change even if you change the public key on the instance, or add key pairs.

Verify your key pair's fingerprint

On the **Key Pairs** page in the Amazon EC2 console, the **Fingerprint** column displays the fingerprints generated from your key pairs. AWS calculates the fingerprint differently depending on whether the key pair was generated by AWS or a third-party tool. If you created the key pair using AWS, the fingerprint is calculated using an SHA-1 hash function. If you created the key pair with a third-party tool and uploaded the public key to AWS, or if you generated a new public key from an existing AWS-created private key and uploaded it to AWS, the fingerprint is calculated using an MD5 hash function.

You can use the SSH2 fingerprint that's displayed on the **Key Pairs** page to verify that the private key you have on your local machine matches the public key stored in AWS. From the computer where you downloaded the private key file, generate an SSH2 fingerprint from the private key file. The output should match the fingerprint that's displayed in the console.

If you're using a Windows local machine, you can run the following commands using the Windows Subsystem for Linux (WSL). Install the WSL and a Linux distribution using the instructions in the [Windows 10 Installation Guide](#). The example in the instructions installs the Ubuntu distribution of Linux, but you can install any distribution. You are prompted to restart your computer for the changes to take effect.

If you created your key pair using AWS, you can use the OpenSSL tools to generate a fingerprint as shown in the following example.

```
$ openssl pkcs8 -in path_to_private_key -inform PEM -outform DER -topk8 -nocrypt | openssl sha1 -c
```

If you created a key pair using a third-party tool and uploaded the public key to AWS, you can use the OpenSSL tools to generate the fingerprint as shown in the following example.

```
$ openssl rsa -in path_to_private_key -pubout -outform DER | openssl md5 -c
```

If you created an OpenSSH key pair using OpenSSH 7.8 or later and uploaded the public key to AWS, you can use **ssh-keygen** to generate the fingerprint as shown in the following examples.

For RSA key pairs:

```
$ ssh-keygen -ef path_to_private_key -m PEM | openssl rsa -RSAPublicKey_in -outform DER |  
openssl md5 -c
```

For ED25519 key pairs:

```
$ ssh-keygen -l -f path_to_private_key.pem
```

Add or replace a key pair for your instance

You can change the key pair that is used to access the default system account of your instance by adding a new public key on the instance, or by replacing the public key (deleting the existing public key and adding a new one) on the instance. You might do this for the following reasons:

- If a user in your organization requires access to the system user account using a separate key pair, you can add the public key to your instance.
- If someone has a copy of the private key (.pem file) and you want to prevent them from connecting to your instance (for example, if they've left your organization), you can delete the public key on the instance and replace it with a new one.

The public keys are located in the .ssh/authorized_keys file on the instance.

To add or replace a key pair, you must be able to connect to your instance. If you've lost your existing private key or you launched your instance without a key pair, you won't be able to connect to your instance and therefore won't be able to add or replace a key pair. If you've lost your private key, you might be able to retrieve it. For more information, see [Connect to your Linux instance if you lose your private key \(p. 1321\)](#). If you launched your instance without a key pair, you won't be able to connect to the instance unless you chose an AMI that is configured to allow users another way to log in.

Note

These procedures are for modifying the key pair for the default user account, such as ec2-user. For information about adding user accounts to your instance, see [Manage user accounts on your Amazon Linux instance \(p. 675\)](#).

To add or replace a key pair

1. Create a new key pair using the [Amazon EC2 console \(p. 1311\)](#) or a [third-party tool \(p. 1313\)](#).
2. Retrieve the public key from your new key pair. For more information, see [Retrieve the public key from the private key \(p. 1316\)](#).
3. [Connect to your instance \(p. 611\)](#) using your existing private key.
4. Using a text editor of your choice, open the .ssh/authorized_keys file on the instance. Paste the public key information from your new key pair underneath the existing public key information. Save the file.
5. Disconnect from your instance, and test that you can connect to your instance using the new private key file.
6. (Optional) If you're replacing an existing key pair, connect to your instance and delete the public key information for the original key pair from the .ssh/authorized_keys file.

Note

If you're using an Auto Scaling group, ensure that the key pair you're replacing is not specified in your launch template or launch configuration. If Amazon EC2 Auto Scaling detects an unhealthy instance, it launches a replacement instance. However, the instance launch fails if the key pair cannot be found. For more information, see [Launch templates](#) in the *Amazon EC2 Auto Scaling User Guide*.

Delete your key pair

When you delete a key pair using the following methods, you are only deleting the public key that you saved in Amazon EC2 when you [created \(p. 1311\)](#) or [imported \(p. 1313\)](#) the key pair. Deleting a key pair doesn't delete the public key from any instances that were previously launched using that key pair. It also doesn't delete the private key on your local computer. You can continue to connect to instances that you launched using a key pair that is subsequently deleted, as long as you still have the private key (.pem) file.

Note

To delete the public key from an instance, see [Delete a public key from an instance \(p. 1320\)](#).

If you're using an Auto Scaling group (for example, in an Elastic Beanstalk environment), ensure that the key pair you're deleting is not specified in an associated launch template or launch configuration. If Amazon EC2 Auto Scaling detects an unhealthy instance, it launches a replacement instance. However, the instance launch fails if the key pair cannot be found. For more information, see [Launch templates](#) in the *Amazon EC2 Auto Scaling User Guide*.

You can delete a key pair using one of the following methods.

Console

To delete your key pair

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Key Pairs**.
3. Select the key pair to delete and choose **Delete**.
4. In the confirmation field, enter **Delete** and then choose **Delete**.

AWS CLI

To delete your key pair

Use the [delete-key-pair](#) AWS CLI command.

PowerShell

To delete your key pair

Use the [Remove-EC2KeyPair](#) AWS Tools for Windows PowerShell command.

Delete a public key from an instance

If you create a Linux AMI from an instance, the public key information is copied from the instance to the AMI. If you launch an instance from the AMI, the new instance includes the public key from the original instance. To prevent someone who has the private key from connecting to the new instance, delete the public key from the original instance *before* creating the AMI.

To delete a public key from an instance

1. [Connect to your instance \(p. 611\)](#).
2. Using a text editor of your choice, open the `.ssh/authorized_keys` file on the instance. Delete the public key information, and then save the file.

Warning

After you delete the public key from the instance and disconnect from the instance, you can't connect to it again unless the AMI provides another way of logging in.

Connect to your Linux instance if you lose your private key

If you lose the private key for an EBS-backed instance, you can regain access to your instance. You must stop the instance, detach its root volume and attach it to another instance as a data volume, modify the `authorized_keys` file with a new public key, move the volume back to the original instance, and restart the instance. For more information about launching, connecting to, and stopping instances, see [Instance lifecycle \(p. 574\)](#).

This procedure is only supported for instances with EBS root volumes. If the root device is an instance store volume, you cannot use this procedure to regain access to your instance; you must have the private key to connect to the instance. To determine the root device type of your instance, open the Amazon EC2 console, choose **Instances**, select the instance, and check the value of **Root device type** in the details pane. The value is either `ebs` or `instance store`.

In addition to the following steps, there are other ways to connect to your Linux instance if you lose your private key. For more information, see [How can I connect to my Amazon EC2 instance if I lost my SSH key pair after its initial launch?](#)

Steps for connecting to an EBS-backed instance with a different key pair

- [Step 1: Create a new key pair \(p. 1321\)](#)
- [Step 2: Get information about the original instance and its root volume \(p. 1321\)](#)
- [Step 3: Stop the original instance \(p. 1322\)](#)
- [Step 4: Launch a temporary instance \(p. 1322\)](#)
- [Step 5: Detach the root volume from the original instance and attach it to the temporary instance \(p. 1322\)](#)
- [Step 6: Add the new public key to `authorized_keys` on the original volume mounted to the temporary instance \(p. 1322\)](#)
- [Step 7: Unmount and detach the original volume from the temporary instance, and reattach it to the original instance \(p. 1324\)](#)
- [Step 8: Connect to the original instance using the new key pair \(p. 1324\)](#)
- [Step 9: Clean up \(p. 1325\)](#)

Step 1: Create a new key pair

Create a new key pair using either the Amazon EC2 console or a third-party tool. If you want to name your new key pair exactly the same as the lost private key, you must first delete the existing key pair. For information about creating a new key pair, see [Create a key pair using Amazon EC2 \(p. 1311\)](#) or [Create a key pair using a third-party tool and import the public key to Amazon EC2 \(p. 1313\)](#).

Step 2: Get information about the original instance and its root volume

Make note of the following information because you'll need it to complete this procedure.

To get information about your original instance

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Instances** in the navigation pane, and then select the instance that you'd like to connect to. (We'll refer to this as the *original* instance.)
3. On the **Details** tab, make note of the instance ID and AMI ID.
4. On the **Networking** tab, make note of the Availability Zone.

5. On the **Storage** tab, under **Root device name**, make note of the device name for the root volume (for example, /dev/xvda). Then, under **Block devices**, find this device name and make note of the volume ID (for example, vol-0a1234b5678c910de).

Step 3: Stop the original instance

Choose **Instance state, Stop instance**. If this option is disabled, either the instance is already stopped or its root device is an instance store volume.

Warning

When you stop an instance, the data on any instance store volumes is erased. To keep data from instance store volumes, be sure to back it up to persistent storage.

Step 4: Launch a temporary instance

Choose **Launch instances**, and then use the launch wizard to launch a *temporary* instance with the following options:

- On the **Choose an AMI** page, select the same AMI that you used to launch the original instance. If this AMI is unavailable, you can create an AMI that you can use from the stopped instance. For more information, see [Create an Amazon EBS-backed Linux AMI \(p. 144\)](#).
- On the **Choose an Instance Type** page, leave the default instance type that the wizard selects for you.
- On the **Configure Instance Details** page, specify the same Availability Zone as the original instance. If you're launching an instance in a VPC, select a subnet in this Availability Zone.
- On the **Add Tags** page, add the tag Name=Temporary to the instance to indicate that this is a temporary instance.
- On the **Review** page, choose **Launch**. Choose the key pair that you created in Step 1, then choose **Launch Instances**.

Step 5: Detach the root volume from the original instance and attach it to the temporary instance

1. In the navigation pane, choose **Volumes** and select the root device volume for the original instance (you made note of its volume ID in a previous step). Choose **Actions, Detach Volume**, and then select **Yes, Detach**. Wait for the state of the volume to become available. (You might need to choose the **Refresh** icon.)
2. With the volume still selected, choose **Actions**, and then select **Attach Volume**. Select the instance ID of the temporary instance, make note of the device name specified under **Device** (for example, /dev/sdf), and then choose **Attach**.

Note

If you launched your original instance from an AWS Marketplace AMI and your volume contains AWS Marketplace codes, you must first stop the temporary instance before you can attach the volume.

Step 6: Add the new public key to authorized_keys on the original volume mounted to the temporary instance

1. Connect to the temporary instance.
2. From the temporary instance, mount the volume that you attached to the instance so that you can access its file system. For example, if the device name is /dev/sdf, use the following commands to mount the volume as /mnt/tempvol.

Note

The device name might appear differently on your instance. For example, devices mounted as `/dev/sdf` might show up as `/dev/xvdf` on the instance. Some versions of Red Hat (or its variants, such as CentOS) might even increment the trailing letter by 4 characters, where `/dev/sdf` becomes `/dev/xvdk`.

- a. Use the `lsblk` command to determine if the volume is partitioned.

```
[ec2-user ~]$ lsblk
NAME   MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT
xvda   202:0    0   8G  0 disk 
##xvda1 202:1    0   8G  0 part /
xvdf   202:80   0 101G  0 disk 
##xvdf1 202:81   0 101G  0 part
xvdg   202:96   0   30G 0 disk
```

In the preceding example, `/dev/xvda` and `/dev/xvdf` are partitioned volumes, and `/dev/xvdg` is not. If your volume is partitioned, you mount the partition (`/dev/xvdf1`) instead of the raw device (`/dev/xvdf`) in the next steps.

- b. Create a temporary directory to mount the volume.

```
[ec2-user ~]$ sudo mkdir /mnt/tempvol
```

- c. Mount the volume (or partition) at the temporary mount point, using the volume name or device name that you identified earlier. The required command depends on your operating system's file system. Note that the device name might appear differently on your instance. See [note](#) in this section for more information.
 - Amazon Linux, Ubuntu, and Debian

```
[ec2-user ~]$ sudo mount /dev/xvdf1 /mnt/tempvol
```

- Amazon Linux 2, CentOS, SUSE Linux 12, and RHEL 7.x

```
[ec2-user ~]$ sudo mount -o nouuid /dev/xvdf1 /mnt/tempvol
```

Note

If you get an error stating that the file system is corrupt, run the following command to use the `fsck` utility to check the file system and repair any issues:

```
[ec2-user ~]$ sudo fsck /dev/xvdf1
```

3. From the temporary instance, use the following command to update `authorized_keys` on the mounted volume with the new public key from the `authorized_keys` for the temporary instance.

Important

The following examples use the Amazon Linux user name `ec2-user`. You might need to substitute a different user name, such as `ubuntu` for Ubuntu instances.

```
[ec2-user ~]$ cp .ssh/authorized_keys /mnt/tempvol/home/ec2-user/.ssh/authorized_keys
```

If this copy succeeded, you can go to the next step.

(Optional) Otherwise, if you don't have permission to edit files in /mnt/tempvol, you must update the file using **sudo** and then check the permissions on the file to verify that you are able to log into the original instance. Use the following command to check the permissions on the file.

```
[ec2-user ~]$ sudo ls -l /mnt/tempvol/home/ec2-user/.ssh  
total 4  
-rw----- 1 222 500 398 Sep 13 22:54 authorized_keys
```

In this example output, **222** is the user ID and **500** is the group ID. Next, use **sudo** to re-run the copy command that failed.

```
[ec2-user ~]$ sudo cp .ssh/authorized_keys /mnt/tempvol/home/ec2-user/.ssh/  
authorized_keys
```

Run the following command again to determine whether the permissions changed.

```
[ec2-user ~]$ sudo ls -l /mnt/tempvol/home/ec2-user/.ssh
```

If the user ID and group ID have changed, use the following command to restore them.

```
[ec2-user ~]$ sudo chown 222:500 /mnt/tempvol/home/ec2-user/.ssh/authorized_keys
```

Step 7: Unmount and detach the original volume from the temporary instance, and reattach it to the original instance

- From the temporary instance, unmount the volume that you attached so that you can reattach it to the original instance. For example, use the following command to unmount the volume at /mnt/tempvol.

```
[ec2-user ~]$ sudo umount /mnt/tempvol
```

- Detach the volume from the temporary instance (you unmounted it in the previous step): From the Amazon EC2 console, select the root device volume for the original instance (you made note of the volume ID in a previous step), choose **Actions**, **Detach Volume**, and then choose **Yes, Detach**. Wait for the state of the volume to become available. (You might need to choose the **Refresh** icon.)
- Reattach the volume to the original instance: With the volume still selected, choose **Actions**, **Attach Volume**. Select the instance ID of the original instance, specify the device name that you noted earlier in [Step 2 \(p. 1321\)](#) for the original root device attachment (/dev/sda1 or /dev/xvda), and then choose **Attach**.

Important

If you don't specify the same device name as the original attachment, you cannot start the original instance. Amazon EC2 expects the root device volume at sda1 or /dev/xvda.

Step 8: Connect to the original instance using the new key pair

Select the original instance, choose **Instance state**, **Start instance**. After the instance enters the running state, you can connect to it using the private key file for your new key pair.

Note

If the name of your new key pair and corresponding private key file is different from the name of the original key pair, ensure that you specify the name of the new private key file when you connect to your instance.

Step 9: Clean up

(Optional) You can terminate the temporary instance if you have no further use for it. Select the temporary instance, and choose **Instance state, Terminate instance**.

Amazon EC2 security groups for Linux instances

A *security group* acts as a virtual firewall for your EC2 instances to control incoming and outgoing traffic. Inbound rules control the incoming traffic to your instance, and outbound rules control the outgoing traffic from your instance. When you launch an instance, you can specify one or more security groups. If you don't specify a security group, Amazon EC2 uses the default security group. You can add rules to each security group that allow traffic to or from its associated instances. You can modify the rules for a security group at any time. New and modified rules are automatically applied to all instances that are associated with the security group. When Amazon EC2 decides whether to allow traffic to reach an instance, it evaluates all of the rules from all of the security groups that are associated with the instance.

When you launch an instance in a VPC, you must specify a security group that's created for that VPC. After you launch an instance, you can change its security groups. Security groups are associated with network interfaces. Changing an instance's security groups changes the security groups associated with the primary network interface (eth0). For more information, see [Changing an instance's security groups](#) in the *Amazon VPC User Guide*. You can also change the security groups associated with any other network interface. For more information, see [Modify network interface attributes \(p. 1115\)](#).

Security is a shared responsibility between AWS and you. For more information, see [Security in Amazon EC2 \(p. 1233\)](#). AWS provides security groups as one of the tools for securing your instances, and you need to configure them to meet your security needs. If you have requirements that aren't fully met by security groups, you can maintain your own firewall on any of your instances in addition to using security groups.

To allow traffic to a Windows instance, see [Amazon EC2 security groups for Windows instances](#) in the *Amazon EC2 User Guide for Windows Instances*.

Security group rules

The rules of a security group control the inbound traffic that's allowed to reach the instances that are associated with the security group. The rules also control the outbound traffic that's allowed to leave them.

The following are the characteristics of security group rules:

- By default, security groups allow all outbound traffic. Note that Amazon EC2 blocks traffic on port 25 by default. For more information, see [Restriction on email sent using port 25 \(p. 1707\)](#).
- Security group rules are always permissive; you can't create rules that deny access.
- Security group rules enable you to filter traffic based on protocols and port numbers.
- Security groups are stateful—if you send a request from your instance, the response traffic for that request is allowed to flow in regardless of inbound security group rules. For VPC security groups, this also means that responses to allowed inbound traffic are allowed to flow out, regardless of outbound rules. For more information, see [Security group connection tracking \(p. 1327\)](#).
- You can add and remove rules at any time. Your changes are automatically applied to the instances that are associated with the security group.

The effect of some rule changes can depend on how the traffic is tracked. For more information, see [Security group connection tracking \(p. 1327\)](#).

- When you associate multiple security groups with an instance, the rules from each security group are effectively aggregated to create one set of rules. Amazon EC2 uses this set of rules to determine whether to allow access.

You can assign multiple security groups to an instance. Therefore, an instance can have hundreds of rules that apply. This might cause problems when you access the instance. We recommend that you condense your rules as much as possible.

For each rule, you specify the following:

- **Name:** The name for the security group (for example, "my-security-group").

A name can be up to 255 characters in length. Allowed characters are a-z, A-Z, 0-9, spaces, and _-:/()#@[]+=;{}!\$*. When the name contains trailing spaces, we trim the spaces when we save the name. For example, if you enter "Test Security Group " for the name, we store it as "Test Security Group".

- **Protocol:** The protocol to allow. The most common protocols are 6 (TCP), 17 (UDP), and 1 (ICMP).
- **Port range:** For TCP, UDP, or a custom protocol, the range of ports to allow. You can specify a single port number (for example, 22), or range of port numbers (for example, 7000–8000).
- **ICMP type and code:** For ICMP, the ICMP type and code. For example, use type 8 for ICMP Echo Request or type 128 for ICMPv6 Echo Request.
- **Source or destination:** The source (inbound rules) or destination (outbound rules) for the traffic to allow. Specify one of the following:
 - A single IPv4 address. You must use the /32 prefix length. For example, 203.0.113.1/32.
 - A single IPv6 address. You must use the /128 prefix length. For example, 2001:db8:1234:1a00::123/128.
 - A range of IPv4 addresses, in CIDR block notation. For example, 203.0.113.0/24.
 - A range of IPv6 addresses, in CIDR block notation. For example, 2001:db8:1234:1a00::/64.
 - The ID of a prefix list. For example, p1-1234abc1234abc123. For more information, see [Prefix lists in the Amazon VPC User Guide](#).
 - The ID of a security group (referred to here as the specified security group). For example, the current security group, a security group from the same VPC, or a security group for a peered VPC. This allows traffic based on the private IP addresses of the resources associated with the specified security group. This does not add rules from the specified security group to the current security group.
- **(Optional) Description:** You can add a description for the rule, which can help you identify it later. A description can be up to 255 characters in length. Allowed characters are a-z, A-Z, 0-9, spaces, and ._-:/()#@[]+=;{}!\$*.

When you create a security group rule, AWS assigns a unique ID to the rule. You can use the ID of a rule when you use the API or CLI to modify or delete the rule.

When you specify a security group as the source or destination for a rule, the rule affects all instances that are associated with the security group. Incoming traffic is allowed based on the private IP addresses of the instances that are associated with the source security group (and not the public IP or Elastic IP addresses). For more information about IP addresses, see [Amazon EC2 instance IP addressing \(p. 1037\)](#). If your security group rule references a deleted security group in the same VPC or in a peer VPC, or if it references a security group in a peer VPC for which the VPC peering connection has been deleted, the rule is marked as stale. For more information, see [Working with Stale Security Group Rules](#) in the [Amazon VPC Peering Guide](#).

If there is more than one rule for a specific port, Amazon EC2 applies the most permissive rule. For example, if you have a rule that allows access to TCP port 22 (SSH) from IP address 203.0.113.1, and another rule that allows access to TCP port 22 from everyone, everyone has access to TCP port 22.

When you add, update, or remove rules, the changes are automatically applied to all instances associated with the security group.

Security group connection tracking

Your security groups use connection tracking to track information about traffic to and from the instance. Rules are applied based on the connection state of the traffic to determine if the traffic is allowed or denied. With this approach, security groups are stateful. This means that responses to inbound traffic are allowed to flow out of the instance regardless of outbound security group rules, and vice versa.

As an example, suppose that you initiate a command such as netcat or similar to your instances from your home computer, and your inbound security group rules allow ICMP traffic. Information about the connection (including the port information) is tracked. Response traffic from the instance for the command is not tracked as a new request, but rather as an established connection, and is allowed to flow out of the instance, even if your outbound security group rules restrict outbound ICMP traffic.

For protocols other than TCP, UDP, or ICMP, only the IP address and protocol number is tracked. If your instance sends traffic to another host (host B), and host B initiates the same type of traffic to your instance in a separate request within 600 seconds of the original request or response, your instance accepts it regardless of inbound security group rules. Your instance accepts it because it's regarded as response traffic.

To ensure that traffic is immediately interrupted when you remove a security group rule, or to ensure that all inbound traffic is subject to firewall rules, you can use a network ACL for your subnet. Network ACLs are stateless and therefore do not automatically allow response traffic. For more information, see [Network ACLs](#) in the *Amazon VPC User Guide*.

Untracked connections

Not all flows of traffic are tracked. If a security group rule permits TCP or UDP flows for all traffic (0.0.0.0/0 or ::/0) and there is a corresponding rule in the other direction that permits all response traffic (0.0.0.0/0 or ::/0) for all ports (0-65535), then that flow of traffic is not tracked. The response traffic is therefore allowed to flow based on the inbound or outbound rule that permits the response traffic, and not on tracking information.

An untracked flow of traffic is immediately interrupted if the rule that enables the flow is removed or modified. For example, if you have an open (0.0.0.0/0) outbound rule, and you remove a rule that allows all (0.0.0.0/0) inbound SSH (TCP port 22) traffic to the instance (or modify it such that the connection would no longer be permitted), your existing SSH connections to the instance are immediately dropped. The connection was not previously being tracked, so the change will break the connection. On the other hand, if you have a narrower inbound rule that initially allows the SSH connection (meaning that the connection was tracked), but change that rule to no longer allow new connections from the address of the current SSH client, the existing connection will not be broken by changing the rule.

Example

In the following example, the security group has specific inbound rules for TCP and ICMP traffic, and outbound rules that allow all outbound IPv4 and IPv6 traffic.

Inbound rules		
Protocol type	Port number	Source IP
TCP	22 (SSH)	203.0.113.1/32
TCP	80 (HTTP)	0.0.0.0/0
TCP	80 (HTTP)	::/0
ICMP	All	0.0.0.0/0

Outbound rules		
Protocol type	Port number	Destination IP
All	All	0.0.0.0/0
All	All	::/0

- TCP traffic on port 22 (SSH) to and from the instance is tracked, because the inbound rule allows traffic from 203.0.113.1/32 only, and not all IP addresses (0.0.0.0/0).
- TCP traffic on port 80 (HTTP) to and from the instance is not tracked, because both the inbound and outbound rules allow all traffic (0.0.0.0/0 or ::/0).
- ICMP traffic is always tracked, regardless of rules.

- If you remove the outbound rule from the security group, all traffic to and from the instance is tracked, including traffic on port 80 (HTTP).

Throttling

Amazon EC2 defines the maximum number of connections that can be tracked per instance. After the maximum is reached, any packets that are sent or received are dropped because a new connection cannot be established. When this happens, applications that send and receive packets cannot communicate properly.

To determine whether packets were dropped because the network traffic for your instance exceeded the maximum number of connections that can be tracked, use the `conntrack_allowance_exceeded` network performance metric. For more information, see [Monitor network performance for your EC2 instance \(p. 1140\)](#).

Connections made through the following are automatically tracked, even if the security group configuration does not require tracking:

- Gateway Load Balancers
- Global Accelerator accelerators
- NAT gateways
- Network Firewall firewall endpoints
- Network Load Balancers
- Transit gateway attachments

With Elastic Load Balancing, if you exceed the maximum number of connections that can be tracked per instance, we recommend that you scale either the number of instances registered with the load balancer or the size of the instances registered with the load balancer.

Default and custom security groups

Your AWS account automatically has a default security group for the default VPC in each Region. If you don't specify a security group when you launch an instance, the instance is automatically associated with the default security group for the VPC. If you don't want your instances to use the default security group, you can create your own custom security groups and specify them when you launch your instances.

Topics

- [Default security groups \(p. 1329\)](#)
- [Custom security groups \(p. 1330\)](#)

Default security groups

Your AWS account automatically has a default security group for the default VPC in each Region. If you don't specify a security group when you launch an instance, the instance is automatically associated with the default security group for the VPC.

A default security group is named "default", and it has an ID assigned by AWS. The following table describes the default rules for a default security group.

Inbound rule			
Source	Protocol	Port range	Description

The security group ID (its own resource ID)	All	All	Allows inbound traffic from network interfaces and instances that are assigned to the same security group.
Outbound rules			
Destination	Protocol	Port range	Description
0.0.0.0/0	All	All	Allows all outbound IPv4 traffic.
::/0	All	All	Allows all outbound IPv6 traffic. This rule is added only if your VPC has an associated IPv6 CIDR block.

You can add or remove inbound and outbound rules for any default security group.

You can't delete a default security group. If you try to delete a default security group, you see the following error: `Client.CannotDelete: the specified group: "sg-51530134" name: "default" cannot be deleted by a user.`

Custom security groups

If you don't want your instances to use the default security group, you can create your own security groups and specify them when you launch your instances. You can create multiple security groups to reflect the different roles that your instances play; for example, a web server or a database server.

When you create a security group, you must provide it with a name and a description. Security group names and descriptions can be up to 255 characters in length, and are limited to the following characters:

a-z, A-Z, 0-9, spaces, and ._-:/()#@[]+=&;{}!\$*

A security group name cannot start with the following: sg-. A security group name must be unique for the VPC.

The following are the default rules for a security group that you create:

- Allows no inbound traffic
- Allows all outbound traffic

After you've created a security group, you can change its inbound rules to reflect the type of inbound traffic that you want to reach the associated instances. You can also change its outbound rules.

For more information about the rules you can add to a security group, see [Security group rules for different use cases \(p. 1340\)](#).

Work with security groups

You can assign a security group to an instance when you launch the instance. When you add or remove rules, those changes are automatically applied to all instances to which you've assigned the security group. For more information, see [Assign a security group to an instance \(p. 1339\)](#).

After you launch an instance, you can change its security groups. For more information, see [Change an instance's security group \(p. 1339\)](#).

You can create, view, update, and delete security groups and security group rules using the Amazon EC2 console and the command line tools.

Tasks

- [Create a security group \(p. 1331\)](#)
- [Copy a security group \(p. 1332\)](#)
- [View your security groups \(p. 1333\)](#)
- [Add rules to a security group \(p. 1333\)](#)
- [Update security group rules \(p. 1336\)](#)
- [Delete rules from a security group \(p. 1337\)](#)
- [Delete a security group \(p. 1338\)](#)
- [Assign a security group to an instance \(p. 1339\)](#)
- [Change an instance's security group \(p. 1339\)](#)

Create a security group

Although you can use the default security group for your instances, you might want to create your own groups to reflect the different roles that instances play in your system.

By default, new security groups start with only an outbound rule that allows all traffic to leave the instances. You must add rules to enable any inbound traffic or to restrict the outbound traffic.

A security group can be used only in the VPC for which it is created.

New console

To create a security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Choose **Create security group**.
4. In the **Basic details** section, do the following.
 - a. Enter a descriptive name and brief description for the security group. They can't be edited after the security group is created. The name and description can be up to 255 characters long. The valid characters are a-z, A-Z, 0-9, spaces, and ._-:/()#@[]+=;&{}!\$*.
 - b. For **VPC**, choose the VPC.
5. You can add security group rules now, or you can add them later. For more information, see [Add rules to a security group \(p. 1333\)](#).
6. You can add tags now, or you can add them later. To add a tag, choose **Add new tag** and enter the tag key and value.
7. Choose **Create security group**.

Old console

To create a security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.

3. Choose **Create Security Group**.
4. Specify a name and description for the security group.
5. For **VPC**, choose the ID of the VPC.
6. You can start adding rules, or you can choose **Create** to create the security group now (you can always add rules later). For more information about adding rules, see [Add rules to a security group \(p. 1333\)](#).

Command line

To create a security group

Use one of the following commands:

- [create-security-group](#) (AWS CLI)
- [New-EC2SecurityGroup](#) (AWS Tools for Windows PowerShell)

Copy a security group

You can create a new security group by creating a copy of an existing one. When you copy a security group, the copy is created with the same inbound and outbound rules as the original security group. If the original security group is in a VPC, the copy is created in the same VPC unless you specify a different one.

The copy receives a new unique security group ID and you must give it a name. You can also add a description.

You can't copy a security group from one Region to another Region.

You can create a copy of a security group using one of the following methods.

New console

To copy a security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group to copy and choose **Actions, Copy to new security group**.
4. Specify a name and optional description, and change the VPC and security group rules if needed.
5. Choose **Create**.

Old console

To copy a security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group you want to copy, choose **Actions, Copy to new**.
4. The **Create Security Group** dialog opens, and is populated with the rules from the existing security group. Specify a name and description for your new security group. For **VPC**, choose the ID of the VPC. When you are done, choose **Create**.

View your security groups

You can view information about your security groups using one of the following methods.

New console

To view your security groups

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Your security groups are listed. To view the details for a specific security group, including its inbound and outbound rules, choose its ID in the **Security group ID** column.

Old console

To view your security groups

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. (Optional) Select **VPC ID** from the filter list, then choose the ID of the VPC.
4. Select a security group. General information is displayed on the **Description** tab, inbound rules on the **Inbound** tab, outbound rules on the **Outbound** tab, and tags on the **Tags** tab.

Command line

To view your security groups

Use one of the following commands.

- [describe-security-groups \(AWS CLI\)](#)
- [describe-security-group-rules \(AWS CLI\)](#)
- [Get-EC2SecurityGroup \(AWS Tools for Windows PowerShell\)](#)

Amazon EC2 Global View

You can use Amazon EC2 Global View to view your security groups across all Regions for which your AWS account is enabled. For more information, see [List and filter resources across Regions using Amazon EC2 Global View \(p. 1691\)](#).

Add rules to a security group

When you add a rule to a security group, the new rule is automatically applied to any instances that are associated with the security group. There might be a short delay before the rule is applied. For more information, see [Security group rules for different use cases \(p. 1340\)](#) and [Security group rules \(p. 1326\)](#).

New console

To add an inbound rule to a security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.

3. Select the security group, and choose **Actions, Edit inbound rules**.
4. For each rule, choose **Add rule** and do the following.
 - a. For **Type**, choose the type of protocol to allow.
 - For custom TCP or UDP, you must enter the port range to allow.
 - For custom ICMP, you must choose the ICMP type from **Protocol**, and, if applicable, the code from **Port range**. For example, to allow ping commands, choose **Echo Request** from **Protocol**.
 - For any other type, the protocol and port range are configured for you.
 - b. For **Source**, do one of the following to allow traffic.
 - Choose **Custom** and then enter an IP address in CIDR notation, a CIDR block, another security group, or a prefix list.
 - Choose **Anywhere** to allow all traffic for the specified protocol to reach your instance. This option automatically adds the 0.0.0.0/0 IPv4 CIDR block as the source. This is acceptable for a short time in a test environment, but it's unsafe in production environments. In production, authorize only a specific IP address or range of addresses to access your instances.
 - c. If your security group is in a VPC that's enabled for IPv6, this option automatically adds a rule for the ::/0 IPv6 CIDR block.
 - Choose **My IP** to allow inbound traffic from only your local computer's public IPv4 address.
5. Choose **Preview changes, Save rules**.

To add an outbound rule to a security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group, and choose **Actions, Edit outbound rules**.
4. For each rule, choose **Add rule** and do the following.
 - a. For **Type**, choose the type of protocol to allow.
 - For custom TCP or UDP, you must enter the port range to allow.
 - For custom ICMP, you must choose the ICMP type from **Protocol**, and, if applicable, the code from **Port range**.
 - For any other type, the protocol and port range are configured automatically.
 - b. For **Destination**, do one of the following.
 - Choose **Custom** and then enter an IP address in CIDR notation, a CIDR block, another security group, or a prefix list for which to allow outbound traffic.
 - Choose **Anywhere** to allow outbound traffic to all IP addresses. This option automatically adds the 0.0.0.0/0 IPv4 CIDR block as the destination.
- c. If your security group is in a VPC that's enabled for IPv6, this option automatically adds a rule for the ::/0 IPv6 CIDR block.
 - Choose **My IP** to allow outbound traffic only to your local computer's public IPv4 address.
5. Choose **Preview changes, Confirm**.

Old console

To add rules to a security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups** and select the security group.
3. On the **Inbound** tab, choose **Edit**.
4. In the dialog, choose **Add Rule** and do the following:
 - For **Type**, select the protocol.
 - If you select a custom TCP or UDP protocol, specify the port range in **Port Range**.
 - If you select a custom ICMP protocol, choose the ICMP type name from **Protocol**, and, if applicable, the code name from **Port Range**. For example, to allow **ping** commands, choose **Echo Request** from **Protocol**.
 - For **Source**, choose one of the following:
 - **Custom**: in the provided field, you must specify an IP address in CIDR notation, a CIDR block, or another security group.
 - **Anywhere**: automatically adds the 0.0.0.0/0 IPv4 CIDR block. This option enables all traffic of the specified type to reach your instance. This is acceptable for a short time in a test environment, but it's unsafe for production environments. In production, authorize only a specific IP address or range of addresses to access your instance.

If your security group is in a VPC that's enabled for IPv6, the **Anywhere** option creates two rules—one for IPv4 traffic (0.0.0.0/0) and one for IPv6 traffic (::/0).

- **My IP**: automatically adds the public IPv4 address of your local computer.
- For **Description**, you can optionally specify a description for the rule.

For more information about the types of rules that you can add, see [Security group rules for different use cases \(p. 1340\)](#).

5. Choose **Save**.
6. You can also specify outbound rules. On the **Outbound** tab, choose **Edit**, **Add Rule**, and do the following:
 - For **Type**, select the protocol.
 - If you select a custom TCP or UDP protocol, specify the port range in **Port Range**.
 - If you select a custom ICMP protocol, choose the ICMP type name from **Protocol**, and, if applicable, the code name from **Port Range**.
 - For **Destination**, choose one of the following:
 - **Custom**: in the provided field, you must specify an IP address in CIDR notation, a CIDR block, or another security group.
 - **Anywhere**: automatically adds the 0.0.0.0/0 IPv4 CIDR block. This option enables outbound traffic to all IP addresses.
7. Choose **Save**.

If your security group is in a VPC that's enabled for IPv6, the **Anywhere** option creates two rules—one for IPv4 traffic (0.0.0.0/0) and one for IPv6 traffic (::/0).

- **My IP**: automatically adds the IP address of your local computer.
- For **Description**, you can optionally specify a description for the rule.

Command line

To add rules to a security group

Use one of the following commands.

- [authorize-security-group-ingress](#) (AWS CLI)
- [Grant-EC2SecurityGroupIngress](#) (AWS Tools for Windows PowerShell)

To add one or more egress rules to a security group

Use one of the following commands.

- [authorize-security-group-egress](#) (AWS CLI)
- [Grant-EC2SecurityGroupEgress](#) (AWS Tools for Windows PowerShell)

Update security group rules

You can update a security group rule using one of the following methods. The updated rule is automatically applied to any instances that are associated with the security group.

New console

When you modify the protocol, port range, or source or destination of an existing security group rule using the console, the console deletes the existing rule and adds a new one for you.

To update a security group rule

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group.
4. Choose **Actions, Edit inbound rules** to update a rule for inbound traffic or **Actions, Edit outbound rules** to update a rule for outbound traffic.
5. Update the rule as required.
6. Choose **Preview changes, Confirm**.

To tag a security group rule

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group.
4. On the **Inbound rules** or **Outbound rules** tab, select the check box for the rule and then choose **Manage tags**.
5. The **Manage tags** page displays any tags that are assigned to the rule. To add a tag, choose **Add tag** and enter the tag key and value. To delete a tag, choose **Remove** next to the tag that you want to delete.
6. Choose **Save changes**.

Old console

When you modify the protocol, port range, or source or destination of an existing security group rule using the console, the console deletes the existing rule and adds a new one for you.

To update a security group rule

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group to update, and choose the **Inbound** tab to update a rule for inbound traffic or the **Outbound** tab to update a rule for outbound traffic.
4. Choose **Edit**.
5. Modify the rule entry as required and choose **Save**.

Command line

You cannot modify the protocol, port range, or source or destination of an existing rule using the Amazon EC2 API or a command line tools. Instead, you must delete the existing rule and add a new rule. You can, however, update the description of an existing rule.

To update a rule

Use one the following command.

- [modify-security-group-rules](#) (AWS CLI)

To update the description for an existing inbound rule

Use one of the following commands.

- [update-security-group-rule-descriptions-ingress](#) (AWS CLI)
- [Update-EC2SecurityGroupRuleIngressDescription](#) (AWS Tools for Windows PowerShell)

To update the description for an existing outbound rule

Use one of the following commands.

- [update-security-group-rule-descriptions-egress](#) (AWS CLI)
- [Update-EC2SecurityGroupRuleEgressDescription](#) (AWS Tools for Windows PowerShell)

To tag a security group rule

Use one of the following commands.

- [create-tags](#) (AWS CLI)
- [New-EC2Tag](#) (AWS Tools for Windows PowerShell)

Delete rules from a security group

When you delete a rule from a security group, the change is automatically applied to any instances associated with the security group.

You can delete rules from a security group using one of the following methods.

New console

To delete a security group rule

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Security Groups**.
3. Select the security group to update, choose **Actions**, and then choose **Edit inbound rules** to remove an inbound rule or **Edit outbound rules** to remove an outbound rule.
4. Choose the **Delete** button to the right of the rule to delete.
5. Choose **Preview changes, Confirm**.

Old console

To delete a security group rule

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select a security group.
4. On the **Inbound** tab (for inbound rules) or **Outbound** tab (for outbound rules), choose **Edit**. Choose **Delete** (a cross icon) next to each rule to delete.
5. Choose **Save**.

Command line

To remove one or more ingress rules from a security group

Use one of the following commands.

- [revoke-security-group-ingress](#) (AWS CLI)
- [Revoke-EC2SecurityGroupIngress](#) (AWS Tools for Windows PowerShell)

To remove one or more egress rules from a security group

Use one of the following commands.

- [revoke-security-group-egress](#) (AWS CLI)
- [Revoke-EC2SecurityGroupEgress](#) (AWS Tools for Windows PowerShell)

Delete a security group

You can't delete a security group that is associated with an instance. You can't delete the default security group. You can't delete a security group that is referenced by a rule in another security group in the same VPC. If your security group is referenced by one of its own rules, you must delete the rule before you can delete the security group.

New console

To delete a security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Security Groups**.
3. Select the security group to delete and choose **Actions, Delete security group, Delete**.

Old console

To delete a security group

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Security Groups**.
3. Select a security group and choose **Actions, Delete Security Group**.
4. Choose **Yes, Delete**.

Command line

To delete a security group

Use one of the following commands.

- [delete-security-group \(AWS CLI\)](#)
- [Remove-EC2SecurityGroup \(AWS Tools for Windows PowerShell\)](#)

Assign a security group to an instance

You can assign one or more security groups to an instance when you launch the instance. You can also specify one or more security groups in a launch template. The security groups will be assigned to all instances that are launched using the launch template.

- To assign a security group to an instance when you launch the instance, see [Step 6: Configure Security Group \(p. 585\)](#).
- To specify a security group in a launch template, see Step 6 of [Create a new launch template using parameters you define \(p. 596\)](#).

Change an instance's security group

After you launch an instance, you can change its security groups by adding or removing security groups. You can change the security groups when the instance is in the `running` or `stopped` state.

New console

To change the security groups for an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance, and then choose **Actions, Security, Change security groups**.
4. For **Associated security groups**, select a security group from the list and choose **Add security group**.

To remove an already associated security group, choose **Remove** for that security group.
5. Choose **Save**.

Old console

To change the security groups for an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select your instance, and then choose **Actions, Networking, Change Security Groups**.
4. To add one or more security groups, select its check box.

To remove an already associated security group, clear its check box.

5. Choose **Assign Security Groups**.

Command line

To change the security groups for an instance using the command line

Use one of the following commands.

- [modify-instance-attribute](#) (AWS CLI)
- [Edit-EC2InstanceAttribute](#) (AWS Tools for Windows PowerShell)

Security group rules for different use cases

You can create a security group and add rules that reflect the role of the instance that's associated with the security group. For example, an instance that's configured as a web server needs security group rules that allow inbound HTTP and HTTPS access. Likewise, a database instance needs rules that allow access for the type of database, such as access over port 3306 for MySQL.

The following are examples of the kinds of rules that you can add to security groups for specific kinds of access.

Examples

- [Web server rules \(p. 1340\)](#)
- [Database server rules \(p. 1341\)](#)
- [Rules to connect to instances from your computer \(p. 1342\)](#)
- [Rules to connect to instances from an instance with the same security group \(p. 1342\)](#)
- [Rules for ping/ICMP \(p. 1342\)](#)
- [DNS server rules \(p. 1343\)](#)
- [Amazon EFS rules \(p. 1343\)](#)
- [Elastic Load Balancing rules \(p. 1344\)](#)
- [VPC peering rules \(p. 1345\)](#)

Web server rules

The following inbound rules allow HTTP and HTTPS access from any IP address. If your VPC is enabled for IPv6, you can add rules to control inbound HTTP and HTTPS traffic from IPv6 addresses.

Protocol type	Protocol number	Port	Source IP	Notes
TCP	6	80 (HTTP)	0.0.0.0/0	Allows inbound HTTP access from any IPv4 address
TCP	6	443 (HTTPS)	0.0.0.0/0	Allows inbound HTTPS access from any IPv4 address
TCP	6	80 (HTTP)	::/0	Allows inbound HTTP access from any IPv6 address

Protocol type	Protocol number	Port	Source IP	Notes
TCP	6	443 (HTTPS)	::/0	Allows inbound HTTPS access from any IPv6 address

Database server rules

The following inbound rules are examples of rules you might add for database access, depending on what type of database you're running on your instance. For more information about Amazon RDS instances, see the [Amazon RDS User Guide](#).

For the source IP, specify one of the following:

- A specific IP address or range of IP addresses (in CIDR block notation) in your local network
- A security group ID for a group of instances that access the database

Protocol type	Protocol number	Port	Notes
TCP	6	1433 (MS SQL)	The default port to access a Microsoft SQL Server database, for example, on an Amazon RDS instance
TCP	6	3306 (MySQL/Aurora)	The default port to access a MySQL or Aurora database, for example, on an Amazon RDS instance
TCP	6	5439 (Redshift)	The default port to access an Amazon Redshift cluster database.
TCP	6	5432 (PostgreSQL)	The default port to access a PostgreSQL database, for example, on an Amazon RDS instance
TCP	6	1521 (Oracle)	The default port to access an Oracle database, for example, on an Amazon RDS instance

You can optionally restrict outbound traffic from your database servers. For example, you might want to allow access to the internet for software updates, but restrict all other kinds of traffic. You must first remove the default outbound rule that allows all outbound traffic.

Protocol type	Protocol number	Port	Destination IP	Notes
TCP	6	80 (HTTP)	0.0.0.0/0	Allows outbound HTTP access to any IPv4 address
TCP	6	443 (HTTPS)	0.0.0.0/0	Allows outbound HTTPS access to any IPv4 address
TCP	6	80 (HTTP)	::/0	(IPv6-enabled VPC only) Allows outbound HTTP access to any IPv6 address

Protocol type	Protocol number	Port	Destination IP	Notes
TCP	6	443 (HTTPS)	::/0	(IPv6-enabled VPC only) Allows outbound HTTPS access to any IPv6 address

Rules to connect to instances from your computer

To connect to your instance, your security group must have inbound rules that allow SSH access (for Linux instances) or RDP access (for Windows instances).

Protocol type	Protocol number	Port	Source IP
TCP	6	22 (SSH)	The public IPv4 address of your computer, or a range of IP addresses in your local network. If your VPC is enabled for IPv6 and your instance has an IPv6 address, you can enter an IPv6 address or range.
TCP	6	3389 (RDP)	The public IPv4 address of your computer, or a range of IP addresses in your local network. If your VPC is enabled for IPv6 and your instance has an IPv6 address, you can enter an IPv6 address or range.

Rules to connect to instances from an instance with the same security group

To allow instances that are associated with the same security group to communicate with each other, you must explicitly add rules for this.

The following table describes the inbound rule for a security group that enables associated instances to communicate with each other. The rule allows all types of traffic.

Protocol type	Protocol number	Ports	Source IP
-1 (All)	-1 (All)	-1 (All)	The ID of the security group.

Rules for ping/ICMP

The **ping** command is a type of ICMP traffic. To ping your instance, you must add the following inbound ICMP rule.

Protocol type	Protocol number	ICMP type	ICMP code	Source IP
ICMP	1	8 (Echo Request)	N/A	The public IPv4 address of your computer, or a range of IPv4 addresses in your local network.

To use the **ping6** command to ping the IPv6 address for your instance, you must add the following inbound ICMPv6 rule.

Protocol type	Protocol number	ICMP type	ICMP code	Source IP
ICMPv6	58	128 (Echo Request)	0	The IPv6 address of your computer, or a range of IPv6 addresses in your local network.

DNS server rules

If you've set up your EC2 instance as a DNS server, you must ensure that TCP and UDP traffic can reach your DNS server over port 53.

For the source IP, specify one of the following:

- An IP address or range of IP addresses (in CIDR block notation) in a network
- The ID of a security group for the set of instances in your network that require access to the DNS server

Protocol type	Protocol number	Port
TCP	6	53
UDP	17	53

Amazon EFS rules

If you're using an Amazon EFS file system with your Amazon EC2 instances, the security group that you associate with your Amazon EFS mount targets must allow traffic over the NFS protocol.

Protocol type	Protocol number	Ports	Source IP	Notes
TCP	6	2049 (NFS)	The ID of the security group	Allows inbound NFS access from resources (including the mount target) associated with this security group

To mount an Amazon EFS file system on your Amazon EC2 instance, you must connect to your instance. Therefore, the security group associated with your instance must have rules that allow inbound SSH from your local computer or local network.

Protocol type	Protocol number	Ports	Source IP	Notes
TCP	6	22 (SSH)	The IP address range of your local computer, or the	Allows inbound SSH access from your local computer.

Protocol type	Protocol number	Ports	Source IP	Notes
			range of IP addresses (in CIDR block notation) for your network.	

Elastic Load Balancing rules

If you're using a load balancer, the security group associated with your load balancer must have rules that allow communication with your instances or targets.

Inbound				
Protocol type	Protocol number	Port	Source IP	Notes
TCP	6	The listener port	For an Internet-facing load-balancer: 0.0.0.0/0 (all IPv4 addresses)	Allow inbound traffic on the load balancer listener port.
			For an internal load-balancer: the IPv4 CIDR block of the VPC	
Outbound				
Protocol type	Protocol number	Port	Destination IP	Notes
TCP	6	The instance listener port	The ID of the instance security group	Allow outbound traffic to instances on the instance listener port.
TCP	6	The health check port	The ID of the instance security group	Allow outbound traffic to instances on the health check port.

The security group rules for your instances must allow the load balancer to communicate with your instances on both the listener port and the health check port.

Inbound				
Protocol type	Protocol number	Port	Source IP	Notes
TCP	6	The instance listener port	The ID of the load balancer security group	Allow traffic from the load balancer on the instance listener port.
TCP	6	The health check port	The ID of the load balancer security group	Allow traffic from the load balancer on the health check port.

For more information, see [Configure security groups for your Classic Load Balancer](#) in the *User Guide for Classic Load Balancers*, and [Security groups for your Application Load Balancer](#) in the *User Guide for Application Load Balancers*.

VPC peering rules

You can update the inbound or outbound rules for your VPC security groups to reference security groups in the peered VPC. Doing so allows traffic to flow to and from instances that are associated with the referenced security group in the peered VPC. For more information about how to configure security groups for VPC peering, see [Updating your security groups to reference peer VPC groups](#).

Update management in Amazon EC2

We recommend that you regularly patch, update, and secure the operating system and applications on your EC2 instances. You can use [AWS Systems Manager Patch Manager](#) to automate the process of installing security-related updates for both the operating system and applications. Alternatively, you can use any automatic update services or recommended processes for installing updates that are provided by the application vendor.

Compliance validation for Amazon EC2

Third-party auditors assess the security and compliance of AWS services as part of multiple AWS compliance programs, such as SOC, PCI, FedRAMP, and HIPAA.

To learn whether Amazon Elastic Compute Cloud or other AWS services are in scope of specific compliance programs, see [AWS Services in Scope by Compliance Program](#). For general information, see [AWS Compliance Programs](#).

You can download third-party audit reports using AWS Artifact. For more information, see [Downloading Reports in AWS Artifact](#).

Your compliance responsibility when using AWS services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

- [Security and Compliance Quick Start Guides](#) – These deployment guides discuss architectural considerations and provide steps for deploying baseline environments on AWS that are security and compliance focused.
- [Architecting for HIPAA Security and Compliance Whitepaper](#) – This whitepaper describes how companies can use AWS to create HIPAA-compliant applications.

Note

Not all services are compliant with HIPAA.

- [AWS Compliance Resources](#) – This collection of workbooks and guides might apply to your industry and location.
- [Evaluating Resources with Rules](#) in the *AWS Config Developer Guide* – The AWS Config service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.
- [AWS Security Hub](#) – This AWS service provides a comprehensive view of your security state within AWS that helps you check your compliance with security industry standards and best practices.
- [AWS Audit Manager](#) – This AWS service helps you continuously audit your AWS usage to simplify how you manage risk and compliance with regulations and industry standards.

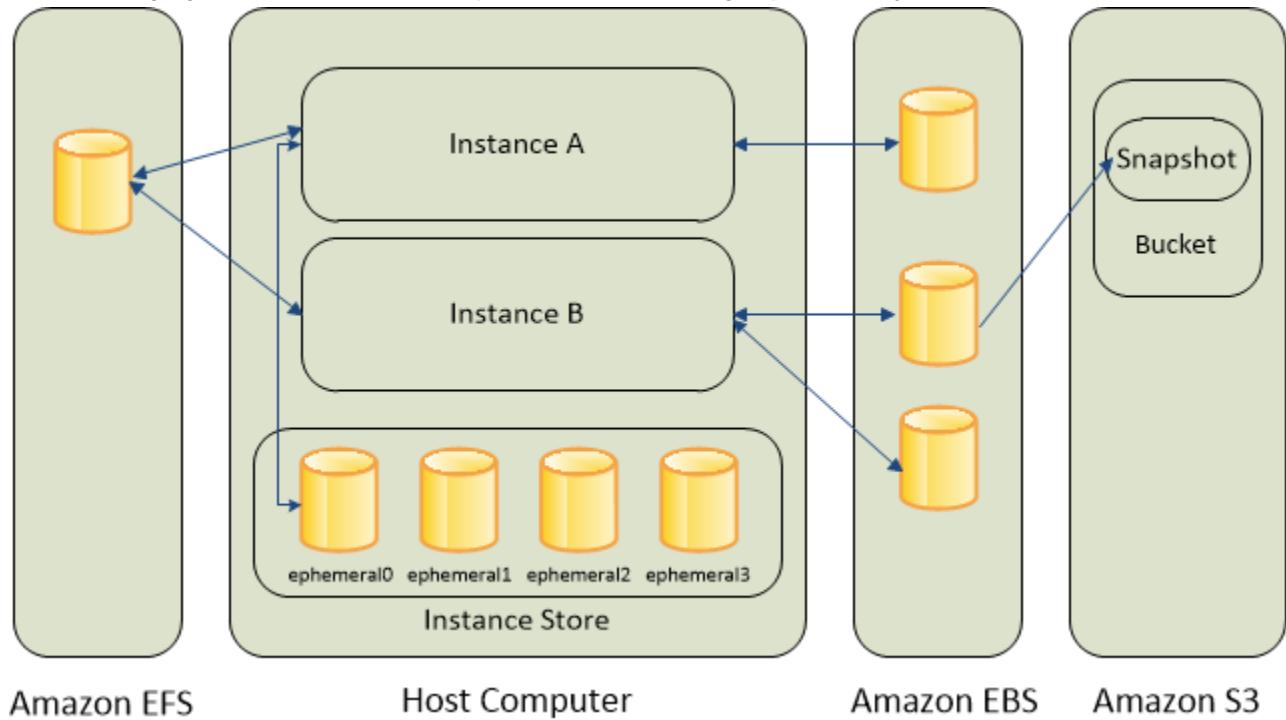

Storage

Amazon EC2 provides you with flexible, cost effective, and easy-to-use data storage options for your instances. Each option has a unique combination of performance and durability. These storage options can be used independently or in combination to suit your requirements.

After reading this section, you should have a good understanding about how you can use the data storage options supported by Amazon EC2 to meet your specific requirements. These storage options include the following:

- [Amazon Elastic Block Store \(p. 1347\)](#)
- [Amazon EC2 instance store \(p. 1620\)](#)
- [Use Amazon EFS with Amazon EC2 \(p. 1640\)](#)
- [Use Amazon S3 with Amazon EC2 \(p. 1638\)](#)

The following figure shows the relationship between these storage options and your instance.

Amazon EBS

Amazon EBS provides durable, block-level storage volumes that you can attach to a running instance. You can use Amazon EBS as a primary storage device for data that requires frequent and granular updates. For example, Amazon EBS is the recommended storage option when you run a database on an instance.

An EBS volume behaves like a raw, unformatted, external block device that you can attach to a single instance. The volume persists independently from the running life of an instance. After an EBS volume is attached to an instance, you can use it like any other physical hard drive. As illustrated in the previous figure, multiple volumes can be attached to an instance. You can also detach an EBS volume from one instance and attach it to another instance. You can dynamically change the configuration of a volume

attached to an instance. EBS volumes can also be created as encrypted volumes using the Amazon EBS encryption feature. For more information, see [Amazon EBS encryption \(p. 1542\)](#).

To keep a backup copy of your data, you can create a *snapshot* of an EBS volume, which is stored in Amazon S3. You can create an EBS volume from a snapshot, and attach it to another instance. For more information, see [Amazon Elastic Block Store \(p. 1347\)](#).

Amazon EC2 instance store

Many instances can access storage from disks that are physically attached to the host computer. This disk storage is referred to as *instance store*. Instance store provides temporary block-level storage for instances. The data on an instance store volume persists only during the life of the associated instance; if you stop, hibernate, or terminate an instance, any data on instance store volumes is lost. For more information, see [Amazon EC2 instance store \(p. 1620\)](#).

Amazon EFS file system

Amazon EFS provides scalable file storage for use with Amazon EC2. You can create an EFS file system and configure your instances to mount the file system. You can use an EFS file system as a common data source for workloads and applications running on multiple instances. For more information, see [Use Amazon EFS with Amazon EC2 \(p. 1640\)](#).

Amazon S3

Amazon S3 provides access to reliable and inexpensive data storage infrastructure. It is designed to make web-scale computing easier by enabling you to store and retrieve any amount of data, at any time, from within Amazon EC2 or anywhere on the web. For example, you can use Amazon S3 to store backup copies of your data and applications. Amazon EC2 uses Amazon S3 to store EBS snapshots and instance store-backed AMIs. For more information, see [Use Amazon S3 with Amazon EC2 \(p. 1638\)](#).

Adding storage

Every time you launch an instance from an AMI, a root storage device is created for that instance. The root storage device contains all the information necessary to boot the instance. You can specify storage volumes in addition to the root device volume when you create an AMI or launch an instance using *block device mapping*. For more information, see [Block device mappings \(p. 1654\)](#).

You can also attach EBS volumes to a running instance. For more information, see [Attach an Amazon EBS volume to an instance \(p. 1375\)](#).

Storage pricing

For information about storage pricing, open [AWS Pricing](#), scroll down to **Services Pricing**, choose **Storage**, and then choose the storage option to open that storage option's pricing page. For information about estimating the cost of storage, see the [AWS Pricing Calculator](#).

Amazon Elastic Block Store (Amazon EBS)

Amazon Elastic Block Store (Amazon EBS) provides block level storage volumes for use with EC2 instances. EBS volumes behave like raw, unformatted block devices. You can mount these volumes as devices on your instances. EBS volumes that are attached to an instance are exposed as storage volumes that persist independently from the life of the instance. You can create a file system on top of these volumes, or use them in any way you would use a block device (such as a hard drive). You can dynamically change the configuration of a volume attached to an instance.

We recommend Amazon EBS for data that must be quickly accessible and requires long-term persistence. EBS volumes are particularly well-suited for use as the primary storage for file systems, databases, or for any applications that require fine granular updates and access to raw, unformatted, block-level storage. Amazon EBS is well suited to both database-style applications that rely on random reads and writes, and to throughput-intensive applications that perform long, continuous reads and writes.

With Amazon EBS, you pay only for what you use. For more information about Amazon EBS pricing, see the Projecting Costs section of the [Amazon Elastic Block Store page](#).

Contents

Features of Amazon EBS

- You create an EBS volume in a specific Availability Zone, and then attach it to an instance in that same Availability Zone. To make a volume available outside of the Availability Zone, you can create a snapshot and restore that snapshot to a new volume anywhere in that Region. You can copy snapshots to other Regions and then restore them to new volumes there, making it easier to leverage multiple AWS Regions for geographical expansion, data center migration, and disaster recovery.
- Amazon EBS provides the following volume types: General Purpose SSD, Provisioned IOPS SSD, Throughput Optimized HDD, and Cold HDD. For more information, see [EBS volume types \(p. 1352\)](#).

The following is a summary of performance and use cases for each volume type.

- General Purpose SSD volumes (`gp2` and `gp3`) balance price and performance for a wide variety of transactional workloads. These volumes are ideal for use cases such as boot volumes, medium-size single instance databases, and development and test environments.
- Provisioned IOPS SSD volumes (`io1` and `io2`) are designed to meet the needs of I/O-intensive workloads that are sensitive to storage performance and consistency. They provide a consistent IOPS rate that you specify when you create the volume. This enables you to predictably scale to tens of thousands of IOPS per instance. Additionally, `io2` volumes provide the highest levels of volume durability.
- Throughput Optimized HDD volumes (`st1`) provide low-cost magnetic storage that defines performance in terms of throughput rather than IOPS. These volumes are ideal for large, sequential workloads such as Amazon EMR, ETL, data warehouses, and log processing.
- Cold HDD volumes (`sc1`) provide low-cost magnetic storage that defines performance in terms of throughput rather than IOPS. These volumes are ideal for large, sequential, cold-data workloads. If you require infrequent access to your data and are looking to save costs, these volumes provides inexpensive block storage.
- You can create your EBS volumes as encrypted volumes, in order to meet a wide range of data-at-rest encryption requirements for regulated/audited data and applications. When you create an encrypted EBS volume and attach it to a supported instance type, data stored at rest on the volume, disk I/O, and snapshots created from the volume are all encrypted. The encryption occurs on the servers that host EC2 instances, providing encryption of data-in-transit from EC2 instances to EBS storage. For more information, see [Amazon EBS encryption \(p. 1542\)](#).
- You can create point-in-time snapshots of EBS volumes, which are persisted to Amazon S3. Snapshots protect data for long-term durability, and they can be used as the starting point for new EBS volumes.

The same snapshot can be used to instantiate as many volumes as you wish. These snapshots can be copied across AWS Regions. For more information, see [Amazon EBS snapshots \(p. 1403\)](#).

- Performance metrics, such as bandwidth, throughput, latency, and average queue length, are available through the AWS Management Console. These metrics, provided by Amazon CloudWatch, allow you to monitor the performance of your volumes to make sure that you are providing enough performance for your applications without paying for resources you don't need. For more information, see [Amazon EBS volume performance on Linux instances \(p. 1588\)](#).

Amazon EBS volumes

An Amazon EBS volume is a durable, block-level storage device that you can attach to your instances. After you attach a volume to an instance, you can use it as you would use a physical hard drive. EBS volumes are flexible. For current-generation volumes attached to current-generation instance types, you can dynamically increase size, modify the provisioned IOPS capacity, and change volume type on live production volumes.

You can use EBS volumes as primary storage for data that requires frequent updates, such as the system drive for an instance or storage for a database application. You can also use them for throughput-intensive applications that perform continuous disk scans. EBS volumes persist independently from the running life of an EC2 instance.

You can attach multiple EBS volumes to a single instance. The volume and instance must be in the same Availability Zone. Depending on the volume and instance types, you can use [Multi-Attach \(p. 1377\)](#) to mount a volume to multiple instances at the same time.

Amazon EBS provides the following volume types: General Purpose SSD (gp2 and gp3), Provisioned IOPS SSD (io1 and io2), Throughput Optimized HDD (st1), Cold HDD (sc1), and Magnetic (standard). They differ in performance characteristics and price, allowing you to tailor your storage performance and cost to the needs of your applications. For more information, see [Amazon EBS volume types \(p. 1352\)](#).

Your account has a limit on the number of EBS volumes that you can use, and the total storage available to you. For more information about these limits, and how to request an increase in your limits, see [Amazon EC2 service quotas \(p. 1706\)](#).

For more information about pricing, see [Amazon EBS Pricing](#).

- [Flexibility \(p. 1352\)](#)

Data availability

When you create an EBS volume, it is automatically replicated within its Availability Zone to prevent data loss due to failure of any single hardware component. You can attach an EBS volume to any EC2 instance in the same Availability Zone. After you attach a volume, it appears as a native block device similar to a hard drive or other physical device. At that point, the instance can interact with the volume just as it would with a local drive. You can connect to the instance and format the EBS volume with a file system, such as ext3, and then install applications.

If you attach multiple volumes to a device that you have named, you can stripe data across the volumes for increased I/O and throughput performance.

You can attach `io1` and `io2` EBS volumes to up to 16 Nitro-based instances. For more information, see [Attach a volume to multiple instances with Amazon EBS Multi-Attach \(p. 1377\)](#). Otherwise, you can attach an EBS volume to a single instance.

You can get monitoring data for your EBS volumes, including root device volumes for EBS-backed instances, at no additional charge. For more information about monitoring metrics, see [Amazon CloudWatch metrics for Amazon EBS \(p. 1603\)](#). For information about tracking the status of your volumes, see [Amazon CloudWatch Events for Amazon EBS \(p. 1609\)](#).

Data persistence

An EBS volume is off-instance storage that can persist independently from the life of an instance. You continue to pay for the volume usage as long as the data persists.

EBS volumes that are attached to a running instance can automatically detach from the instance with their data intact when the instance is terminated if you uncheck the **Delete on Termination** check box when you configure EBS volumes for your instance on the EC2 console. The volume can then be reattached to a new instance, enabling quick recovery. If the check box for **Delete on Termination** is checked, the volume(s) will delete upon termination of the EC2 instance. If you are using an EBS-backed instance, you can stop and restart that instance without affecting the data stored in the attached volume. The volume remains attached throughout the stop-start cycle. This enables you to process and store the data on your volume indefinitely, only using the processing and storage resources when required. The data persists on the volume until the volume is deleted explicitly. The physical block storage used by deleted EBS volumes is overwritten with zeroes before it is allocated to another account. If you are dealing with sensitive data, you should consider encrypting your data manually or storing the data on a volume protected by Amazon EBS encryption. For more information, see [Amazon EBS encryption \(p. 1542\)](#).

By default, the root EBS volume that is created and attached to an instance at launch is deleted when that instance is terminated. You can modify this behavior by changing the value of the flag `DeleteOnTermination` to `false` when you launch the instance. This modified value causes the volume to persist even after the instance is terminated, and enables you to attach the volume to another instance.

By default, additional EBS volumes that are created and attached to an instance at launch are not deleted when that instance is terminated. You can modify this behavior by changing the value of the flag

`DeleteOnTermination` to `true` when you launch the instance. This modified value causes the volumes to be deleted when the instance is terminated.

Data encryption

For simplified data encryption, you can create encrypted EBS volumes with the Amazon EBS encryption feature. All EBS volume types support encryption. You can use encrypted EBS volumes to meet a wide range of data-at-rest encryption requirements for regulated/audited data and applications. Amazon EBS encryption uses 256-bit Advanced Encryption Standard algorithms (AES-256) and an Amazon-managed key infrastructure. The encryption occurs on the server that hosts the EC2 instance, providing encryption of data-in-transit from the EC2 instance to Amazon EBS storage. For more information, see [Amazon EBS encryption \(p. 1542\)](#).

Amazon EBS encryption uses AWS Key Management Service (AWS KMS) master keys when creating encrypted volumes and any snapshots created from your encrypted volumes. The first time you create an encrypted EBS volume in a region, a default master key is created for you automatically. This key is used for Amazon EBS encryption unless you select a customer master key (CMK) that you created separately using AWS KMS. Creating your own CMK gives you more flexibility, including the ability to create, rotate, disable, define access controls, and audit the encryption keys used to protect your data. For more information, see the [AWS Key Management Service Developer Guide](#).

Data security

Amazon EBS volumes are presented to you as raw, unformatted block devices. These devices are logical devices that are created on the EBS infrastructure and the Amazon EBS service ensures that the devices are logically empty (that is, the raw blocks are zeroed or they contain cryptographically pseudorandom data) prior to any use or re-use by a customer.

If you have procedures that require that all data be erased using a specific method, either after or before use (or both), such as those detailed in [DoD 5220.22-M](#) (National Industrial Security Program Operating Manual) or [NIST 800-88](#) (Guidelines for Media Sanitization), you have the ability to do so on Amazon EBS. That block-level activity will be reflected down to the underlying storage media within the Amazon EBS service.

Snapshots

Amazon EBS provides the ability to create snapshots (backups) of any EBS volume and write a copy of the data in the volume to Amazon S3, where it is stored redundantly in multiple Availability Zones. The volume does not need to be attached to a running instance in order to take a snapshot. As you continue to write data to a volume, you can periodically create a snapshot of the volume to use as a baseline for new volumes. These snapshots can be used to create multiple new EBS volumes or move volumes across Availability Zones. Snapshots of encrypted EBS volumes are automatically encrypted.

When you create a new volume from a snapshot, it's an exact copy of the original volume at the time the snapshot was taken. EBS volumes that are created from encrypted snapshots are automatically encrypted. By optionally specifying a different Availability Zone, you can use this functionality to create a duplicate volume in that zone. The snapshots can be shared with specific AWS accounts or made public. When you create snapshots, you incur charges in Amazon S3 based on the volume's total size. For a successive snapshot of the volume, you are only charged for any additional data beyond the volume's original size.

Snapshots are incremental backups, meaning that only the blocks on the volume that have changed after your most recent snapshot are saved. If you have a volume with 100 GiB of data, but only 5 GiB of data have changed since your last snapshot, only the 5 GiB of modified data is written to Amazon S3. Even though snapshots are saved incrementally, the snapshot deletion process is designed so that you need to retain only the most recent snapshot.

To help categorize and manage your volumes and snapshots, you can tag them with metadata of your choice. For more information, see [Tag your Amazon EC2 resources \(p. 1692\)](#).

To back up your volumes automatically, you can use [Amazon Data Lifecycle Manager \(p. 1485\)](#) or [AWS Backup](#).

Flexibility

EBS volumes support live configuration changes while in production. You can modify volume type, volume size, and IOPS capacity without service interruptions. For more information, see [Amazon EBS Elastic Volumes \(p. 1529\)](#).

Amazon EBS volume types

Amazon EBS provides the following volume types, which differ in performance characteristics and price, so that you can tailor your storage performance and cost to the needs of your applications. The volume types fall into these categories:

- [Solid state drives \(SSD\) \(p. 1352\)](#) — Optimized for transactional workloads involving frequent read/write operations with small I/O size, where the dominant performance attribute is IOPS.
- [Hard disk drives \(HDD\) \(p. 1353\)](#) — Optimized for large streaming workloads where the dominant performance attribute is throughput.
- [Previous generation \(p. 1354\)](#) — Hard disk drives that can be used for workloads with small datasets where data is accessed infrequently and performance is not of primary importance. We recommend that you consider a current generation volume type instead.

There are several factors that can affect the performance of EBS volumes, such as instance configuration, I/O characteristics, and workload demand. To fully use the IOPS provisioned on an EBS volume, use [EBS-optimized instances \(p. 1562\)](#). For more information about getting the most out of your EBS volumes, see [Amazon EBS volume performance on Linux instances \(p. 1588\)](#).

For more information about pricing, see [Amazon EBS Pricing](#).

Solid state drives (SSD)

The SSD-backed volumes provided by Amazon EBS fall into these categories:

- General Purpose SSD — Provides a balance of price and performance. We recommend these volumes for most workloads.
- Provisioned IOPS SSD — Provides high performance for mission-critical, low-latency, or high-throughput workloads.

The following is a summary of the use cases and characteristics of SSD-backed volumes. For information about the maximum IOPS and throughput per instance, see [Amazon EBS-optimized instances \(p. 1562\)](#).

	General Purpose SSD		Provisioned IOPS SSD		
Volume type	gp3	gp2	io2 Block Express ‡	io2	io1
Durability	99.8% - 99.9% durability (0.1% - 0.2% annual failure rate)	99.8% - 99.9% durability (0.1% - 0.2% annual failure rate)	99.999% durability (0.001% annual failure rate)	99.999% durability (0.001% annual failure rate)	99.8% - 99.9% durability (0.1% - 0.2% annual failure rate)
Use cases	<ul style="list-style-type: none">• Low-latency interactive apps• Development and test environments		Workloads that require:	<ul style="list-style-type: none">• Workloads that require sustained IOPS performance or more than 16,000 IOPS	

	General Purpose SSD		Provisioned IOPS SSD	
			<ul style="list-style-type: none"> Sub-millisecond latency Sustained IOPS performance More than 64,000 IOPS or 1,000 MiB/s of throughput 	<ul style="list-style-type: none"> I/O-intensive database workloads
Volume size	1 GiB - 16 TiB		4 GiB - 64 TiB	4 GiB - 16 TiB
Max IOPS per volume (16 KiB I/O)	16,000		256,000	64,000 †
Max throughput per volume	1,000 MiB/s	250 MiB/s *	4,000 MiB/s	1,000 MiB/s †
Amazon EBS Multi-attach	Not supported		Supported	
Boot volume	Supported			

* The throughput limit is between 128 MiB/s and 250 MiB/s, depending on the volume size. Volumes smaller than or equal to 170 GiB deliver a maximum throughput of 128 MiB/s. Volumes larger than 170 GiB but smaller than 334 GiB deliver a maximum throughput of 250 MiB/s if burst credits are available. Volumes larger than or equal to 334 GiB deliver 250 MiB/s regardless of burst credits. gp2 volumes that were created before December 3, 2018 and that have not been modified since creation might not reach full performance unless you [modify the volume \(p. 1529\)](#).

† Maximum IOPS and throughput are guaranteed only on [Instances built on the Nitro System \(p. 247\)](#) provisioned with more than 32,000 IOPS. Other instances guarantee up to 32,000 IOPS and 500 MiB/s. io1 volumes that were created before December 6, 2017 and that have not been modified since creation might not reach full performance unless you [modify the volume \(p. 1529\)](#).

‡ io2 Block Express volumes are supported with R5b instances only. io2 volumes attached to an R5b instance during or after launch automatically run on Block Express. For more information, see [io2 Block Express volumes \(p. 1359\)](#).

Hard disk drives (HDD)

The HDD-backed volumes provided by Amazon EBS fall into these categories:

- Throughput Optimized HDD — A low-cost HDD designed for frequently accessed, throughput-intensive workloads.

- Cold HDD — The lowest-cost HDD design for less frequently accessed workloads.

The following is a summary of the use cases and characteristics of HDD-backed volumes. For information about the maximum IOPS and throughput per instance, see [Amazon EBS-optimized instances \(p. 1562\)](#).

	Throughput Optimized HDD	Cold HDD
Volume type	st1	sc1

Use cases	<ul style="list-style-type: none"> • Big data • Data warehouses • Log processing 	<ul style="list-style-type: none"> • Throughput-oriented storage for data that is infrequently accessed • Scenarios where the lowest storage cost is important
Volume size	125 GiB - 16 TiB	125 GiB - 16 TiB
Max IOPS per volume (1 MiB I/O)	500	250
Max throughput per volume	500 MiB/s	250 MiB/s
Amazon EBS Multi-attach	Not supported	Not supported
Boot volume	Not supported	Not supported

Previous generation volume types

The following table describes previous-generation EBS volume types. If you need higher performance or performance consistency than previous-generation volumes can provide, we recommend that you consider using General Purpose SSD (gp2 and gp3) or other current volume types. For more information, see [Previous Generation Volumes](#).

	Magnetic
Volume type	standard
Use cases	Workloads where data is infrequently accessed
Volume size	1 GiB-1 TiB
Max IOPS per volume	40–200
Max throughput per volume	40–90 MiB/s
Boot volume	Supported

General Purpose SSD volumes (gp3)

General Purpose SSD (gp3) volumes offer cost-effective storage that is ideal for a broad range of workloads. These volumes deliver a consistent baseline rate of 3,000 IOPS and 125 MiB/s, included with

the price of storage. You can provision additional IOPS (up to 16,000) and throughput (up to 1,000 MiB/s) for an additional cost.

The maximum ratio of provisioned IOPS to provisioned volume size is 500 IOPS per GiB. The maximum ratio of provisioned throughput to provisioned IOPS is .25 MiB/s per IOPS. The following volume configurations support provisioning either maximum IOPS or maximum throughput:

- 32 GiB or larger: $500 \text{ IOPS/GiB} \times 32 \text{ GiB} = 16,000 \text{ IOPS}$
- 8 GiB or larger and 4,000 IOPS or higher: $4,000 \text{ IOPS} \times 0.25 \text{ MiB/s/IOPS} = 1,000 \text{ MiB/s}$

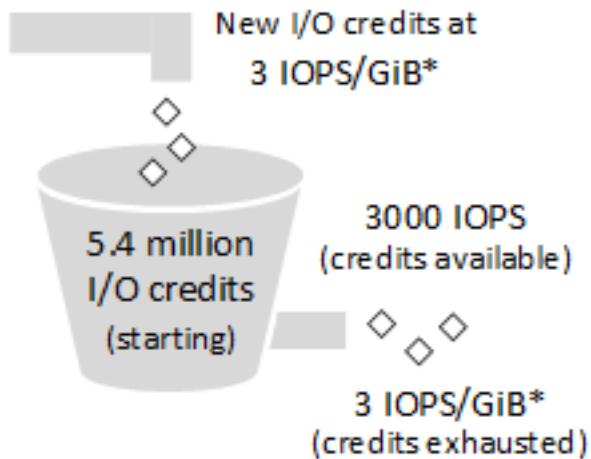

General Purpose SSD volumes (gp2)

General Purpose SSD (gp2) volumes offer cost-effective storage that is ideal for a broad range of workloads. These volumes deliver single-digit millisecond latencies and the ability to burst to 3,000 IOPS for extended periods of time. Between a minimum of 100 IOPS (at 33.33 GiB and below) and a maximum of 16,000 IOPS (at 5,334 GiB and above), baseline performance scales linearly at 3 IOPS per GiB of volume size. AWS designs gp2 volumes to deliver their provisioned performance 99% of the time. A gp2 volume can range in size from 1 GiB to 16 TiB.

I/O Credits and burst performance

The performance of gp2 volumes is tied to volume size, which determines the baseline performance level of the volume and how quickly it accumulates I/O credits; larger volumes have higher baseline performance levels and accumulate I/O credits faster. I/O credits represent the available bandwidth that your gp2 volume can use to burst large amounts of I/O when more than the baseline performance is needed. The more credits your volume has for I/O, the more time it can burst beyond its baseline performance level and the better it performs when more performance is needed. The following diagram shows the burst-bucket behavior for gp2.

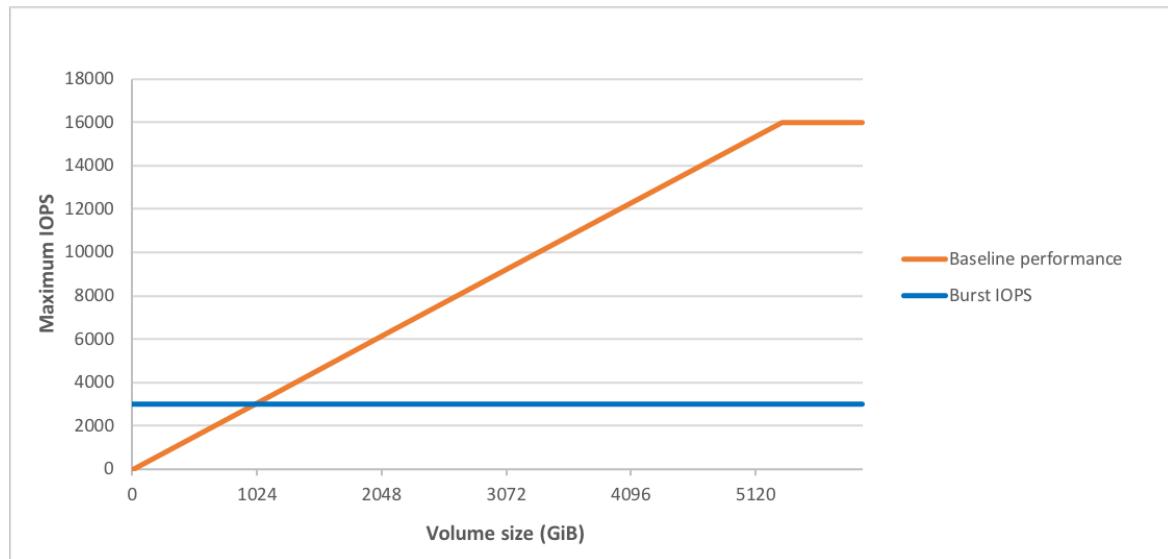

GP2 burst bucket

* Scaling linearly between minimum 100 IOPS and maximum 16,000 IOPS

Each volume receives an initial I/O credit balance of 5.4 million I/O credits, which is enough to sustain the maximum burst performance of 3,000 IOPS for at least 30 minutes. This initial credit balance is designed to provide a fast initial boot cycle for boot volumes and to provide a good bootstrapping

experience for other applications. Volumes earn I/O credits at the baseline performance rate of 3 IOPS per GiB of volume size. For example, a 100 GiB gp2 volume has a baseline performance of 300 IOPS.

When your volume requires more than the baseline performance I/O level, it draws on I/O credits in the credit balance to burst to the required performance level, up to a maximum of 3,000 IOPS. When your volume uses fewer I/O credits than it earns in a second, unused I/O credits are added to the I/O credit balance. The maximum I/O credit balance for a volume is equal to the initial credit balance (5.4 million I/O credits).

When the baseline performance of a volume is higher than maximum burst performance, I/O credits are never spent. If the volume is attached to an instance built on the [Nitro System \(p. 247\)](#), the burst balance is not reported. For other instances, the reported burst balance is 100%.

The burst duration of a volume is dependent on the size of the volume, the burst IOPS required, and the credit balance when the burst begins. This is shown in the following equation:

$$\text{Burst duration} = \frac{(\text{Credit balance})}{(\text{Burst IOPS}) - 3(\text{Volume size in GiB})}$$

The following table lists several volume sizes and the associated baseline performance of the volume (which is also the rate at which it accumulates I/O credits), the burst duration at the 3,000 IOPS maximum (when starting with a full credit balance), and the time in seconds that the volume would take to refill an empty credit balance.

Volume size (GiB)	Baseline performance (IOPS)	Burst duration when driving sustained 3,000 IOPS (second)	Seconds to fill empty credit balance when driving no IO
1	100	1,802	54,000
100	300	2,000	18,000
250	750	2,400	7,200
334 (Min. size for max throughput)	1,002	2,703	5,389
500	1,500	3,600	3,600

Volume size (GiB)	Baseline performance (IOPS)	Burst duration when driving sustained 3,000 IOPS (second)	Seconds to fill empty credit balance when driving no IO
750	2,250	7,200	2,400
1,000	3,000	N/A*	N/A*
5,334 (Min. size for max IOPS)	16,000	N/A*	N/A*
16,384 (16 TiB, max volume size)	16,000	N/A*	N/A*

* The baseline performance of the volume exceeds the maximum burst performance.

What happens if I empty my I/O credit balance?

If your gp2 volume uses all of its I/O credit balance, the maximum IOPS performance of the volume remains at the baseline IOPS performance level (the rate at which your volume earns credits) and the volume's maximum throughput is reduced to the baseline IOPS multiplied by the maximum I/O size. Throughput can never exceed 250 MiB/s. When I/O demand drops below the baseline level and unused credits are added to the I/O credit balance, the maximum IOPS performance of the volume again exceeds the baseline. For example, a 100 GiB gp2 volume with an empty credit balance has a baseline performance of 300 IOPS and a throughput limit of 75 MiB/s (300 I/O operations per second * 256 KiB per I/O operation = 75 MiB/s). The larger a volume is, the greater the baseline performance is and the faster it replenishes the credit balance. For more information about how IOPS are measured, see [I/O characteristics and monitoring \(p. 1590\)](#).

If you notice that your volume performance is frequently limited to the baseline level (due to an empty I/O credit balance), you should consider switching to a gp3 volume.

For information about using CloudWatch metrics and alarms to monitor your burst bucket balance, see [Monitor the burst bucket balance for volumes \(p. 1368\)](#).

Throughput performance

Throughput for a gp2 volume can be calculated using the following formula, up to the throughput limit of 250 MiB/s:

$$\text{Throughput in MiB/s} = ((\text{Volume size in GiB}) \times (\text{IOPS per GiB}) \times (\text{I/O size in KiB}))$$

Assuming V = volume size, I = I/O size, R = I/O rate, and T = throughput, this can be simplified to:

$$T = VIR$$

The smallest volume size that achieves the maximum throughput is given by:

$$\begin{aligned} V &= \frac{T}{I \cdot R} \\ &= \frac{250 \text{ MiB/s}}{(256 \text{ KiB})(3 \text{ IOPS/GiB})} \\ &= [(250)(2^{20})(\text{Bytes})]/s \end{aligned}$$

```
= -----  
      (256)(2^10)(Bytes)([3 IOP/s]/[(2^30)(Bytes)])  
  
= -----  
      (250)(2^20)(2^30)(Bytes)  
= -----  
      (256)(2^10)(3)  
  
= 357,913,941,333 Bytes  
  
= 333# GiB (334 GiB in practice because volumes are provisioned in whole gibibytes)
```

Provisioned IOPS SSD volumes

Provisioned IOPS SSD (`io1` and `io2`) volumes are designed to meet the needs of I/O-intensive workloads, particularly database workloads, that are sensitive to storage performance and consistency. Provisioned IOPS SSD volumes use a consistent IOPS rate, which you specify when you create the volume, and Amazon EBS delivers the provisioned performance 99.9 percent of the time.

`io1` volumes are designed to provide 99.8 to 99.9 percent volume durability with an annual failure rate (AFR) no higher than 0.2 percent, which translates to a maximum of two volume failures per 1,000 running volumes over a one-year period. `io2` volumes are designed to provide 99.999 percent volume durability with an AFR no higher than 0.001 percent, which translates to a single volume failure per 100,000 running volumes over a one-year period.

Provisioned IOPS SSD `io1` and `io2` volumes are available for all Amazon EC2 instance types. Provisioned IOPS SSD `io2` volumes attached to R5b instances run on EBS Block Express. For more information, see [io2 Block Express volumes](#).

Considerations for `io2` volumes

- Keep the following in mind when **launching instances with `io2` volumes**:
 - If you launch an R5b instance with an `io2` volume, the volume automatically runs on [Block Express \(p. 1359\)](#), regardless of the volume's size and IOPS.
 - You can't launch an instance type that does not support [Block Express \(p. 1359\)](#) with an `io2` volume that has a size greater than 16 TiB or IOPS greater than 64,000.
 - You can't launch an R5b instance with an encrypted `io2` volume that has a size greater than 16 TiB or IOPS greater than 64,000 from an unencrypted AMI or a shared encrypted AMI. In this case, you must first create an encrypted AMI in your account and then use that AMI to launch the instance.
- Keep the following in mind when **creating `io2` volumes**:
 - If you create an `io2` volume with a size greater than 16 TiB or IOPS greater than 64,000 in a Region where [Block Express \(p. 1359\)](#) is supported, the volume automatically runs on Block Express.
 - You can't create an `io2` volume with a size greater than 16 TiB or IOPS greater than 64,000 in a Region where [Block Express \(p. 1359\)](#) is not supported.
 - If you create an `io2` volume with a size of 16 TiB or less and IOPS of 64,000 or less in a Region where [Block Express \(p. 1359\)](#) is supported, the volume does not run on Block Express.
 - You can't create an encrypted `io2` volume that has a size greater than 16 TiB or IOPS greater than 64,000 from an unencrypted snapshot or a shared encrypted snapshot. In this case, you must first create an encrypted snapshot in your account and then use that snapshot to create the volume.
- Keep the following in mind when **attaching `io2` volumes** to instances:
 - If you attach an `io2` volume to an R5b instance, the volume automatically runs on [Block Express \(p. 1359\)](#). It can take up to 48 hours to optimize the volume for Block Express. During this time, the volume provides `io2` latency. After the volume has been optimized, it provides the sub-millisecond latency supported by Block Express.
 - You can't attach an `io2` volume with a size greater than 16 TiB or IOPS greater than 64,000 to an instance type that does not support [Block Express \(p. 1359\)](#).

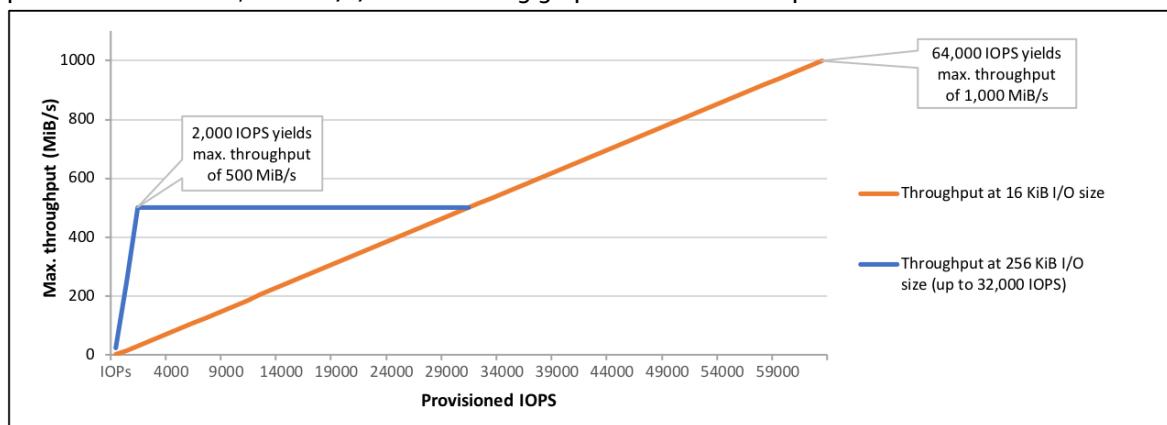

- If you detach an **io2** volume with a size of 16 TiB or less and IOPS of 64,000 or less from an R5b instance and attach it to an instance type that does not support [Block Express \(p. 1359\)](#), the volume no longer runs on Block Express and it provides **io2** latency.
- Keep the following in mind when **modifying io2 volumes**:
 - You can't modify an **io2** volume and increase its size beyond 16 TiB or its IOPS beyond 64,000 while it is attached to an instance type that does not support [Block Express \(p. 1359\)](#).
 - You can't modify the size or provisioned IOPS of an **io2** volume that is attached to an R5b instance.

Performance

Provisioned IOPS SSD volumes can range in size from 4 GiB to 16 TiB and you can provision from 100 IOPS up to 64,000 IOPS per volume. You can achieve up to 64,000 IOPS only on [Instances built on the Nitro System \(p. 247\)](#). On other instance families you can achieve performance up to 32,000 IOPS. The maximum ratio of provisioned IOPS to requested volume size (in GiB) is 50:1 for **io1** volumes, and 500:1 for **io2** volumes. For example, a 100 GiB **io1** volume can be provisioned with up to 5,000 IOPS, while a 100 GiB **io2** volume can be provisioned with up to 50,000 IOPS. On a supported instance type, the following volume sizes allow provisioning up to the 64,000 IOPS maximum:

- **io1** volume 1,280 GiB in size or greater ($50 \times 1,280 \text{ GiB} = 64,000 \text{ IOPS}$)
- **io2** volume 128 GiB in size or greater ($500 \times 128 \text{ GiB} = 64,000 \text{ IOPS}$)

Provisioned IOPS SSD volumes provisioned with up to 32,000 IOPS support a maximum I/O size of 256 KiB and yield as much as 500 MiB/s of throughput. With the I/O size at the maximum, peak throughput is reached at 2,000 IOPS. Volumes provisioned with more than 32,000 IOPS (up to the maximum of 64,000 IOPS) yield a linear increase in throughput at a rate of 16 KiB per provisioned IOPS. For example, a volume provisioned with 48,000 IOPS can support up to 750 MiB/s of throughput (16 KiB per provisioned IOPS \times 48,000 provisioned IOPS = 750 MiB/s). To achieve the maximum throughput of 1,000 MiB/s, a volume must be provisioned with 64,000 IOPS (16 KiB per provisioned IOPS \times 64,000 provisioned IOPS = 1,000 MiB/s). The following graph illustrates these performance characteristics:

Your per-I/O latency experience depends on the provisioned IOPS and on your workload profile. For the best I/O latency experience, ensure that you provision IOPS to meet the I/O profile of your workload.

io2 Block Express volumes

Note

io2 Block Express volumes are supported with R5b instances only.

io2 Block Express volumes is the next generation of Amazon EBS storage server architecture. It has been built for the purpose of meeting the performance requirements of the most demanding I/O intensive applications that run on Nitro-based Amazon EC2 instances.

Block Express architecture increases performance and scale. Block Express servers communicate with Nitro-based instances using the Scalable Reliable Datagram (SRD) networking protocol. This interface is implemented in the Nitro Card dedicated for Amazon EBS I/O function on the host hardware of the instance. It minimizes I/O delay and latency variation (network jitter), which provides faster and more consistent performance for your applications. For more information, see [io2 Block Express volumes](#).

io2 Block Express volumes are suited for workloads that benefit from a single volume that provides sub-millisecond latency, and supports higher IOPS, higher throughput, and larger capacity than io2 volumes.

io2 Block Express volumes support the same features as io2 volumes, including Multi-Attach and encryption.

Topics

- [Considerations \(p. 1360\)](#)
- [Performance \(p. 1360\)](#)
- [Quotas \(p. 1361\)](#)
- [Pricing and billing \(p. 1361\)](#)

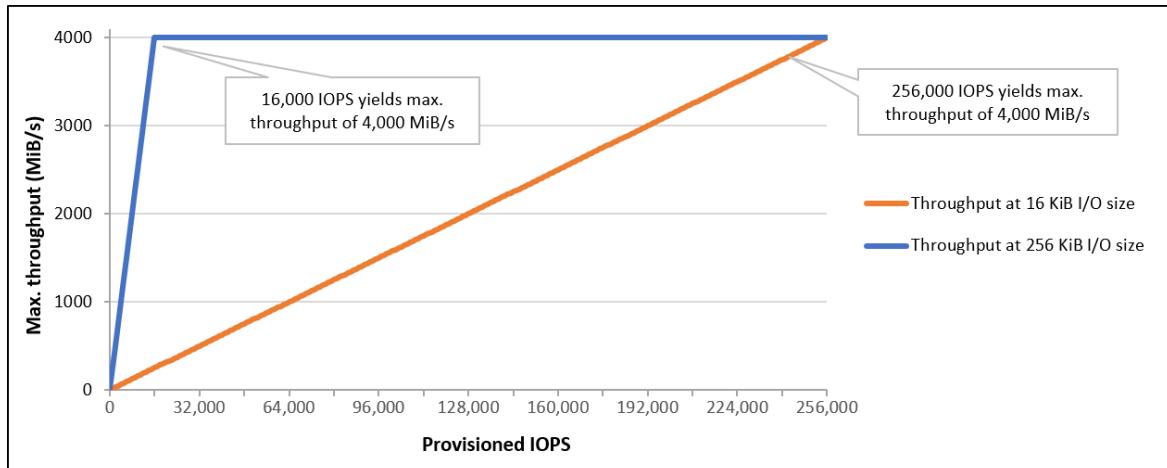

Considerations

- io2 Block Express volumes are currently supported with R5b instances only.
- io2 Block Express volumes are currently available in all Regions where R5b instances are available, including us-east-1, us-east-2, us-west-2, ap-southeast-1, ap-northeast-1, and eu-central-1. R5b instance availability might vary by Availability Zone. For more information about R5b availability, see [Find an Amazon EC2 instance type](#).
- io2 Block Express volumes do not support fast snapshot restore. We recommend that you initialize these volumes to ensure that they deliver full performance. For more information, see [Initialize Amazon EBS volumes \(p. 1593\)](#).
- io2 Block Express volumes do not support Elastic Volume operations.

Performance

With io2 Block Express volumes, you can provision volumes with:

- Sub-millisecond average latency
- Storage capacity up to 64 TiB (65,536 GiB)
- Provisioned IOPS up to 256,000, with an IOPS:GiB ratio of 1,000:1. Maximum IOPS can be provisioned with volumes 256 GiB in size and larger ($1,000 \text{ IOPS} \times 256 \text{ GiB} = 256,000 \text{ IOPS}$).
- Volume throughput up to 4,000 MiB/s. Throughput scales proportionally up to 0.256 MiB/s per provisioned IOPS. Maximum throughput can be achieved at 16,000 IOPS or higher.

Quotas

`io2` Block Express volumes adhere to the same service quotas as `io2` volumes. For more information, see [Amazon EBS quotas](#).

Pricing and billing

`io2` volumes and `io2` Block Express volumes are billed at the same rate. For more information, see [Amazon EBS pricing](#).

Usage reports do not distinguish between `io2` Block Express volumes and `io2` volumes. We recommend that you use tags to help you identify costs associated with `io2` Block Express volumes.

Throughput Optimized HDD volumes

Throughput Optimized HDD (`st1`) volumes provide low-cost magnetic storage that defines performance in terms of throughput rather than IOPS. This volume type is a good fit for large, sequential workloads such as Amazon EMR, ETL, data warehouses, and log processing. Bootable `st1` volumes are not supported.

Throughput Optimized HDD (`st1`) volumes, though similar to Cold HDD (`sc1`) volumes, are designed to support *frequently* accessed data.

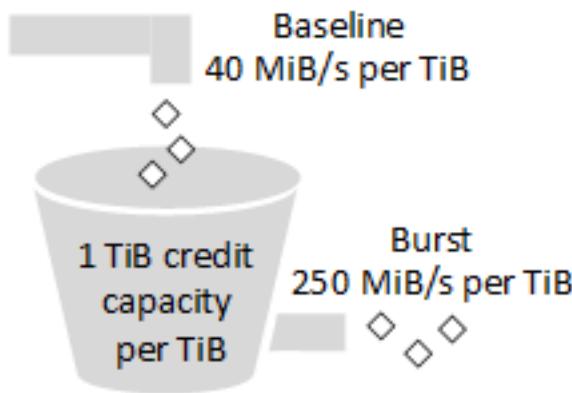

This volume type is optimized for workloads involving large, sequential I/O, and we recommend that customers with workloads performing small, random I/O use `gp2`. For more information, see [Inefficiency of small read/writes on HDD \(p. 1368\)](#).

Throughput credits and burst performance

Like `gp2`, `st1` uses a burst-bucket model for performance. Volume size determines the baseline throughput of your volume, which is the rate at which the volume accumulates throughput credits. Volume size also determines the burst throughput of your volume, which is the rate at which you can spend credits when they are available. Larger volumes have higher baseline and burst throughput. The more credits your volume has, the longer it can drive I/O at the burst level.

The following diagram shows the burst-bucket behavior for `st1`.

ST1 burst bucket

Subject to throughput and throughput-credit caps, the available throughput of an `st1` volume is expressed by the following formula:

$$(\text{Volume size}) \times (\text{Credit accumulation rate per TiB}) = \text{Throughput}$$

For a 1-TiB `st1` volume, burst throughput is limited to 250 MiB/s, the bucket fills with credits at 40 MiB/s, and it can hold up to 1 TiB-worth of credits.

Larger volumes scale these limits linearly, with throughput capped at a maximum of 500 MiB/s. After the bucket is depleted, throughput is limited to the baseline rate of 40 MiB/s per TiB.

On volume sizes ranging from 0.125 TiB to 16 TiB, baseline throughput varies from 5 MiB/s to a cap of 500 MiB/s, which is reached at 12.5 TiB as follows:

$$12.5 \text{ TiB} \times \frac{40 \text{ MiB/s}}{1 \text{ TiB}} = 500 \text{ MiB/s}$$

Burst throughput varies from 31 MiB/s to a cap of 500 MiB/s, which is reached at 2 TiB as follows:

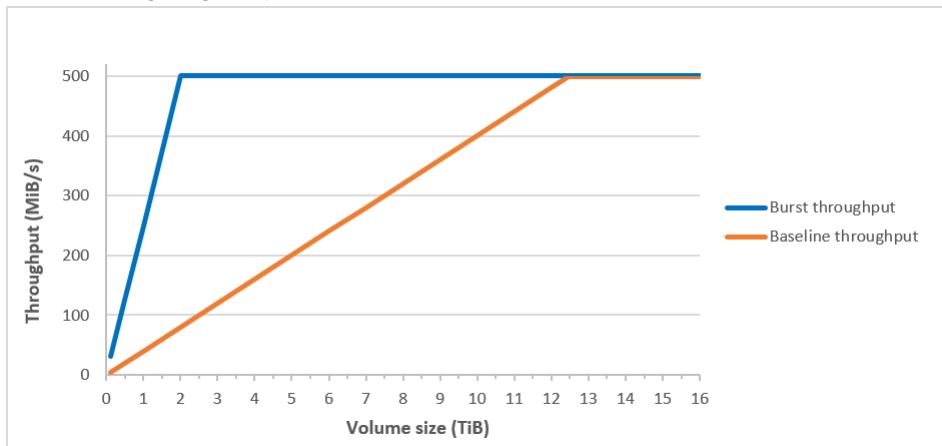

$$2 \text{ TiB} \times \frac{250 \text{ MiB/s}}{1 \text{ TiB}} = 500 \text{ MiB/s}$$

The following table states the full range of base and burst throughput values for `st1`:

Volume size (TiB)	ST1 base throughput (MiB/s)	ST1 burst throughput (MiB/s)
0.125	5	31
0.5	20	125
1	40	250
2	80	500
3	120	500

Volume size (TiB)	ST1 base throughput (MiB/s)	ST1 burst throughput (MiB/s)
4	160	500
5	200	500
6	240	500
7	280	500
8	320	500
9	360	500
10	400	500
11	440	500
12	480	500
12.5	500	500
13	500	500
14	500	500
15	500	500
16	500	500

The following diagram plots the table values:

Note

When you create a snapshot of a Throughput Optimized HDD (st1) volume, performance may drop as far as the volume's baseline value while the snapshot is in progress.

For information about using CloudWatch metrics and alarms to monitor your burst bucket balance, see [Monitor the burst bucket balance for volumes \(p. 1368\)](#).

Cold HDD volumes

Cold HDD (sc1) volumes provide low-cost magnetic storage that defines performance in terms of throughput rather than IOPS. With a lower throughput limit than st1, sc1 is a good fit for large, sequential cold-data workloads. If you require infrequent access to your data and are looking to save costs, sc1 provides inexpensive block storage. Bootable sc1 volumes are not supported.

Cold HDD (`sc1`) volumes, though similar to Throughput Optimized HDD (`st1`) volumes, are designed to support *infrequently* accessed data.

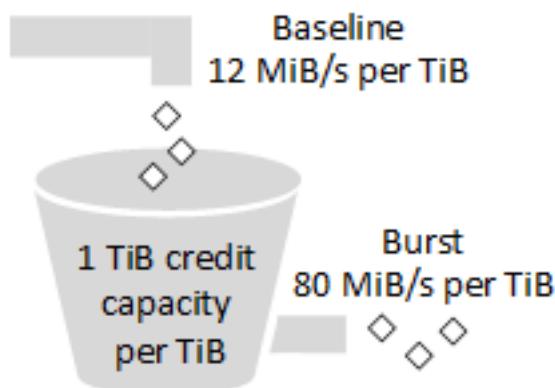

Note

This volume type is optimized for workloads involving large, sequential I/O, and we recommend that customers with workloads performing small, random I/O use `gp2`. For more information, see [Inefficiency of small read/writes on HDD \(p. 1368\)](#).

Throughput credits and burst performance

Like `gp2`, `sc1` uses a burst-bucket model for performance. Volume size determines the baseline throughput of your volume, which is the rate at which the volume accumulates throughput credits. Volume size also determines the burst throughput of your volume, which is the rate at which you can spend credits when they are available. Larger volumes have higher baseline and burst throughput. The more credits your volume has, the longer it can drive I/O at the burst level.

SC1 burst bucket

Subject to throughput and throughput-credit caps, the available throughput of an `sc1` volume is expressed by the following formula:

$$(\text{Volume size}) \times (\text{Credit accumulation rate per TiB}) = \text{Throughput}$$

For a 1-TiB `sc1` volume, burst throughput is limited to 80 MiB/s, the bucket fills with credits at 12 MiB/s, and it can hold up to 1 TiB-worth of credits.

Larger volumes scale these limits linearly, with throughput capped at a maximum of 250 MiB/s. After the bucket is depleted, throughput is limited to the baseline rate of 12 MiB/s per TiB.

On volume sizes ranging from 0.125 TiB to 16 TiB, baseline throughput varies from 1.5 MiB/s to a maximum of 192 MiB/s, which is reached at 16 TiB as follows:

$$12 \text{ MiB/s} \\ 16 \text{ TiB} \times \frac{12 \text{ MiB/s}}{1 \text{ TiB}} = 192 \text{ MiB/s}$$

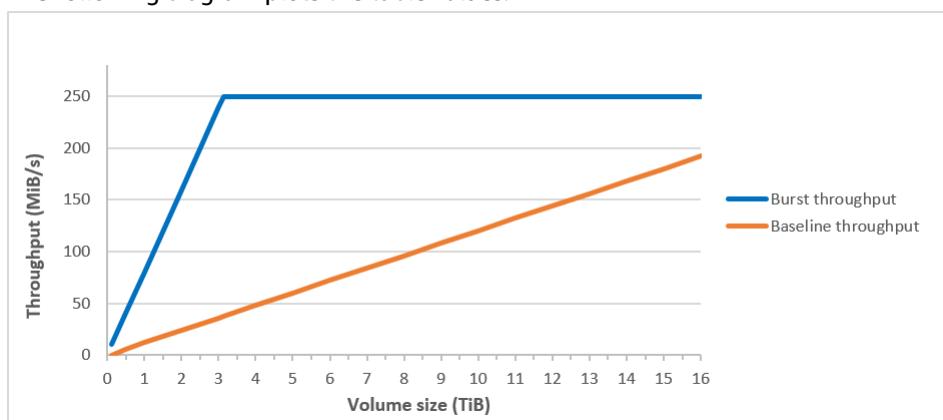

Burst throughput varies from 10 MiB/s to a cap of 250 MiB/s, which is reached at 3.125 TiB as follows:

$$80 \text{ MiB/s} \\ 3.125 \text{ TiB} \times \frac{80 \text{ MiB/s}}{1 \text{ TiB}} = 250 \text{ MiB/s}$$

The following table states the full range of base and burst throughput values for `sc1`:

Volume Size (TiB)	SC1 Base Throughput (MiB/s)	SC1 Burst Throughput (MiB/s)
0.125	1.5	10
0.5	6	40
1	12	80
2	24	160
3	36	240
3.125	37.5	250
4	48	250
5	60	250
6	72	250
7	84	250
8	96	250
9	108	250
10	120	250
11	132	250
12	144	250
13	156	250
14	168	250
15	180	250
16	192	250

The following diagram plots the table values:

Note

When you create a snapshot of a Cold HDD (sc1) volume, performance may drop as far as the volume's baseline value while the snapshot is in progress.

For information about using CloudWatch metrics and alarms to monitor your burst bucket balance, see [Monitor the burst bucket balance for volumes \(p. 1368\)](#).

Magnetic volumes

Magnetic volumes are backed by magnetic drives and are suited for workloads where data is accessed infrequently, and scenarios where low-cost storage for small volume sizes is important. These volumes deliver approximately 100 IOPS on average, with burst capability of up to hundreds of IOPS, and they can range in size from 1 GiB to 1 TiB.

Note

Magnetic is a previous generation volume type. For new applications, we recommend using one of the newer volume types. For more information, see [Previous Generation Volumes](#).

For information about using CloudWatch metrics and alarms to monitor your burst bucket balance, see [Monitor the burst bucket balance for volumes \(p. 1368\)](#).

Performance considerations when using HDD volumes

For optimal throughput results using HDD volumes, plan your workloads with the following considerations in mind.

Comparing Throughput Optimized HDD and Cold HDD

The st1 and sc1 bucket sizes vary according to volume size, and a full bucket contains enough tokens for a full volume scan. However, larger st1 and sc1 volumes take longer for the volume scan to complete due to per-instance and per-volume throughput limits. Volumes attached to smaller instances are limited to the per-instance throughput rather than the st1 or sc1 throughput limits.

Both st1 and sc1 are designed for performance consistency of 90% of burst throughput 99% of the time. Non-compliant periods are approximately uniformly distributed, targeting 99% of expected total throughput each hour.

In general, scan times are expressed by this formula:

$$\frac{\text{Volume size}}{\text{Throughput}} = \text{Scan time}$$

For example, taking the performance consistency guarantees and other optimizations into account, an st1 customer with a 5-TiB volume can expect to complete a full volume scan in 2.91 to 3.27 hours.

- Optimal scan time

$$\frac{5 \text{ TiB}}{500 \text{ MiB/s}} = \frac{5 \text{ TiB}}{0.00047684 \text{ TiB/s}} = 10,486 \text{ seconds} = 2.91 \text{ hours}$$

- Maximum scan time

$$\frac{2.91 \text{ hours}}{(0.90)(0.99)} = 3.27 \text{ hours}$$

-- From expected performance of 90% of burst 99% of the time

Similarly, an sc1 customer with a 5-TiB volume can expect to complete a full volume scan in 5.83 to 6.54 hours.

- Optimal scan time

$$\frac{5 \text{ TiB}}{250 \text{ MiB/s}} = \frac{5 \text{ TiB}}{0.000238418 \text{ TiB/s}} = 20972 \text{ seconds} = 5.83 \text{ hours}$$

- Maximum scan time

$$\frac{5.83 \text{ hours}}{(0.90)(0.99)} = 6.54 \text{ hours}$$

The following table shows ideal scan times for volumes of various size, assuming full buckets and sufficient instance throughput.

Volume size (TiB)	ST1 scan time with burst (hours)*	SC1 scan time with burst (hours)*
1	1.17	3.64
2	1.17	3.64
3	1.75	3.64
4	2.33	4.66
5	2.91	5.83
6	3.50	6.99
7	4.08	8.16
8	4.66	9.32
9	5.24	10.49
10	5.83	11.65
11	6.41	12.82
12	6.99	13.98
13	7.57	15.15
14	8.16	16.31
15	8.74	17.48
16	9.32	18.64

* These scan times assume an average queue depth (rounded to the nearest whole number) of four or more when performing 1 MiB of sequential I/O.

Therefore if you have a throughput-oriented workload that needs to complete scans quickly (up to 500 MiB/s), or requires several full volume scans a day, use `st1`. If you are optimizing for cost, your data is relatively infrequently accessed, and you don't need more than 250 MiB/s of scanning performance, then use `sc1`.

Inefficiency of small read/writes on HDD

The performance model for `st1` and `sc1` volumes is optimized for sequential I/Os, favoring high-throughput workloads, offering acceptable performance on workloads with mixed IOPS and throughput, and discouraging workloads with small, random I/O.

For example, an I/O request of 1 MiB or less counts as a 1 MiB I/O credit. However, if the I/Os are sequential, they are merged into 1 MiB I/O blocks and count only as a 1 MiB I/O credit.

Limitations on per-instance throughput

Throughput for `st1` and `sc1` volumes is always determined by the smaller of the following:

- Throughput limits of the volume
- Throughput limits of the instance

As for all Amazon EBS volumes, we recommend that you select an appropriate EBS-optimized EC2 instance in order to avoid network bottlenecks. For more information, see [Amazon EBS-optimized instances \(p. 1562\)](#).

Monitor the burst bucket balance for volumes

You can monitor the burst-bucket level for `gp2`, `st1`, and `sc1` volumes using the `EBS.BurstBalance` metric available in Amazon CloudWatch. This metric shows the percentage of I/O credits (for `gp2`) or throughput credits (for `st1` and `sc1`) remaining in the burst bucket. For more information about the `BurstBalance` metric and other metrics related to I/O, see [I/O characteristics and monitoring \(p. 1590\)](#). CloudWatch also allows you to set an alarm that notifies you when the `BurstBalance` value falls to a certain level. For more information, see [Creating Amazon CloudWatch Alarms](#).

Constraints on the size and configuration of an EBS volume

The size of an Amazon EBS volume is constrained by the physics and arithmetic of block data storage, as well as by the implementation decisions of operating system (OS) and file system designers. AWS imposes additional limits on volume size to safeguard the reliability of its services.

The following sections describe the most important factors that limit the usable size of an EBS volume and offer recommendations for configuring your EBS volumes.

Contents

- [Storage capacity \(p. 1368\)](#)
- [Service limitations \(p. 1369\)](#)
- [Partitioning schemes \(p. 1369\)](#)
- [Data block sizes \(p. 1370\)](#)

Storage capacity

The following table summarizes the theoretical and implemented storage capacities for the most commonly used file systems on Amazon EBS, assuming a 4,096 byte block size.

Partitioning scheme	Max addressable blocks	Theoretical max size (blocks × block size)	Ext4 implemented max size*	XFS implemented max size**	NTFS implemented max size	Max supported by EBS
MBR	2^{32}	2 TiB	2 TiB	2 TiB	2 TiB	2 TiB

Partitioning scheme	Max addressable blocks	Theoretical max size (blocks × block size)	Ext4 implemented max size*	XFS implemented max size**	NTFS implemented max size	Max supported by EBS
GPT	2^{64}	64 ZiB 1 EiB = 1024^2 TiB (50 TiB certified on RHEL7)	500 TiB (certified on RHEL7)	256 TiB		64 TiB †

* https://ext4.wiki.kernel.org/index.php/Ext4_Howto and <https://access.redhat.com/solutions/1532>

** <https://access.redhat.com/solutions/1532>

† io2 Block Express volumes support up to 64 TiB for GPT partitions. For more information, see [io2 Block Express volumes \(p. 1359\)](#).

Service limitations

Amazon EBS abstracts the massively distributed storage of a data center into virtual hard disk drives. To an operating system installed on an EC2 instance, an attached EBS volume appears to be a physical hard disk drive containing 512-byte disk sectors. The OS manages the allocation of data blocks (or clusters) onto those virtual sectors through its storage management utilities. The allocation is in conformity with a volume partitioning scheme, such as master boot record (MBR) or GUID partition table (GPT), and within the capabilities of the installed file system (ext4, NTFS, and so on).

EBS is not aware of the data contained in its virtual disk sectors; it only ensures the integrity of the sectors. This means that AWS actions and OS actions are independent of each other. When you are selecting a volume size, be aware of the capabilities and limits of both, as in the following cases:

- EBS currently supports a maximum volume size of 64 TiB. This means that you can create an EBS volume as large as 64 TiB, but whether the OS recognizes all of that capacity depends on its own design characteristics and on how the volume is partitioned.
- Linux boot volumes may use either the MBR or GPT partitioning scheme. MBR supports boot volumes up to 2047 GiB (2 TiB - 1 GiB). GPT with GRUB 2 supports boot volumes 2 TiB or larger. If your Linux AMI uses MBR, your boot volume is limited to 2047 GiB, but your non-boot volumes do not have this limit. For more information, see [Make an Amazon EBS volume available for use on Linux \(p. 1382\)](#).

Partitioning schemes

Among other impacts, the partitioning scheme determines how many logical data blocks can be uniquely addressed in a single volume. For more information, see [Data block sizes \(p. 1370\)](#). The common partitioning schemes in use are *master boot record* (MBR) and *GUID partition table* (GPT). The important differences between these schemes can be summarized as follows.

MBR

MBR uses a 32-bit data structure to store block addresses. This means that each data block is mapped with one of 2^{32} possible integers. The maximum addressable size of a volume is given by the following formula:

$$2^{32} \times \text{Block size}$$

The block size for MBR volumes is conventionally limited to 512 bytes. Therefore:

$$2^{32} \times 512 \text{ bytes} = 2 \text{ TiB}$$

Engineering workarounds to increase this 2-TiB limit for MBR volumes have not met with widespread industry adoption. Consequently, Linux and Windows never detect an MBR volume as being larger than 2 TiB even if AWS shows its size to be larger.

GPT

GPT uses a 64-bit data structure to store block addresses. This means that each data block is mapped with one of 2^{64} possible integers. The maximum addressable size of a volume is given by the following formula:

$$2^{64} \times \text{Block size}$$

The block size for GPT volumes is commonly 4,096 bytes. Therefore:

$$\begin{aligned} 2^{64} \times 4,096 \text{ bytes} \\ = 2^{64} \times 2^{12} \text{ bytes} \\ = 2^{70} \times 2^6 \text{ bytes} \\ = 64 \text{ ZiB} \end{aligned}$$

Real-world computer systems don't support anything close to this theoretical maximum. Implemented file-system size is currently limited to 50 TiB for ext4 and 256 TiB for NTFS—both of which exceed the 16-TiB limit imposed by AWS.

Data block sizes

Data storage on a modern hard drive is managed through *logical block addressing*, an abstraction layer that allows the operating system to read and write data in logical blocks without knowing much about the underlying hardware. The OS relies on the storage device to map the blocks to its physical sectors. EBS advertises 512-byte sectors to the operating system, which reads and writes data to disk using data blocks that are a multiple of the sector size.

The industry default size for logical data blocks is currently 4,096 bytes (4 KiB). Because certain workloads benefit from a smaller or larger block size, file systems support non-default block sizes that can be specified during formatting. Scenarios in which non-default block sizes should be used are outside the scope of this topic, but the choice of block size has consequences for the storage capacity of the volume. The following table shows storage capacity as a function of block size:

Block size	Max volume size
4 KiB (default)	16 TiB
8 KiB	32 TiB
16 KiB	64 TiB
32 KiB	128 TiB
64 KiB (maximum)	256 TiB

The EBS-imposed limit on volume size (16 TiB) is currently equal to the maximum size enabled by 4-KiB data blocks.

Create an Amazon EBS volume

You can create an Amazon EBS volume and then attach it to any EC2 instance in the same Availability Zone. If you create an encrypted EBS volume, you can only attach it to supported instance types. For more information, see [Supported instance types \(p. 1544\)](#).

If you are creating a volume for a high-performance storage scenario, you should make sure to use a Provisioned IOPS SSD volume (io1 or io2) and attach it to an instance with enough bandwidth to support your application, such as an EBS-optimized instance. The same advice holds for Throughput Optimized HDD (st1) and Cold HDD (sc1) volumes. For more information, see [Amazon EBS-optimized instances \(p. 1562\)](#).

Empty EBS volumes receive their maximum performance the moment that they are available and do not require initialization (formerly known as pre-warming). However, storage blocks on volumes that were created from snapshots must be initialized (pulled down from Amazon S3 and written to the volume) before you can access the block. This preliminary action takes time and can cause a significant increase in the latency of an I/O operation the first time each block is accessed. Volume performance is achieved after all blocks have been downloaded and written to the volume. For most applications, amortizing this cost over the lifetime of the volume is acceptable. To avoid this initial performance hit in a production environment, you can force immediate initialization of the entire volume or enable fast snapshot restore. For more information, see [Initialize Amazon EBS volumes \(p. 1593\)](#).

Important

If you create an io2 volume with a size greater than 16 TiB or with IOPS greater than 64,000 in a Region where EBS Block Express is supported, the volume automatically runs on Block Express.

io2 Block Express volumes can be attached to R5b instances only. For more information, see [io2 Block Express volumes](#).

Methods of creating a volume

- Create and attach EBS volumes when you launch instances by specifying a block device mapping. For more information, see [Launch an instance using the Launch Instance Wizard \(p. 580\)](#) and [Block device mappings \(p. 1654\)](#).
- Create an empty EBS volume and attach it to a running instance. For more information, see [Create an empty volume \(p. 1371\)](#) below.
- Create an EBS volume from a previously created snapshot and attach it to a running instance. For more information, see [Create a volume from a snapshot \(p. 1373\)](#) below.

Create an empty volume

Empty volumes receive their maximum performance the moment that they are available and do not require initialization.

You can create an empty EBS volume using one of the following methods.

New console

To create an empty EBS volume using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Choose **Create volume**.
4. For **Volume type**, choose the type of volume to create. For more information, see [Amazon EBS volume types \(p. 1352\)](#).
5. For **Size**, enter the size of the volume, in GiB. For more information, see [Constraints on the size and configuration of an EBS volume \(p. 1368\)](#).

6. (io1, io2, and gp3 only) For **IOPS**, enter the maximum number of input/output operations per second (IOPS) that the volume should provide.
7. (gp3 only) For **Throughput**, enter the throughput that the volume should provide, in MiB/s.
8. For **Availability Zone**, choose the Availability Zone in which to create the volume. A volume can be attached only to an instance that is in the same Availability Zone.
9. For **Snapshot ID**, keep the default value (**Don't create volume from a snapshot**).
10. (io1 and io2 only) To enable the volume for Amazon EBS Multi-Attach, select **Enable Multi-Attach**. For more information, see [Attach a volume to multiple instances with Amazon EBS Multi-Attach \(p. 1377\)](#).
11. Set the encryption status for the volume.

If your account is enabled for [encryption by default \(p. 1545\)](#), then encryption is automatically enabled and you can't disable it. You can choose the KMS key to use to encrypt the volume.

If your account is not enabled for encryption by default, encryption is optional. To encrypt the volume, for **Encryption**, choose **Encrypt this volume** and then select the KMS key to use to encrypt the volume.

Note

Encrypted volumes can be attached only to instances that support Amazon EBS encryption. For more information, see [Amazon EBS encryption \(p. 1542\)](#).

12. (Optional) To assign custom tags to the volume, in the **Tags** section, choose **Add tag**, and then enter a tag key and value pair. For more information, see [Tag your Amazon EC2 resources \(p. 1692\)](#).
13. Choose **Create volume**.

Note

The volume is ready for use when the volume status is **Available**.

14. To use the volume, attach it to an instance. For more information, see [Attach an Amazon EBS volume to an instance \(p. 1375\)](#).

Old console

To create an empty EBS volume using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, select the Region in which you would like to create your volume. This choice is important because some Amazon EC2 resources can be shared between Regions, while others can't. For more information, see [Resource locations \(p. 1683\)](#).
3. In the navigation pane, choose **ELASTIC BLOCK STORE, Volumes**.
4. Choose **Create Volume**.
5. For **Volume Type**, choose a volume type. For more information, see [Amazon EBS volume types \(p. 1352\)](#).
6. For **Size**, enter the size of the volume, in GiB. For more information, see [Constraints on the size and configuration of an EBS volume \(p. 1368\)](#).
7. For **IOPS**, enter the maximum number of input/output operations per second (IOPS) that the volume should provide. You can specify IOPS only for gp3, io1, and io2 volumes.
8. For **Throughput**, enter the throughput that the volume should provide, in MiB/s. You can specify throughput only for gp3 volumes.
9. For **Availability Zone**, choose the Availability Zone in which to create the volume. An EBS volume must be attached to an EC2 instance that is in the same Availability Zone as the volume.
10. (Optional) If the instance type supports EBS encryption and you want to encrypt the volume, select **Encrypt this volume** and choose a CMK. If encryption by default is enabled in this Region,

EBS encryption is enabled and the default CMK for EBS encryption is chosen. You can choose a different CMK from **Master Key** or paste the full ARN of any key that you can access. For more information, see [Amazon EBS encryption \(p. 1542\)](#).

11. (Optional) Choose **Create additional tags** to add tags to the volume. For each tag, provide a tag key and a tag value. For more information, see [Tag your Amazon EC2 resources \(p. 1692\)](#).
12. Choose **Create Volume**. The volume is ready for use when the volume status is **Available**.
13. To use your new volume, attach it to an instance, format it, and mount it. For more information, see [Attach an Amazon EBS volume to an instance \(p. 1375\)](#).

AWS CLI

To create an empty EBS volume using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [create-volume \(AWS CLI\)](#)
- [New-EC2Volume \(AWS Tools for Windows PowerShell\)](#)

Create a volume from a snapshot

Volumes created from snapshots load lazily in the background. This means that there is no need to wait for all of the data to transfer from Amazon S3 to your EBS volume before the instance can start accessing an attached volume and all its data. If your instance accesses data that hasn't yet been loaded, the volume immediately downloads the requested data from Amazon S3, and then continues loading the rest of the volume data in the background. Volume performance is achieved after all blocks are downloaded and written to the volume. To avoid the initial performance hit in a production environment, see [Initialize Amazon EBS volumes \(p. 1593\)](#).

New EBS volumes that are created from encrypted snapshots are automatically encrypted. You can also encrypt a volume on-the-fly while restoring it from an unencrypted snapshot. Encrypted volumes can only be attached to instance types that support EBS encryption. For more information, see [Supported instance types \(p. 1544\)](#).

You can create a volume from a snapshot using one of the following methods.

New console

To create an empty EBS volume using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Choose **Create volume**.
4. For **Volume type**, choose the type of volume to create. For more information, see [Amazon EBS volume types \(p. 1352\)](#).
5. For **Size**, enter the size of the volume, in GiB. For more information, see [Constraints on the size and configuration of an EBS volume \(p. 1368\)](#).
6. (io1, io2, and gp3 only) For **IOPS**, enter the maximum number of input/output operations per second (IOPS) that the volume should provide.
7. (gp3 only) For **Throughput**, enter the throughput that the volume should provide, in MiB/s.
8. For **Availability Zone**, choose the Availability Zone in which to create the volume. A volume can be attached only to instances that are in the same Availability Zone.

9. For **Snapshot ID**, select the snapshot from which to create the volume.
10. Set the encryption status for the volume.

If the selected snapshot is encrypted, or if your account is enabled for [encryption by default \(p. 1545\)](#), then encryption is automatically enabled and you can't disable it. You can choose the KMS key to use to encrypt the volume.

If the selected snapshot is unencrypted and your account is not enabled for encryption by default, encryption is optional. To encrypt the volume, for **Encryption**, choose **Encrypt this volume** and then select the KMS key to use to encrypt the volume.

Note

Encrypted volumes can be attached only to instances that support Amazon EBS encryption. For more information, see [Amazon EBS encryption \(p. 1542\)](#).

11. (Optional) To assign custom tags to the volume, in the **Tags** section, choose **Add tag**, and then enter a tag key and value pair. For more information, see [Tag your Amazon EC2 resources \(p. 1692\)](#).
12. Choose **Create Volume**.

Note

The volume is ready for use when the volume status is **Available**.

13. To use the volume, attach it to an instance. For more information, see [Attach an Amazon EBS volume to an instance \(p. 1375\)](#).

Old console

To create an EBS volume from a snapshot using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, select the Region that your snapshot is located in.

To use the snapshot to create a volume in a different region, copy your snapshot to the new Region and then use it to create a volume in that Region. For more information, see [Copy an Amazon EBS snapshot \(p. 1413\)](#).

3. In the navigation pane, choose **ELASTIC BLOCK STORE, Volumes**.
4. Choose **Create Volume**.
5. For **Volume Type**, choose a volume type. For more information, see [Amazon EBS volume types \(p. 1352\)](#).
6. For **Snapshot ID**, start typing the ID or description of the snapshot from which you are restoring the volume, and choose it from the list of suggested options.
7. (Optional) Select **Encrypt this volume** to change the encryption state of your volume. This is optional if [encryption by default \(p. 1545\)](#) is enabled. Select a CMK from **Master Key** to specify a CMK other than the default CMK for EBS encryption.
8. For **Size**, verify that the default size of the snapshot meets your needs or enter the size of the volume, in GiB.

If you specify both a volume size and a snapshot, the size must be equal to or greater than the snapshot size. When you select a volume type and a snapshot, the minimum and maximum sizes for the volume are shown next to **Size**. For more information, see [Constraints on the size and configuration of an EBS volume \(p. 1368\)](#).

9. For **IOPS**, enter the maximum number of input/output operations per second (IOPS) that the volume should provide. You can specify IOPS only for gp3, io1, and io2 volumes.
10. For **Throughput**, enter the throughput that the volume should provide, in MiB/s. You can specify throughput only for gp3 volumes.

11. For **Availability Zone**, choose the Availability Zone in which to create the volume. An EBS volume must be attached to an EC2 instance that is in the same Availability Zone as the volume.
12. (Optional) Choose **Create additional tags** to add tags to the volume. For each tag, provide a tag key and a tag value.
13. Choose **Create Volume**.
14. To use your new volume, attach it to an instance and mount it. For more information, see [Attach an Amazon EBS volume to an instance \(p. 1375\)](#).
15. If you created a volume that is larger than the snapshot, you must extend the file system on the volume to take advantage of the extra space. For more information, see [Amazon EBS Elastic Volumes \(p. 1529\)](#).

AWS CLI

To create an EBS volume from a snapshot using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [create-volume \(AWS CLI\)](#)
- [New-EC2Volume \(AWS Tools for Windows PowerShell\)](#)

Attach an Amazon EBS volume to an instance

You can attach an available EBS volume to one or more of your instances that is in the same Availability Zone as the volume.

For information about adding EBS volumes to your instance at launch, see [Instance block device mapping \(p. 1659\)](#).

Prerequisites

- Determine how many volumes that you can attach to your instance. For more information, see [Instance volume limits \(p. 1644\)](#).
- Determine whether you can attach your volume to multiple instances and enable Multi-Attach. For more information, see [Attach a volume to multiple instances with Amazon EBS Multi-Attach \(p. 1377\)](#).
- If a volume is encrypted, you can attach it only to an instance that supports Amazon EBS encryption. For more information, see [Supported instance types \(p. 1544\)](#).
- If a volume has an AWS Marketplace product code:
 - You can attach a volume only to a stopped instance.
 - You must be subscribed to the AWS Marketplace code that is on the volume.
 - The instance's configuration, such as its type and operating system, must support that specific AWS Marketplace code. For example, you cannot take a volume from a Windows instance and attach it to a Linux instance.
- AWS Marketplace product codes are copied from the volume to the instance.

Important

If you attach an `io2` volume to an R5b instance, the volume always runs on EBS Block Express. Currently, only R5b instances support `io2` Block Express volumes. For more information, see [io2 Block Express volumes](#).

You can attach a volume to an instance using one of the following methods.

New console

To attach an EBS volume to an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Select the volume to attach and choose **Actions, Attach volume**.

Note

You can attach only volumes that are in the **Available** state.

4. For **Instance**, enter the ID of the instance or select the instance from the list of options.

Note

- The volume must be attached to an instance in the same Availability Zone.
- If the volume is encrypted, it can only be attached to instance types that support Amazon EBS encryption. For more information, see [Amazon EBS encryption \(p. 1542\)](#).

5. For **Device name**, enter a supported device name for the volume. This device name is used by Amazon EC2. The block device driver for the instance might assign a different device name when mounting the volume. For more information, see [Device names on Linux instances \(p. 1652\)](#).
6. Choose **Attach volume**.
7. Connect to the instance and mount the volume. For more information, see [Make an Amazon EBS volume available for use on Linux \(p. 1382\)](#).

Old console

To attach an EBS volume to an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic Block Store, Volumes**.
3. Select an available volume and choose **Actions, Attach Volume**.
4. For **Instance**, start typing the name or ID of the instance. Select the instance from the list of options (only instances that are in the same Availability Zone as the volume are displayed).
5. For **Device**, you can keep the suggested device name, or type a different supported device name. For more information, see [Device names on Linux instances \(p. 1652\)](#).
6. Choose **Attach**.
7. Connect to your instance and mount the volume. For more information, see [Make an Amazon EBS volume available for use on Linux \(p. 1382\)](#).

AWS CLI

To attach an EBS volume to an instance using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [attach-volume \(AWS CLI\)](#)
- [Add-EC2Volume \(AWS Tools for Windows PowerShell\)](#)

Note

In some situations, you may find that a volume other than the volume attached to /dev/xvda or /dev/sda has become the root volume of your instance. This can happen when you have

attached the root volume of another instance, or a volume created from the snapshot of a root volume, to an instance with an existing root volume. For more information, see [Boot from the wrong volume](#).

Attach a volume to multiple instances with Amazon EBS Multi-Attach

Amazon EBS Multi-Attach enables you to attach a single Provisioned IOPS SSD (io1 or io2) volume to multiple instances that are in the same Availability Zone. You can attach multiple Multi-Attach enabled volumes to an instance or set of instances. Each instance to which the volume is attached has full read and write permission to the shared volume. Multi-Attach makes it easier for you to achieve higher application availability in clustered Linux applications that manage concurrent write operations.

Contents

- [Considerations and limitations \(p. 382\)](#)
- [Performance \(p. 1378\)](#)
- [Work with Multi-Attach \(p. 1378\)](#)
- [Monitor a Multi-Attach enabled volume \(p. 1382\)](#)
- [Pricing and billing \(p. 562\)](#)

Considerations and limitations

- Multi-Attach enabled volumes can be attached to up to 16 Linux instances built on the [Nitro System \(p. 247\)](#) that are in the same Availability Zone. You can attach a volume that is Multi-Attach enabled to Windows instances, but the operating system does not recognize the data on the volume that is shared between the instances, which can result in data inconsistency.

Note

io1 volumes with Multi-Attach enabled are not supported with the R5b instance type. To use Multi-Attach with R5b instance types, you must use io2 volumes.

- Multi-Attach is supported exclusively on [Provisioned IOPS SSD volumes \(p. 1358\)](#).
- Multi-Attach for io1 volumes is available in the following Regions only: us-east-1, us-west-2, eu-west-1, and ap-northeast-2.

Multi-Attach for io2 and io2 Block Express volumes is available in all Regions that support those volumes types volumes.

- Standard file systems, such as XFS and EXT4, are not designed to be accessed simultaneously by multiple servers, such as EC2 instances. Using Multi-Attach with a standard file system can result in data corruption or loss, so this is not safe for production workloads. You can use a clustered file system to ensure data resiliency and reliability for production workloads.
- Multi-Attach enabled volumes do not support I/O fencing. I/O fencing protocols control write access in a shared storage environment to maintain data consistency. Your applications must provide write ordering for the attached instances to maintain data consistency.
- Multi-Attach enabled volumes can't be created as boot volumes.
- Multi-Attach enabled volumes can be attached to one block device mapping per instance.
- Multi-Attach can't be enabled during instance launch using either the Amazon EC2 console or RunInstances API.
- Multi-Attach enabled volumes that have an issue at the Amazon EBS infrastructure layer are unavailable to all attached instances. Issues at the Amazon EC2 or networking layer might impact only some attached instances.
- The following table shows volume modification support for Multi-Attach enabled io1 and io2 volumes after creation.

	io2 volumes	io1 volumes
Modify volume type	X	X
Modify volume size	✓	X
Modify provisioned IOPS	✓	X
Enable Multi-Attach	✓ *	X
Disable Multi-Attach	✓ *	X

* You can't enable or disable Multi-Attach while the volume is attached to an instance.

Performance

Each attached instance is able to drive its maximum IOPS performance up to the volume's maximum provisioned performance. However, the aggregate performance of all of the attached instances can't exceed the volume's maximum provisioned performance. If the attached instances' demand for IOPS is higher than the volume's Provisioned IOPS, the volume will not exceed its provisioned performance.

For example, say you create an io2 Multi-Attach enabled volume with 50,000 Provisioned IOPS and you attach it to an m5.8xlarge instance and a c5.12xlarge instance. The m5.8xlarge and c5.12xlarge instances support a maximum of 30,000 and 40,000 IOPS respectively. Each instance can drive its maximum IOPS as it is less than the volume's Provisioned IOPS of 50,000. However, if both instances drive I/O to the volume simultaneously, their combined IOPS can't exceed the volume's provisioned performance of 50,000 IOPS. The volume will not exceed 50,000 IOPS.

To achieve consistent performance, it is best practice to balance I/O driven from attached instances across the sectors of a Multi-Attach enabled volume.

Work with Multi-Attach

Multi-Attach enabled volumes can be managed in much the same way that you would manage any other Amazon EBS volume. However, in order to use the Multi-Attach functionality, you must enable it for the volume. When you create a new volume, Multi-Attach is disabled by default.

Contents

- [Enable Multi-Attach \(p. 1378\)](#)
- [Disable Multi-Attach \(p. 1380\)](#)
- [Attach a volume to instances \(p. 1381\)](#)
- [Delete on termination \(p. 1381\)](#)

Enable Multi-Attach

You can enable Multi-Attach for io1 and io2 volumes during creation.

Use one of the following methods to enable Multi-Attach for an io1 or io2 volume during creation.

New console

To enable Multi-Attach during volume creation

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Choose **Create volume**.
4. For **Volume type**, choose **Provisioned IOPS SSD (io1)** or **Provisioned IOPS SSD (io2)**.
5. For **Size** and **IOPS**, choose the required volume size and the number of IOPS to provision.
6. For **Availability Zone**, choose the same Availability Zone that the instances are in.
7. For **Amazon EBS Multi-Attach**, choose **Enable Multi-Attach**.
8. (Optional) For **Snapshot ID**, choose the snapshot from which to create the volume.
9. Set the encryption status for the volume.

If the selected snapshot is encrypted, or if your account is enabled for [encryption by default \(p. 1545\)](#), then encryption is automatically enabled and you can't disable it. You can choose the KMS key to use to encrypt the volume.

If the selected snapshot is unencrypted and your account is not enabled for encryption by default, encryption is optional. To encrypt the volume, for **Encryption**, choose **Encrypt this volume** and then select the KMS key to use to encrypt the volume.

Note

You can attach encrypted volumes only to instances that support Amazon EBS encryption. For more information, see [Amazon EBS encryption \(p. 1542\)](#).

10. (Optional) To assign custom tags to the volume, in the **Tags** section, choose **Add tag**, and then enter a tag key and value pair. For more information, see [Tag your Amazon EC2 resources \(p. 1692\)](#).
11. Choose **Create volume**.

Old console

To enable Multi-Attach during volume creation

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Choose **Create Volume**.
4. For **Volume Type**, choose **Provisioned IOPS SSD (io1)** or **Provisioned IOPS SSD (io2)**.
5. For **Size** and **IOPS**, choose the required volume size and the number of IOPS to provision.
6. For **Availability Zone**, choose the same Availability Zone that the instances are in.
7. For **Multi-Attach**, choose **Enable**.
8. Choose **Create Volume**.

Command line

To enable Multi-Attach during volume creation

Use the `create-volume` command and specify the `--multi-attach-enabled` parameter.

```
$ aws ec2 create-volume --volume-type io2 --multi-attach-enabled --size 100 --iops 2000  
--region us-west-2 --availability-zone us-west-2b
```

You can also enable Multi-Attach for `io2` volumes after they have been created only if they are not attached to any instances.

Note

You can't enable Multi-Attach for `io1` volumes after creation.

Use one of the following methods to enable Multi-Attach for an Amazon EBS volume after it has been created.

New console

To enable Multi-Attach after creation

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Select the volume and choose **Actions, Modify volume**.
4. For **Amazon EBS Multi-Attach**, choose **Enable Multi-Attach**.
5. Choose **Modify**.

Old console

To enable Multi-Attach after creation

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Select the volume and choose **Actions, Modify Volume**.
4. For **Multi-Attach**, choose **Enable**.
5. Choose **Modify**.

Command line

To enable Multi-Attach after creation

Use the `modify-volume` command and specify the `--multi-attach-enabled` parameter.

```
$ aws ec2 modify-volume --volume-id vol-1234567890abcdef0 --multi-attach-enabled
```

Disable Multi-Attach

You can disable Multi-Attach for an `io2` volume only if it is attached to no more than one instance.

Note

You can't disable Multi-Attach for `io1` volumes after creation.

Use one of the following methods to disable Multi-Attach for an `io2` volume.

New console

To disable Multi-Attach after creation

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Select the volume and choose **Actions, Modify volume**.
4. For **Amazon EBS Multi-Attach**, clear **Enable Multi-Attach**.
5. Choose **Modify**.

Old console

To disable Multi-Attach

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Select the volume and choose **Actions, Modify Volume**.
4. For **Multi-Attach**, clear **Enable**.
5. Choose **Modify**.

Command line

To disable Multi-Attach after creation

Use the [modify-volume](#) command and specify the `--no-multi-attach-enabled` parameter.

```
$ aws ec2 modify-volume --volume-id vol-1234567890abcdef0 --no-multi-attach-enabled
```

Attach a volume to instances

You attach a Multi-Attach enabled volume to an instance in the same way that you attach any other EBS volume. For more information, see [Attach an Amazon EBS volume to an instance \(p. 1375\)](#).

Delete on termination

Multi-Attach enabled volumes are deleted on instance termination if the last attached instance is terminated and if that instance is configured to delete the volume on termination. If the volume is attached to multiple instances that have different delete on termination settings in their volume block device mappings, the last attached instance's block device mapping setting determines the delete on termination behavior.

To ensure predictable delete on termination behavior, enable or disable delete on termination for all of the instances to which the volume is attached.

By default, when a volume is attached to an instance, the delete on termination setting for the block device mapping is set to false. If you want to turn on delete on termination for a Multi-Attach enabled volume, modify the block device mapping.

If you want the volume to be deleted when the attached instances are terminated, enable delete on termination in the block device mapping for all of the attached instances. If you want to retain the volume after the attached instances have been terminated, disable delete on termination in the block device mapping for all of the attached instances. For more information, see [Preserve Amazon EBS volumes on instance termination \(p. 665\)](#).

You can modify an instance's delete on termination setting at launch or after it has launched. If you enable or disable delete on termination during instance launch, the settings apply only to volumes that are attached at launch. If you attach a volume to an instance after launch, you must explicitly set the delete on termination behavior for that volume.

You can modify an instance's delete on termination setting using the command line tools only.

To modify the delete on termination setting for an existing instance

Use the [modify-instance-attribute](#) command and specify the `DeleteOnTermination` attribute in the `--block-device-mappings` option.

```
aws ec2 modify-instance-attribute --instance-id i-1234567890abcdef0 --block-device-mappings file://mapping.json
```

Specify the following in `mapping.json`.

```
[  
  {  
    "DeviceName": "/dev/sdf",  
    "Ebs": {  
      "DeleteOnTermination": true/false  
    }  
  }  
]
```

Monitor a Multi-Attach enabled volume

You can monitor a Multi-Attach enabled volume using the CloudWatch Metrics for Amazon EBS volumes. For more information, see [Amazon CloudWatch metrics for Amazon EBS \(p. 1603\)](#).

Data is aggregated across all of the attached instances. You can't monitor metrics for individual attached instances.

Pricing and billing

There are no additional charges for using Amazon EBS Multi-Attach. You are billed the standard charges that apply to Provisioned IOPS SSD (`io1` and `io2`) volumes. For more information, see [Amazon EBS pricing](#).

Make an Amazon EBS volume available for use on Linux

After you attach an Amazon EBS volume to your instance, it is exposed as a block device. You can format the volume with any file system and then mount it. After you make the EBS volume available for use, you can access it in the same ways that you access any other volume. Any data written to this file system is written to the EBS volume and is transparent to applications using the device.

You can take snapshots of your EBS volume for backup purposes or to use as a baseline when you create another volume. For more information, see [Amazon EBS snapshots \(p. 1403\)](#).

You can get directions for volumes on a Windows instance from [Make a volume available for use on Windows](#) in the *Amazon EC2 User Guide for Windows Instances*.

Format and mount an attached volume

Suppose that you have an EC2 instance with an EBS volume for the root device, `/dev/xvda`, and that you have just attached an empty EBS volume to the instance using `/dev/sdf`. Use the following procedure to make the newly attached volume available for use.

To format and mount an EBS volume on Linux

1. Connect to your instance using SSH. For more information, see [Connect to your Linux instance \(p. 611\)](#).
2. The device could be attached to the instance with a different device name than you specified in the block device mapping. For more information, see [Device names on Linux instances \(p. 1652\)](#). Use the `lsblk` command to view your available disk devices and their mount points (if applicable) to help you determine the correct device name to use. The output of `lsblk` removes the `/dev/` prefix from full device paths.

The following is example output for an instance built on the [Nitro System \(p. 247\)](#), which exposes EBS volumes as NVMe block devices. The root device is `/dev/nvme0n1`, which has two partitions named `nvme0n1p1` and `nvme0n1p128`. The attached volume is `/dev/nvme1n1`, which has no partitions and is not yet mounted.

```
[ec2-user ~]$ lsblk
NAME      MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT
nvme1n1    259:0    0   10G  0 disk
nvme0n1    259:1    0    8G  0 disk
-nvme0n1p1  259:2    0    8G  0 part /
-nvme0n1p128 259:3    0    1M  0 part
```

The following is example output for a T2 instance. The root device is `/dev/xvda`, which has one partition named `xvda1`. The attached volume is `/dev/xvdf`, which has no partitions and is not yet mounted.

```
[ec2-user ~]$ lsblk
NAME      MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT
xvda     202:0    0    8G  0 disk
-xvda1   202:1    0    8G  0 part /
xvdf     202:80   0   10G  0 disk
```

3. Determine whether there is a file system on the volume. New volumes are raw block devices, and you must create a file system on them before you can mount and use them. Volumes that were created from snapshots likely have a file system on them already; if you create a new file system on top of an existing file system, the operation overwrites your data.

Use one or both of the following methods to determine whether there is a file system on the volume:

- Use the `file -s` command to get information about a specific device, such as its file system type. If the output shows simply data, as in the following example output, there is no file system on the device

```
[ec2-user ~]$ sudo file -s /dev/xvdf
/dev/xvdf: data
```

If the device has a file system, the command shows information about the file system type. For example, the following output shows a root device with the XFS file system.

```
[ec2-user ~]$ sudo file -s /dev/xvda1
/dev/xvda1: SGI XFS filesystem data (blksz 4096, inosz 512, v2 dirs)
```

- Use the `lsblk -f` command to get information about all of the devices attached to the instance.

```
[ec2-user ~]$ sudo lsblk -f
```

For example, the following output shows that there are three devices attached to the instances —`nvme1n1`, `nvme0n1`, and `nvme2n1`. The first column lists the devices and their partitions. The `FSTYPE` column shows the file system type for each device. If the column is empty for a specific device, it means that the device does not have a file system. In this case, device `nvme1n1` and partition `nvme0n1p1` on device `nvme0n1` are both formatted using the XFS file system, while device `nvme2n1` and partition `nvme0n1p128` on device `nvme0n1` do not have file systems.

```
NAME FSTYPE LABEL UUID          MOUNTPOINT
nvme1n1      xfs  7f939f28-6dcc-4315-8c42-6806080b94dd
```

```
nvme0n1
##nvme0n1p1 xfs      / 90e29211-2de8-4967-b0fb-16f51a6e464c      /
##nvme0n1p128
nvme2n1
```

If the output from these commands show that there is no file system on the device, you must create one.

4. (Conditional) If you discovered that there is a file system on the device in the previous step, skip this step. If you have an empty volume, use the **mkfs -t** command to create a file system on the volume.

Warning

Do not use this command if you're mounting a volume that already has data on it (for example, a volume that was created from a snapshot). Otherwise, you'll format the volume and delete the existing data.

```
[ec2-user ~]$ sudo mkfs -t xfs /dev/xvdf
```

If you get an error that `mkfs.xfs` is not found, use the following command to install the XFS tools and then repeat the previous command:

```
[ec2-user ~]$ sudo yum install xfsprogs
```

5. Use the **mkdir** command to create a mount point directory for the volume. The mount point is where the volume is located in the file system tree and where you read and write files to after you mount the volume. The following example creates a directory named `/data`.

```
[ec2-user ~]$ sudo mkdir /data
```

6. Use the following command to mount the volume at the directory you created in the previous step.

```
[ec2-user ~]$ sudo mount /dev/xvdf /data
```

7. Review the file permissions of your new volume mount to make sure that your users and applications can write to the volume. For more information about file permissions, see [File security at The Linux Documentation Project](#).
8. The mount point is not automatically preserved after rebooting your instance. To automatically mount this EBS volume after reboot, see [Automatically mount an attached volume after reboot \(p. 1384\)](#).

Automatically mount an attached volume after reboot

To mount an attached EBS volume on every system reboot, add an entry for the device to the `/etc/fstab` file.

You can use the device name, such as `/dev/xvdf`, in `/etc/fstab`, but we recommend using the device's 128-bit universally unique identifier (UUID) instead. Device names can change, but the UUID persists throughout the life of the partition. By using the UUID, you reduce the chances that the system becomes unbootable after a hardware reconfiguration. For more information, see [Identify the EBS device \(p. 1559\)](#).

To mount an attached volume automatically after reboot

1. (Optional) Create a backup of your `/etc/fstab` file that you can use if you accidentally destroy or delete this file while editing it.

```
[ec2-user ~]$ sudo cp /etc/fstab /etc/fstab.orig
```

2. Use the **blkid** command to find the UUID of the device. Make a note of the UUID of the device that you want to mount after reboot. You'll need it in the following step.

For example, the following command shows that there are two devices mounted to the instance, and it shows the UUIDs for both devices.

```
[ec2-user ~]$ sudo blkid  
/dev/xvda1: LABEL="/" UUID="ca774df7-756d-4261-a3f1-76038323e572" TYPE="xfs"  
PARTLABEL="Linux" PARTUUID="02dc367-e87c-4f2e-9a72-a3cf8f299c10"  
/dev/xvdf: UUID="aebf131c-6957-451e-8d34-ec978d9581ae" TYPE="xfs"
```

For Ubuntu 18.04 use the **lsblk** command.

```
[ec2-user ~]$ sudo lsblk -o +UUID
```

3. Open the **/etc/fstab** file using any text editor, such as **nano** or **vim**.

```
[ec2-user ~]$ sudo vim /etc/fstab
```

4. Add the following entry to **/etc/fstab** to mount the device at the specified mount point. The fields are the UUID value returned by **blkid** (or **lsblk** for Ubuntu 18.04), the mount point, the file system, and the recommended file system mount options. For more information about the required fields, run **man fstab** to open the **fstab** manual.

In the following example, we mount the device with UUID **aebf131c-6957-451e-8d34-ec978d9581ae** to mount point **/data** and we use the **xfs** file system. We also use the **defaults** and **nofail** flags. We specify **0** to prevent the file system from being dumped, and we specify **2** to indicate that it is a non-root device.

```
UUID=aebf131c-6957-451e-8d34-ec978d9581ae /data xfs defaults,nofail 0 2
```

Note

If you ever boot your instance without this volume attached (for example, after moving the volume to another instance), the **nofail** mount option enables the instance to boot even if there are errors mounting the volume. Debian derivatives, including Ubuntu versions earlier than 16.04, must also add the **nobootwait** mount option.

5. To verify that your entry works, run the following commands to unmount the device and then mount all file systems in **/etc/fstab**. If there are no errors, the **/etc/fstab** file is OK and your file system will mount automatically after it is rebooted.

```
[ec2-user ~]$ sudo umount /data  
[ec2-user ~]$ sudo mount -a
```

If you receive an error message, address the errors in the file.

Warning

Errors in the **/etc/fstab** file can render a system unbootable. Do not shut down a system that has errors in the **/etc/fstab** file.

If you are unsure how to correct errors in **/etc/fstab** and you created a backup file in the first step of this procedure, you can restore from your backup file using the following command.

```
[ec2-user ~]$ sudo mv /etc/fstab.orig /etc/fstab
```

View information about an Amazon EBS volume

You can view descriptive information about your EBS volumes. For example, you can view information about all volumes in a specific Region or view detailed information about a single volume, including its size, volume type, whether the volume is encrypted, which master key was used to encrypt the volume, and the specific instance to which the volume is attached.

You can get additional information about your EBS volumes, such as how much disk space is available, from the operating system on the instance.

View volume information

You can view information about a volume using one of the following methods.

New console

To view information about a volume using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. To reduce the list, you can filter your volumes using tags and volume attributes. Choose the filter field, select a tag or volume attribute, and then select the filter value.
4. To view more information about a volume, choose its ID.

To view the EBS volumes that are attached to an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance.
4. On the **Storage** tab, the **Block devices** section lists the volumes that are attached to the instance. To view information about a specific volume, choose its ID in the **Volume ID** column.

Old console

To view information about an EBS volume using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. (Optional) Use the filter options in the search field to display only the volumes that interest you. For example, if you know the instance ID, choose **Instance ID** from the search field menu, and then choose the instance ID from the list provided. To remove a filter, choose it again.
4. Select the volume.
5. In the details pane, you can inspect the information provided about the volume. **Attachment information** shows the instance ID this volume is attached to and the device name under which it is attached.
6. (Optional) Choose the **Attachment information** link to view additional details about the instance.

To view the EBS volumes that are attached to an instance using the new console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.

3. Select the instance.
4. In the **Description** tab, view the information provided for **Block devices**. To view information about a specific volume, choose a link next to Block devices and then choose the volume ID.

To view the EBS volumes that are attached to an instance using the old console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance.
4. In the **Description** tab, for **Block devices**, select the block device mapping and then choose the **EBS ID** to view additional details for the volume.

AWS CLI

To view information about an EBS volume using the command line

You can use one of the following commands to view volume attributes. For more information, see [Access Amazon EC2 \(p. 3\)](#).

- [describe-volumes \(AWS CLI\)](#)
- [Get-EC2Volume \(AWS Tools for Windows PowerShell\)](#)

Amazon EC2 Global View

You can use Amazon EC2 Global View to view your volumes across all Regions for which your AWS account is enabled. For more information, see [List and filter resources across Regions using Amazon EC2 Global View \(p. 1691\)](#).

Volume state

Volume state describes the availability of an Amazon EBS volume. You can view the volume state in the **State** column on the **Volumes** page in the console, or by using the [describe-volumes](#) AWS CLI command.

The possible volume states are:

creating

The volume is being created.

available

The volume is not attached to an instance.

in-use

The volume is attached to an instance.

deleting

The volume is being deleted.

deleted

The volume is deleted.

error

The underlying hardware related to your EBS volume has failed, and the data associated with the volume is unrecoverable. For information about how to restore the volume or recover the data on the volume, see [My EBS volume has a status of "error"](#).

View volume metrics

You can get additional information about your EBS volumes from Amazon CloudWatch. For more information, see [Amazon CloudWatch metrics for Amazon EBS \(p. 1603\)](#).

View free disk space

You can get additional information about your EBS volumes, such as how much disk space is available, from the Linux operating system on the instance. For example, use the following command:

```
[ec2-user ~]$ df -hT /dev/xvda1
Filesystem      Type      Size  Used Avail Use% Mounted on
/dev/xvda1      xfs       8.0G  1.2G  6.9G  15%  /
```

For information about viewing free disk space on a Windows instance, see [View free disk space](#) in the *Amazon EC2 User Guide for Windows Instances*.

Replace an Amazon EBS volume

Amazon EBS snapshots are the preferred backup tool on Amazon EC2 because of their speed, convenience, and cost. When creating a volume from a snapshot, you recreate its state at a specific point in time with the data saved up to that specific point intact. By attaching a volume created from a snapshot to an instance, you can duplicate data across Regions, create test environments, replace a damaged or corrupted production volume in its entirety, or retrieve specific files and directories and transfer them to another attached volume. For more information, see [Amazon EBS snapshots \(p. 1403\)](#).

The procedure for replacing a volume differs depending on whether the volume is the root volume or a data volume.

Topics

- [Replace a root volume \(p. 1388\)](#)
- [Replace a data volume \(p. 1391\)](#)

Replace a root volume

Amazon EC2 enables you to replace the root EBS volume for an instance without stopping the instance. You can restore the root volume for an instance to its launch state, or to a specific snapshot. This allows you to fix issues, such as root volume corruption or guest operating system network configuration errors, while retaining the following:

- Data stored on instance store volumes — Instance store volumes remain attached to the instance after the root volume has been replaced.
- Network configuration — All network interfaces remain attached to the instance and they retain their IP addresses, identifiers, and attachment IDs. When the instance becomes available, all pending network traffic is flushed. Additionally, the instance remains on the same physical host, so it retains its public and private IP addresses and DNS name.
- IAM policies — IAM profiles and policies (such as tag-based policies) that are associated with the instance are retained and enforced.

When you replace the root volume for an instance, a new volume is restored to the original volume's launch state, or using a specific snapshot. The original volume is detached from the instance, and the new volume is attached to the instance in its place. The original volume is not automatically deleted. If you no longer need it, you can delete it manually after the root volume replacement task completes. For more information about root volume replacement task states, see [View root volume replacement tasks \(p. 1390\)](#).

Topics

- [Considerations \(p. 382\)](#)
- [Replace a root volume \(p. 1389\)](#)
- [View root volume replacement tasks \(p. 1390\)](#)

Considerations

- The instance is automatically rebooted when the root volume is replaced. The contents of the memory (RAM) is erased during the reboot.
- You can't replace the root volume if it is an instance store volume.
- You can't replace the root volume for metal instances.
- You can only use snapshots that belong to the same lineage as the instance's current root volume. You can't use snapshot copies created from snapshots that were taken from the root volume. Additionally, after successfully completing a root volume replacement task, snapshots taken from the previous root volume can't be used to create a root volume replacement task for the new volume.

Replace a root volume

When you replace the root volume for an instance, you can choose to restore the volume to its initial launch state, or you can choose to restore the volume to a specific snapshot. If you choose to restore the volume to a specific snapshot, then you must select a snapshot that was taken of that root volume. If you choose to restore the root volume to its initial launch state, the root volume is restored from the snapshot that was used to create the volume.

You can replace the root volume for an instance using one of the following methods. If you use the Amazon EC2 console, note that replacing the root volume is only available in the new console.

New console

To replace the root volume

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance for which to replace the root volume and choose **Actions, Monitor and troubleshoot, Replace root volume**.
4. In the **Replace root volume** screen, do one of the following:
 - To restore the instance's root volume to its initial launch state, choose **Create replacement task** without selecting a snapshot.
 - To restore the instance's root volume to a specific snapshot, for **Snapshot**, select the snapshot to use, and then choose **Create replacement task**.

AWS CLI

To restore the root volume to the initial launch state

Use the `create-replace-root-volume-task` command. Specify the ID of the instance for which to replace the root volume and omit the `--snapshot-id` parameter.

```
$ aws ec2 create-replace-root-volume-task --instance-id instance_id
```

For example:

```
$ aws ec2 create-replace-root-volume-task --instance-id i-1234567890abcdef0
```

To restore the root volume to a specific snapshot

Use the [create-replace-root-volume-task](#) command. Specify the ID of the instance for which to replace the root volume and the ID of the snapshot to use.

```
$ aws ec2 create-replace-root-volume-task --instance-id instance_id --snapshot-id snapshot_id
```

For example:

```
$ aws ec2 create-replace-root-volume-task --instance-id i-1234567890abcdef0 --snapshot-id snap-9876543210abcdef0
```

View root volume replacement tasks

After you start a root volume replacement task, the task enters the following states:

- **pending** — the replacement volume is being created.
- **in-progress** — the original volume is being detached and the replacement volume is being attached.
- **succeeded** — the replacement volume has been successfully attached to the instance and the instance is available.
- **failing** — the replacement task is in the process of failing.
- **failed** — the replacement task has failed but the original root volume is still attached.
- **failing-detached** — the replacement task is in the process of failing. The instance might have no root volume attached.
- **failed-detached** — the replacement task has failed and the instance has no root volume attached.

You can view the root volume replacement tasks for an instance using one of the following methods. If you use the console, note that this functionality is only available in the new console.

New console

To view the root volume replacement tasks

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance for which to view the root volume replacement tasks, and then choose the **Storage** tab.
4. In the **Storage** tab, expand **Recent root volume replacement tasks**.

AWS CLI

To view the status of a root volume replacement task

Use the [describe-replace-root-volume-tasks](#) command and specify the IDs of the root volume replacement tasks to view.

```
$ aws ec2 describe-replace-root-volume-tasks --replace-root-volume-task-ids task_id_1 task_id_2
```

For example:

```
$ aws ec2 describe-replace-root-volume-tasks --replace-root-volume-task-ids replacevol-1234567890abcdef0
```

```
{  
    "ReplaceRootVolumeTasks": [  
        {  
            "ReplaceRootVolumeTaskId": "replacevol-1234567890abcdef0",  
            "InstanceId": "i-1234567890abcdef0",  
            "TaskState": "succeeded",  
            "StartTime": "2020-11-06 13:09:54.0",  
            "CompleteTime": "2020-11-06 13:10:14.0"  
        }]  
    }  
}
```

Alternatively, specify the `instance-id` filter to filter the results by instance.

```
$ aws ec2 describe-replace-root-volume-tasks --filters Name=instance-  
id,Values=instance_id
```

For example:

```
$ aws ec2 describe-replace-root-volume-tasks --filters Name=instance-  
id,Values=i-1234567890abcdef0
```

Replace a data volume

You can use the following procedure to replace a (non-root) data volume with another volume created from a previous snapshot of that volume. You must detach the current volume and then attach the new volume.

Note that EBS volumes can only be attached to EC2 instances in the same Availability Zone.

Use the following method.

New console

To replace a data volume

1. Create a volume from the snapshot and write down the ID of the new volume. For more information, see [Create a volume from a snapshot \(p. 1373\)](#).
2. On the Instances page, select the instance on which to replace the volume and write down the instance ID.

With the instance still selected, choose the **Storage** tab. In the **Block devices** section, find the volume to replace and write down the device name for the volume, for example `/dev/sda1`.

Choose the volume ID.

3. On the Volumes screen, select the volume and choose **Actions, Detach volume, Detach**.
4. Select the new volume that you created in step 1 and choose **Actions, Attach volume**.

For **Instance** and **Device name**, enter the instance ID and device name that you wrote down in Step 2, and then choose **Attach volume**.

5. Connect to your instance and mount the volume. For more information, see [Make an Amazon EBS volume available for use on Linux \(p. 1382\)](#).

Old console

To replace a data volume

1. Create a volume from the snapshot and write down the ID of the new volume. For more information, see [Create a volume from a snapshot \(p. 1373\)](#).
2. On the volumes page, select the check box for the volume to replace. On the **Description** tab, find **Attachment information** and write down the device name of the volume (for example, `/dev/sda1`) and the ID of the instance.
3. With the volume still selected, choose **Actions, Detach Volume**. When prompted for confirmation, choose **Yes, Detach**. Clear the check box for this volume.
4. Select the check box for the new volume that you created in step 1. Choose **Actions, Attach Volume**. Enter the instance ID and device name that you wrote down in step 2, and then choose **Attach**.
5. Connect to your instance and mount the volume. For more information, see [Make an Amazon EBS volume available for use on Linux \(p. 1382\)](#).

Monitor the status of your volumes

Amazon Web Services (AWS) automatically provides data that you can use to monitor your Amazon Elastic Block Store (Amazon EBS) volumes.

Contents

- [EBS volume status checks \(p. 1392\)](#)
- [EBS volume events \(p. 1394\)](#)
- [Work with an impaired volume \(p. 1395\)](#)
- [Work with the Auto-Enabled IO volume attribute \(p. 1397\)](#)

For additional monitoring information, see [Amazon CloudWatch metrics for Amazon EBS \(p. 1603\)](#) and [Amazon CloudWatch Events for Amazon EBS \(p. 1609\)](#).

EBS volume status checks

Volume status checks enable you to better understand, track, and manage potential inconsistencies in the data on an Amazon EBS volume. They are designed to provide you with the information that you need to determine whether your Amazon EBS volumes are impaired, and to help you control how a potentially inconsistent volume is handled.

Volume status checks are automated tests that run every 5 minutes and return a pass or fail status. If all checks pass, the status of the volume is `ok`. If a check fails, the status of the volume is `impaired`. If the status is `insufficient-data`, the checks may still be in progress on the volume. You can view the results of volume status checks to identify any impaired volumes and take any necessary actions.

When Amazon EBS determines that a volume's data is potentially inconsistent, the default is that it disables I/O to the volume from any attached EC2 instances, which helps to prevent data corruption. After I/O is disabled, the next volume status check fails, and the volume status is `impaired`. In addition, you'll see an event that lets you know that I/O is disabled, and that you can resolve the impaired status of the volume by enabling I/O to the volume. We wait until you enable I/O to give you the opportunity to decide whether to continue to let your instances use the volume, or to run a consistency check using a command, such as `fsck`, before doing so.

Note

Volume status is based on the volume status checks, and does not reflect the volume state. Therefore, volume status does not indicate volumes in the `error` state (for example, when a volume is incapable of accepting I/O.) For information about volume states, see [Volume state \(p. 1387\)](#).

If the consistency of a particular volume is not a concern, and you'd prefer that the volume be made available immediately if it's impaired, you can override the default behavior by configuring the volume to automatically enable I/O. If you enable the **Auto-Enable IO** volume attribute (`autoEnableIO` in the API), the volume status check continues to pass. In addition, you'll see an event that lets you know that the volume was determined to be potentially inconsistent, but that its I/O was automatically enabled. This enables you to check the volume's consistency or replace it at a later time.

The I/O performance status check compares actual volume performance to the expected performance of a volume. It alerts you if the volume is performing below expectations. This status check is available only for Provisioned IOPS SSD (`io1` and `io2`) and General Purpose SSD (`gp3`) volumes that are attached to an instance. The status check is not valid for General Purpose SSD (`gp2`), Throughput Optimized HDD (`st1`), Cold HDD (`sc1`), or Magnetic(`standard`) volumes. The I/O performance status check is performed once every minute, and CloudWatch collects this data every 5 minutes. It might take up to 5 minutes from the moment that you attach an `io1` or `io2` volume to an instance for the status check to report the I/O performance status.

Important

While initializing Provisioned IOPS SSD volumes that were restored from snapshots, the performance of the volume may drop below 50 percent of its expected level, which causes the volume to display a warning state in the **I/O Performance** status check. This is expected, and you can ignore the warning state on Provisioned IOPS SSD volumes while you are initializing them. For more information, see [Initialize Amazon EBS volumes \(p. 1593\)](#).

The following table lists statuses for Amazon EBS volumes.

Volume status	I/O enabled status	I/O performance status (<code>io1</code> , <code>io2</code> , and <code>gp3</code> volumes only)
ok	Enabled (I/O Enabled or I/O Auto-Enabled)	Normal (Volume performance is as expected)
warning	Enabled (I/O Enabled or I/O Auto-Enabled)	Degraded (Volume performance is below expectations) Severely Degraded (Volume performance is well below expectations)
impaired	Enabled (I/O Enabled or I/O Auto-Enabled) Disabled (Volume is offline and pending recovery, or is waiting for the user to enable I/O)	Stalled (Volume performance is severely impacted) Not Available (Unable to determine I/O performance because I/O is disabled)
insufficient-data	Enabled (I/O Enabled or I/O Auto-Enabled) Insufficient Data	Insufficient Data

You can view and work with status checks using the following methods.

New console and Old console

To view status checks

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.

The **Volume status** column displays the operational status of each volume.

3. To view the status details of a specific volume, select it in the grid and choose the **Status checks** tab.
4. If you have a volume with a failed status check (status is `impaired`), see [Work with an impaired volume \(p. 1395\)](#).

Alternatively, you can choose **Events** in the navigator to view all the events for your instances and volumes. For more information, see [EBS volume events \(p. 1394\)](#).

AWS CLI

To view volume status information

Use one of the following commands.

- [describe-volume-status](#) (AWS CLI)
- [Get-EC2VolumeStatus](#) (AWS Tools for Windows PowerShell)

For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

EBS volume events

When Amazon EBS determines that a volume's data is potentially inconsistent, it disables I/O to the volume from any attached EC2 instances by default. This causes the volume status check to fail, and creates a volume status event that indicates the cause of the failure.

To automatically enable I/O on a volume with potential data inconsistencies, change the setting of the **Auto-Enabled IO** volume attribute (`autoEnableIO` in the API). For more information about changing this attribute, see [Work with an impaired volume \(p. 1395\)](#).

Each event includes a start time that indicates the time at which the event occurred, and a duration that indicates how long I/O for the volume was disabled. The end time is added to the event when I/O for the volume is enabled.

Volume status events include one of the following descriptions:

Awaiting Action: Enable IO

Volume data is potentially inconsistent. I/O is disabled for the volume until you explicitly enable it. The event description changes to **IO Enabled** after you explicitly enable I/O.

IO Enabled

I/O operations were explicitly enabled for this volume.

IO Auto-Enabled

I/O operations were automatically enabled on this volume after an event occurred. We recommend that you check for data inconsistencies before continuing to use the data.

Normal

For `io1`, `io2`, and `gp3` volumes only. Volume performance is as expected.

Degraded

For io1, io2, and gp3 volumes only. Volume performance is below expectations.

Severely Degraded

For io1, io2, and gp3 volumes only. Volume performance is well below expectations.

Stalled

For io1, io2, and gp3 volumes only. Volume performance is severely impacted.

You can view events for your volumes using the following methods.

New console and Old console

To view events for your volumes

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**. All instances and volumes that have events are listed.
3. You can filter by volume to view only volume status. You can also filter on specific status types.
4. Select a volume to view its specific event.

AWS CLI

To view events for your volumes

Use one of the following commands.

- [describe-volume-status](#) (AWS CLI)
- [Get-EC2VolumeStatus](#) (AWS Tools for Windows PowerShell)

For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

If you have a volume where I/O is disabled, see [Work with an impaired volume \(p. 1395\)](#). If you have a volume where I/O performance is below normal, this might be a temporary condition due to an action you have taken (for example, creating a snapshot of a volume during peak usage, running the volume on an instance that cannot support the I/O bandwidth required, accessing data on the volume for the first time, etc.).

Work with an impaired volume

Use the following options if a volume is impaired because the volume's data is potentially inconsistent.

Options

- [Option 1: Perform a consistency check on the volume attached to its instance \(p. 1395\)](#)
- [Option 2: Perform a consistency check on the volume using another instance \(p. 1396\)](#)
- [Option 3: Delete the volume if you no longer need it \(p. 1397\)](#)

Option 1: Perform a consistency check on the volume attached to its instance

The simplest option is to enable I/O and then perform a data consistency check on the volume while the volume is still attached to its Amazon EC2 instance.

To perform a consistency check on an attached volume

1. Stop any applications from using the volume.

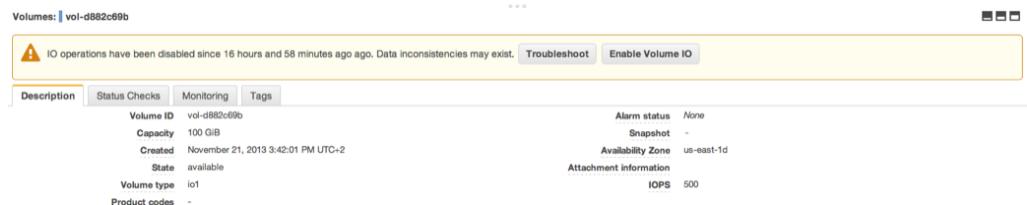

2. Enable I/O on the volume. Use one of the following methods.

New console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Select the volume on which to enable I/O operations.
4. Choose **Actions, Enable I/O**.

Old console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Select the volume on which to enable I/O operations.
4. In the details pane, choose **Enable Volume IO**, and then choose **Yes, Enable**.

AWS CLI

To enable I/O for a volume with the command line

You can use one of the following commands to view event information for your Amazon EBS volumes. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [enable-volume-io \(AWS CLI\)](#)
- [Enable-EC2VolumeIO \(AWS Tools for Windows PowerShell\)](#)

3. Check the data on the volume.
 - a. Run the **fsck** command.
 - b. (Optional) Review any available application or system logs for relevant error messages.
 - c. If the volume has been impaired for more than 20 minutes, you can contact the AWS Support Center. Choose **Troubleshoot**, and then in the **Troubleshoot Status Checks** dialog box, choose **Contact Support** to submit a support case.

Option 2: Perform a consistency check on the volume using another instance

Use the following procedure to check the volume outside your production environment.

Important

This procedure may cause the loss of write I/Os that were suspended when volume I/O was disabled.

To perform a consistency check on a volume in isolation

1. Stop any applications from using the volume.
2. Detach the volume from the instance. For more information, see [Detach an Amazon EBS volume from a Linux instance \(p. 1400\)](#).

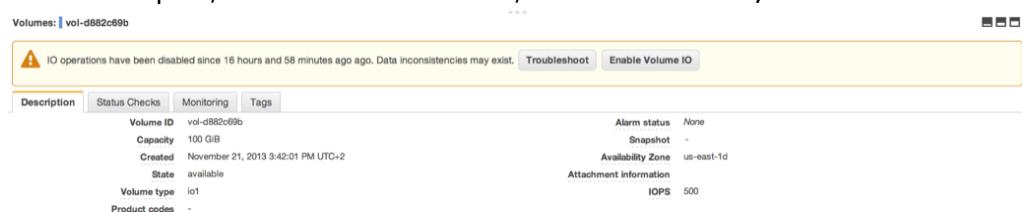

3. Enable I/O on the volume. Use one of the following methods.

New console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Events**.
3. Select the volume that you detached in the previous step.
4. Choose **Actions, Enable I/O**.

Old console

1. In the navigation pane, choose **Volumes**.
2. Select the volume that you detached in the previous step.
3. In the details pane, choose **Enable Volume IO**, and then choose **Yes, Enable**.

AWS CLI

To enable I/O for a volume with the command line

You can use one of the following commands to view event information for your Amazon EBS volumes. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [enable-volume-io](#) (AWS CLI)
 - [Enable-EC2VolumeIO](#) (AWS Tools for Windows PowerShell)
4. Attach the volume to another instance. For more information, see [Launch your instance \(p. 578\)](#) and [Attach an Amazon EBS volume to an instance \(p. 1375\)](#).
 5. Check the data on the volume.
 - a. Run the **fsck** command.
 - b. (Optional) Review any available application or system logs for relevant error messages.
 - c. If the volume has been impaired for more than 20 minutes, you can contact the AWS Support Center. Choose **Troubleshoot**, and then in the troubleshooting dialog box, choose **Contact Support** to submit a support case.

Option 3: Delete the volume if you no longer need it

If you want to remove the volume from your environment, simply delete it. For information about deleting a volume, see [Delete an Amazon EBS volume \(p. 1402\)](#).

If you have a recent snapshot that backs up the data on the volume, you can create a new volume from the snapshot. For more information, see [Create a volume from a snapshot \(p. 1373\)](#).

Work with the Auto-Enabled IO volume attribute

When Amazon EBS determines that a volume's data is potentially inconsistent, it disables I/O to the volume from any attached EC2 instances by default. This causes the volume status check to fail, and

creates a volume status event that indicates the cause of the failure. If the consistency of a particular volume is not a concern, and you prefer that the volume be made available immediately if it's **impaired**, you can override the default behavior by configuring the volume to automatically enable I/O. If you enable the **Auto-Enabled IO** volume attribute (`autoEnableIO` in the API), I/O between the volume and the instance is automatically re-enabled and the volume's status check will pass. In addition, you'll see an event that lets you know that the volume was in a potentially inconsistent state, but that its I/O was automatically enabled. When this event occurs, you should check the volume's consistency and replace it if necessary. For more information, see [EBS volume events \(p. 1394\)](#).

You can view and modify the **Auto-Enabled IO** attribute of a volume using one of the following methods.

New console

To view the Auto-Enabled IO attribute of a volume

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Select the volume and choose the **Status checks** tab.

The **Auto-enabled I/O** field displays the current setting (**Enabled** or **Disabled**) for the selected volume.

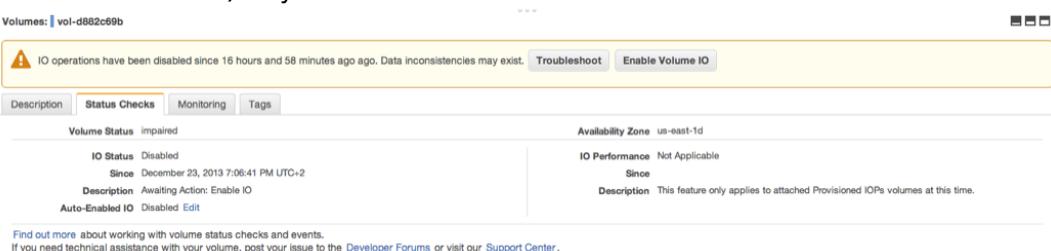

To modify the Auto-Enabled IO attribute of a volume

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Select the volume and choose **Actions, Manage auto-enabled I/O**.
4. To automatically enable I/O for an impaired volume, select the **Auto-enable I/O for impaired volumes** check box. To disable the feature, clear the check box.
5. Choose **Update**.

Old console

To view the Auto-Enabled IO attribute of a volume

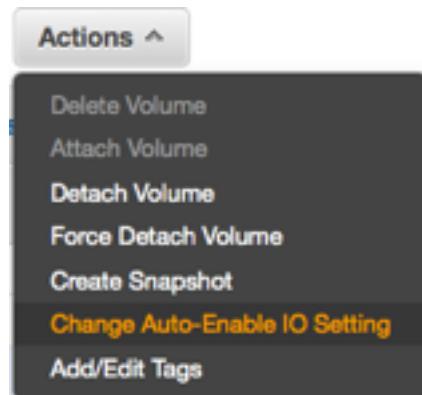

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Select the volume and choose **Status Checks**. **Auto-Enabled IO** displays the current setting (**Enabled** or **Disabled**) for your volume.

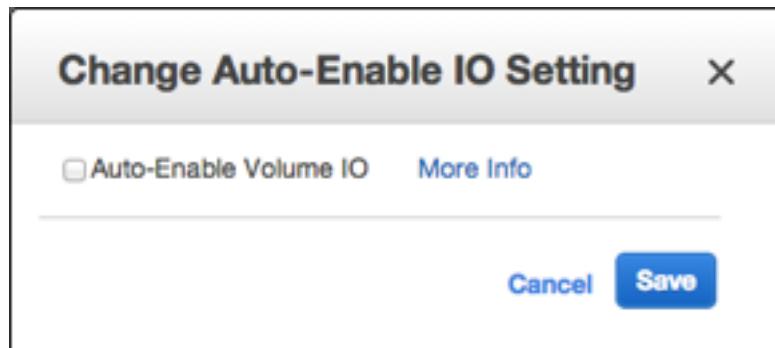

To modify the Auto-Enabled IO attribute of a volume

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.

3. Select the volume and choose **Actions, Change Auto-Enable IO Setting**. Alternatively, choose the **Status Checks** tab, and for **Auto-Enabled IO**, choose **Edit**.

4. Select the **Auto-Enable Volume IO** check box to automatically enable I/O for an impaired volume. To disable the feature, clear the check box.

5. Choose **Save**.

AWS CLI

To view the autoEnableIO attribute of a volume

Use one of the following commands.

- [describe-volume-attribute \(AWS CLI\)](#)
- [Get-EC2VolumeAttribute \(AWS Tools for Windows PowerShell\)](#)

To modify the autoEnableIO attribute of a volume

Use one of the following commands.

- [modify-volume-attribute \(AWS CLI\)](#)
- [Edit-EC2VolumeAttribute \(AWS Tools for Windows PowerShell\)](#)

For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#)

Detach an Amazon EBS volume from a Linux instance

You need to detach an Amazon Elastic Block Store (Amazon EBS) volume from an instance before you can attach it to a different instance or delete it. Detaching a volume does not affect the data on the volume.

For information about detaching volumes from a Windows instance, see [Detach a volume from a Windows instance](#) in the *Amazon EC2 User Guide for Windows Instances*.

Topics

- [Considerations \(p. 382\)](#)
- [Unmount and detach a volume \(p. 1400\)](#)
- [Troubleshoot \(p. 1401\)](#)

Considerations

- You can detach an Amazon EBS volume from an instance explicitly or by terminating the instance. However, if the instance is running, you must first unmount the volume from the instance.
- If an EBS volume is the root device of an instance, you must stop the instance before you can detach the volume.
- You can reattach a volume that you detached (without unmounting it), but it might not get the same mount point. If there were writes to the volume in progress when it was detached, the data on the volume might be out of sync.
- After you detach a volume, you are still charged for volume storage as long as the storage amount exceeds the limit of the AWS Free Tier. You must delete a volume to avoid incurring further charges. For more information, see [Delete an Amazon EBS volume \(p. 1402\)](#).

Unmount and detach a volume

Use the following procedures to unmount and detach a volume from an instance. This can be useful when you need to attach the volume to a different instance or when you need to delete the volume.

Steps

- [Step 1: Unmount the volume \(p. 1400\)](#)
- [Step 2: Detach the volume from the instance \(p. 1400\)](#)

Step 1: Unmount the volume

From your Linux instance, use the following command to unmount the /dev/sdh device.

```
[ec2-user ~]$ umount -d /dev/sdh
```

Step 2: Detach the volume from the instance

To detach the volume from the instance, use one of the following methods:

New console

To detach an EBS volume using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Volumes**.
3. Select the volume to detach and choose **Actions, Detach volume**.
4. When prompted for confirmation, choose **Detach**.

Old console

To detach an EBS volume using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Select a volume and choose **Actions, Detach Volume**.
4. When prompted for confirmation, choose **Yes, Detach**.

Command line

To detach an EBS volume from an instance using the command line

After unmounting the volume, you can use one of the following commands to detach it. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [detach-volume \(AWS CLI\)](#)
- [Dismount-EC2Volume \(AWS Tools for Windows PowerShell\)](#)

Troubleshoot

The following are common problems encountered when detaching volumes, and how to resolve them.

Note

To guard against the possibility of data loss, take a snapshot of your volume before attempting to unmount it. Forced detachment of a stuck volume can cause damage to the file system or the data it contains or an inability to attach a new volume using the same device name, unless you reboot the instance.

- If you encounter problems while detaching a volume through the Amazon EC2 console, it can be helpful to use the **describe-volumes** CLI command to diagnose the issue. For more information, see [describe-volumes](#).
- If your volume stays in the detaching state, you can force the detachment by choosing **Force Detach**. Use this option only as a last resort to detach a volume from a failed instance, or if you are detaching a volume with the intention of deleting it. The instance doesn't get an opportunity to flush file system caches or file system metadata. If you use this option, you must perform the file system check and repair procedures.
- If you've tried to force the volume to detach multiple times over several minutes and it stays in the detaching state, you can post a request for help to the [Amazon EC2 forum](#). To help expedite a resolution, include the volume ID and describe the steps that you've already taken.
- When you attempt to detach a volume that is still mounted, the volume can become stuck in the busy state while it is trying to detach. The following output from **describe-volumes** shows an example of this condition:

```
"Volumes": [  
  {  
    "AvailabilityZone": "us-west-2b",  
    "Attachments": [  
      {
```

```
        "AttachTime": "2016-07-21T23:44:52.000Z",
        "InstanceId": "i-fedc9876",
        "VolumeId": "vol-1234abcd",
        "State": "busy",
        "DeleteOnTermination": false,
        "Device": "/dev/sdf"
    }
    ...
]
```

When you encounter this state, detachment can be delayed indefinitely until you unmount the volume, force detachment, reboot the instance, or all three.

Delete an Amazon EBS volume

You can delete an Amazon EBS volume that you no longer need. After deletion, its data is gone and the volume can't be attached to any instance. So before deletion, you can store a snapshot of the volume, which you can use to re-create the volume later.

Note

You can't delete a volume if it's attached to an instance. To delete a volume, you must first detach it. For more information, see [Detach an Amazon EBS volume from a Linux instance \(p. 1400\)](#).

You can check if a volume is attached to an instance. In the console, on the **Volumes** page, you can view the state of your volumes.

- If a volume is attached to an instance, it's in the **in-use** state.
- If a volume is detached from an instance, it's in the **available** state. You can delete this volume.

You can delete an EBS volume using one of the following methods.

New console

To delete an EBS volume using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Select the volume to delete and choose **Actions, Delete volume**.

Note

If **Delete volume** is greyed out, the volume is attached to an instance. You must detach the volume from the instance before it can be deleted.

4. In the confirmation dialog box, choose **Delete**.

Old console

To delete an EBS volume using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Select a volume and choose **Actions, Delete Volume**. If **Delete Volume** is greyed out, the volume is attached to an instance.
4. In the confirmation dialog box, choose **Yes, Delete**.

AWS CLI

To delete an EBS volume using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [delete-volume \(AWS CLI\)](#)
- [Remove-EC2Volume \(AWS Tools for Windows PowerShell\)](#)

Amazon EBS snapshots

You can back up the data on your Amazon EBS volumes to Amazon S3 by taking point-in-time snapshots. Snapshots are *incremental* backups, which means that only the blocks on the device that have changed after your most recent snapshot are saved. This minimizes the time required to create the snapshot and saves on storage costs by not duplicating data. Each snapshot contains all of the information that is needed to restore your data (from the moment when the snapshot was taken) to a new EBS volume.

When you create an EBS volume based on a snapshot, the new volume begins as an exact replica of the original volume that was used to create the snapshot. The replicated volume loads data in the background so that you can begin using it immediately. If you access data that hasn't been loaded yet, the volume immediately downloads the requested data from Amazon S3, and then continues loading the rest of the volume's data in the background. For more information, see [Create Amazon EBS snapshots \(p. 1407\)](#).

When you delete a snapshot, only the data unique to that snapshot is removed. For more information, see [Delete an Amazon EBS snapshot \(p. 1411\)](#).

Snapshot events

You can track the status of your EBS snapshots through CloudWatch Events. For more information, see [EBS snapshot events \(p. 1613\)](#).

Multi-volume snapshots

Snapshots can be used to create a backup of critical workloads, such as a large database or a file system that spans across multiple EBS volumes. Multi-volume snapshots allow you to take exact point-in-time, data coordinated, and crash-consistent snapshots across multiple EBS volumes attached to an EC2 instance. You are no longer required to stop your instance or to coordinate between volumes to ensure crash consistency, because snapshots are automatically taken across multiple EBS volumes. For more information, see the steps for creating a multi-volume EBS snapshot under [Create Amazon EBS snapshots \(p. 1407\)](#).

Snapshot pricing

Charges for your snapshots are based on the amount of data stored. Because snapshots are incremental, deleting a snapshot might not reduce your data storage costs. Data referenced exclusively by a snapshot is removed when that snapshot is deleted, but data referenced by other snapshots is preserved. For more information, see [Amazon Elastic Block Store Volumes and Snapshots](#) in the [AWS Billing and Cost Management User Guide](#).

Contents

- [How incremental snapshots work \(p. 1404\)](#)
- [Copy and share snapshots \(p. 1406\)](#)

How incremental snapshots work

This section shows how an EBS snapshot captures the state of a volume at a point in time, and how successive snapshots of a changing volume create a history of those changes.

Relations among multiple snapshots of the same volume

The diagram in this section shows Volume 1 at three points in time. A snapshot is taken of each of these three volume states. The diagram specifically shows the following:

- In State 1, the volume has 10 GiB of data. Because **Snap A** is the first snapshot taken of the volume, the entire 10 GiB of data must be copied.
- In State 2, the volume still contains 10 GiB of data, but 4 GiB have changed. **Snap B** needs to copy and store only the 4 GiB that changed after **Snap A** was taken. The other 6 GiB of unchanged data, which are already copied and stored in **Snap A**, are *referenced* by **Snap B** rather than being copied again. This is indicated by the dashed arrow.
- In State 3, 2 GiB of data have been added to the volume, for a total of 12 GiB. **Snap C** needs to copy the 2 GiB that were added after **Snap B** was taken. As shown by the dashed arrows, **Snap C** also references 4 GiB of data stored in **Snap B**, and 6 GiB of data stored in **Snap A**.
- The total storage required for the three snapshots is 16 GiB.

Relations among incremental snapshots of different volumes

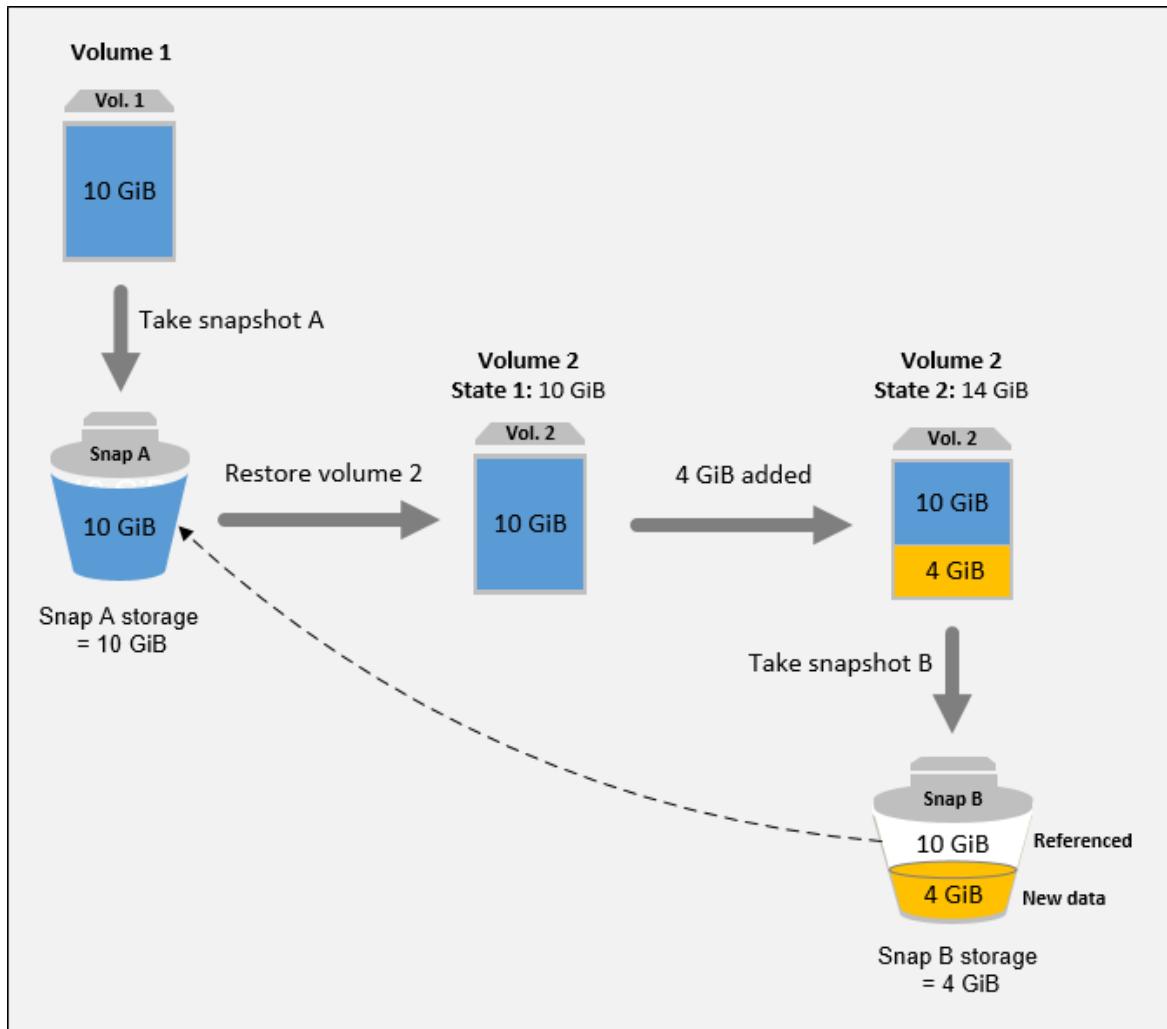

The diagram in this section shows how incremental snapshots can be taken from different volumes.

Important

The diagram assumes that you own **Vol 1** and that you have created **Snap A**. If **Vol 1** was owned by another AWS account and that account took **Snap A** and shared it with you, then **Snap B** would be a full snapshot.

1. **Vol 1** has 10 GiB of data. Because **Snap A** is the first snapshot taken of the volume, the entire 10 GiB of data is copied and stored.
2. **Vol 2** is created from **Snap A**, so it is an exact replica of **Vol 1** at the time the snapshot was taken.
3. Over time, 4 GiB of data is added to **Vol 2** and its total size becomes 14 GiB.
4. **Snap B** is taken from **Vol 2**. For **Snap B**, only the 4 GiB of data that was added after the volume was created from **Snap A** is copied and stored. The other 10 GiB of unchanged data, which is already stored in **Snap A**, is referenced by **Snap B** instead of being copied and stored again.

Snap B is an incremental snapshot of **Snap A**, even though it was created from a different volume.

For more information about how data is managed when you delete a snapshot, see [Delete an Amazon EBS snapshot \(p. 1411\)](#).

Copy and share snapshots

You can share a snapshot across AWS accounts by modifying its access permissions. You can make copies of your own snapshots as well as snapshots that have been shared with you. For more information, see [Share an Amazon EBS snapshot \(p. 1441\)](#).

A snapshot is constrained to the AWS Region where it was created. After you create a snapshot of an EBS volume, you can use it to create new volumes in the same Region. For more information, see [Create a volume from a snapshot \(p. 1373\)](#). You can also copy snapshots across Regions, making it possible to use multiple Regions for geographical expansion, data center migration, and disaster recovery. You can copy any accessible snapshot that has a completed status. For more information, see [Copy an Amazon EBS snapshot \(p. 1413\)](#).

Encryption support for snapshots

EBS snapshots fully support EBS encryption.

- Snapshots of encrypted volumes are automatically encrypted.
- Volumes that you create from encrypted snapshots are automatically encrypted.
- Volumes that you create from an unencrypted snapshot that you own or have access to can be encrypted on-the-fly.
- When you copy an unencrypted snapshot that you own, you can encrypt it during the copy process.
- When you copy an encrypted snapshot that you own or have access to, you can reencrypt it with a different key during the copy process.
- The first snapshot you take of an encrypted volume that has been created from an unencrypted snapshot is always a full snapshot.
- The first snapshot you take of a reencrypted volume, which has a different CMK compared to the source snapshot, is always a full snapshot.

Complete documentation of possible snapshot encryption scenarios is provided in [Create Amazon EBS snapshots \(p. 1407\)](#) and in [Copy an Amazon EBS snapshot \(p. 1413\)](#).

For more information, see [Amazon EBS encryption \(p. 1542\)](#).

Create Amazon EBS snapshots

You can create a point-in-time snapshot of an EBS volume and use it as a baseline for new volumes or for data backup. If you make periodic snapshots of a volume, the snapshots are incremental—the new snapshot saves only the blocks that have changed since your last snapshot.

Snapshots occur asynchronously; the point-in-time snapshot is created immediately, but the status of the snapshot is pending until the snapshot is complete (when all of the modified blocks have been transferred to Amazon S3), which can take several hours for large initial snapshots or subsequent snapshots where many blocks have changed. While it is completing, an in-progress snapshot is not affected by ongoing reads and writes to the volume.

You can take a snapshot of an attached volume that is in use. However, snapshots only capture data that has been written to your Amazon EBS volume at the time the snapshot command is issued. This might exclude any data that has been cached by any applications or the operating system. If you can pause any file writes to the volume long enough to take a snapshot, your snapshot should be complete. However, if you can't pause all file writes to the volume, you should unmount the volume from within the instance, issue the snapshot command, and then remount the volume to ensure a consistent and complete snapshot. You can remount and use your volume while the snapshot status is pending.

To make snapshot management easier, you can tag your snapshots during creation or add tags afterward. For example, you can apply tags describing the original volume from which the snapshot was created, or the device name that was used to attach the original volume to an instance. For more information, see [Tag your Amazon EC2 resources \(p. 1692\)](#).

Snapshot encryption

Snapshots that are taken from encrypted volumes are automatically encrypted. Volumes that are created from encrypted snapshots are also automatically encrypted. The data in your encrypted volumes and

any associated snapshots is protected both at rest and in motion. For more information, see [Amazon EBS encryption \(p. 1542\)](#).

By default, only you can create volumes from snapshots that you own. However, you can share your unencrypted snapshots with specific AWS accounts, or you can share them with the entire AWS community by making them public. For more information, see [Share an Amazon EBS snapshot \(p. 1441\)](#).

You can share an encrypted snapshot only with specific AWS accounts. For others to use your shared, encrypted snapshot, you must also share the CMK key that was used to encrypt it. Users with access to your encrypted snapshot must create their own personal copy of it and then use that copy. Your copy of a shared, encrypted snapshot can also be re-encrypted using a different key. For more information, see [Share an Amazon EBS snapshot \(p. 1441\)](#).

Multi-volume snapshots

You can create multi-volume snapshots, which are point-in-time snapshots for all EBS volumes attached to an EC2 instance. You can also create lifecycle policies to automate the creation and retention of multi-volume snapshots. For more information, see [Amazon Data Lifecycle Manager \(p. 1485\)](#).

After the snapshots are created, each snapshot is treated as an individual snapshot. You can perform all snapshot operations, such as restore, delete, and copy across Regions or accounts, just as you would with a single volume snapshot. You can also tag your multi-volume snapshots as you would a single volume snapshot. We recommend you tag your multiple volume snapshots to manage them collectively during restore, copy, or retention.

Multi-volume, crash-consistent snapshots are typically restored as a set. It is helpful to identify the snapshots that are in a crash-consistent set by tagging your set with the instance ID, name, or other relevant details. You can also choose to automatically copy tags from the source volume to the corresponding snapshots. This helps you to set the snapshot metadata, such as access policies, attachment information, and cost allocation, to match the source volume.

After creating your snapshots, they appear in your EC2 console created at the exact point-in-time.

If any one snapshot for the multi-volume snapshot set fails, all of the other snapshots display an error status and a `createSnapshots` CloudWatch event with a result of `failed` is sent to your AWS account. For more information, see [Create snapshots \(createSnapshots\) \(p. 1614\)](#).

Amazon Data Lifecycle Manager

You can create, retain, and delete snapshots manually, or you can use Amazon Data Lifecycle Manager to manage your snapshots for you. For more information, see [Amazon Data Lifecycle Manager \(p. 1485\)](#).

Considerations

The following considerations apply to creating snapshots:

- When you create a snapshot for an EBS volume that serves as a root device, you should stop the instance before taking the snapshot.
- You cannot create snapshots from instances for which hibernation is enabled.
- You cannot create snapshots from hibernated instances.
- Although you can take a snapshot of a volume while a previous snapshot of that volume is in the `pending` status, having multiple `pending` snapshots of a volume can result in reduced volume performance until the snapshots complete.
- There is a limit of one `pending` snapshot for a single `st1` or `sc1` volume, or five `pending` snapshots for a single volume of the other volume types. If you receive a

ConcurrentSnapshotLimitExceeded error while trying to create multiple concurrent snapshots of the same volume, wait for one or more of the pending snapshots to complete before creating another snapshot of that volume.

- When a snapshot is created from a volume with an AWS Marketplace product code, the product code is propagated to the snapshot.

Create a snapshot

To create a snapshot from the specified volume, use one of the following methods.

New console

To create a snapshot using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Snapshots**, **Create snapshot**.
3. For **Resource type**, choose **Volume**.
4. For **Volume ID**, select the volume from which to create the snapshot.

The **Encryption** field indicates the selected volume's encryption status. If the selected volume is encrypted, the snapshot is automatically encrypted using the same KMS key. If the selected volume is unencrypted, the snapshot is not encrypted.

5. (Optional) For **Description**, enter a brief description for the snapshot.
6. (Optional) To assign custom tags to the snapshot, in the **Tags** section, choose **Add tag**, and then enter the key-value pair. You can add up to 50 tags.
7. Choose **Create snapshot**.

Old console

To create a snapshot using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Snapshots** under **Elastic Block Store** in the navigation pane.
3. Choose **Create Snapshot**.
4. For **Select resource type**, choose **Volume**.
5. For **Volume**, select the volume.
6. (Optional) Enter a description for the snapshot.
7. (Optional) Choose **Add Tag** to add tags to your snapshot. For each tag, provide a tag key and a tag value.
8. Choose **Create Snapshot**.

AWS CLI

To create a snapshot using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [create-snapshot](#) (AWS CLI)
- [New-EC2Snapshot](#) (AWS Tools for Windows PowerShell)

Create a multi-volume snapshot

To create a snapshot from the volumes of an instance, use one of the following methods.

New console

To create multi-volume snapshots using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation panel, choose **Snapshots**, **Create snapshot**.
3. For **Resource type**, choose **Instance**.
4. For **Instance ID**, choose the instance from which to create the snapshots. Multi-volume snapshots support up to 40 EBS volumes for each instance.

The **Attached volumes** section lists all of the volumes that are attached to the selected instance, along with their encryption statuses. Snapshots get the same encryption status as their source volume.

5. For **Description**, enter a brief description for the snapshots. This description is applied to all of the snapshots.
6. To create snapshots from all of the instance's volumes, including its root volume, for **Root volume**, choose **Include**. To create snapshots from the instance's data volumes only, for **Root volume**, choose **Exclude**.
7. (Optional) To automatically copy tags from the source volumes to the corresponding snapshots, for **Copy tags from source volume**, select **Enable**. This sets snapshot metadata—such as access policies, attachment information, and cost allocation—to match the source volume.
8. (Optional) To assign custom tags to the snapshots, in the **Tags** section, choose **Add tag**, and then enter the key-value pair. You can add up to 50 tags.
9. Choose **Create snapshot**.

During snapshot creation, the snapshots are managed together. If one of the snapshots in the volume set fails, the other snapshots are moved to error status for the volume set. You can monitor the progress of your snapshots using [CloudWatch Events](#). After the snapshot creation process completes, CloudWatch generates an event that contains the status and all of the relevant snapshot details for the affected instance.

Old console

To create multi-volume snapshots using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Snapshots** under **Elastic Block Store** in the navigation pane.
3. Choose **Create Snapshot**.
4. For **Select resource type**, choose **Instance**.
5. Select the instance ID for which you want to create simultaneous backups for all of the attached EBS volumes. Multi-volume snapshots support up to 40 EBS volumes per instance.
6. (Optional) Set **Exclude root volume**.
7. (Optional) Set **Copy tags from volume** flag to automatically copy tags from the source volume to the corresponding snapshots. This sets snapshot metadata—such as access policies, attachment information, and cost allocation—to match the source volume.
8. (Optional) Choose **Add Tag** to add tags to your snapshot. For each tag, provide a tag key and a tag value.
9. Choose **Create Snapshot**.

AWS CLI

To create multi-volume snapshots using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [create-snapshots \(AWS CLI\)](#)
- [New-EC2SnapshotBatch \(AWS Tools for Windows PowerShell\)](#)

If all of the snapshots complete successfully, a `createSnapshots` CloudWatch event with a result of `succeeded` is sent to your AWS account. If any one snapshot for the multi-volume snapshot set fails, all of the other snapshots display an error status and a `createSnapshots` CloudWatch event with a result of `failed` is sent to your AWS account. For more information, see [Create snapshots \(createSnapshots\) \(p. 1614\)](#).

Work with EBS snapshots

You can copy snapshots, share snapshots, and create volumes from snapshots. For more information, see the following:

- [Copy an Amazon EBS snapshot \(p. 1413\)](#)
- [Share an Amazon EBS snapshot \(p. 1441\)](#)
- [Create a volume from a snapshot \(p. 1373\)](#)

Delete an Amazon EBS snapshot

After you no longer need an Amazon EBS snapshot of a volume, you can delete it. Deleting a snapshot has no effect on the volume. Deleting a volume has no effect on the snapshots made from it.

Incremental snapshot deletion

If you make periodic snapshots of a volume, the snapshots are *incremental*. This means that only the blocks on the device that have changed after your most recent snapshot are saved in the new snapshot. Even though snapshots are saved incrementally, the snapshot deletion process is designed so that you need to retain only the most recent snapshot in order to create volumes.

If data was present on a volume held in an earlier snapshot or series of snapshots, and that data is subsequently deleted from the volume later on, the data is still considered to be unique data of the earlier snapshots. Unique data is only deleted from the sequence of snapshots if all snapshots that reference the unique data are deleted.

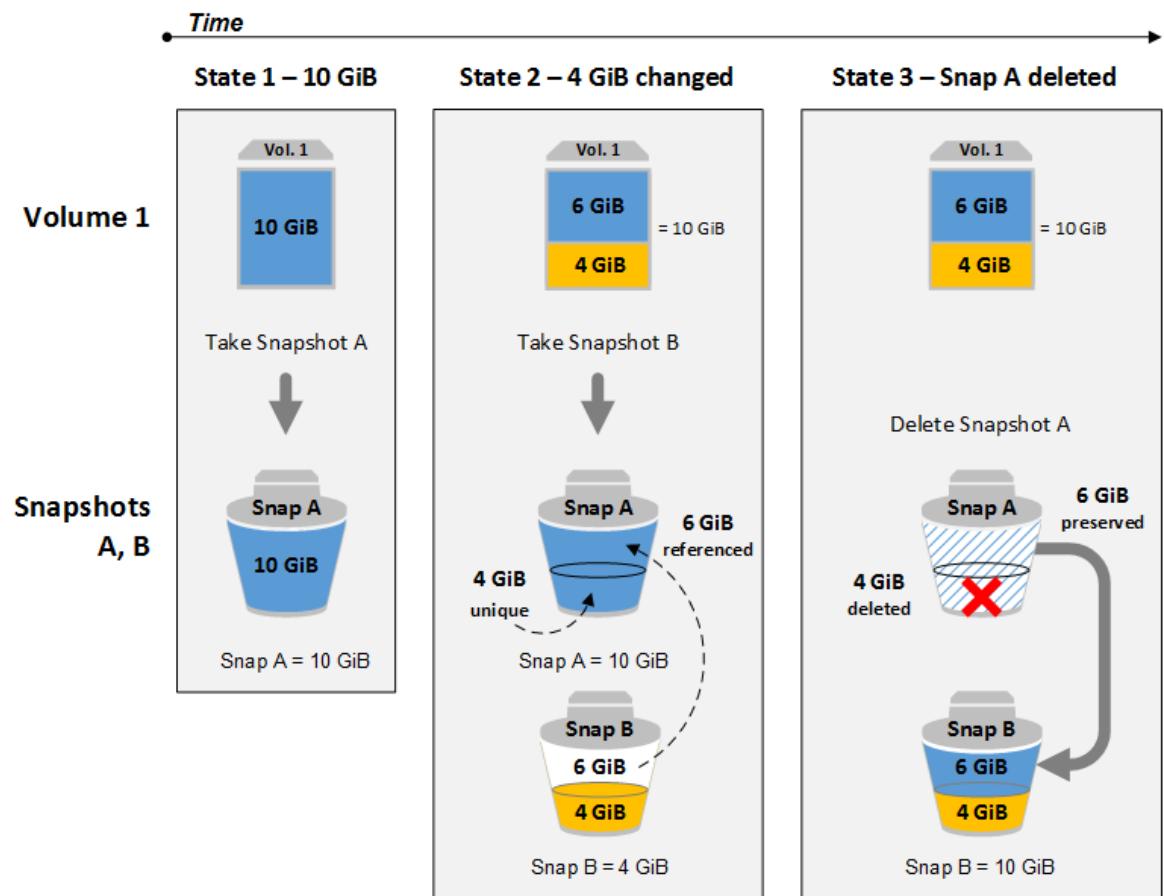

When you delete a snapshot, only the data that is referenced exclusively by that snapshot is removed. Unique data is only deleted if all of the snapshots that reference it are deleted. Deleting previous snapshots of a volume does not affect your ability to create volumes from later snapshots of that volume.

Deleting a snapshot might not reduce your organization's data storage costs. Other snapshots might reference that snapshot's data, and referenced data is always preserved. If you delete a snapshot containing data being used by a later snapshot, costs associated with the referenced data are allocated to the later snapshot. For more information about how snapshots store data, see [How incremental snapshots work \(p. 1404\)](#) and the following example.

In the following diagram, Volume 1 is shown at three points in time. A snapshot has captured each of the first two states, and in the third, a snapshot has been deleted.

- In State 1, the volume has 10 GiB of data. Because Snap A is the first snapshot taken of the volume, the entire 10 GiB of data must be copied.
- In State 2, the volume still contains 10 GiB of data, but 4 GiB have changed. Snap B needs to copy and store only the 4 GiB that changed after Snap A was taken. The other 6 GiB of unchanged data, which are already copied and stored in Snap A, are referenced by Snap B rather than (again) copied. This is indicated by the dashed arrow.
- In state 3, the volume has not changed since State 2, but Snapshot A has been deleted. The 6 GiB of data stored in Snapshot A that were referenced by Snapshot B have now been moved to Snapshot B, as shown by the heavy arrow. As a result, you are still charged for storing 10 GiB of data; 6 GiB of unchanged data preserved from Snap A and 4 GiB of changed data from Snap B.

Deleting a snapshot with some of its data referenced by another snapshot

Considerations

The following considerations apply to deleting snapshots:

- You can't delete a snapshot of the root device of an EBS volume used by a registered AMI. You must first deregister the AMI before you can delete the snapshot. For more information, see [Deregister your Linux AMI \(p. 196\)](#).
- You can't delete a snapshot that is managed by the AWS Backup service using Amazon EC2. Instead, use AWS Backup to delete the corresponding recovery points in the backup vault.
- You can create, retain, and delete snapshots manually, or you can use Amazon Data Lifecycle Manager to manage your snapshots for you. For more information, see [Amazon Data Lifecycle Manager \(p. 1485\)](#).

- Although you can delete a snapshot that is still in progress, the snapshot must complete before the deletion takes effect. This might take a long time. If you are also at your concurrent snapshot limit, and you attempt to take an additional snapshot, you might get a `ConcurrentSnapshotLimitExceeded` error. For more information, see the [Service Quotas](#) for Amazon EBS in the *Amazon Web Services General Reference*.
- If you delete a snapshot that matches an Recycle Bin retention rule, the snapshot is retained in the Recycle Bin instead of being immediately deleted. For more information, see [Recycle Bin \(p. 1664\)](#).

Delete a snapshot

To delete a snapshot, use one of the following methods.

New console

To delete a snapshot using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Snapshots**.
3. Select the snapshot to delete, and then choose **Actions, Delete snapshot**.
4. Choose **Delete**.

Old console

To delete a snapshot using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Snapshots** in the navigation pane.
3. Select a snapshot and then choose **Delete** from the **Actions** list.
4. Choose **Yes, Delete**.

AWS CLI

To delete a snapshot using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [delete-snapshot \(AWS CLI\)](#)
- [Remove-EC2Snapshot \(AWS Tools for Windows PowerShell\)](#)

Delete a multi-volume snapshot

To delete multi-volume snapshots, retrieve all of the snapshots for your multi-volume snapshot set using the tag you applied to the set when you created the snapshots. Then, delete the snapshots individually.

You will not be prevented from deleting individual snapshots in the multi-volume snapshot set. If you delete a snapshot while it is in the `pending` state, only that snapshot is deleted. The other snapshots in the multi-volume snapshot set still complete successfully.

Copy an Amazon EBS snapshot

With Amazon EBS, you can create point-in-time snapshots of volumes, which we store for you in Amazon S3. After you create a snapshot and it has finished copying to Amazon S3 (when the snapshot status is

(completed), you can copy it from one AWS Region to another, or within the same Region. Amazon S3 server-side encryption (256-bit AES) protects a snapshot's data in transit during a copy operation. The snapshot copy receives an ID that is different from the ID of the original snapshot.

To copy multi-volume snapshots to another AWS Region, retrieve the snapshots using the tag you applied to the multi-volume snapshot set when you created it. Then individually copy the snapshots to another Region.

If you would like another account to be able to copy your snapshot, you must either modify the snapshot permissions to allow access to that account or make the snapshot public so that all AWS accounts can copy it. For more information, see [Share an Amazon EBS snapshot \(p. 1441\)](#).

For information about copying an Amazon RDS snapshot, see [Copying a DB Snapshot](#) in the *Amazon RDS User Guide*.

Use cases

- Geographic expansion: Launch your applications in a new AWS Region.
- Migration: Move an application to a new Region, to enable better availability and to minimize cost.
- Disaster recovery: Back up your data and logs across different geographical locations at regular intervals. In case of disaster, you can restore your applications using point-in-time backups stored in the secondary Region. This minimizes data loss and recovery time.
- Encryption: Encrypt a previously unencrypted snapshot, change the key with which the snapshot is encrypted, or create a copy that you own in order to create a volume from it (for encrypted snapshots that have been shared with you).
- Data retention and auditing requirements: Copy your encrypted EBS snapshots from one AWS account to another to preserve data logs or other files for auditing or data retention. Using a different account helps prevent accidental snapshot deletions, and protects you if your main AWS account is compromised.

Prerequisites

- You can copy any accessible snapshots that have a completed status, including shared snapshots and snapshots that you have created.
- You can copy AWS Marketplace, VM Import/Export, and Storage Gateway snapshots, but you must verify that the snapshot is supported in the destination Region.

Considerations

- Each account can have up to twenty concurrent snapshot copy requests to a single destination Region.
- User-defined tags are not copied from the source snapshot to the new snapshot. You can add user-defined tags during or after the copy operation. For more information, see [Tag your Amazon EC2 resources \(p. 1692\)](#).
- Snapshots created by a snapshot copy operation have an arbitrary volume ID that should not be used for any purpose.
- Resource-level permissions specified for the snapshot copy operation apply only to the new snapshot. You cannot specify resource-level permissions for the source snapshot. For an example, see [Example: Copying snapshots \(p. 1262\)](#).

Pricing

- For pricing information about copying snapshots across AWS Regions and accounts, see [Amazon EBS Pricing](#).

- Snapshot copy operations within a single account and Region do not copy any actual data and therefore are cost-free as long as the encryption status of the snapshot copy does not change.
- If you copy a snapshot and encrypt it to a new KMS key, a complete (non-incremental) copy is created. This results in additional storage costs.
- If you copy a snapshot to a new Region, a complete (non-incremental) copy is created. This results in additional storage costs. Subsequent copies of the same snapshot are incremental.

Incremental snapshot copying

Whether a snapshot copy is incremental is determined by the most recently completed snapshot copy. When you copy a snapshot across Regions or accounts, the copy is an incremental copy if the following conditions are met:

- The snapshot was copied to the destination Region or account previously.
- The most recent snapshot copy still exists in the destination Region or account.
- All copies of the snapshot in the destination Region or account are either unencrypted or were encrypted using the same KMS key.

If the most recent snapshot copy was deleted, the next copy is a full copy, not an incremental copy. If a copy is still pending when you start another copy, the second copy starts only after the first copy finishes.

We recommend that you tag your snapshots with the volume ID and creation time so that you can keep track of the most recent snapshot copy of a volume in the destination Region or account.

To see whether your snapshot copies are incremental, check the [copySnapshot \(p. 1615\)](#) CloudWatch event.

Encryption and snapshot copying

When you copy a snapshot, you can encrypt the copy or you can specify a KMS key that is different than the original, and the resulting copied snapshot uses the new KMS key. However, changing the encryption status of a snapshot during a copy operation results in a full (not incremental) copy, which might incur greater data transfer and storage charges.

To copy an encrypted snapshot shared from another AWS account, you must have permissions to use the snapshot and the customer master key (CMK) that was used to encrypt the snapshot. When using an encrypted snapshot that was shared with you, we recommend that you re-encrypt the snapshot by copying it using a KMS key that you own. This protects you if the original KMS key is compromised, or if the owner revokes it, which could cause you to lose access to any encrypted volumes that you created using the snapshot. For more information, see [Share an Amazon EBS snapshot \(p. 1441\)](#).

You apply encryption to EBS snapshot copies by setting the `Encrypted` parameter to `true`. (The `Encrypted` parameter is optional if [encryption by default \(p. 1545\)](#) is enabled).

Optionally, you can use `KmsKeyId` to specify a custom key to use to encrypt the snapshot copy. (The `Encrypted` parameter must also be set to `true`, even if encryption by default is enabled.) If `KmsKeyId` is not specified, the key that is used for encryption depends on the encryption state of the source snapshot and its ownership.

The following tables describe the encryption outcome for each possible combination of settings.

Topics

- [Encryption outcomes: Copying snapshots that you own \(p. 1416\)](#)
- [Encryption outcomes: Copying snapshots that are shared with you \(p. 1416\)](#)

[Encryption outcomes: Copying snapshots that you own](#)

Encryption by default	Is Encrypted parameter set?	Source snapshot encryption status	Default (no KMS key specified)	Custom (KMS key specified)
Disabled	No	Unencrypted	Unencrypted	N/A
		Encrypted	Encrypted by AWS managed key	
	Yes	Unencrypted	Encrypted by default KMS key	Encrypted by specified KMS key**
		Encrypted	Encrypted by default KMS key	
Enabled	No	Unencrypted	Encrypted by default KMS key	N/A
		Encrypted	Encrypted by default KMS key	
	Yes	Unencrypted	Encrypted by default KMS key	Encrypted by specified KMS key**
		Encrypted	Encrypted by default KMS key	

** This is a customer managed key specified for the copy action. This customer managed key is used instead of the default customer managed key for the AWS account and Region.

[Encryption outcomes: Copying snapshots that are shared with you](#)

Copy a snapshot

To copy a snapshot, use one of the following methods.

New console

To copy a snapshot using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Snapshots**.
3. Select the snapshot to copy, and then choose **Actions**, **Copy snapshot**.
4. For **Description**, enter a brief description for the snapshot copy.

By default, the description includes information about the source snapshot so that you can identify a copy from the original. You can change this description as needed.

5. For **Destination Region**, select the Region in which to create the snapshot copy.
6. Specify the encryption status for the snapshot copy.

If the source snapshot is encrypted, or if your account is enabled for [encryption by default \(p. 1545\)](#), then the snapshot copy is automatically encrypted and you can't change its encryption status.

If the source snapshot is unencrypted and your account is not enabled for encryption by default, encryption is optional. To encrypt the snapshot copy, for **Encryption**, select **Encrypt this snapshot**. Then, for **KMS key**, select the KMS key to use to encrypt the snapshot in the destination Region.

7. Choose **Copy snapshot**.

Old console

To copy a snapshot using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Snapshots**.
3. Select the snapshot to copy, and then choose **Copy** from the **Actions** list.
4. In the **Copy Snapshot** dialog box, update the following as necessary:
 - **Destination region:** Select the Region where you want to write the copy of the snapshot.
 - **Description:** By default, the description includes information about the source snapshot so that you can identify a copy from the original. You can change this description as necessary.
 - **Encryption:** If the source snapshot is not encrypted, you can choose to encrypt the copy. If you have enabled [encryption by default \(p. 1545\)](#), the **Encryption** option is set and cannot be unset from the snapshot console. If the **Encryption** option is set, you can choose to encrypt it to a customer managed CMK by selecting one in the field, described below.

You cannot strip encryption from an encrypted snapshot.

- **Master Key:** The customer master key (CMK) to be used to encrypt this snapshot. The default key for your account is displayed initially, but you can optionally select from the master keys in your account or type/paste the ARN of a key from a different account. You can create new master encryption keys in the [AWS KMS console](#).
5. Choose **Copy**.
 6. In the **Copy Snapshot** confirmation dialog box, choose **Snapshots** to go to the **Snapshots** page in the Region specified, or choose **Close**.

To view the progress of the copy process, switch to the destination Region, and then refresh the **Snapshots** page. Copies in progress are listed at the top of the page.

AWS CLI

To copy a snapshot using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [copy-snapshot \(AWS CLI\)](#)
- [Copy-EC2Snapshot \(AWS Tools for Windows PowerShell\)](#)

To check for failure

If you attempt to copy an encrypted snapshot without having permissions to use the encryption key, the operation fails silently. The error state is not displayed in the console until you refresh the page. You can also check the state of the snapshot from the command line, as in the following example.

```
aws ec2 describe-snapshots --snapshot-id snap-0123abcd
```

If the copy failed because of insufficient key permissions, you see the following message: "StateMessage": "Given key ID is not accessible".

When copying an encrypted snapshot, you must have `DescribeKey` permissions on the default CMK. Explicitly denying these permissions results in copy failure. For information about managing CMK keys, see [Controlling Access to Customer Master Keys](#).

Archive Amazon EBS snapshots

Amazon EBS Snapshots Archive is a new storage tier that you can use for low-cost, long-term storage of your rarely-accessed snapshots that do not need frequent or fast retrieval.

By default, when you create a snapshot, it is stored in the Amazon EBS Snapshot Standard tier (*standard tier*). Snapshots stored in the standard tier are incremental. This means that only the blocks on the volume that have changed after your most recent snapshot are saved.

When you archive a snapshot, the incremental snapshot is converted to a full snapshot, and it is moved from the standard tier to the Amazon EBS Snapshots Archive tier (*archive tier*). Full snapshots include all of the blocks that were written to the volume at the time when the snapshot was created.

When you need to access an archived snapshot, you can restore it from the archive tier to the standard tier, and then use it in the same way that you use any other snapshot in your account.

Amazon EBS Snapshots Archive offers up to 75 percent lower snapshot storage costs for snapshots that you plan to store for 90 days or longer and that you rarely need to access.

Some typical use cases include:

- Archiving the only snapshot of a volume, such as end-of-project snapshots
- Archiving full, point-in-time incremental snapshots for compliance reasons.
- Archiving monthly, quarterly, or yearly incremental snapshots.

Topics

- [Considerations and limitations \(p. 1419\)](#)
- [Pricing and billing \(p. 1420\)](#)
- [Quotas \(p. 1421\)](#)
- [Guidelines and best practices for archiving snapshots \(p. 1422\)](#)
- [Work with snapshot archiving \(p. 1430\)](#)
- [Monitor snapshot archiving \(p. 1436\)](#)

Considerations and limitations

Considerations

- The minimum archive period is 90 days. If you delete or permanently restore an archived snapshot before the minimum archive period of 90 days, you are billed for remaining days in the archive tier, rounded to the nearest hour. For more information, see [Pricing and billing \(p. 1420\)](#).
- It can take up to 72 hours to restore an archived snapshot from the archive tier to the standard tier, depending on the size of the snapshot.
- Archived snapshots are always full snapshots. A full snapshot contains all the blocks written to the volume at the time the snapshot was created. The full snapshot will likely be larger than the incremental snapshot from which it was created. However, if you have only one incremental snapshot of a volume on the standard tier, the size of the full snapshot in the archive tier will be the same size as the snapshot in standard tier. This is because the first snapshot taken of a volume is always a full snapshot.
- When a snapshot is archived, the data of the snapshot that is referenced by other snapshots in the snapshot lineage are retained in the standard tier. Data and storage costs associated with the referenced data that is retained on the standard tier are allocated to the next snapshot in the lineage. This ensures that subsequent snapshots in the lineage are not affected by the archival.
- If you delete an archived snapshot that matches a Recycle Bin retention rule, the archived snapshot is retained in the Recycle Bin for the retention period defined in the retention rule. To use the snapshot, you must first recover it from the Recycle Bin and then restore it from the archive tier. For more information, see [Recycle Bin \(p. 1664\)](#) and [Pricing and billing \(p. 1420\)](#).

Limitations

- You can archive snapshots that are in the completed state only.
- You can archive only snapshots that you own in your account. To archive a snapshot that is shared with you, first copy the snapshot to your account and then archive the snapshot copy.
- You can't archive a snapshot of the root device volume of a registered AMI.
- You can't archive snapshots that are associated with an Amazon EBS-backed AMI.
- You can't cancel the snapshot archive or snapshot restore process after it has been started.
- You can't share archived snapshots. If you archive a snapshot that you have shared with other accounts, the accounts with which the snapshot is shared lose access after the snapshot is archived.
- You can't copy an archived snapshot. If you need to copy an archived snapshot, you must first restore it.

- You can't enable fast snapshot restore for an archived snapshot. Fast snapshot restore is automatically disabled when a snapshot is archived. If you need to use fast snapshot restore, you must manually enable it after restoring the snapshot.

Pricing and billing

Archived snapshots are billed at a rate of \$0.0125 per GB-month. For example, if you archive a 100 GiB snapshot, you are billed \$1.25 (100 GiB * \$0.0125) per month.

Snapshot restores are billed at a rate of \$0.03 per GB of data restored. For example, if you restore a 100 GiB snapshot from the archive tier, you are billed one time for \$3 (100 GiB * \$0.03).

After the snapshot is restored to the standard tier, the snapshot is billed at the standard rate for snapshots of \$0.05 per GB-month.

For more information, see [Amazon EBS pricing](#).

Billing for the minimum archive period

The minimum archive period is 90 days. If you delete or permanently restore an archived snapshot before the minimum archive period of 90 days, you are billed a pro-rated charge equal to the archive tier storage charge for the remaining days, rounded to the nearest hour. For example, if you delete or permanently restore an archived snapshot after 40 days, you are billed for the remaining 50 days of the minimum archive period.

Note

Temporarily restoring an archived snapshot before the minimum archive period of 90 days does not incur this charge.

Temporary restores

When you temporarily restore a snapshot, the snapshot is restored from the archive tier to the standard tier, and a copy of the snapshot remains in the archive tier. You are billed for both the snapshot in the standard tier and the snapshot copy in the archive tier for the duration of the temporary restore period. When the temporarily restored snapshot is removed from the standard tier, you are no longer billed for it, and you are billed for the snapshot in the archive tier only.

Permanent restores

When you permanently restore a snapshot, the snapshot is restored from the archive tier to the standard tier, and the snapshot is deleted from the archive tier. You are billed for the snapshot in the standard tier only.

Deleting snapshots

If you delete a snapshot while it is being archived, you are billed for the snapshot data that has already been moved to the archive tier. This data is subject to the minimum archive period of 90 days and billed accordingly upon deletion. For example, if you archive a 100 GiB snapshot, and you delete the snapshot after only 40 GiB has been archived, you are billed \$1.50 for the minimum archive period of 90 days for the 40 GiB that has already been archived ($\$0.0125 \text{ per GB-month} * 40 \text{ GB} * (90 \text{ days} * 24 \text{ hours}) / (24 \text{ hours/day} * 30\text{-day month})$).

If you delete a snapshot while it is being restored from the archive tier, you are billed for the snapshot restore for the full size of the snapshot (snapshot size * \$0.03). For example, if you restore a 100 GiB snapshot from the archive tier, and you delete the snapshot at any point before the snapshot restore completes, you are billed \$3 (100 GiB snapshot size * \$0.03).

Recycle Bin

Archived snapshots are billed at the rate for archived snapshots while they are in the Recycle Bin. Archived snapshots that are in the Recycle Bin are subject to the minimum archive period of 90 days and they are billed accordingly if they are deleted by Recycle Bin before the minimum archive period. In other words, if a retention rule deletes an archived snapshot from the Recycle Bin before the minimum period of 90 days, you are billed for the remaining days.

If you delete a snapshot that matches a retention rule while the snapshot is being archived, the archived snapshot is retained in the Recycle Bin for the retention period defined in the retention rule. It is billed at the rate for archived snapshots.

If you delete a snapshot that matches a retention rule while the snapshot is being restored, the restored snapshot is retained in the Recycle Bin for the remainder of the retention period, and billed at the standard snapshot rate. To use the restored snapshot, you must first recover it from the Recycle Bin.

For more information, see [Recycle Bin \(p. 1664\)](#).

Cost tracking

Archived snapshots appear in the AWS Cost and Usage Report with their same resource ID and Amazon Resource Name (ARN). For more information, see the [AWS Cost and Usage Report User Guide](#).

You can use the following usage types to identify the associated costs:

- `SnapshotArchiveStorage` — fee for monthly data storage
- `SnapshotArchiveRetrieval` — one-time fee for snapshot restores
- `SnapshotArchiveEarlyDelete` — fee for deleting or permanently restoring a snapshot before the minimum archive period (90 days)

Quotas

This section describes the default quotas for archived and in-progress snapshots.

Quota	Default quota			
Archived snapshots per volume	25			
Concurrent 5 in-progress snapshot archives per account	5			
Concurrent 5 in-progress snapshot restores per account	5			

If you need more than the default limits, complete the AWS Support Center [Create case](#) form to request a limit increase.

Guidelines and best practices for archiving snapshots

This section provides some guidelines and best practices for archiving snapshots.

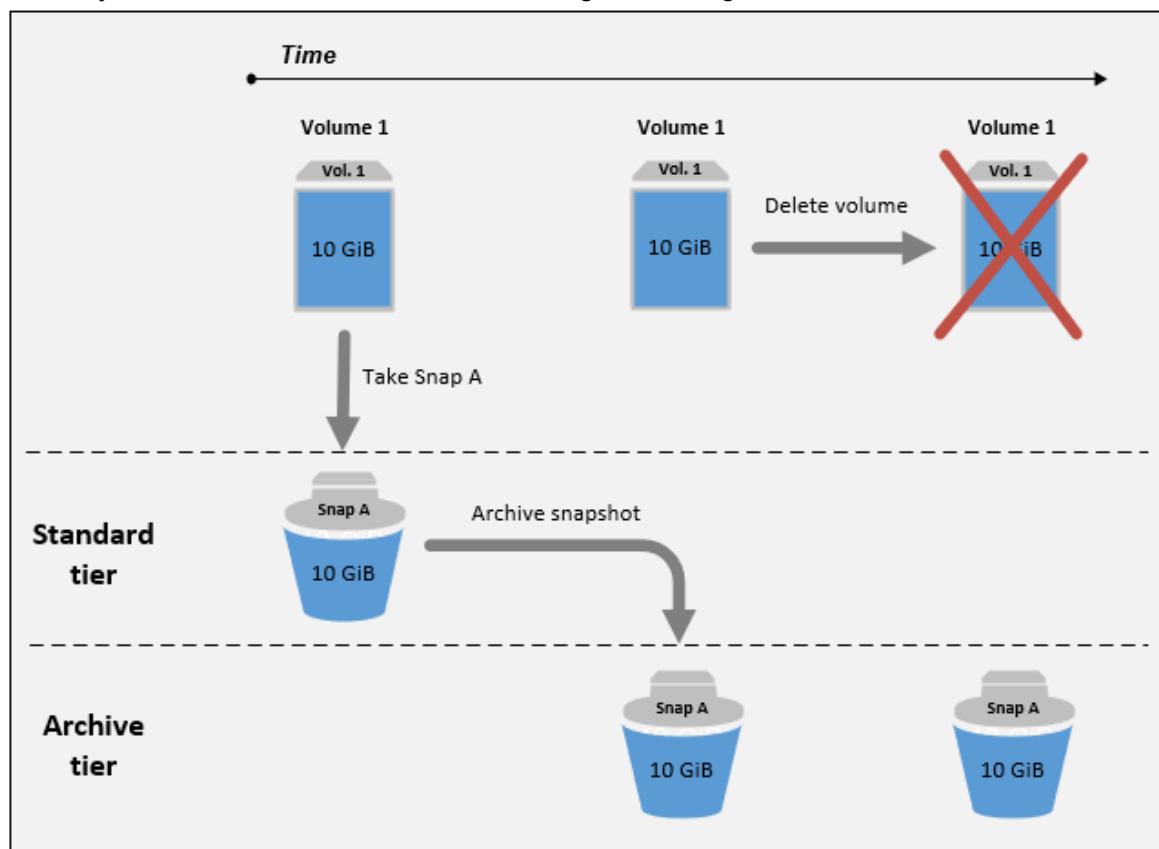

Topics

- [Archiving the only snapshot of a volume \(p. 1422\)](#)
- [Archiving incremental snapshots of a single volume \(p. 1422\)](#)
- [Archiving full snapshots for compliance reasons \(p. 1423\)](#)
- [Determining the reduction in standard tier storage costs \(p. 1424\)](#)

Archiving the only snapshot of a volume

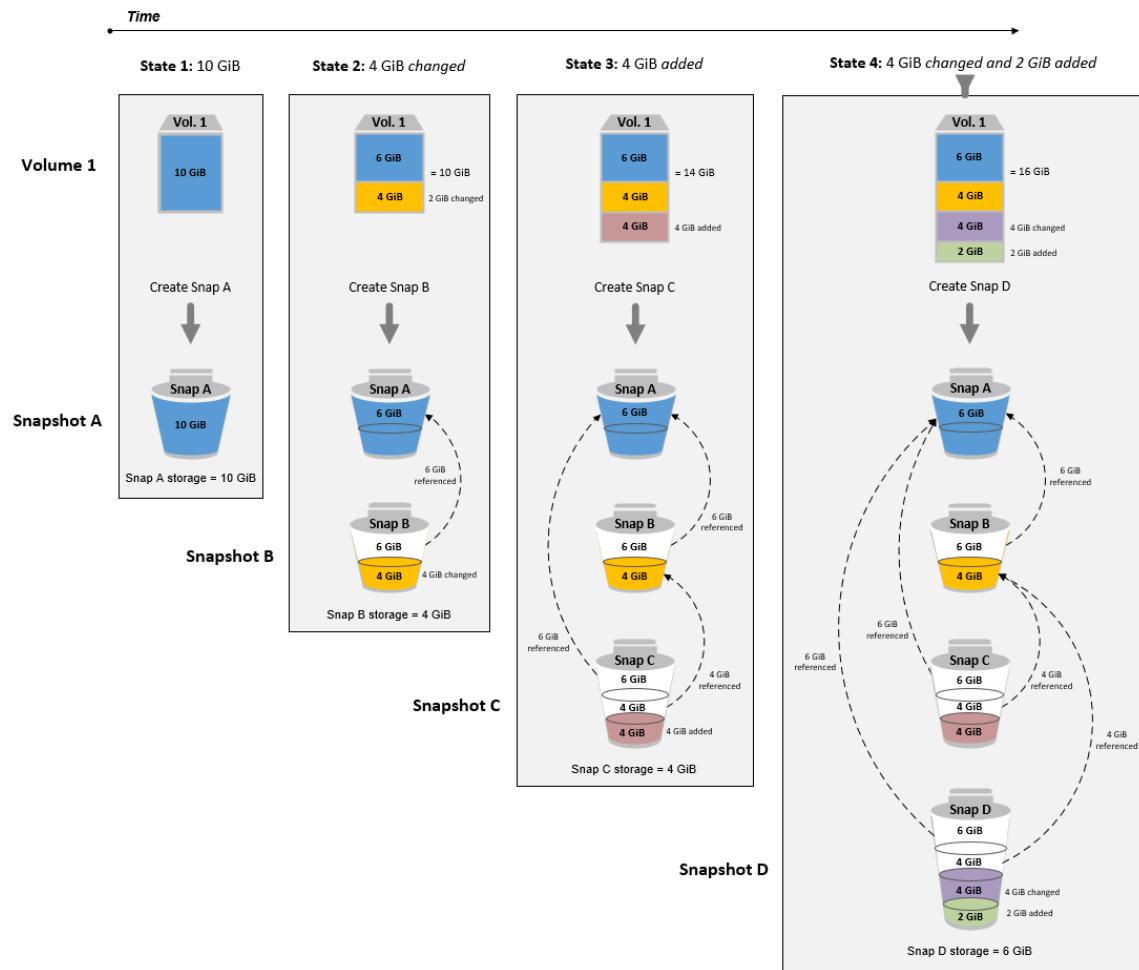

When you have only one snapshot of a volume, the snapshot is always the same size as the blocks written to the volume at the time the snapshot was created. When you archive such a snapshot, the snapshot in the standard tier is converted to an equivalent-sized full snapshot and it is moved from the standard tier to the archive tier.

Archiving these snapshots can help you save with lower storage costs. If you no longer need the source volume, you can delete the volume for further storage cost savings.

Archiving incremental snapshots of a single volume

When you archive an incremental snapshot, the snapshot is converted to a full snapshot and it is moved to the archive tier. For example, in the following image, if you archive **Snap B**, the snapshot is converted to a full snapshot that is 10 GiB in size and moved to the archive tier. Similarly, if you archive **Snap C**, the size of the full snapshot in the archive tier is 14 GiB.

If you are archiving snapshots to reduce your storage costs in the standard tier, you should not archive the first snapshot in a set of incremental snapshots. These snapshots are referenced by subsequent snapshots in the snapshot lineage. In most cases, archiving these snapshots will not reduce storage costs.

Note

You should not archive the last snapshot in a set of incremental snapshots. The last snapshot is the most recent snapshot taken of a volume. You will need this snapshot in the standard tier if you want to create volumes from it in the case of a volume corruption or loss.

If you archive a snapshot that contains data that is referenced by a later snapshot in the lineage, the data storage and storage costs associated with the referenced data are allocated to the later snapshot in the lineage. In this case, archiving the snapshot will not reduce data storage or storage costs. For example, in the preceding image, if you archive **Snap B**, it's 4 GiB of data is attributed to **Snap C**. In this case, your overall storage costs will increase because you incur storage costs for the full version of **Snap B** in the archive tier, and your storage costs for the standard tier remain unchanged.

If you archive **Snap C**, your standard tier storage will decrease by 4 GiB because the data is not referenced by any other snapshots later in the lineage. And your archive tier storage will increase by 14 GiB because the snapshot is converted to a full snapshot.

Archiving full snapshots for compliance reasons

You might need to create full backups of volumes on a monthly, quarterly, or yearly basis for compliance reasons. For these backups, you might need standalone snapshots without backward or forward

references to other snapshots in the snapshot lineage. Snapshots archived with EBS Snapshots Archive are full snapshots, and they do not have any references to other snapshots in the lineage. Additionally, you will likely need to retain these snapshots for compliance reasons for several years. EBS Snapshots Archive makes it cost-effective to archive these full snapshots for long-term retention.

Determining the reduction in standard tier storage costs

If you want to archive an incremental snapshot to reduce your storage costs, you should consider the size of the full snapshot in the archive tier and the reduction in storage in the standard tier. This section explains how to do this.

Important

The API responses are data accurate at the point-in-time when the APIs are called. API responses can differ as the data associated with a snapshot changes as a result of changes in the snapshot lineage.

To determine the reduction in storage and storage costs in the standard tier, use the following steps.

1. Check the size of the full snapshot. To determine the full size of the snapshot, use the [list-snapshot-blocks](#) command. For `--snapshot-id`, specify the ID of the snapshot that you want to archive.

```
$ aws ebs list-snapshot-blocks --snapshot-id snapshot_id
```

This returns information about all of the blocks in the specified snapshot. The `BlockIndex` of the last block returned by the command indicates the number of blocks in the snapshot. The number of blocks multiplied by 512 KiB, which is the snapshot block size, gives you a close approximation of the size of the full snapshot in the archive tier ($\text{blocks} * 512 \text{ KiB} = \text{full snapshot size}$).

For example, the following command lists the blocks for snapshot `snap-01234567890abcdef`.

```
$ aws ebs list-snapshot-blocks --snapshot-id snap-01234567890abcdef
```

The following is the command output, with some blocks omitted. The following output indicates that the snapshot includes about 16,383 blocks of data. This approximates to a full snapshot size of about 8 GiB ($16,383 * 512 \text{ KiB} = 7.99 \text{ GiB}$).

```
{
    "VolumeSize": 8,
    "Blocks": [
        {
            "BlockToken": "ABgBAeShfa5RwG+RiWUg2pwmnCU/YMnV7fGMxLbCWfEBEUmnuqac5RmoyVat",
            "BlockIndex": 0
        },
        {
            "BlockToken": "ABgBATdTONyThPUAbQhbUQXsn5TGoY/J17GfE83j9WN7siupavOTw9E1KpFh",
            "BlockIndex": 1
        },
        {
            "BlockToken": "EBEUmmuqXsn5TGoY/QwmnCU/YMnV74eKE2TSsn5TGoY/E83j9WQhbUQXsn5T",
            "BlockIndex": 4
        },
        .....
        {
            "BlockToken": "yThPUAbQhb5V8xpwmnCU/YMnV74eKE2TSFY1sKP/4r05y47WETdTOnyThPUA",
            "BlockIndex": 12890
        },
    ]
}
```

```
{  
    "BlockToken":  
        "ABgBASHKD5V8xEbaRKdxdkZZS4eKE2TSFYlMG1sKP/4r05y47WEHqKaNPcLs",  
        "BlockIndex": 12906  
    },  
    {  
        "BlockToken": "ABgBARROGMUJo6P9X3CFHQGZNQ7av9B6vZtTTqV89QqC  
+SkO0HWMLwkGXjna",  
        "BlockIndex": 16383  
    }  
],  
"VolumeSize": 8,  
"ExpiryTime": 1637677800.845,  
"BlockSize": 524288  
}
```

2. Find the source volume from which the snapshot that you want to archive was created. Use the [describe-snapshots](#) command. For `--snapshot-id`, specify the ID of the snapshot that you want to archive. The `VolumeId` response parameter indicates the ID of the source volume.

```
$ aws ec2 describe-snapshots --snapshot-id snapshot_id
```

For example, the following command returns information about snapshot `snap-09c9114207084f0d9`.

```
$ aws ec2 describe-snapshots --snapshot-id snap-09c9114207084f0d9
```

The following is the command output, which indicates that snapshot `snap-09c9114207084f0d9` was created from volume `vol-0f3e2c292c52b85c3`.

```
{  
    "Snapshots": [  
        {  
            "Description": "",  
            "Tags": [],  
            "Encrypted": false,  
            "VolumeId": "vol-0f3e2c292c52b85c3",  
            "State": "completed",  
            "VolumeSize": 8,  
            "StartTime": "2021-11-16T08:29:49.840Z",  
            "Progress": "100%",  
            "OwnerId": "123456789012",  
            "SnapshotId": "snap-09c9114207084f0d9"  
        }  
    ]  
}
```

3. Find all of the snapshots created from the source volume. Use the [describe-snapshots](#) command. Specify the `volume-id` filter, and for the filter value, specify the volume ID from the previous step.

```
$ aws ec2 describe-snapshots --filters "Name=volume-id, Values=volume_id"
```

For example, the following command returns all snapshots created from volume `vol-0f3e2c292c52b85c3`.

```
$ aws ec2 describe-snapshots --filters "Name=volume-id, Values=vol-0f3e2c292c52b85c3"
```

The following is the command output, which indicates that three snapshots were created from volume `vol-0f3e2c292c52b85c3`.

```
{
  "Snapshots": [
    {
      "Description": "",
      "Tags": [],
      "Encrypted": false,
      "VolumeId": "vol-0f3e2c292c52b85c3",
      "State": "completed",
      "VolumeSize": 8,
      "StartTime": "2021-11-14T08:57:39.300Z",
      "Progress": "100%",
      "OwnerId": "123456789012",
      "SnapshotId": "snap-08ca60083f86816b0"
    },
    {
      "Description": "",
      "Tags": [],
      "Encrypted": false,
      "VolumeId": "vol-0f3e2c292c52b85c3",
      "State": "completed",
      "VolumeSize": 8,
      "StartTime": "2021-11-15T08:29:49.840Z",
      "Progress": "100%",
      "OwnerId": "123456789012",
      "SnapshotId": "snap-09c9114207084f0d9"
    },
    {
      "Description": "01",
      "Tags": [],
      "Encrypted": false,
      "VolumeId": "vol-0f3e2c292c52b85c3",
      "State": "completed",
      "VolumeSize": 8,
      "StartTime": "2021-11-16T07:50:08.042Z",
      "Progress": "100%",
      "OwnerId": "123456789012",
      "SnapshotId": "snap-024f49fe8dd853fa8"
    }
  ]
}
```

4. Using the output from the previous command, sort the snapshots by their creation times, from earliest to newest. The `StartTime` response parameter for each snapshot indicates its creation time, in UTC time format.

For example, the snapshots returned in the previous step arranged by creation time, from earliest to newest, is as follows:

1. `snap-08ca60083f86816b0` (earliest – created before the snapshot that you want to archive)
2. `snap-09c9114207084f0d9` (the snapshot to archive)
3. `snap-024f49fe8dd853fa8` (newest – created after the snapshot that you want to archive)
5. Identify the snapshots that were created immediately before and after the snapshot that you want to archive. In this case, you want to archive snapshot `snap-09c9114207084f0d9`, which was the second incremental snapshot created in the set of three snapshots. Snapshot `snap-08ca60083f86816b0` was created immediately before, and snapshot `snap-024f49fe8dd853fa8` was created immediately after.
6. Find the unreferenced data in the snapshot that you want to archive. First, find the blocks that are different between the snapshot that was created immediately before the snapshot that you want to archive, and the snapshot that you want to archive. Use the [list-changed-blocks](#) command. For `--first-snapshot-id`, specify the ID of the snapshot that was created immediately before the

snapshot that you want to archive. For `--second-snapshot-id`, specify the ID of the snapshot that you want to archive.

```
$ aws ebs list-changed-blocks --first-snapshot-id snapshot_created_before --second-snapshot-id snapshot_to_archive
```

For example, the following command shows the block indexes for the blocks that are different between snapshot `snap-08ca60083f86816b0` (the snapshot created before the snapshot you want to archive), and snapshot `snap-09c9114207084f0d9` (the snapshot you want to archive).

```
$ aws ebs list-changed-blocks --first-snapshot-id snap-08ca60083f86816b0 --second-snapshot-id snap-09c9114207084f0d9
```

The following shows the command output, with some blocks omitted.

```
{  
    "BlockSize": 524288,  
    "ChangedBlocks": [  
        {  
            "FirstBlockToken": "ABgBAX6y  
+WH6Rm9y5zq1VyeTCmEzGmTT0jNZG1cDirFq1rOVeFbWXsH3W4z/",  
            "SecondBlockToken": "ABgBASyx0bHHBnTERu  
+9USLxYK/81UT0dbHIUFqUjQUkwTwK5qkjP8NSGyNB",  
            "BlockIndex": 4  
        },  
        {  
            "FirstBlockToken": "ABgBAcfL  
+EfmoMNgstqrFnYgsAxR4SDSO4LkNLYOOCbGBWcfJnpn90E9XX1",  
            "SecondBlockToken": "ABgBAdX0mtX6aBAT3EBy+8jFCESMpig7csKjbO20cd08m2iNJv2Ue

            "BlockIndex": 14  
        },  
        {  
            "FirstBlockToken":  
"ABgBAZBfEv4EHS1aSXTXxSE3mBZG6CNelkwxp1jzmqSHICGlFmZCyJXzE4r3",  
            "SecondBlockToken":  
"ABgBAVWR7QuQQB0AP2TtmNkgS4Aec5KAQVCldnpsc91zBiNmSfw9ouIlbeXWy",  
            "BlockIndex": 15  
        },  
        ....  
        {  
            "SecondBlockToken": "ABgBAeHwXPL+z3DBLjDhwjdAM9+CPGV5VO5Q3rEEA  
+ku50P498hjnTAgMhLG",  
            "BlockIndex": 13171  
        },  
        {  
            "SecondBlockToken":  
"ABgBAbZcPiVtLx6U3Fb4lAjRdrkJMwW5M2tiCgIp6ZZpcZ8AwXxkjVUUHADq",  
    ]  
}
```

```
        "BlockIndex": 13172
    },
    {
        "SecondBlockToken": "ABgBAVmEd/pQ9VW9hWiOujOAKcauOnUFCo
+eZ5ASVdWLXWWC04ijfoDTpTVZ",
        "BlockIndex": 13173
    },
    {
        "SecondBlockToken": "ABgBAT/jeN7w
+8ALuNdaiwXmsSfM6tOvMoLBLJ14LKVavw4IiB1d0iykWe6b",
        "BlockIndex": 13174
    },
    {
        "SecondBlockToken": "ABgBAXtGvUhTjjUqkwKXfxzyR2GpQei/
+pJSG/19ESwvt7Hd8GHaUqVs6Zf3",
        "BlockIndex": 13175
    }
],
"ExpiryTime": 1637648751.813,
"VolumeSize": 8
}
```

Next, use the same command to find blocks that are different between the snapshot that you want to archive and the snapshot that was created immediately after it. For `--first-snapshot-id`, specify the ID of the snapshot that you want to archive. For `--second-snapshot-id`, specify the ID of the snapshot that was created immediately after the snapshot that you want to archive.

```
$ aws ebs list-changed-blocks --first-snapshot-id snapshot_to_archive --second-
snapshot-id snapshot_created_after
```

For example, the following command shows the block indexes of the blocks that are different between snapshot `snap-09c9114207084f0d9` (the snapshot that you want to archive) and snapshot `snap-024f49fe8dd853fa8` (the snapshot created after the snapshot that you want to archive).

```
$ aws ebs list-changed-blocks --first-snapshot-id snap-09c9114207084f0d9 --second-
snapshot-id snap-024f49fe8dd853fa8
```

The following shows the command output, with some blocks omitted.

```
{
    "BlockSize": 524288,
    "ChangedBlocks": [

}

```

7. Compare the output returned by both commands in the previous step. If the same block index appears in both command outputs, it indicates that the block contains unreferenced data.

For example, the command outputs in the previous step indicate that blocks 4, 5, 13, and 15 are unique to snapshot snap-09c9114207084f0d9 and that they are not referenced by any other snapshots in the snapshot lineage.

To determine the reduction in standard tier storage, multiply the number of blocks that appear in both command outputs by 512 KiB, which is the snapshot block size.

For example, if 9,950 block indexes appear in both command outputs, it indicates that you will decrease standard tier storage by around 4.85 GiB (9,950 blocks * 512 KiB = 4.85 GiB).

8. Determine the storage costs for storing the unreferenced blocks in the standard tier for 90 days. Compare this value with the cost of storing the full snapshot, described in from step 1, in the archive tier. You can determine your costs savings by comparing the values, assuming that you do

not restore the full snapshot from the archive tier during the minimum 90-day period. For more information, see [Pricing and billing \(p. 1420\)](#).

Work with snapshot archiving

Topics

- [Archive a snapshot \(p. 1430\)](#)
- [Restore an archived snapshot \(p. 1431\)](#)
- [Modify the restore period or restore type for a temporarily restored snapshot \(p. 1432\)](#)
- [View archived snapshots \(p. 1434\)](#)

Archive a snapshot

You can archive any snapshot that is in the completed state and that you own in your account. You can't archive snapshots that are in the pending or error states, or snapshots that are shared with you. For more information, see [Considerations and limitations \(p. 1419\)](#).

Archived snapshots retain their snapshot ID, encryption status, AWS Identity and Access Management (IAM) permissions, owner information, and resource tags. However, fast snapshot restore and snapshot sharing are automatically disabled after the snapshot is archived.

You can continue to use the snapshot while the archive is in process. As soon as the snapshot tiering status reaches the archival-complete state, you can no longer use the snapshot.

You can archive a snapshot using one of the following methods.

Console

To archive a snapshot

Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

1. In the navigation pane, choose **Snapshots**.
2. In the list of snapshots, select the snapshot to archive and then choose **Actions, Archive snapshot**.
3. To confirm, choose **Archive snapshot**.

AWS CLI

To archive a snapshot

Use the `modify-snapshot-tier` AWS CLI command. For `--snapshot-id`, specify the ID of the snapshot to archive. For `--storage-tier`, specify `archive`.

```
$ aws ec2 modify-snapshot-tier \
--snapshot-id snapshot_id \
--storage-tier archive
```

For example, the following command archives snapshot `snap-01234567890abcdef`.

```
$ aws ec2 modify-snapshot-tier \
--snapshot-id snap-01234567890abcdef \
--storage-tier archive
```

The following is the command output. The `TieringStartTime` response parameter indicates the date and time at which the archive process was started, in UTC time format (YYYY-MM-DDTHH:MM:SSZ).

```
{  
    "SnapshotId": "snap-01234567890abcdef",  
    "TieringStartTime": "2021-09-15T16:44:37.574Z"  
}
```

Restore an archived snapshot

Before you can use an archived snapshot, you must first restore it to the standard tier. The restored snapshot has the same snapshot ID, encryption status, IAM permissions, owner information, and resource tags that it had before it was archived. After it is restored, you can use it in the same way that you use any other snapshot in your account. The restored snapshot is always a full snapshot.

When you restore a snapshot, you can choose to restore it **permanently** or **temporarily**.

If you restore a snapshot permanently, the snapshot is moved from the archive tier to the standard tier permanently. The snapshot remains restored and ready for use until you manually re-archive it or you manually delete it. When you permanently restore a snapshot, the snapshot is removed from the archive tier.

If you restore a snapshot temporarily, the snapshot is copied from the archive tier to the standard tier for a restore period that you specify. The snapshot remains restored and ready for use for the restore period only. During the restore period, a copy of the snapshot remains in the archive tier. After the period expires, the snapshot is automatically removed from the standard tier. You can increase or decrease the restore period or change the restore type to permanent at any time during the restore period. For more information, see [Modify the restore period or restore type for a temporarily restored snapshot \(p. 1432\)](#).

You can restore an archived snapshot using one of the following methods.

Console

To restore a snapshot from the archive

Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

1. In the navigation pane, choose **Snapshots**.
2. In the list of snapshots, select the archived snapshot to restore, and then choose **Actions**, **Restore snapshot from archive**.
3. Specify the type of restore to perform. For **Restore type**, do one of the following:
 - To restore the snapshot permanently, select **Permanent**.
 - To restore the snapshot temporarily, select **Temporary**, and then for **Temporary restore period**, enter the number of days for which to restore the snapshot.
4. To confirm, choose **Restore snapshot**.

AWS CLI

To permanently restore an archived snapshot

Use the `restore-snapshot-tier` AWS CLI command. For `--snapshot-id`, specify the ID of the snapshot to restore, and include the `--permanent-restore` option.

```
$ aws ec2 restore-snapshot-tier \  
--snapshot-id snapshot_id \  
...
```

```
--permanent-restore
```

For example, the following command permanently restores snapshot snap-01234567890abcdef.

```
$ aws ec2 restore-snapshot-tier \  
--snapshot-id snap-01234567890abcdef \  
--permanent-restore
```

The following is the command output.

```
{  
    "SnapshotId": "snap-01234567890abcdef",  
    "IsPermanentRestore": true  
}
```

To temporarily restore an archived snapshot

Use the [restore-snapshot-tier](#) AWS CLI command. Omit the `--permanent-restore` option. For `--snapshot-id`, specify the ID of the snapshot to restore, and for `--temporary-restore-days`, specify the number of days for which to restore the snapshot.

`--temporary-restore-days` must be specified in days. The allowed range is 1 - 180. If you do not specify a value, it defaults to 1 day.

```
$ aws ec2 restore-snapshot-tier \  
--snapshot-id snapshot_id \  
--temporary-restore-days number_of_days
```

For example, the following command temporarily restores snapshot snap-01234567890abcdef for a restore period of 5 days.

```
$ aws ec2 restore-snapshot-tier \  
--snapshot-id snap-01234567890abcdef \  
--temporary-restore-days 5
```

The following is the command output.

```
{  
    "SnapshotId": "snap-01234567890abcdef",  
    "RestoreDuration": 5,  
    "IsPermanentRestore": false  
}
```

Modify the restore period or restore type for a temporarily restored snapshot

When you restore a snapshot temporarily, you must specify the number of days for which the snapshot is to remain restored in your account. After the restore period expires, the snapshot is automatically removed from the standard tier.

You can change the restore period for a temporarily restored snapshot at any time.

You can choose to either increase or decrease the restore period, or you can change the restore type from temporary to permanent.

If you change the restore period, the new restore period is effective from the current date. For example, if you specify a new restore period of 5 days, the snapshot will remain restored for five days from the current date.

Note

You can end a temporary restore early by setting the restore period to 1 day.

If you change the restore type from temporary to permanent, the snapshot copy is deleted from the archive tier, and the snapshot remains available in your account until you manually re-archive it or delete it.

You can modify the restore period for a snapshot using one of the following methods.

Console

To modify the restore period or restore type

Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

1. In the navigation pane, choose **Snapshots**.
2. In the list of snapshots, select the snapshot that you previously temporarily restored, and then choose **Actions, Restore snapshot from archive**.
3. For **Restore type**, do one of the following:
 - To change the restore type from temporary to permanent, select **Permanent**.
 - To increase or decrease the restore period, keep **Temporary**, and then for **Temporary restore period**, enter the new restore period in days.
4. To confirm, choose **Restore snapshot**.

AWS CLI

To modify the restore period or change the restore type

Use the `restore-snapshot-tier` AWS CLI command. For `--snapshot-id`, specify the ID of the snapshot that you previously temporarily restored. To change the restore type from temporary to permanent, specify `--permanent-restore` and omit `--temporary-restore-days`. To increase or decrease the restore period, omit `--permanent-restore` and for `--temporary-restore-days`, specify the new restore period in days.

Example: Increase or decrease the restore period

The following command changes the restore period for snapshot `snap-01234567890abcdef` to 10 days.

```
$ aws ec2 restore-snapshot-tier \
--snapshot-id snap-01234567890abcdef
--temporary-restore-days 10
```

The following is the command output.

```
{
  "SnapshotId": "snap-01234567890abcdef",
  "RestoreDuration": 10,
  "IsPermanentRestore": false
}
```

Example: Change restore type to permanent

The following command changes the restore type for snapshot `snap-01234567890abcdef` from temporary to permanent.

```
$ aws ec2 restore-snapshot-tier \
--snapshot-id snap-01234567890abcdef
```

```
--permanent-restore
```

The following is the command output.

```
{  
    "SnapshotId": "snap-01234567890abcdef",  
    "IsPermanentRestore": true  
}
```

View archived snapshots

You can view storage tier information for snapshots using one of the following methods.

Console

To view storage tier information for a snapshot

Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

1. In the navigation pane, choose **Snapshots**.
2. In the list of snapshots, select the snapshot and choose the **Storage tier** tab.

The tab provides the following information:

- **Last tier change started on** — The date and time when the last archive or restore was started.
- **Tier change progress** — The progress of the last archive or restore action, as a percentage.
- **Storage tier** — The storage tier for the snapshot. Always `archive` for archived snapshots, and `standard` for snapshots stored on the standard tier, including temporarily restored snapshots.
- **Tiering status** — The status of the last archive or restore action.
- **Archive completed on** — The date and time when the archive completed.
- **Temporary restore expires on** — The date and time when a temporarily restored snapshot is set to expire.

AWS CLI

To view archival information about an archived snapshot

Use the `describe-snapshot-tier-status` AWS CLI command. Specify the `snapshot-id` filter, and for the filter value, specify the snapshot ID. Alternatively, to view all archived snapshots, omit the filter.

```
$ aws ec2 describe-snapshot-tier-status --filters "Name=snapshot-id,  
Values=snapshot_id"
```

The output includes the following response parameters:

- **Status** — The status of the snapshot. Always `completed` for archived snapshots. Only snapshots that are in the `completed` state can be archived.
- **LastTieringStartTime** — The date and time that the archival process started, in UTC time format (YYYY-MM-DDTHH:MM:SSZ).
- **LastTieringOperationState** — The current state of the archival process. Possible states include: `archival-in-progress` | `archival-completed` | `archival-failed` | `permanent-restore-in-progress` | `permanent-restore-completed` | `permanent-restore-failed` | `temporary-restore-in-progress` | `temporary-restore-completed` | `temporary-restore-failed`

- `LastTieringProgress` — The progress of the snapshot archival process, as a percentage.
- `StorageTier` — The storage tier for the snapshot. Always `archive` for archived snapshots, and `standard` for snapshots stored on the standard tier, including temporarily restored snapshots.
- `ArchivalCompleteTime` — The date and time that the archival process completed, in UTC time format (YYYY-MM-DDTHH:MM:SSZ).

Example

The following command displays information about snapshot `snap-01234567890abcdef`.

```
$ aws ec2 describe-snapshot-tier-status --filters "Name=snapshot-id, Values=snap-01234567890abcdef"
```

The following is the command output.

```
{
    "SnapshotTierStatuses": [
        {
            "Status": "completed",
            "ArchivalCompleteTime": "2021-09-15T17:33:16.147Z",
            "LastTieringProgress": 100,
            "Tags": [],
            "VolumeId": "vol-01234567890abcdef",
            "LastTieringOperationState": "archival-completed",
            "StorageTier": "archive",
            "OwnerId": "123456789012",
            "SnapshotId": "snap-01234567890abcdef",
            "LastTieringStartTime": "2021-09-15T16:44:37.574Z"
        }
    ]
}
```

To view archived and standard tier snapshots

Use the [describe-snapshot](#) AWS CLI command. For `--snapshot-ids`, specify the ID of the snapshot view.

```
$ aws ec2 describe-snapshots --snapshot-ids snapshot_id
```

For example, the following command displays information about snapshot `snap-01234567890abcdef`.

```
$ aws ec2 describe-snapshots --snapshot-ids snap-01234567890abcdef
```

The following is the command output. The `StorageTier` response parameter indicates whether the snapshot is currently archived. `archive` indicates that the snapshot is currently archived and stored in the archive tier, and `standard` indicates that the snapshot is currently not archived and that it is stored in the standard tier.

In the following example output, only `Snap A` is archived. `Snap B` and `Snap C` are not archived.

Additionally, the `RestoreExpiryTime` response parameter is returned only for snapshots that are temporarily restored from the archive. It indicates when temporarily restored snapshots are to be automatically removed from the standard tier. It is **not** returned for snapshots that are permanently restored.

In the following example output, `Snap C` is temporarily restored, and it will be automatically removed from the standard tier at 2021-09-19T21:00:00.000Z (September 19, 2021 at 21:00 UTC).

```
{  
    "Snapshots": [  
        {  
            "Description": "Snap A",  
            "Encrypted": false,  
            "VolumeId": "vol-01234567890aaaaaaaa",  
            "State": "completed",  
            "VolumeSize": 8,  
            "StartTime": "2021-09-07T21:00:00.000Z",  
            "Progress": "100%",  
            "OwnerId": "123456789012",  
            "SnapshotId": "snap-01234567890aaaaaaaa",  
            "StorageTier": "archive",  
            "Tags": []  
        },  
        {  
            "Description": "Snap B",  
            "Encrypted": false,  
            "VolumeId": "vol-09876543210bbbbbb",  
            "State": "completed",  
            "VolumeSize": 10,  
            "StartTime": "2021-09-14T21:00:00.000Z",  
            "Progress": "100%",  
            "OwnerId": "123456789012",  
            "SnapshotId": "snap-09876543210bbbbbb",  
            "StorageTier": "standard",  
            "RestoreExpiryTime": "2019-09-19T21:00:00.000Z",  
            "Tags": []  
        },  
        {  
            "Description": "Snap C",  
            "Encrypted": false,  
            "VolumeId": "vol-054321543210cccccc",  
            "State": "completed",  
            "VolumeSize": 12,  
            "StartTime": "2021-08-01T21:00:00.000Z",  
            "Progress": "100%",  
            "OwnerId": "123456789012",  
            "SnapshotId": "snap-054321543210cccccc",  
            "StorageTier": "standard",  
            "Tags": []  
        }  
    ]  
}
```

To view only snapshots that are stored in the archive tier or the standard tier

Use the `describe-snapshot` AWS CLI command. Include the `--filter` option, for the filter name, specify `storage-tier`, and for the filter value specify either `archive` or `standard`.

```
$ aws ec2 describe-snapshots --filters "Name=storage-tier,Values=archive/standard"
```

For example, the following command displays only archived snapshots.

```
$ aws ec2 describe-snapshots --filters "Name=storage-tier,Values=archive"
```

Monitor snapshot archiving

Amazon EBS emits events related to snapshot archiving actions. You can use AWS Lambda and Amazon CloudWatch Events to handle event notifications programmatically. Events are emitted on a best effort basis. For more information, see the [Amazon CloudWatch Events User Guide](#).

The following events are available:

- `archiveSnapshot` — Emitted when a snapshot archive action succeeds or fails.

The following is an example of an event that is emitted when a snapshot archive action succeeds.

```
{  
    "version": "0",  
    "id": "01234567-0123-0123-0123-012345678901",  
    "detail-type": "EBS Snapshot Notification",  
    "source": "aws.ec2",  
    "account": "123456789012",  
    "time": "2021-05-25T13:12:22Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1::snapshot/snap-01234567890abcdef"  
    ],  
    "detail": {  
        "event": "archiveSnapshot",  
        "result": "succeeded",  
        "cause": "",  
        "request-id": "123456789",  
        "snapshot_id": "arn:aws:ec2:us-east-1::snapshot/snap-01234567890abcdef",  
        "startTime": "2021-05-25T13:12:22Z",  
        "endTime": "2021-05-45T15:30:00Z",  
        "recycleBinExitTime": "2021-10-45T15:30:00Z"  
    }  
}
```

The following is an example of an event that is emitted when a snapshot archive action fails.

```
{  
    "version": "0",  
    "id": "01234567-0123-0123-0123-012345678901",  
    "detail-type": "EBS Snapshot Notification",  
    "source": "aws.ec2",  
    "account": "123456789012",  
    "time": "2021-05-25T13:12:22Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1::snapshot/snap-01234567890abcdef"  
    ],  
    "detail": {  
        "event": "archiveSnapshot",  
        "result": "failed",  
        "cause": "Source snapshot ID is not valid",  
        "request-id": "1234567890",  
        "snapshot_id": "arn:aws:ec2:us-east-1::snapshot/snap-01234567890abcdef",  
        "startTime": "2021-05-25T13:12:22Z",  
        "endTime": "2021-05-45T15:30:00Z",  
        "recycleBinExitTime": "2021-10-45T15:30:00Z"  
    }  
}
```

- `restoreSnapshot` — Emitted when a snapshot restore action succeeds or fails.

The following is an example of an event that is emitted when a permanent restore action succeeds.

```
{  
    "version": "0",  
    "id": "01234567-0123-0123-0123-012345678901",  
    "detail-type": "EBS Snapshot Notification",  
    "source": "aws.ec2",  
    "account": "123456789012",  
    "time": "2021-05-25T13:12:22Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1::snapshot/snap-01234567890abcdef"  
    ],  
    "detail": {  
        "event": "restoreSnapshot",  
        "result": "succeeded",  
        "cause": "The restore operation completed successfully",  
        "request-id": "123456789",  
        "snapshot_id": "arn:aws:ec2:us-east-1::snapshot/snap-01234567890abcdef",  
        "startTime": "2021-05-25T13:12:22Z",  
        "endTime": "2021-05-45T15:30:00Z",  
        "recycleBinExitTime": "2021-10-45T15:30:00Z"  
    }  
}
```

```
{  
    "time": "2021-05-25T13:12:22Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1::snapshot/snap-01234567890abcdef"  
    ],  
    "detail": {  
        "event": "restoreSnapshot",  
        "result": "succeeded",  
        "cause": "",  
        "request-id": "1234567890",  
        "snapshot_id": "arn:aws:ec2:us-east-1::snapshot/snap-01234567890abcdef"  
        "startTime": "2021-05-25T13:12:22Z",  
        "endTime": "2021-10-45T15:30:00Z"  
    }  
}
```

The following is an example of an event that is emitted when a permanent restore action fails.

```
{  
    "version": "0",  
    "id": "01234567-0123-0123-0123-012345678901",  
    "detail-type": "EBS Snapshot Notification",  
    "source": "aws.ec2",  
    "account": "123456789012",  
    "time": "2021-05-25T13:12:22Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1::snapshot/snap-01234567890abcdef"  
    ],  
    "detail": {  
        "event": "restoreSnapshot",  
        "result": "failed",  
        "cause": "Source snapshot ID is not valid",  
        "request-id": "1234567890",  
        "snapshot_id": "arn:aws:ec2:us-east-1::snapshot/snap-01234567890abcdef",  
        "startTime": "2021-05-25T13:12:22Z",  
        "endTime": "2021-05-45T15:30:00Z",  
        "recycleBinExitTime": "2021-10-45T15:30:00Z"  
    }  
}
```

The following is an example of an event that is emitted when a temporary restore action succeeds.

```
{  
    "version": "0",  
    "id": "01234567-0123-0123-0123-012345678901",  
    "detail-type": "EBS Snapshot Notification",  
    "source": "aws.ec2",  
    "account": "123456789012",  
    "time": "2021-05-25T13:12:22Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1::snapshot/snap-01234567890abcdef"  
    ],  
    "detail": {  
        "event": "restoreSnapshot",  
        "result": "succeeded",  
        "cause": "",  
        "request-id": "1234567890",  
        "snapshot_id": "arn:aws:ec2:us-east-1::snapshot/snap-01234567890abcdef",  
        "startTime": "2021-05-25T13:12:22Z",  
        "endTime": "2021-05-45T15:30:00Z",  
        "restoreExpiryTime": "2021-06-45T15:30:00Z",  
    }  
}
```

```
        "recycleBinExitTime": "2021-10-45T15:30:00Z"
    }
}
```

The following is an example of an event that is emitted when a temporary restore action fails.

```
{
    "version": "0",
    "id": "01234567-0123-0123-0123-012345678901",
    "detail-type": "EBS Snapshot Notification",
    "source": "aws.ec2",
    "account": "123456789012",
    "time": "2021-05-25T13:12:22Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws:ec2:us-east-1::snapshot/snap-01234567890abcdef"
    ],
    "detail": {
        "event": "restoreSnapshot",
        "result": "failed",
        "cause": "Source snapshot ID is not valid",
        "request-id": "1234567890",
        "snapshot_id": "arn:aws:ec2:us-east-1::snapshot/snap-01234567890abcdef",
        "startTime": "2021-05-25T13:12:22Z",
        "endTime": "2021-05-45T15:30:00Z",
        "recycleBinExitTime": "2021-10-45T15:30:00Z"
    }
}
```

- `restoreExpiry` — Emitted when the restore period for a temporarily restored snapshot expires.

The following is an example.

```
{
    "version": "0",
    "id": "01234567-0123-0123-0123-012345678901",
    "detail-type": "EBS Snapshot Notification",
    "source": "aws.ec2",
    "account": "123456789012",
    "time": "2021-05-25T13:12:22Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws:ec2:us-east-1::snapshot/snap-01234567890abcdef"
    ],
    "detail": {
        "event": "restoryExpiry",
        "result": "succeeded",
        "cause": "",
        "request-id": "1234567890",
        "snapshot_id": "arn:aws:ec2:us-east-1::snapshot/snap-01234567890abcdef",
        "startTime": "2021-05-25T13:12:22Z",
        "endTime": "2021-05-45T15:30:00Z",
        "recycleBinExitTime": "2021-10-45T15:30:00Z"
    }
}
```

View Amazon EBS snapshot information

You can view detailed information about your snapshots using one of the following methods.

New console

To view snapshot information using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Snapshots**.
3. To view only your snapshots that you own, in the top-left corner of the screen, choose **Owned by me**. You can also filter the list of snapshots using tags and other snapshot attributes. In the **Filter** field, select the attribute field, and then select or enter the attribute value. For example, to view only encrypted snapshots, select **Encryption**, and then enter **true**.
4. To view more information about a specific snapshot, choose its ID in the list.

Old console

To view snapshot information using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Snapshots** in the navigation pane.
3. To reduce the list, choose an option from the **Filter** list. For example, to view only your snapshots, choose **Owned By Me**. You can also filter your snapshots using tags and snapshot attributes. Choose the search bar to view the available tags and attributes.
4. To view more information about a snapshot, select it.

AWS CLI

To view snapshot information using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [describe-snapshots](#) (AWS CLI)
- [Get-EC2Snapshot](#) (AWS Tools for Windows PowerShell)

Example Example 1: Filter based on tags

The following command describes the snapshots with the tag Stack=production.

```
aws ec2 describe-snapshots --filters Name>tag:Stack,Values=production
```

Example Example 2: Filter based on volume

The following command describes the snapshots created from the specified volume.

```
aws ec2 describe-snapshots --filters Name=volume-id,Values=vol-049df61146c4d7901
```

Example Example 3: Filter based on snapshot age

With the AWS CLI, you can use JMESPath to filter results using expressions. For example, the following command displays the IDs of all snapshots created by your AWS account (represented by **123456789012**) before the specified date (represented by **2020-03-31**). If you do not specify the owner, the results include all public snapshots.

```
aws ec2 describe-snapshots --filters Name=owner-id,Values=123456789012 --query "Snapshots[?(StartTime<=`2020-03-31`)].[SnapshotId]" --output text
```

The following command displays the IDs of all snapshots created in the specified date range.

```
aws ec2 describe-snapshots --filters Name=owner-id,Values=123456789012 --query "Snapshots[?(StartTime>=`2019-01-01` && (StartTime<=`2019-12-31`)].[SnapshotId]" --output text
```

Share an Amazon EBS snapshot

You can modify the permissions of a snapshot if you want to share it with other AWS accounts. You can share snapshots publicly with all other AWS accounts, or you can share them privately with individual AWS accounts that you specify. Users that you have authorized can use the snapshots that you share to create their own EBS volumes, while your original snapshot remains unaffected.

Important

When you share a snapshot, you are giving others access to all of the data on the snapshot.
Share snapshots only with people that you trust with *all* of your snapshot data.

Topics

- [Before you share a snapshot \(p. 1441\)](#)
- [Share a snapshot \(p. 1441\)](#)
- [Share a KMS key \(p. 1443\)](#)
- [View snapshots that are shared with you \(p. 1444\)](#)
- [Use snapshots that are shared with you \(p. 1445\)](#)
- [Determine the use of snapshots that you share \(p. 1445\)](#)

Before you share a snapshot

The following considerations apply to sharing snapshots:

- Snapshots are constrained to the Region in which they were created. To share a snapshot with another Region, copy the snapshot to that Region and then share the copy. For more information, see [Copy an Amazon EBS snapshot \(p. 1413\)](#).
- You can't share snapshots that are encrypted with the default AWS managed key. You can only share snapshots that are encrypted with a customer managed key. For more information, see [Creating Keys](#) in the [AWS Key Management Service Developer Guide](#).
- You can share only unencrypted snapshots publicly.
- When you share an encrypted snapshot, you must also share the customer managed key used to encrypt the snapshot. For more information, see [Share a KMS key \(p. 1443\)](#).

Share a snapshot

You can share a snapshot using one of the methods described in the section.

New console

To share a snapshot

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Snapshots**.
3. Select the snapshot to share, and then choose **Actions, Modify permissions**.
4. Specify the snapshot's permissions. *Current setting* indicates the snapshot's current sharing permissions.
 - To share the snapshot publicly with all AWS accounts, choose **Public**.
 - To share the snapshot privately with specific AWS accounts, choose **Private**. Then, in the **Sharing accounts** section, choose **Add account**, and enter the 12-digit account ID (without hyphens) of the account to share with.
5. Choose **Save changes**.

Old console

To share a snapshot

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Snapshots** in the navigation pane.
3. Select the snapshot and then choose **Actions, Modify Permissions**.
4. Make the snapshot public or share it with specific AWS accounts as follows:
 - To make the snapshot public, choose **Public**.
 - To share the snapshot with one or more AWS accounts, choose **Private**, enter the AWS account ID (without hyphens) in **AWS Account Number**, and choose **Add Permission**. Repeat for any additional AWS accounts.
5. Choose **Save**.

AWS CLI

The permissions for a snapshot are specified using the `createVolumePermission` attribute of the snapshot. To make a snapshot public, set the group to `all`. To share a snapshot with a specific AWS account, set the user to the ID of the AWS account.

To share a snapshot publicly

Use one of the following commands.

- [modify-snapshot-attribute \(AWS CLI\)](#)

For `--attribute`, specify `createVolumePermission`. For `--operation-type`, specify `add`. For `--group-names`, specify `all`.

```
$ aws ec2 modify-snapshot-attribute --snapshot-id 1234567890abcdef0 --attribute createVolumePermission --operation-type add --group-names all
```

- [Edit-EC2SnapshotAttribute \(AWS Tools for Windows PowerShell\)](#)

For `-Attribute`, specify `CreateVolumePermission`. For `-OperationType`, specify `Add`. For `-GroupName`, specify `all`.

```
PS C:\> Edit-EC2SnapshotAttribute -SnapshotId 1234567890abcdef0 -Attribute CreateVolumePermission -OperationType Add -GroupName all
```

To share a snapshot privately

Use one of the following commands.

- [modify-snapshot-attribute \(AWS CLI\)](#)

For --attribute, specify `createVolumePermission`. For --operation-type, specify `add`. For --user-ids, specify the 12-digit IDs of the AWS accounts with which to share the snapshots.

```
$ aws ec2 modify-snapshot-attribute --snapshot-id 1234567890abcdef0 --attribute createVolumePermission --operation-type add --user-ids 123456789012
```

- [Edit-EC2SnapshotAttribute \(AWS Tools for Windows PowerShell\)](#)

For -Attribute, specify `CreateVolumePermission`. For -OperationType, specify `Add`. For UserId, specify the 12-digit IDs of the AWS accounts with which to share the snapshots.

```
PS C:\> Edit-EC2SnapshotAttribute -SnapshotId 1234567890abcdef0 -Attribute CreateVolumePermission -OperationType Add -UserId 123456789012
```

Share a KMS key

When you share an encrypted snapshot, you must also share the customer managed key used to encrypt the snapshot. You can apply cross-account permissions to a customer managed key either when it is created or at a later time.

Users of your shared customer managed key who are accessing encrypted snapshots must be granted permissions to perform the following actions on the key:

- `kms:DescribeKey`
- `kms:CreateGrant`
- `kms:GenerateDataKey`
- `kms:ReEncrypt`
- `kms:Decrypt`

For more information about controlling access to a customer managed key, see [Using key policies in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

To share customer managed key using the AWS KMS console

1. Open the AWS KMS console at <https://console.aws.amazon.com/kms>.
2. To change the AWS Region, use the Region selector in the upper-right corner of the page.
3. Choose **Customer managed keys** in the navigation pane.
4. In the **Alias** column, choose the alias (text link) of the customer managed key that you used to encrypt the snapshot. The key details open in a new page.
5. In the **Key policy** section, you see either the *policy view* or the *default view*. The policy view displays the key policy document. The default view displays sections for **Key administrators**, **Key deletion**, **Key Use**, and **Other AWS accounts**. The default view displays if you created the policy in the console and have not customized it. If the default view is not available, you'll need to manually edit the policy in the policy view. For more information, see [Viewing a Key Policy \(Console\)](#) in the *AWS Key Management Service Developer Guide*.

Use either the policy view or the default view, depending on which view you can access, to add one or more AWS account IDs to the policy, as follows:

- (Policy view) Choose **Edit**. Add one or more AWS account IDs to the following statements: "Allow use of the key" and "Allow attachment of persistent resources". Choose **Save changes**. In the following example, the AWS account ID 444455556666 is added to the policy.

```
{  
    "Sid": "Allow use of the key",  
    "Effect": "Allow",  
    "Principal": {"AWS": [  
        "arn:aws:iam::111122223333:user/KeyUser",  
        "arn:aws:iam::444455556666:root"  
    ]},  
    "Action": [  
        "kms:Encrypt",  
        "kms:Decrypt",  
        "kms:ReEncrypt*",  
        "kms:GenerateDataKey*",  
        "kms:DescribeKey"  
    ],  
    "Resource": "*"  
},  
{  
    "Sid": "Allow attachment of persistent resources",  
    "Effect": "Allow",  
    "Principal": {"AWS": [  
        "arn:aws:iam::111122223333:user/KeyUser",  
        "arn:aws:iam::444455556666:root"  
    ]},  
    "Action": [  
        "kms>CreateGrant",  
        "kms>ListGrants",  
        "kms:RevokeGrant"  
    ],  
    "Resource": "*",  
    "Condition": {"Bool": {"kms:GrantIsForAWSResource": true}}  
}
```

- (Default view) Scroll down to **Other AWS accounts**. Choose **Add other AWS accounts** and enter the AWS account ID as prompted. To add another account, choose **Add another AWS account** and enter the AWS account ID. When you have added all AWS accounts, choose **Save changes**.

View snapshots that are shared with you

You can view snapshots that are shared with you using one of the following methods.

New console and Old console

To view shared snapshots using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Snapshots**.
3. Filter the listed snapshots. In the top-left corner of the screen, choose one of the following options:
 - **Private snapshots** — To view only snapshots that are shared with you privately.
 - **Public snapshots** — To view only snapshots that are shared with you publicly.

AWS CLI

To view snapshot permissions using the command line

Use one of the following commands:

- [describe-snapshot-attribute](#) (AWS CLI)

- [Get-EC2SnapshotAttribute](#) (AWS Tools for Windows PowerShell)

Use snapshots that are shared with you

To use a shared unencrypted snapshot

Locate the shared snapshot by ID or description. For more information, see [View snapshots that are shared with you \(p. 1444\)](#). You can use this snapshot as you would any other snapshot that you own in your account. For example, you can create a volume from the snapshot or copy it to a different Region.

To use a shared encrypted snapshot

Locate the shared snapshot by ID or description. For more information, see [View snapshots that are shared with you \(p. 1444\)](#). Create a copy of the shared snapshot in your account, and encrypt the copy with a KMS key that you own. You can then use the copy to create volumes or you can copy it to different Regions.

Determine the use of snapshots that you share

You can use AWS CloudTrail to monitor whether a snapshot that you have shared with others is copied or used to create a volume. The following events are logged in CloudTrail:

- **SharedSnapshotCopyInitiated** — A shared snapshot is being copied.
- **SharedSnapshotVolumeCreated** — A shared snapshot is being used to create a volume.

For more information about using CloudTrail, see [Log Amazon EC2 and Amazon EBS API calls with AWS CloudTrail \(p. 1018\)](#).

Recover snapshots from the Recycle Bin

Recycle Bin is a data recovery feature that enables you to restore accidentally deleted Amazon EBS snapshots and EBS-backed AMIs. When using Recycle Bin, if your resources are deleted, they are retained in the Recycle Bin for a time period that you specify before being permanently deleted.

You can restore a resource from the Recycle Bin at any time before its retention period expires. After you restore a resource from the Recycle Bin, the resource is removed from the Recycle Bin and you can use it in the same way that you use any other resource of that type in your account. If the retention period expires and the resource is not restored, the resource is permanently deleted from the Recycle Bin and it is no longer available for recovery.

Snapshots in the Recycle Bin are billed at the same rate as regular snapshots in your account. There are no additional charges for using Recycle Bin and retention rules. For more information, see [Amazon EBS pricing](#).

For more information, see [Recycle Bin \(p. 1664\)](#).

Topics

- [Permissions for working with snapshots in the Recycle Bin \(p. 1445\)](#)
- [View snapshots in the Recycle Bin \(p. 1446\)](#)
- [Restore snapshots from the Recycle Bin \(p. 1447\)](#)

Permissions for working with snapshots in the Recycle Bin

By default, IAM users don't have permission to work with snapshots that are in the Recycle Bin. To allow IAM users to work with these resources, you must create IAM policies that grant permission to use specific resources and API actions. You then attach those policies to the IAM users or the groups that require those permissions.

To view and recover snapshots that are in the Recycle Bin, IAM users must have the following permissions:

- `ec2>ListSnapshotsInRecycleBin`
- `ec2(RestoreSnapshotFromRecycleBin`

To manage tags for snapshots in the Recycle Bin, IAM users need the following additional permissions.

- `ec2>CreateTags`
- `ec2>DeleteTags`

To use the Recycle Bin console, IAM users need the `ec2:DescribeTags` permission.

The following is an example IAM policy. It includes the `ec2:DescribeTags` permission for console users, and it includes the `ec2:CreateTags` and `ec2:DeleteTags` permissions for managing tags. If the permissions are not needed, you can remove them from the policy.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2>ListSnapshotsInRecycleBin",  
                "ec2(RestoreSnapshotFromRecycleBin"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2>CreateTags",  
                "ec2>DeleteTags",  
                "ec2:DescribeTags"  
            ],  
            "Resource": "arn:aws:ec2:Region:account-id:snapshot/*"  
        },  
    ]  
}
```

For more information about the permissions needed to use Recycle Bin, see [Permissions for working with Recycle Bin and retention rules \(p. 1667\)](#).

View snapshots in the Recycle Bin

While a snapshot is in the Recycle Bin, you can view limited information about it, including:

- The ID of the snapshot.
- The snapshot description.
- The ID of the volume from which the snapshot was created.
- The date and time when the snapshot was deleted and it entered Recycle Bin.
- The date and time when the retention period expires. The snapshot will be permanently deleted from the Recycle Bin at this time.

You can view the snapshots in the Recycle Bin using one of the following methods.

Recycle Bin console

To view snapshots in the Recycle Bin using the console

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation panel, choose **Recycle Bin**.
3. The grid lists all of the snapshots that are currently in the Recycle Bin. To view the details for a specific snapshot, select it in the grid and choose **Actions, View details**.

AWS CLI

To view snapshots in the Recycle Bin using the AWS CLI

Use the [list-snapshots-in-recycle-bin](#) AWS CLI command. Include the --snapshot-id option to view a specific snapshot. Or omit the --snapshot-id option to view all snapshots in the Recycle Bin.

```
$ aws ec2 list-snapshots-in-recycle-bin --snapshot-id snapshot_id
```

For example, the following command provides information about snapshot snap-01234567890abcdef in the Recycle Bin.

```
$ aws ec2 list-snapshots-in-recycle-bin --snapshot-id snap-01234567890abcdef
```

Example output:

```
{  
    "SnapshotRecycleBinInfo": [  
        {  
            "Description": "Monthly data backup snapshot",  
            "RecycleBinEnterTime": "2021-12-01T13:00:00.000Z",  
            "RecycleBinExitTime": "2021-12-15T13:00:00.000Z",  
            "VolumeId": "vol-abcdef09876543210",  
            "SnapshotId": "snap-01234567890abcdef"  
        }  
    ]  
}
```

Restore snapshots from the Recycle Bin

You can't use a snapshot in any way while it is in the Recycle Bin. To use the snapshot, you must first restore it. When you restore a snapshot from the Recycle Bin, the snapshot is immediately available for use, and it is removed from the Recycle Bin. You can use a restored snapshot in the same way that you use any other snapshot in your account.

You can restore a snapshot from the Recycle Bin using one of the following methods.

Recycle Bin console

To restore a snapshot from the Recycle Bin using the console

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation panel, choose **Recycle Bin**.
3. The grid lists all of the snapshots that are currently in the Recycle Bin. Select the snapshot to restore and choose **Recover**.
4. When prompted, choose **Recover**.

AWS CLI

To restore a deleted snapshot from the Recycle Bin using the AWS CLI

Use the [restore-snapshot-from-recycle-bin](#) AWS CLI command. For `--snapshot-id`, specify the ID of the snapshot to restore.

```
$ aws ec2 restore-snapshot-from-recycle-bin --snapshot-id snapshot_id
```

For example, the following command restores snapshot `snap-01234567890abcdef` from the Recycle Bin.

```
$ aws restore-snapshot-from-recycle-bin --snapshot-id snap-01234567890abcdef
```

The command returns no output on success.

Amazon EBS local snapshots on Outposts

Amazon EBS snapshots are a point-in-time copy of your EBS volumes.

By default, snapshots of EBS volumes on an Outpost are stored in Amazon S3 in the Region of the Outpost. You can also use Amazon EBS local snapshots on Outposts to store snapshots of volumes on an Outpost locally in Amazon S3 on the Outpost itself. This ensures that the snapshot data resides on the Outpost, and on your premises. In addition, you can use AWS Identity and Access Management (IAM) policies and permissions to set up data residency enforcement policies to ensure that snapshot data does not leave the Outpost. This is especially useful if you reside in a country or region that is not yet served by an AWS Region and that has data residency requirements.

This topic provides information about working with Amazon EBS local snapshots on Outposts. For more information about Amazon EBS snapshots and about working with snapshots in an AWS Region, see [Amazon EBS snapshots \(p. 1403\)](#).

For more information about AWS Outposts, see [AWS Outposts Features](#) and the [AWS Outposts User Guide](#). For pricing information, see [AWS Outposts pricing](#).

Topics

- [Frequently asked questions \(p. 1448\)](#)
- [Prerequisites \(p. 1450\)](#)
- [Considerations \(p. 382\)](#)
- [Controlling access with IAM \(p. 1450\)](#)
- [Working with local snapshots \(p. 1452\)](#)

Frequently asked questions

1. What are local snapshots?

By default, Amazon EBS snapshots of volumes on an Outpost are stored in Amazon S3 in the Region of the Outpost. If the Outpost is provisioned with Amazon S3 on Outposts, you can choose to store the snapshots locally on the Outpost itself. Local snapshots are incremental, which means that only the blocks of the volume that have changed after your most recent snapshot are saved. You can use these snapshots to restore a volume on the same Outpost as the snapshot at any time. For more information about Amazon EBS snapshots, see [Amazon EBS snapshots \(p. 1403\)](#).

2. Why should I use local snapshots?

Snapshots are a convenient way of backing up your data. With local snapshots, all of your snapshot data is stored locally on the Outpost. This means that it does not leave your premises. This is

especially useful if you reside in a country or region that is not yet served by an AWS Region and that has residency requirements.

Additionally, using local snapshots can help to reduce the bandwidth used for communication between the Region and the Outpost in bandwidth constrained environments.

3. How do I enforce snapshot data residency on Outposts?

You can use AWS Identity and Access Management (IAM) policies to control the permissions that principals (AWS accounts, IAM users, and IAM roles) have when working with local snapshots and to enforce data residency. You can create a policy that prevents principals from creating snapshots from Outpost volumes and instances and storing the snapshots in an AWS Region. Currently, copying snapshots and images from an Outpost to a Region is not supported. For more information, see [Controlling access with IAM \(p. 1450\)](#).

4. Are multi-volume, crash-consistent local snapshots supported?

Yes, you can create multi-volume, crash-consistent local snapshots from instances on an Outpost.

5. How do I create local snapshots?

You can create snapshots manually using the AWS Command Line Interface (AWS CLI) or the Amazon EC2 console. For more information see, [Working with local snapshots \(p. 1452\)](#). You can also automate the lifecycle of local snapshots using Amazon Data Lifecycle Manager. For more information see, [Automate snapshots on an Outpost \(p. 1457\)](#).

6. Can I create, use, or delete local snapshots if my Outpost loses connectivity to its Region?

No. The Outpost must have connectivity with its Region as the Region provides the access, authorization, logging, and monitoring services that are critical for your snapshots' health. If there is no connectivity, you can't create new local snapshots, create volumes or launch instances from existing local snapshots, or delete local snapshots.

7. How quickly is Amazon S3 storage capacity made available after deleting local snapshots?

Amazon S3 storage capacity becomes available within 72 hours after deleting local snapshots and the volumes that reference them.

8. How can I ensure that I do not run out of Amazon S3 capacity on my Outpost?

We recommend that you use Amazon CloudWatch alarms to monitor your Amazon S3 storage capacity, and delete snapshots and volumes that you no longer need to avoid running out of storage capacity. If you are using Amazon Data Lifecycle Manager to automate the lifecycle of local snapshots, ensure that your snapshot retention policies do not retain snapshots for longer than is needed.

9. What happens if I run out of local Amazon S3 capacity on my Outposts?

If you run out of local Amazon S3 capacity on your Outposts, Amazon Data Lifecycle Manager will not be able to successfully create local snapshots on the Outposts. Amazon Data Lifecycle Manager will attempt to create the local snapshots on the Outposts, but the snapshots immediately transition to the `error` state and they are eventually deleted by Amazon Data Lifecycle Manager. We recommend that you use the `SnapshotsCreateFailed` Amazon CloudWatch metric to monitor your snapshot lifecycle policies for snapshot creation failures. For more information, see [Monitor your policies using Amazon CloudWatch \(p. 1522\)](#).

10. Can I use local snapshots and AMIs backed by local snapshots with Spot Instances and Spot Fleet?

No, you can't use local snapshots or AMIs backed by local snapshots to launch Spot Instances or a Spot Fleet.

11. Can I use local snapshots and AMIs backed by local snapshots with Amazon EC2 Auto Scaling?

Yes, you can use local snapshots and AMIs backed by local snapshots to launch Auto Scaling groups in a subnet that is on the same Outpost as the snapshots. The Amazon EC2 Auto Scaling group service-linked role must have permission to use the KMS key used to encrypt the snapshots.

You can't use local snapshots or AMIs backed by local snapshots to launch Auto Scaling groups in an AWS Region.

Prerequisites

To store snapshots on an Outpost, you must have an Outpost that is provisioned with Amazon S3 on Outposts. For more information about Amazon S3 on Outposts, see [Using Amazon S3 on Outposts](#) in the *Amazon Simple Storage Service User Guide*.

Considerations

Keep the following in mind when working with local snapshots.

- Outposts must have connectivity to their AWS Region to use local snapshots.
- Snapshot metadata is stored in the AWS Region associated with the Outpost. This does not include any snapshot data.
- Snapshots stored on Outposts are encrypted by default. Unencrypted snapshots are not supported. Snapshots that are created on an Outpost and snapshots that are copied to an Outpost are encrypted using the default KMS key for the Region or a different KMS key that you specify at the time of the request.
- When you create a volume on an Outpost from a local snapshot, you cannot re-encrypt the volume using a different KMS key. Volumes created from local snapshots must be encrypted using the same KMS key as the source snapshot.
- After you delete local snapshots from an Outpost, the Amazon S3 storage capacity used by the deleted snapshots becomes available within 72 hours. For more information, see [Delete local snapshots \(p. 1457\)](#).
- You can't export local snapshots from an Outpost.
- You can't enable fast snapshot restore for local snapshots.
- EBS direct APIs are not supported with local snapshots.
- You can't copy local snapshots or AMIs from an Outpost to an AWS Region, from one Outpost to another, or within an Outpost. However, you can copy snapshots from an AWS Region to an Outpost. For more information, see [Copy snapshots from an AWS Region to an Outpost \(p. 1455\)](#).
- When copying a snapshot from an AWS region to an Outpost, the data is transferred over the service link. Copying multiple snapshots simultaneously could impact other services running on the Outpost.
- You can't share local snapshots.
- You must use IAM policies to ensure that your data residency requirements are met. For more information, see [Controlling access with IAM \(p. 1450\)](#).
- Local snapshots are incremental backups. Only the blocks in the volume that have changed after your most recent snapshot are saved. Each local snapshot contains all of the information that is needed to restore your data (from the moment when the snapshot was taken) to a new EBS volume. For more information, see [How incremental snapshots work \(p. 1404\)](#).
- You can't use IAM policies to enforce data residency for **CopySnapshot** and **CopyImage** actions.

Controlling access with IAM

You can use AWS Identity and Access Management (IAM) policies to control the permissions that principals (AWS accounts, IAM users, and IAM roles) have when working with local snapshots. The following are example policies that you can use to grant or deny permission to perform specific actions with local snapshots.

Important

Copying snapshots and images from an Outpost to a Region is currently not supported. As a result, you currently can't use IAM policies to enforce data residency for **CopySnapshot** and **CopyImage** actions.

Topics

- [Enforce data residency for snapshots \(p. 1451\)](#)
- [Prevent principals from deleting local snapshots \(p. 1451\)](#)

Enforce data residency for snapshots

The following example policy prevents all principals from creating snapshots from volumes and instances on Outpost `arn:aws:outposts:us-east-1:123456789012:outpost/op-1234567890abcdef` and storing the snapshot data in an AWS Region. Principals can still create local snapshots. This policy ensures that all snapshots remain on the Outpost.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Deny",  
            "Action": [  
                "ec2:CreateSnapshot",  
                "ec2:CreateSnapshots"  
            ],  
            "Resource": "arn:aws:ec2:us-east-1::snapshot/*",  
            "Condition": {  
                "StringEquals": {  
                    "ec2:SourceOutpostArn": "arn:aws:outposts:us-  
east-1:123456789012:outpost/op-1234567890abcdef0"  
                },  
                "Null": {  
                    "ec2:OutpostArn": "true"  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateSnapshot",  
                "ec2:CreateSnapshots"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

Prevent principals from deleting local snapshots

The following example policy prevents all principals from deleting local snapshots that are stored on Outpost `arn:aws:outposts:us-east-1:123456789012:outpost/op-1234567890abcdef0`.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Deny",  
            "Action": [  
                "ec2>DeleteSnapshot"  
            ],  
            "Resource": "arn:aws:ec2:us-east-1::snapshot/*",  
            "Condition": {  
                "StringEquals": {  
                    "ec2:OutpostArn": "arn:aws:outposts:us-east-1:123456789012:outpost/  
op-1234567890abcdef0"  
                }  
            }  
        }  
    ]  
}
```

```
        }
    },
{
    "Effect": "Allow",
    "Action": [
        "ec2:DeleteSnapshot"
    ],
    "Resource": "*"
}
]
```

Working with local snapshots

The following sections explain how to use local snapshots.

Topics

- [Rules for storing snapshots \(p. 1452\)](#)
- [Create local snapshots from volumes on an Outpost \(p. 1453\)](#)
- [Create multi-volume local snapshots from instances on an Outpost \(p. 1453\)](#)
- [Create AMIs from local snapshots \(p. 1454\)](#)
- [Copy snapshots from an AWS Region to an Outpost \(p. 1455\)](#)
- [Copy AMIs from an AWS Region to an Outpost \(p. 1456\)](#)
- [Create volumes from local snapshots \(p. 1456\)](#)
- [Launch instances from AMIs backed by local snapshots \(p. 238\)](#)
- [Delete local snapshots \(p. 1457\)](#)
- [Automate snapshots on an Outpost \(p. 1457\)](#)

Rules for storing snapshots

The following rules apply to snapshot storage:

- If the most recent snapshot of a volume is stored on an Outpost, then all successive snapshots must be stored on the same Outpost.
- If the most recent snapshot of a volume is stored in an AWS Region, then all successive snapshots must be stored in the same Region. To start creating local snapshots from that volume, do the following:
 1. Create a snapshot of the volume in the AWS Region.
 2. Copy the snapshot to the Outpost from the AWS Region.
 3. Create a new volume from the local snapshot.
 4. Attach the volume to an instance on the Outpost.

For the new volume on the Outpost, the next snapshot can be stored on the Outpost or in the AWS Region. All successive snapshots must then be stored in that same location.

- Local snapshots, including snapshots created on an Outpost and snapshots copied to an Outpost from an AWS Region, can be used only to create volumes on the same Outpost.
- If you create a volume on an Outpost from a snapshot in a Region, then all successive snapshots of that new volume must be in the same Region.
- If you create a volume on an Outpost from a local snapshot, then all successive snapshots of that new volume must be on the same Outpost.

Create local snapshots from volumes on an Outpost

You can create local snapshots from volumes on your Outpost. You can choose to store the snapshots on the same Outpost as the source volume, or in the Region for the Outpost.

Local snapshots can be used to create volumes on the same Outpost only.

You can create local snapshots from volumes on an Outpost using one of the following methods.

Console

To create local snapshots from volumes on an Outpost

Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

1. In the navigation pane, choose **Volumes**.
2. Select the volume on the Outpost, and choose **Actions, Create Snapshot**.
3. (Optional) For **Description**, enter a brief description for the snapshot.
4. For **Snapshot destination**, choose **AWS Outpost**. The snapshot will be created on the same Outpost as the source volume. The **Outpost ARN** field shows the Amazon Resource Name (ARN) of the destination Outpost.
5. (Optional) Choose **Add Tag** to add tags to your snapshot. For each tag, provide a tag key and a tag value.
6. Choose **Create Snapshot**.

Command line

To create local snapshots from volumes on an Outpost

Use the `create-snapshot` command. Specify the ID of the volume from which to create the snapshot, and the ARN of the destination Outpost on which to store the snapshot. If you omit the Outpost ARN, the snapshot is stored in the AWS Region for the Outpost.

For example, the following command creates a local snapshot of volume `vol-1234567890abcdef0`, and stores the snapshot on Outpost `arn:aws:outposts:us-east-1:123456789012:outpost/op-1234567890abcdef0`.

```
$ aws ec2 create-snapshot --volume-id vol-1234567890abcdef0 --outpost-arn arn:aws:outposts:us-east-1:123456789012:outpost/op-1234567890abcdef0 --description "single volume local snapshot"
```

Create multi-volume local snapshots from instances on an Outpost

You can create crash-consistent multi-volume local snapshots from instances on your Outpost. You can choose to store the snapshots on the same Outpost as the source instance, or in the Region for the Outpost.

Multi-volume local snapshots can be used to create volumes on the same Outpost only.

You can create multi-volume local snapshots from instances on an Outpost using one of the following methods.

Console

To create multi-volume local snapshots from instances on an Outpost

Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

1. In the navigation pane, choose **Snapshots**.
2. Choose **Create Snapshot**.
3. For **Select resource type**, choose **Instance**.
4. For **Instance ID**, select the instance on the Outpost from which to create the snapshots.
5. (Optional) For **Description**, enter a brief description for the snapshots.
6. For **Snapshot destination**, choose **AWS Outpost**. The snapshots will be created on the same Outpost as the source instance. The **Outpost ARN** shows the ARN of the destination Outpost.
7. (Optional) To exclude the root volume from being snapshotted, select **Exclude root volume**.
8. (Optional) To automatically copy tags from the source volume to the snapshots, select **Copy tags from volume**. This sets snapshot metadata—such as access policies, attachment information, and cost allocation—to match the source volume.
9. (Optional) Choose **Add Tag** to add tags to your snapshot. For each tag, provide a tag key and a tag value.
10. Choose **Create Snapshot**.

During snapshot creation, the snapshots are managed together. If one of the snapshots in the volume set fails, the other snapshots in the volume set are moved to error status.

Command line

To create multi-volume local snapshots from instances on an Outpost

Use the [create-snapshots](#) command. Specify the ID of the instance from which to create the snapshots, and the ARN of the destination Outpost on which to store the snapshots. If you omit the Outpost ARN, the snapshots are stored in the AWS Region for the Outpost.

For example, the following command creates snapshots of the volumes attached to instance `i-1234567890abcdef0` and stores the snapshots on Outpost `arn:aws:outposts:us-east-1:123456789012:outpost/op-1234567890abcdef0`.

```
$ aws ec2 create-snapshots --instance-specification InstanceId=i-1234567890abcdef0 --outpost-arn arn:aws:outposts:us-east-1:123456789012:outpost/op-1234567890abcdef0 --description "multi-volume local snapshots"
```

Create AMIs from local snapshots

You can create Amazon Machine Images (AMIs) using a combination of local snapshots and snapshots that are stored in the Region of the Outpost. For example, if you have an Outpost in `us-east-1`, you can create an AMI with data volumes that are backed by local snapshots on that Outpost, and a root volume that is backed by a snapshot in the `us-east-1` Region.

Note

- You can't create AMIs that include backing snapshots stored across multiple Outposts.
- You can't currently create AMIs directly from instances on an Outposts using [CreateImage API](#) or the Amazon EC2 console for Outposts that are enabled with Amazon S3 on Outposts.
- AMIs that are backed by local snapshots can be used to launch instances on the same Outpost only.

To create an AMI on an Outpost from snapshots in a Region

1. Copy the snapshots from the Region to the Outpost. For more information, see [Copy snapshots from an AWS Region to an Outpost \(p. 1455\)](#).

2. Use the Amazon EC2 console or the [register-image](#) command to create the AMI using the snapshot copies on the Outpost. For more information, see [Creating an AMI from a snapshot](#).

To create an AMI on an Outpost from an instance on an Outpost

1. Create snapshots from the instance on the Outpost and store the snapshots on the Outpost. For more information, see [Create multi-volume local snapshots from instances on an Outpost \(p. 1453\)](#).
2. Use the Amazon EC2 console or the [register-image](#) command to create the AMI using the local snapshots. For more information, see [Creating an AMI from a snapshot](#).

To create an AMI in a Region from an instance on an Outpost

1. Create snapshots from the instance on the Outpost and store the snapshots in the Region. For more information, see [Create local snapshots from volumes on an Outpost \(p. 1453\)](#) or [Create multi-volume local snapshots from instances on an Outpost \(p. 1453\)](#).
2. Use the Amazon EC2 console or the [register-image](#) command to create the AMI using the snapshot copies in the Region. For more information, see [Creating an AMI from a snapshot](#).

Copy snapshots from an AWS Region to an Outpost

You can copy snapshots from an AWS Region to an Outpost. You can do this only if the snapshots are in the Region for the Outpost. If the snapshots are in a different Region, you must first copy the snapshot to the Region for the Outpost, and then copy it from that Region to the Outpost.

Note

You can't copy local snapshots from an Outpost to a Region, from one Outpost to another, or within the same Outpost.

You can copy snapshots from a Region to an Outpost using one of the following methods.

Console

To copy a snapshot from an AWS Region to an Outpost

Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

1. In the navigation pane, choose **Snapshots**.
2. Select the snapshot in the Region, and choose **Actions, Copy**.
3. For **Destination Region**, choose the Region for the destination Outpost.
4. For **Snapshot Destination**, choose **AWS Outpost**.

The **Snapshot Destination** field only appears if you have Outposts in the selected destination Region. If the field does not appear, you do not have any Outposts in the selected destination Region.

5. For **Destination Outpost ARN**, enter the ARN of the Outpost to which to copy the snapshot.
6. (Optional) For **Description**, enter a brief description of the copied snapshot.
7. Encryption is enabled by default for the snapshot copy. Encryption cannot be disabled. For **KMS key**, choose the KMS key to use.
8. Choose **Copy**.

Command line

To copy a snapshot from a Region to an Outpost

Use the [copy-snapshot](#) command. Specify the ID of the snapshot to copy, the Region from which to copy the snapshot, and the ARN of the destination Outpost.

For example, the following command copies snapshot `snap-1234567890abcdef0` from the `us-east-1` Region to Outpost `arn:aws:outposts:us-east-1:123456789012:outpost/op-1234567890abcdef0`.

```
$ aws ec2 copy-snapshot --source-region us-east-1 --source-snapshot-id snap-1234567890abcdef0 --destination-outpost-arn arn:aws:outposts:us-east-1:123456789012:outpost/op-1234567890abcdef0 --description "Local snapshot copy"
```

Copy AMIs from an AWS Region to an Outpost

You can copy AMIs from an AWS Region to an Outpost. When you copy an AMI from a Region to an Outpost, all of the snapshots associated with the AMI are copied from the Region to the Outpost.

You can copy an AMI from a Region to an Outpost only if the snapshots associated with the AMI are in the Region for the Outpost. If the snapshots are in a different Region, you must first copy the AMI to the Region for the Outpost, and then copy it from that Region to the Outpost.

Note

You can't copy an AMI from an Outpost to a Region, from one Outpost to another, or within an Outpost.

You can copy AMIs from a Region to an Outpost using the AWS CLI only.

Command line

To copy an AMI from a Region to an Outpost

Use the [copy-image](#) command. Specify the ID of the AMI to copy, the source Region, and the ARN of the destination Outpost.

For example, the following command copies AMI `ami-1234567890abcdef0` from the `us-east-1` Region to Outpost `arn:aws:outposts:us-east-1:123456789012:outpost/op-1234567890abcdef0`.

```
$ aws ec2 copy-image --source-region us-east-1 --source-image-id ami-1234567890abcdef0 --name "Local AMI copy" --destination-outpost-arn arn:aws:outposts:us-east-1:123456789012:outpost/op-1234567890abcdef0
```

Create volumes from local snapshots

You can create volumes on Outposts from local snapshots. Volumes must be created on the same Outpost as the source snapshots. You cannot use local snapshots to create volumes in the Region for the Outpost.

When you create a volume from a local snapshot, you cannot re-encrypt the volume using different KMS key. Volumes created from local snapshots must be encrypted using the same KMS key as the source snapshot.

For more information, see [Create a volume from a snapshot \(p. 1373\)](#).

Launch instances from AMIs backed by local snapshots

You can launch instances from AMIs that are backed by local snapshots. You must launch Instances on the same Outpost as the source AMI. For more information, see [Launch an instance on your Outpost](#) in the *AWS Outposts User Guide*.

Delete local snapshots

You can delete local snapshots from an Outpost. After you delete a snapshot from an Outpost, the Amazon S3 storage capacity used by the deleted snapshot becomes available within 72 hours after deleting the snapshot and the volumes that reference that snapshot.

Because Amazon S3 storage capacity does not become available immediately, we recommend that you use Amazon CloudWatch alarms to monitor your Amazon S3 storage capacity. Delete snapshots and volumes that you no longer need to avoid running out of storage capacity.

For more information about deleting snapshots, see [Delete a snapshot \(p. 1413\)](#).

Automate snapshots on an Outpost

You can create Amazon Data Lifecycle Manager snapshot lifecycle policies that automatically create, copy, retain, and delete snapshots of your volumes and instances on an Outpost. You can choose whether to store the snapshots in a Region or whether to store them locally on an Outpost. Additionally, you can automatically copy snapshots that are created and stored in an AWS Region to an Outpost.

The following table shows provides and Overview of the supported features.

Resource location	Snapshot destination	Cross-region copy		Fast snapshot restore	Cross-account sharing
		To Region	To Outpost		
Region	Region	✓	✓	✓	✓
Outpost	Region	✓	✓	✓	✓
Outpost	Outpost	✗	✗	✗	✗

Considerations

- Only Amazon EBS snapshot lifecycle policies are currently supported. EBS-backed AMI policies and Cross-account sharing event policies are not supported.
- If a policy manages snapshots for volumes or instances in a Region, then snapshots are created in the same Region as the source resource.
- If a policy manages snapshots for volumes or instances on an Outpost, then snapshots can be created on the source Outpost, or in the Region for that Outpost.
- A single policy can't manage both snapshots in a Region and snapshots on an Outpost. If you need to automate snapshots in a Region and on an Outpost, you must create separate policies.
- Fast snapshot restore is not supported for snapshots created on an Outpost, or for snapshots copied to an Outpost.
- Cross-account sharing is not supported for snapshots created on an Outpost.

For more information about creating a snapshot lifecycle that manages local snapshots, see [Automating snapshot lifecycles \(p. 1490\)](#).

Use EBS direct APIs to access the contents of an EBS snapshot

You can use the Amazon Elastic Block Store (Amazon EBS) direct APIs to create EBS snapshots, write data directly to your snapshots, read data on your snapshots, and identify the differences or changes between two snapshots. If you're an independent software vendor (ISV) who offers backup services for Amazon EBS, the EBS direct APIs make it more efficient and cost-effective to track incremental changes

on your EBS volumes through snapshots. This can be done without having to create new volumes from snapshots, and then use Amazon Elastic Compute Cloud (Amazon EC2) instances to compare the differences.

You can create incremental snapshots directly from data on-premises into EBS volumes and the cloud to use for quick disaster recovery. With the ability to write and read snapshots, you can write your on-premises data to an EBS snapshot during a disaster. Then after recovery, you can restore it back to AWS or on-premises from the snapshot. You no longer need to build and maintain complex mechanisms to copy data to and from Amazon EBS.

This user guide provides an overview of the elements that make up the EBS direct APIs, and examples of how to use them effectively. For more information about the actions, data types, parameters, and errors of the APIs, see the [EBS direct APIs reference](#). For more information about the supported AWS Regions, endpoints, and service quotas for the EBS direct APIs, see [Amazon EBS Endpoints and Quotas in the AWS General Reference](#).

Understand the EBS direct APIs

The following are the key elements that you should understand before getting started with the EBS direct APIs.

Snapshots

Snapshots are the primary means to back up data from your EBS volumes. With the EBS direct APIs, you can also back up data from your on-premises disks to snapshots. To save storage costs, successive snapshots are incremental, containing only the volume data that changed since the previous snapshot. For more information, see [Amazon EBS snapshots \(p. 1403\)](#).

Note

Public snapshots are not supported by the EBS direct APIs.

Blocks

A block is a fragment of data within a snapshot. Each snapshot can contain thousands of blocks. All blocks in a snapshot are of a fixed size.

Block indexes

A block index is a logical index in units of 512 KiB blocks. To identify the block index, divide the logical offset of the data in the logical volume by the block size (logical offset of data/524288). The logical offset of the data must be 512 KiB aligned.

Block tokens

A block token is the identifying hash of a block within a snapshot, and it is used to locate the block data. Block tokens returned by EBS direct APIs are temporary. They change on the expiry timestamp specified for them, or if you run another `ListSnapshotBlocks` or `ListChangedBlocks` request for the same snapshot.

Checksum

A checksum is a small-sized datum derived from a block of data for the purpose of detecting errors that were introduced during its transmission or storage. The EBS direct APIs use checksums to validate data integrity. When you read data from an EBS snapshot, the service provides Base64-encoded SHA256 checksums for each block of data transmitted, which you can use for validation. When you write data to an EBS snapshot, you must provide a Base64 encoded SHA256 checksum for each block of data transmitted. The service validates the data received using the checksum provided. For more information, see [Use checksums \(p. 1475\)](#) later in this guide.

Encryption

Encryption protects your data by converting it into unreadable code that can be deciphered only by people who have access to the KMS key used to encrypt it. You can use the EBS direct APIs to read and write encrypted snapshots, but there are some limitations. For more information, see [Use encryption \(p. 1473\)](#) later in this guide.

API actions

The EBS direct APIs consists of six actions. There are three read actions and three write actions. The read actions are:

- **ListSnapshotBlocks** — returns the block indexes and block tokens of blocks in the specified snapshot
- **ListChangedBlocks** — returns the block indexes and block tokens of blocks that are different between two specified snapshots of the same volume and snapshot lineage.
- **GetSnapshotBlock** — returns the data in a block for the specified snapshot ID, block index, and block token.

The write actions are:

- **StartSnapshot** — starts a snapshot, either as an incremental snapshot of an existing one or as a new snapshot. The started snapshot remains in a pending state until it is completed using the CompleteSnapshot action.
- **PutSnapshotBlock** — adds data to a started snapshot in the form of individual blocks. You must specify a Base64-encoded SHA256 checksum for the block of data transmitted. The service validates the checksum after the transmission is completed. The request fails if the checksum computed by the service doesn't match what you specified.
- **CompleteSnapshot** — completes a started snapshot that is in a pending state. The snapshot is then changed to a completed state.

IAM permissions for EBS direct APIs

An AWS Identity and Access Management (IAM) user must have the following policies to use the EBS direct APIs. For more information, see [Changing Permissions for an IAM User](#).

For more information about the EBS direct APIs resources, actions, and condition context keys for use in IAM permission policies, see [Actions, resources, and condition keys for Amazon Elastic Block Store](#) in the *Service Authorization Reference*.

Important

Be cautious when assigning the following policies to IAM users. By assigning these policies, you might give access to a user who is denied access to the same resource through the Amazon EC2 APIs, such as the CopySnapshot or CreateVolume actions.

Permissions to read snapshots

The following policy allows the *read* EBS direct APIs to be used on all snapshots in a specific AWS Region. In the policy, replace <Region> with the Region of the snapshot.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ebs>ListSnapshotBlocks",  
                "ebs>ListChangedBlocks",  
                "ebs>GetSnapshotBlock"  
            ],  
            "Resource": "arn:aws:ec2:<Region>::snapshot/*"  
        }  
    ]  
}
```

The following policy allows the *read* EBS direct APIs to be used on snapshots with a specific key-value tag. In the policy, replace <Key> with the key value of the tag, and <Value> with the value of the tag.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ebs>ListSnapshotBlocks",  
                "ebs>ListChangedBlocks",  
                "ebs>GetSnapshotBlock"  
            ],  
            "Resource": "arn:aws:ec2:*::snapshot/*",  
            "Condition": {  
                "StringEqualsIgnoreCase": {  
                    "aws:ResourceTag/<Key>": "<Value>"  
                }  
            }  
        }  
    ]  
}
```

The following policy allows all of the *read* EBS direct APIs to be used on all snapshots in the account only within a specific time range. This policy authorizes use of the EBS direct APIs based on the aws:CurrentTime global condition key. In the policy, be sure to replace the date and time range shown with the date and time range for your policy.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ebs>ListSnapshotBlocks",  
                "ebs>ListChangedBlocks",  
                "ebs>GetSnapshotBlock"  
            ],  
            "Resource": "arn:aws:ec2:*::snapshot/*",  
            "Condition": {  
                "DateGreaterThan": {  
                    "aws:CurrentTime": "2018-05-29T00:00:00Z"  
                },  
                "DateLessThan": {  
                    "aws:CurrentTime": "2020-05-29T23:59:59Z"  
                }  
            }  
        }  
    ]  
}
```

```
        }
    ]  
}
```

For more information, see [Changing Permissions for an IAM User](#) in the *IAM User Guide*.

Permissions to write snapshots

The following policy allows the *write* EBS direct APIs to be used on all snapshots in a specific AWS Region. In the policy, replace `<Region>` with the Region of the snapshot.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ebs:StartSnapshot",
                "ebs:PutSnapshotBlock",
                "ebs:CompleteSnapshot"
            ],
            "Resource": "arn:aws:ec2:<Region>::snapshot/*"
        }
    ]
}
```

The following policy allows the *write* EBS direct APIs to be used on snapshots with a specific key-value tag. In the policy, replace `<Key>` with the key value of the tag, and `<Value>` with the value of the tag.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ebs:StartSnapshot",
                "ebs:PutSnapshotBlock",
                "ebs:CompleteSnapshot"
            ],
            "Resource": "arn:aws:ec2::snapshot/*",
            "Condition": {
                "StringEqualsIgnoreCase": {
                    "aws:ResourceTag/<Key>": "<Value>"
                }
            }
        }
    ]
}
```

The following policy allows all of the EBS direct APIs to be used. It also allows the `StartSnapshot` action only if a parent snapshot ID is specified. Therefore, this policy blocks the ability to start new snapshots without using a parent snapshot.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ebs:*",
            "Resource": "*",
            "Condition": {
```

```
        "StringEquals": {
            "ebs:ParentSnapshot": "arn:aws:ec2:::snapshot/*"
        }
    }
]
}
```

The following policy allows all of the EBS direct APIs to be used. It also allows only the `user` tag key to be created for a new snapshot. This policy also ensures that the user has access to create tags. The `StartSnapshot` action is the only action that can specify tags.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ebs:*",
            "Resource": "*",
            "Condition": {
                "ForAllValues:StringEquals": {
                    "aws:TagKeys": "user"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": "ec2:CreateTags",
            "Resource": "*"
        }
    ]
}
```

The following policy allows all of the *write* EBS direct APIs to be used on all snapshots in the account only within a specific time range. This policy authorizes use of the EBS direct APIs based on the `aws:CurrentTime` global condition key. In the policy, be sure to replace the date and time range shown with the date and time range for your policy.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ebs:StartSnapshot",
                "ebs:PutSnapshotBlock",
                "ebs:CompleteSnapshot"
            ],
            "Resource": "arn:aws:ec2:::snapshot/*",
            "Condition": {
                "DateGreaterThan": {
                    "aws:CurrentTime": "2018-05-29T00:00:00Z"
                },
                "DateLessThan": {
                    "aws:CurrentTime": "2020-05-29T23:59:59Z"
                }
            }
        }
    ]
}
```

For more information, see [Changing Permissions for an IAM User](#) in the *IAM User Guide*.

Permissions to use AWS KMS keys

The following policy grants permission to decrypt an encrypted snapshot using a specific KMS key. It also grants permission to encrypt new snapshots using the default KMS key for EBS encryption. In the policy, replace `<Region>` with the Region of the KMS key, `<AccountId>` with the ID of the AWS account of the KMS key, and `<KeyId>` with the ID of the KMS key.

Note

By default, all principals in the account have access to the default AWS managed KMS key for Amazon EBS encryption, and they can use it for EBS encryption and decryption operations. If you are using a customer managed key, you must create a new key policy or modify the existing key policy for the customer managed key to grant the principal access to the customer managed key. For more information, see [Key policies in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "VisualEditor0",  
            "Effect": "Allow",  
            "Action": [  
                "kms:Encrypt",  
                "kms:Decrypt",  
                "kms:GenerateDataKey",  
                "kms:GenerateDataKeyWithoutPlaintext",  
                "kms:ReEncrypt*",  
                "kms>CreateGrant",  
                "ec2:CreateTags",  
                "kms:DescribeKey"  
            ],  
            "Resource": "arn:aws:kms:<Region>:<AccountId>:key/<KeyId>"  
        }  
    ]  
}
```

For more information, see [Changing Permissions for an IAM User](#) in the *IAM User Guide*.

Use EBS direct APIs

The following topics show how to read and write snapshots using the EBS direct APIs. You can read and write snapshots using the AWS CLI, AWS APIs, and AWS SDKs only. For more information, see:

- [Installing the AWS CLI](#) and [Configuring the AWS CLI](#)
- [EBS direct APIs Reference](#)
- [AWS SDKs](#)

Important

The EBS direct APIs require an AWS Signature Version 4 signature. For more information, see [Use Signature Version 4 signing \(p. 1475\)](#).

Topics

- [Read snapshots with EBS direct APIs \(p. 1464\)](#)
- [Write snapshots with EBS direct APIs \(p. 1469\)](#)
- [Use encryption \(p. 1473\)](#)
- [Use Signature Version 4 signing \(p. 1475\)](#)
- [Use checksums \(p. 1475\)](#)

- [Idempotency for StartSnapshot API \(p. 1476\)](#)
- [Optimize performance \(p. 1476\)](#)

Read snapshots with EBS direct APIs

The following steps describe how to use the EBS direct APIs to read snapshots:

1. Use the `ListSnapshotBlocks` action to view all block indexes and block tokens of blocks in a snapshot. Or use the `ListChangedBlocks` action to view only the block indexes and block tokens of blocks that are different between two snapshots of the same volume and snapshot lineage. These actions help you identify the block tokens and block indexes of blocks for which you might want to get data.
2. Use the `GetSnapshotBlock` action, and specify the block index and block token of the block for which you want to get data.

The following examples show how to read snapshots using the EBS direct APIs.

Topics

- [List blocks in a snapshot \(p. 1464\)](#)
- [List blocks that are different between two snapshots \(p. 1466\)](#)
- [Get block data from a snapshot \(p. 1468\)](#)

List blocks in a snapshot

AWS CLI

The following `list-snapshot-blocks` example command returns the block indexes and block tokens of blocks that are in snapshot `snap-0987654321`. The `--starting-block-index` parameter limits the results to block indexes greater than 1000, and the `--max-results` parameter limits the results to the first 100 blocks.

```
aws ebs list-snapshot-blocks --snapshot-id snap-0987654321 --starting-block-index 1000  
--max-results 100
```

The following example response for the previous command lists the block indexes and block tokens in the snapshot. Use the `get-snapshot-block` command and specify the block index and block token of the block for which you want to get data. The block tokens are valid until the expiry time listed.

```
{  
    "Blocks": [  
        {  
            "BlockIndex": 1001,  
            "BlockToken": "AAABAV3/  
PNhXOynVdMYHUpPsetaSvjLB1dtIGfbJv5OJ0sX855EzGTWos4a4"  
        },  
        {  
            "BlockIndex": 1002,  
            "BlockToken": "AAABATGQIgwr0WwIuqIMjCA/Sy7e/  
YoQFZsHejzGNvjKauzNgzeI13YHBfQB"  
        },  
        {  
            "BlockIndex": 1007,  
            "BlockToken": "AAABAZ9CTuQtUvp/  
dXqRWw4d07eOgTZ3jvn6hiW30W9duM8MiMw6yQayzF2c"  
        },  
    ]  
}
```

```
{  
    "BlockIndex": 1012,  
    "BlockToken": "AAABAQdzxhw0rVV6PNmsfo/  
YRIxo9JPR85XxPf1BLjg0Hec6pygYr6laE1p0"  
},  
{  
    "BlockIndex": 1030,  
    "BlockToken": "AAABAAyvPax6mv+iGWLdTUjQtFWouQ7Dqz6nSD9L  
+CbXnvpkswA6iDID523d"  
},  
{  
    "BlockIndex": 1031,  
    "BlockToken": "AAABATgWZC0XcFwUKvTJbUXMiSPg59KVxJGL  
+BWBClkw6spzCxJVqDVaTskJ"  
},  
...  
],  
"ExpiryTime": 1576287332.806,  
"VolumeSize": 32212254720,  
"BlockSize": 524288  
}
```

AWS API

The following [ListChangedBlocks](#) example request returns the block indexes and block tokens of blocks that are in snapshot snap-0acEXAMPLEcf41648. The `startingBlockIndex` parameter limits the results to block indexes greater than 1000, and the `maxResults` parameter limits the results to the first 100 blocks.

```
GET /snapshots/snap-0acEXAMPLEcf41648/blocks?maxResults=100&startingBlockIndex=1000  
HTTP/1.1  
Host: ebs.us-east-2.amazonaws.com  
Accept-Encoding: identity  
User-Agent: <User agent parameter>  
X-Amz-Date: 20200617T231953Z  
Authorization: <Authentication parameter>
```

The following example response for the previous request lists the block indexes and block tokens in the snapshot. Use the `GetSnapshotBlock` action and specify the block index and block token of the block for which you want to get data. The block tokens are valid until the expiry time listed.

```
HTTP/1.1 200 OK  
x-amzn-RequestId: d6e5017c-70a8-4539-8830-57f5557f3f27  
Content-Type: application/json  
Content-Length: 2472  
Date: Wed, 17 Jun 2020 23:19:56 GMT  
Connection: keep-alive  
  
{  
    "BlockSize": 524288,  
    "Blocks": [  
        {  
            "BlockIndex": 0,  
            "BlockToken": "AAUBAcuWqOCnDNuKle11s7IIX6jp6FYcC/q8oT93913HhvLva  
+3JRrSybp/0"  
        },  
        {  
            "BlockIndex": 1536,  
            "BlockToken":  
"AAUBAWudwfmoFCrQhGV1LwuRKm2b8ZXPiyrgoykTRC6IU1NbxEWDY1pPjvnV"  
        },  
        {  
            "BlockIndex": 3072,
```

```
        "BlockToken":  
        "AAUBAV7p6pC5fKAC7TokoNCtAnZhqq27u6YEXZ3MwRevBkDjmMx6iuA6tsBt"  
    },  
    {  
        "BlockIndex": 3073,  
        "BlockToken":  
        "AAUBAbqt9zpqBUEvtO2HINAfFaWToOwlPjbIsQOlx6JUN/0+iMq10NtNbnX4"  
    },  
    ...  
],  
"ExpiryTime": 1.59298379649E9,  
"VolumeSize": 3  
}
```

List blocks that are different between two snapshots

AWS CLI

The following [list-changed-blocks](#) example command returns the block indexes and block tokens of blocks that are different between snapshots snap-1234567890 and snap-0987654321. The `--starting-block-index` parameter limits the results to block indexes greater than 0, and the `--max-results` parameter limits the results to the first 500 blocks..

```
aws ebs list-changed-blocks --first-snapshot-id snap-1234567890 --second-snapshot-id snap-0987654321 --starting-block-index 0 --max-results 500
```

The following example response for the previous command shows that block indexes 0, 6000, 6001, 6002, and 6003 are different between the two snapshots. Additionally, block indexes 6001, 6002, and 6003 exist only in the first snapshot ID specified, and not in the second snapshot ID because there is no second block token listed in the response.

Use the `get-snapshot-block` command and specify the block index and block token of the block for which you want to get data. The block tokens are valid until the expiry time listed.

```
{  
    "ChangedBlocks": [  
        {  
            "BlockIndex": 0,  
            "FirstBlockToken": "AAABA Vahm9SO60Dyi00RySzn2ZjGjW/  
KN3uygGls0QOYWebzBbDnX2dGpmC",  
            "SecondBlockToken":  
            "AAABAf8o0o6UFi1rDbSZGIRaCEdDyBu9TlvtCQxxoKV8qrUPQP7vcM6iWGsr"  
        },  
        {  
            "BlockIndex": 6000,  
            "FirstBlockToken": "AAABAbYSizvJ0/  
R9tz8suI8dSzecLjN4kkazK8inFXVintPkdaVFLfCMQsKe",  
            "SecondBlockToken":  
            "AAABA ZnqTdzFmKRpsaMAsDxviVqEI/3jJzI2crq2eFDCgHmyNf777elD9oVR"  
        },  
        {  
            "BlockIndex": 6001,  
            "FirstBlockToken": "AAABASBpSJ2UAD3PLxJnCt6zun4/  
T4sU25Bnb8jB5Q6FRXHFqAIAqE04hJoR"  
        },  
        {  
            "BlockIndex": 6002,  
            "FirstBlockToken": "AAABASqX4/  
NWjvNceoyMULjcRd0DnwbSwNnes1UkoP62CrQXvn47BY5435aw"  
        },  
        {  
    ]
```

```
"BlockIndex": 6003,  
"FirstBlockToken":

```

AWS API

The following [ListChangedBlocks](#) example request returns the block indexes and block tokens of blocks that are different between snapshots `snap-0acEXAMPLEcf41648` and `snap-0c9EXAMPLE1b30e2f`. The `startingBlockIndex` parameter limits the results to block indexes greater than 0, and the `maxResults` parameter limits the results to the first 500 blocks.

```
GET /snapshots/snap-0c9EXAMPLE1b30e2f/changedblocks?  
firstSnapshotId=snap-0acEXAMPLEcf41648&maxResults=500&startingBlockIndex=0 HTTP/1.1  
Host: ebs.us-east-2.amazonaws.com  
Accept-Encoding: identity  
User-Agent: <User agent parameter>  
X-Amz-Date: 20200617T232546Z  
Authorization: <Authentication parameter>
```

The following example response for the previous request shows that block indexes 0, 3072, 6002, and 6003 are different between the two snapshots. Additionally, block indexes 6002, and 6003 exist only in the first snapshot ID specified, and not in the second snapshot ID because there is no second block token listed in the response.

Use the `GetSnapshotBlock` action and specify the block index and block token of the block for which you want to get data. The block tokens are valid until the expiry time listed.

```
HTTP/1.1 200 OK

Get block data from a snapshot

AWS CLI

The following [get-snapshot-block](#) example command returns the data in the block index 6001 with block token AAABASBpSJ2UAD3PLxJnCt6zun4/T4sU25Bnb8jB5Q6FRXHFqAIaqE04hJoR, in snapshot snap-1234567890. The binary data is output to the data file in the C:\Temp directory on a Windows computer. If you run the command on a Linux or Unix computer, replace the output path with /tmp/data to output the data to the data file in the /tmp directory.

```
aws ebs get-snapshot-block --snapshot-id snap-1234567890 --block-index 6001 --block-token AAABASBpSJ2UAD3PLxJnCt6zun4/T4sU25Bnb8jB5Q6FRXHFqAIaqE04hJoR C:/Temp/data
```

The following example response for the previous command shows the size of the data returned, the checksum to validate the data, and the algorithm of the checksum. The binary data is automatically saved to the directory and file you specified in the request command.

```
{  
    "DataLength": "524288",  
    "Checksum": "cf0Y6/Fn0oFa4VyjQPOa/iD0zhTf1PTKzxGv2OKowXc=",  
    "ChecksumAlgorithm": "SHA256"  
}
```

AWS API

The following [GetSnapshotBlock](#) example request returns the data in the block index 3072 with block token AAUBARGCaufCqBRZC8tEkPYGGkSv3vqv0jJ2xKDl3ljdFiytUxBLXYgTmkid, in snapshot snap-0c9EXAMPLE1b30e2f.

```
GET /snapshots/snap-0c9EXAMPLE1b30e2f(blocks/3072?  
blockToken=AAUBARGCaufCqBRZC8tEkPYGGkSv3vqv0jJ2xKDl3ljdFiytUxBLXYgTmkid HTTP/1.1  
Host: ebs.us-east-2.amazonaws.com  
Accept-Encoding: identity  
User-Agent: <User agent parameter>

```

Write snapshots with EBS direct APIs

The following steps describe how to use the EBS direct APIs to write incremental snapshots:

1. Use the `StartSnapshot` action and specify a parent snapshot ID to start a snapshot as an incremental snapshot of an existing one, or omit the parent snapshot ID to start a new snapshot. This action returns the new snapshot ID, which is in a pending state.
2. Use the `PutSnapshotBlock` action and specify the ID of the pending snapshot to add data to it in the form of individual blocks. You must specify a Base64-encoded SHA256 checksum for the block of data transmitted. The service computes the checksum of the data received and validates it with the checksum that you specified. The action fails if the checksums don't match.
3. When you're done adding data to the pending snapshot, use the `CompleteSnapshot` action to start an asynchronous workflow that seals the snapshot and moves it to a completed state.

Repeat these steps to create a new, incremental snapshot using the previously created snapshot as the parent.

For example, in the following diagram, snapshot A is the first new snapshot started. Snapshot A is used as the parent snapshot to start snapshot B. Snapshot B is used as the parent snapshot to start and create snapshot C. Snapshots A, B, and C are incremental snapshots. Snapshot A is used to create EBS volume 1. Snapshot D is created from EBS volume 1. Snapshot D is an incremental snapshot of A; it is not an incremental snapshot of B or C.

The following examples show how to write snapshots using the EBS direct APIs.

Topics

- [Start a snapshot \(p. 1470\)](#)
- [Put data into a snapshot \(p. 1471\)](#)
- [Complete a snapshot \(p. 1472\)](#)

Start a snapshot

AWS CLI

The following [start-snapshot](#) example command starts an 8 GiB snapshot, using snapshot `snap-123EXAMPLE1234567` as the parent snapshot. The new snapshot will be an incremental snapshot of the parent snapshot. The snapshot moves to an error state if there are no put or complete requests made for the snapshot within the specified 60 minute timeout period. The `550e8400-e29b-41d4-a716-446655440000` client token ensures idempotency for the request. If the client token is omitted, the AWS SDK automatically generates one for you. For more information about idempotency, see [Idempotency for StartSnapshot API \(p. 1476\)](#).

```
aws ebs start-snapshot --volume-size 8 --parent-snapshot snap-123EXAMPLE1234567 --  
timeout 60 --client-token 550e8400-e29b-41d4-a716-446655440000
```

The following example response for the previous command shows the snapshot ID, AWS account ID, status, volume size in GiB, and size of the blocks in the snapshot. The snapshot is started in a pending state. Specify the snapshot ID in subsequent `put-snapshot-block` commands to write data to the snapshot, then use the `complete-snapshot` command to complete the snapshot and change its status to completed.

```
{  
    "SnapshotId": "snap-0aaEXAMPLEe306d62",  
    "OwnerId": "111122223333",  
    "Status": "pending",  
    "VolumeSize": 8,  
    "BlockSize": 524288  
}
```

AWS API

The following [StartSnapshot](#) example request starts an 8 GiB snapshot, using snapshot `snap-123EXAMPLE1234567` as the parent snapshot. The new snapshot will be an incremental snapshot of the parent snapshot. The snapshot moves to an error state if there are no put or complete requests made for the snapshot within the specified 60 minute timeout period. The `550e8400-e29b-41d4-a716-446655440000` client token ensures idempotency for the request. If the client token is omitted, the AWS SDK automatically generates one for you. For more information about idempotency, see [Idempotency for StartSnapshot API \(p. 1476\)](#).

```
POST /snapshots HTTP/1.1  
Host: ebs.us-east-2.amazonaws.com  
Accept-Encoding: identity  
User-Agent: <User agent parameter>  
X-Amz-Date: 20200618T040724Z  
Authorization: <Authentication parameter>  
  
{  
    "VolumeSize": 8,  
    "ParentSnapshot": snap-123EXAMPLE1234567,  
    "ClientToken": "550e8400-e29b-41d4-a716-446655440000",  
    "Timeout": 60  
}
```

The following example response for the previous request shows the snapshot ID, AWS account ID, status, volume size in GiB, and size of the blocks in the snapshot. The snapshot is started in a pending state. Specify the snapshot ID in a subsequent `PutSnapshotBlocks` request to write data to the snapshot.

```
HTTP/1.1 201 Created
```

```
x-amzn-RequestId: 929e6eb9-7183-405a-9502-5b7da37c1b18

    "StartTime": null,
    "Status": "pending",
    "Tags": null,
    "VolumeSize": 8
}
```

Put data into a snapshot

AWS CLI

The following [put-snapshot](#) example command writes 524288 Bytes of data to block index 1000 on snapshot snap-0aaEXAMPLEe306d62. The Base64 encoded QOD3gmEQOXATfJx2Aa34W4FU2nZGyXfqtsUuktOw8DM= checksum was generated using the SHA256 algorithm. The data that is transmitted is in the /tmp/data file.

```
aws ebs put-snapshot-block --snapshot-id snap-0aaEXAMPLEe306d62
--block-index 1000 --data-length 524288 --block-data /tmp/data --
checksum QOD3gmEQOXATfJx2Aa34W4FU2nZGyXfqtsUuktOw8DM= --checksum-algorithm SHA256
```

The following example response for the previous command confirms the data length, checksum, and checksum algorithm for the data received by the service.

```
{
    "DataLength": "524288",
    "Checksum": "QOD3gmEQOXATfJx2Aa34W4FU2nZGyXfqtsUuktOw8DM=",
    "ChecksumAlgorithm": "SHA256"
}
```

AWS API

The following [PutSnapshot](#) example request writes 524288 Bytes of data to block index 1000 on snapshot snap-052EXAMPLEc85d8dd. The Base64 encoded QOD3gmEQOXATfJx2Aa34W4FU2nZGyXfqtsUuktOw8DM= checksum was generated using the SHA256 algorithm. The data is transmitted in the body of the request and is represented as *BlockData* in the following example.

```
PUT /snapshots/snap-052EXAMPLEc85d8dd(blocks)/1000 HTTP/1.1
Host: ebs.us-east-2.amazonaws.com
Accept-Encoding: identity
x-amz-Data-Length: 524288
x-amz-C checksum: QOD3gmEQOXATfJx2Aa34W4FU2nZGyXfqtsUuktOw8DM=
x-amz-C checksum-Algorithm: SHA256
User-Agent: <User agent parameter>
X-Amz-Date: 20200618T042215Z
X-Amz-Content-SHA256: UNSIGNED-PAYOUT
Authorization: <Authentication parameter>

BlockData
```

The following is example response for the previous request confirms the data length, checksum, and checksum algorithm for the data received by the service.

```
HTTP/1.1 201 Created
x-amzn-RequestId: 643ac797-7e0c-4ad0-8417-97b77b43c57b
x-amz-C checksum: QOD3gmEQOXATfJx2Aa34W4FU2nZGyXfqtsUuktOw8DM=
x-amz-C checksum-Algorithm: SHA256
Content-Type: application/json
Content-Length: 2
Date: Thu, 18 Jun 2020 04:22:12 GMT
Connection: keep-alive

{}
```

Complete a snapshot

AWS CLI

The following [complete-snapshot](#) example command completes snapshot `snap-0aaEXAMPLEe306d62`. The command specifies that 5 blocks were written to the snapshot. The `6D3nmwi5f2F0wlh7xX8QprrrJBFzDX8aacdOcA3KCM3c=` checksum represents the checksum for the complete set of data written to a snapshot. For more information about checksums, see [Use checksums \(p. 1475\)](#) earlier in this guide.

```
aws ebs complete-snapshot --snapshot-id snap-0aaEXAMPLEe306d62 --changed-blocks-count 5
--checksum 6D3nmwi5f2F0wlh7xX8QprrrJBFzDX8aacdOcA3KCM3c= --checksum-algorithm SHA256 --
checksum-aggregation-method LINEAR
```

The following is an example response for the previous command.

```
{
    "Status": "pending"
}
```

AWS API

The following [CompleteSnapshot](#) example request completes snapshot `snap-052EXAMPLEc85d8dd`. The command specifies that 5 blocks were written to the snapshot. The `6D3nmwi5f2F0wlh7xX8QprrrJBFzDX8aacdOcA3KCM3c=` checksum represents the checksum for the complete set of data written to a snapshot.

```
POST /snapshots/completion/snap-052EXAMPLEc85d8dd HTTP/1.1
Host: ebs.us-east-2.amazonaws.com
Accept-Encoding: identity
x-amz-ChangedBlocksCount: 5
x-amz-C checksum: 6D3nmwi5f2F0wlh7xX8QprrrJBFzDX8aacdOcA3KCM3c=
x-amz-C checksum-Algorithm: SHA256
x-amz-C checksum-Aggregation-Method: LINEAR
User-Agent: <User agent parameter>
X-Amz-Date: 20200618T043158Z
Authorization: <Authentication parameter>
```

The following is an example response for the previous request.

```
HTTP/1.1 202 Accepted
x-amzn-RequestId: 06cba5b5-b731-49de-af40-80333ac3a117
Content-Type: application/json
Content-Length: 20
```

```
Date: Thu, 18 Jun 2020 04:31:50 GMT
Connection: keep-alive
{"Status": "pending"}
```

Use encryption

When you start a new snapshot using [StartSnapshot](#), the encryption status depends on the values that you specify for **Encrypted**, **KmsKeyArn**, and **ParentSnapshotId**, and whether your AWS account is enabled for [encryption by default \(p. 1545\)](#).

Note

- You might need additional IAM permissions to use the EBS direct APIs with encryption. For more information, see [Permissions to use AWS KMS keys \(p. 1463\)](#).
- If Amazon EBS encryption by default is enabled on your AWS account, you can't create unencrypted snapshots.
- If Amazon EBS encryption by default is enabled on your AWS account, you cannot start a new snapshot using an unencrypted parent snapshot. You must first encrypt the parent snapshot by copying it. For more information, see [Copy an Amazon EBS snapshot \(p. 1413\)](#).

Topics

- [Encryption outcomes: Unencrypted parent snapshot \(p. 1473\)](#)
- [Encryption outcomes: Encrypted parent snapshot \(p. 1474\)](#)
- [Encryption outcomes: No parent snapshot \(p. 1474\)](#)

Encryption outcomes: Unencrypted parent snapshot

The following table describes the encryption outcome for each possible combination of settings when specifying an unencrypted parent snapshot.

ParentSnapshot	Encrypted	KmsKeyArn	Encryption by default	Result
Unencrypted	Omitted	Omitted	Enabled	The request fails with ValidationException.
			Disabled	The snapshot is unencrypted.
	Specified	Enabled	Enabled	
			Disabled	
Unencrypted	True	Omitted	Enabled	The request fails with ValidationException.
			Disabled	
		Specified	Enabled	
			Disabled	
Unencrypted	False	Omitted	Enabled	The request fails with ValidationException.
			Disabled	
		Specified	Enabled	

ParentSnapshot	Encrypted	KmsKeyArn	Encryption by default	Result
			Disabled	

Encryption outcomes: Encrypted parent snapshot

The following table describes the encryption outcome for each possible combination of settings when specifying an encrypted parent snapshot.

ParentSnapshot	Encrypted	KmsKeyArn	Encryption by default	Result
Encrypted	Omitted	Omitted	Enabled	The snapshot is encrypted using the same KMS key as the parent snapshot.
			Disabled	
	Specified	Enabled	Enabled	The request fails with <code>ValidationException</code> .
			Disabled	
Encrypted	True	Omitted	Enabled	The request fails with <code>ValidationException</code> .
			Disabled	
	Specified	Enabled	Enabled	
			Disabled	
Encrypted	False	Omitted	Enabled	The request fails with <code>ValidationException</code> .
			Disabled	
	Specified	Enabled	Enabled	
			Disabled	

Encryption outcomes: No parent snapshot

The following tables describe the encryption outcome for each possible combination of settings when not using a parent snapshot.

ParentSnapshot	Encrypted	KmsKeyArn	Encryption by default	Result
Omitted	True	Omitted	Enabled	The snapshot is encrypted using the default KMS key for your account. *
			Disabled	
	Specified	Enabled	Enabled	The snapshot is encrypted using the KMS key specified for <code>KmsKeyArn</code> .
			Disabled	
Omitted	False	Omitted	Enabled	The request fails with <code>ValidationException</code> .
			Disabled	The snapshot is unencrypted.

ParentSnapshot	Encrypted	KmsKeyArn	Encryption by default	Result
		Specified	Enabled	The request fails with ValidationException.
			Disabled	
Omitted	Omitted	Omitted	Enabled	The snapshot is encrypted using the default KMS key for your account. *
			Disabled	The snapshot is unencrypted.
	Specified	Specified	Enabled	The snapshot is encrypted using the KMS key specified for KmsKeyArn.
			Disabled	

* This default KMS key could be a customer managed key or the default AWS managed KMS key for Amazon EBS encryption.

Use Signature Version 4 signing

Signature Version 4 is the process to add authentication information to AWS requests sent by HTTP. For security, most requests to AWS must be signed with an access key, which consists of an access key ID and secret access key. These two keys are commonly referred to as your security credentials. For information about how to obtain credentials for your account, see [Understanding and getting your credentials](#).

If you intend to manually create HTTP requests, you must learn how to sign them. When you use the AWS Command Line Interface (AWS CLI) or one of the AWS SDKs to make requests to AWS, these tools automatically sign the requests for you with the access key that you specify when you configure the tools. When you use these tools, you don't need to learn how to sign requests yourself.

For more information, see [Signing AWS requests with Signature Version 4](#) in the *AWS General Reference*.

Use checksums

The GetSnapshotBlock action returns data that is in a block of a snapshot, and the PutSnapshotBlock action adds data to a block in a snapshot. The block data that is transmitted is not signed as part of the Signature Version 4 signing process. As a result, checksums are used to validate the integrity of the data as follows:

- When you use the GetSnapshotBlock action, the response provides a Base64-encoded SHA256 checksum for the block data using the **x-amz-Checksum** header, and the checksum algorithm using the **x-amz-Checksum-Algorithm** header. Use the returned checksum to validate the integrity of the data. If the checksum that you generate doesn't match what Amazon EBS provided, you should consider the data not valid and retry your request.
- When you use the PutSnapshotBlock action, your request must provide a Base64-encoded SHA256 checksum for the block data using the **x-amz-Checksum** header, and the checksum algorithm using the **x-amz-Checksum-Algorithm** header. The checksum that you provide is validated against a checksum generated by Amazon EBS to validate the integrity of the data. If the checksums do not correspond, the request fails.
- When you use the CompleteSnapshot action, your request can optionally provide an aggregate Base64-encoded SHA256 checksum for the complete set of data added to the snapshot. Provide the checksum using the **x-amz-Checksum** header, the checksum algorithm using the **x-amz-Checksum-Algorithm** header, and the checksum aggregation method using the **x-amz-Checksum-Aggregation-Method** header. To generate the aggregated checksum using the linear aggregation method, arrange the checksums for each written block in ascending order of their block index, concatenate them to form a single string, and then generate the checksum on the entire string using the SHA256 algorithm.

The checksums in these actions are part of the Signature Version 4 signing process.

Idempotency for StartSnapshot API

Idempotency ensures that an API request completes only once. With an idempotent request, if the original request completes successful, the subsequent retries return the result from the original successful request and they have no additional effect.

The [StartSnapshot](#) API supports idempotency using a *client token*. A client token is a unique string that you specify when you make an API request. If you retry an API request with the same client token and the same request parameters after it has completed successfully, the result of the original request is returned. If you retry a request with the same client token, but change one or more of the request parameters, the `ConflictException` error is returned.

If you do not specify your own client token, the AWS SDKs automatically generates a client token for the request to ensure that it is idempotent.

A client token can be any string that includes up to up to 64 ASCII characters. You should not reuse the same client tokens for different requests.

To make an idempotent StartSnapshot request with your own client token using the API

Specify the `ClientToken` request parameter.

```
POST /snapshots HTTP/1.1
Host: ebs.us-east-2.amazonaws.com
Accept-Encoding: identity
User-Agent: <User agent parameter>
X-Amz-Date: 20200618T040724Z
Authorization: <Authentication parameter>

{
    "VolumeSize": 8,
    "ParentSnapshot": "snap-123EXAMPLE1234567",
    "ClientToken": "550e8400-e29b-41d4-a716-446655440000",
    "Timeout": 60
}
```

To make an idempotent StartSnapshot request with your own client token using the AWS CLI

Specify the `client-token` request parameter.

```
$ aws ebs start-snapshot --region us-east-2 --volume-size 8 --parent-snapshot
snap-123EXAMPLE1234567 --timeout 60 --client-token 550e8400-e29b-41d4-a716-446655440000
```

Optimize performance

You can run API requests concurrently. Assuming `PutSnapshotBlock` latency is 100ms, then a thread can process 10 requests in one second. Furthermore, assuming your client application creates multiple threads and connections (for example, 100 connections), it can make 1000 (10 * 100) requests per second in total. This will correspond to a throughput of around 500 MB per second.

The following list contains few things to look for in your application:

- Is each thread using a separate connection? If the connections are limited on the application then multiple threads will wait for the connection to be available and you will notice lower throughput.
- Is there any wait time in the application between two put requests? This will reduce the effective throughput of a thread.

- The bandwidth limit on the instance – If bandwidth on the instance is shared by other applications, it could limit the available throughput for PutSnapshotBlock requests.

Be sure to take note of other workloads that might be running in the account to avoid bottlenecks. You should also build retry mechanisms into your EBS direct APIs workflows to handle throttling, timeouts, and service unavailability.

Review the EBS direct APIs service quotas to determine the maximum API requests that you can run per second. For more information, see [Amazon Elastic Block Store Endpoints and Quotas](#) in the *AWS General Reference*.

Pricing for EBS direct APIs

Topics

- [Pricing for APIs \(p. 1477\)](#)
- [Networking costs \(p. 1477\)](#)

Pricing for APIs

The price that you pay to use the EBS direct APIs depends on the requests you make. For more information, see [Amazon EBS pricing](#).

- **ListChangedBlocks** and **ListSnapshotBlocks** APIs are charged per request. For example, if you make 100,000 ListSnapshotBlocks API requests in a Region that charges \$0.0006 per 1,000 requests, you will be charged \$0.06 (\$0.0006 per 1,000 requests x 100).
- **GetSnapshotBlock** is charged per block returned. For example, if you make 100,000 GetSnapshotBlock API requests in a Region that charges \$0.003 per 1,000 blocks returned, you will be charged \$0.30 (\$0.003 per 1,000 blocks retruned x 100).
- **PutSnapshotBlock** is charged per block written. For example, if you make 100,000 PutSnapshotBlock API requests in a Region that charges \$0.006 per 1,000 blocks written, you will be charged \$0.60 (\$0.006 per 1,000 blocks written x 100).

Networking costs

Data transfer costs

Data transferred directly between EBS direct APIs and Amazon EC2 instances in the same AWS Region is free when using [non-FIPS endpoints](#). For more information, see [AWS service endpoints](#). If other AWS services are in the path of your data transfer, you will be charged their associated data processing costs. These services include, but are not limited to, PrivateLink endpoints, NAT Gateway and Transit Gateway.

VPC interface endpoints

If you are using EBS direct APIs from Amazon EC2 instances or AWS Lambda functions in private subnets, you can use VPC interface endpoints, instead of using NAT gateways, to reduce network data transfer costs. For more information, see [Using interface VPC endpoints with EBS direct APIs \(p. 1477\)](#).

Using interface VPC endpoints with EBS direct APIs

You can establish a private connection between your VPC and EBS direct APIs by creating an *interface VPC endpoint*. Interface endpoints are powered by [AWS PrivateLink](#), a technology that enables you to privately access EBS direct APIs without an internet gateway, NAT device, VPN connection, or AWS Direct Connect connection. Instances in your VPC don't need public IP addresses to communicate with EBS direct APIs. Traffic between your VPC and EBS direct APIs does not leave the Amazon network.

Each interface endpoint is represented by one or more [Elastic Network Interfaces](#) in your subnets.

For more information, see [Interface VPC endpoints \(AWS PrivateLink\)](#) in the *Amazon VPC User Guide*.

Considerations for EBS direct APIs VPC endpoints

Before you set up an interface VPC endpoint for EBS direct APIs, ensure that you review [Interface endpoint properties and limitations](#) in the *Amazon VPC User Guide*.

VPC endpoint policies are not supported for EBS direct APIs. By default, full access to EBS direct APIs is allowed through the endpoint. However, you can control access to the interface endpoint using security groups. For more information, see [Controlling access to services with VPC endpoints](#) in the *Amazon VPC User Guide*.

Create an interface VPC endpoint for EBS direct APIs

You can create a VPC endpoint for EBS direct APIs using either the Amazon VPC console or the AWS Command Line Interface (AWS CLI). For more information, see [Creating an interface endpoint](#) in the *Amazon VPC User Guide*.

Create a VPC endpoint for EBS direct APIs using the following service name:

- com.amazonaws.*region*.ebs

If you enable private DNS for the endpoint, you can make API requests to EBS direct APIs using its default DNS name for the Region, for example, ebs.us-east-1.amazonaws.com. For more information, see [Accessing a service through an interface endpoint](#) in the *Amazon VPC User Guide*.

Log API Calls for EBS direct APIs with AWS CloudTrail

The EBS direct APIs service is integrated with AWS CloudTrail. CloudTrail is a service that provides a record of actions taken by a user, role, or an AWS service. CloudTrail captures all API calls performed in EBS direct APIs as events. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon Simple Storage Service (Amazon S3) bucket. If you don't configure a trail, you can still view the most recent management events in the CloudTrail console in [Event history](#). Data events are not captured in Event history. You can use the information collected by CloudTrail to determine the request that was made to EBS direct APIs, the IP address from which the request was made, who made the request, when it was made, and additional details.

For more information about CloudTrail, see the [AWS CloudTrail User Guide](#).

EBS direct APIs Information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When supported event activity occurs in EBS direct APIs, that activity is recorded in a CloudTrail event along with other AWS service events in [Event history](#). You can view, search, and download recent events in your AWS account. For more information, see [Viewing Events with CloudTrail Event History](#).

For an ongoing record of events in your AWS account, including events for EBS direct APIs, create a trail. A *trail* enables CloudTrail to deliver log files to an S3 bucket. By default, when you create a trail in the console, the trail applies to all AWS Regions. The trail logs events from all Regions in the AWS partition and delivers the log files to the S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see the following:

- [Overview for Creating a Trail](#)
- [CloudTrail Supported Services and Integrations](#)
- [Configuring Amazon SNS Notifications for CloudTrail](#)
- [Receiving CloudTrail Log Files from Multiple Regions](#) and [Receiving CloudTrail Log Files from Multiple Accounts](#)

Supported API actions

For EBS direct APIs, you can use CloudTrail to log two types of events:

- **Management events** — Management events provide visibility into management operations that are performed on snapshots in your AWS account. The following API actions are logged by default as management events in trails:
 - [StartSnapshot](#)
 - [CompleteSnapshot](#)

For more information about logging management events, see [Logging management events for trails](#) in the *CloudTrail User Guide*.

- **Data events** — These events provide visibility into the snapshot operations performed on or within a snapshot. The following API actions can optionally be logged as data events in trails:
 - [ListSnapshotBlocks](#)
 - [ListChangedBlocks](#)
 - [GetSnapshotBlock](#)
 - [PutSnapshotBlock](#)

Data events are not logged by default when you create a trail. You can use only *advanced event selectors* to record data events on EBS direct API calls. For more information, see [Logging data events for trails](#) in the *CloudTrail User Guide*.

Note

If you perform an action on a snapshot that is shared with you, data events are not sent to the AWS account that owns the snapshot.

Identity information

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root or AWS Identity and Access Management (IAM) user credentials.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another AWS service.

For more information, see the [CloudTrail userIdentityElement](#).

Understand EBS direct APIs Log File Entries

A trail is a configuration that enables delivery of events as log files to an S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. CloudTrail log files aren't an ordered stack trace of the public API calls, so they don't appear in any specific order.

The following are example CloudTrail log entries.

StartSnapshot

Frequently asked questions

Can a snapshot be accessed using the EBS direct APIs if it has a pending status?

No. The snapshot can be accessed only if it has a completed status.

Are the block indexes returned by the EBS direct APIs in numerical order?

Yes. The block indexes returned are unique, and in numerical order.

Can I submit a request with a MaxResults parameter value of under 100?

No. The minimum MaxResult parameter value you can use is 100. If you submit a request with a MaxResult parameter value of under 100, and there are more than 100 blocks in the snapshot, then the API will return at least 100 results.

Can I run API requests concurrently?

You can run API requests concurrently. Be sure to take note of other workloads that might be running in the account to avoid bottlenecks. You should also build retry mechanisms into your EBS direct APIs workflows to handle throttling, timeouts, and service unavailability. For more information, see [Optimize performance \(p. 1476\)](#).

Review the EBS direct APIs service quotas to determine the API requests that you can run per second. For more information, see [Amazon Elastic Block Store Endpoints and Quotas](#) in the [AWS General Reference](#).

When running the ListChangedBlocks action, is it possible to get an empty response even though there are blocks in the snapshot?

Yes. If the changed blocks are scarce in the snapshot, the response may be empty but the API will return a next page token value. Use the next page token value to continue to the next page of results. You can confirm that you have reached the last page of results when the API returns a next page token value of null.

If the NextToken parameter is specified together with a StartingBlockIndex parameter, which of the two is used?

The NextToken is used, and the StartingBlockIndex is ignored.

How long are the block tokens and next tokens valid?

Block tokens are valid for seven days, and next tokens are valid for 60 minutes.

Are encrypted snapshots supported?

Yes. Encrypted snapshots can be accessed using the EBS direct APIs.

To access an encrypted snapshot, the user must have access to the KMS key used to encrypt the snapshot, and the AWS KMS decrypt action. See the [IAM permissions for EBS direct APIs \(p. 1459\)](#) section earlier in this guide for the AWS KMS policy to assign to a user.

Are public snapshots supported?

Public snapshots are not supported.

Does list snapshot block return all block indexes and block tokens in a snapshot, or only those that have data written to them?

It returns only block indexes and tokens that have data written to them.

Can I get a history of the API calls made by the EBS direct APIs on my account for security analysis and operational troubleshooting purposes?

Yes. To receive a history of EBS direct APIs API calls made on your account, turn on AWS CloudTrail in the AWS Management Console. For more information, see [Log API Calls for EBS direct APIs with AWS CloudTrail \(p. 1478\)](#).

Automate the snapshot lifecycle

You can use Amazon Data Lifecycle Manager to automate the creation, retention, and deletion of snapshots that you use to back up your Amazon EBS volumes.

For more information, see [Amazon Data Lifecycle Manager \(p. 1485\)](#).

Amazon Data Lifecycle Manager

You can use Amazon Data Lifecycle Manager to automate the creation, retention, and deletion of EBS snapshots and EBS-backed AMIs. When you automate snapshot and AMI management, it helps you to:

- Protect valuable data by enforcing a regular backup schedule.
- Create standardized AMIs that can be refreshed at regular intervals.
- Retain backups as required by auditors or internal compliance.
- Reduce storage costs by deleting outdated backups.
- Create disaster recovery backup policies that back up data to isolated accounts.

When combined with the monitoring features of Amazon CloudWatch Events and AWS CloudTrail, Amazon Data Lifecycle Manager provides a complete backup solution for Amazon EC2 instances and individual EBS volumes at no additional cost.

Important

Amazon Data Lifecycle Manager cannot be used to manage snapshots or AMIs that are created by any other means.

Amazon Data Lifecycle Manager cannot be used to automate the creation, retention, and deletion of instance store-backed AMIs.

How Amazon Data Lifecycle Manager works

The following are the key elements of Amazon Data Lifecycle Manager.

Elements

- [Snapshots \(p. 1485\)](#)
- [EBS-backed AMIs \(p. 1486\)](#)
- [Target resource tags \(p. 1486\)](#)
- [Amazon Data Lifecycle Manager tags \(p. 1486\)](#)
- [Lifecycle policies \(p. 1486\)](#)
- [Policy schedules \(p. 1487\)](#)

Snapshots

Snapshots are the primary means to back up data from your EBS volumes. To save storage costs, successive snapshots are incremental, containing only the volume data that changed since the previous snapshot. When you delete one snapshot in a series of snapshots for a volume, only the data that's unique to that snapshot is removed. The rest of the captured history of the volume is preserved.

For more information, see [Amazon EBS snapshots \(p. 1403\)](#).

EBS-backed AMIs

An Amazon Machine Image (AMI) provides the information that's required to launch an instance. You can launch multiple instances from a single AMI when you need multiple instances with the same configuration. Amazon Data Lifecycle Manager supports EBS-backed AMIs only. EBS-backed AMIs include a snapshot for each EBS volume that's attached to the source instance.

For more information, see [Amazon Machine Images \(AMI\) \(p. 103\)](#).

Target resource tags

Amazon Data Lifecycle Manager uses resource tags to identify the resources to back up. Tags are customizable metadata that you can assign to your AWS resources (including Amazon EC2 instances, EBS volumes and snapshots). An Amazon Data Lifecycle Manager policy (described later) targets an instance or volume for backup using a single tag. Multiple tags can be assigned to an instance or volume if you want to run multiple policies on it.

You can't use a '\' or '=' character in a tag key.

For more information, see [Tag your Amazon EC2 resources \(p. 1692\)](#).

Amazon Data Lifecycle Manager tags

Amazon Data Lifecycle Manager applies the following tags to all snapshots and AMIs created by a policy, to distinguish them from snapshots and AMIs created by any other means:

- `aws:dlm:lifecycle-policy-id`
- `aws:dlm:lifecycle-schedule-name`
- `aws:dlm:expirationTime` — For policies with age-based retention schedules only.
- `dlm:managed`

You can also specify custom tags to be applied to snapshots and AMIs on creation. You can't use a '\' or '=' character in a tag key.

The target tags that Amazon Data Lifecycle Manager uses to associate volumes with a snapshot policy can optionally be applied to snapshots created by the policy. Similarly, the target tags that are used to associate instances with an AMI policy can optionally be applied to AMIs created by the policy.

Lifecycle policies

A lifecycle policy consists of these core settings:

- **Policy type**—Defines the type of resources that the policy can manage. Amazon Data Lifecycle Manager supports the following types of lifecycle policies:
 - Snapshot lifecycle policy—Used to automate the lifecycle of EBS snapshots. These policies can target individual EBS volumes or all EBS volumes attached to an instance.
 - EBS-backed AMI lifecycle policy—Used to automate the lifecycle of EBS-backed AMIs and their backing snapshots. These policies can target instances only.
 - Cross-account copy event policy—Used to automate snapshot copies across accounts. Use this policy type in conjunction with an EBS snapshot policy that shares snapshots across accounts.
- **Resource type**—Defines the type of resources that are targeted by the policy. Snapshot lifecycle policies can target instances or volumes. Use `VOLUME` to create snapshots of individual volumes, or use `INSTANCE` to create multi-volume snapshots of all of the volumes that are attached to an instance. For more information, see [Multi-volume snapshots \(p. 1408\)](#). AMI lifecycle policies can target instances

only. One AMI is created that includes snapshots of all of the volumes that are attached to the target instance.

- **Target tags**—Specifies the tags that must be assigned to an EBS volume or an Amazon EC2 instance for it to be targeted by the policy.
- **Schedules**—The start times and intervals for creating snapshots or AMIs. The first snapshot or AMI creation operation starts within one hour after the specified start time. Subsequent snapshot or AMI creation operations start within one hour of their scheduled time. A policy can have up to four schedules: one mandatory schedule, and up to three optional schedules. For more information, see [Policy schedules \(p. 1487\)](#).
- **Retention**—Specifies how snapshots or AMIs are to be retained. You can retain snapshots or AMIs based either on their total count (count-based), or their age (age-based). For snapshot policies, when the retention threshold is reached, the oldest snapshot is deleted. For AMI policies, when the retention threshold is reached, the oldest AMI is deregistered and its backing snapshots are deleted.

For example, you could create a policy with settings similar to the following:

- Manages all EBS volumes that have a tag with a key of `account` and a value of `finance`.
- Creates snapshots every 24 hours at 0900 UTC.
- Retains only the five most recent snapshots.
- Starts snapshot creation no later than 0959 UTC each day.

Policy schedules

Policy schedules define when snapshots or AMIs are created by the policy. Policies can have up to four schedules—one mandatory schedule, and up to three optional schedules.

Adding multiple schedules to a single policy lets you create snapshots or AMIs at different frequencies using the same policy. For example, you can create a single policy that creates daily, weekly, monthly, and yearly snapshots. This eliminates the need to manage multiple policies.

For each schedule, you can define the frequency, fast snapshot restore settings (snapshot lifecycle policies only), cross-Region copy rules, and tags. The tags that are assigned to a schedule are automatically assigned to the snapshots or AMIs that are created when the schedule is initiated. In addition, Amazon Data Lifecycle Manager automatically assigns a system-generated tag based on the schedule's frequency to each snapshot or AMI.

Each schedule is initiated individually based on its frequency. If multiple schedules are initiated at the same time, Amazon Data Lifecycle Manager creates only one snapshot or AMI and applies the retention settings of the schedule that has the highest retention period. The tags of all of the initiated schedules are applied to the snapshot or AMI.

- (Snapshot lifecycle policies only) If more than one of the initiated schedules is enabled for fast snapshot restore, then the snapshot is enabled for fast snapshot restore in all of the Availability Zones specified across all of the initiated schedules. The highest retention settings of the initiated schedules is used for each Availability Zone.
- If more than one of the initiated schedules is enabled for cross-Region copy, the snapshot or AMI is copied to all Regions specified across all of the initiated schedules. The highest retention period of the initiated schedules is applied.

Considerations for Amazon Data Lifecycle Manager

Your AWS account has the following quotas related to Amazon Data Lifecycle Manager:

- You can create up to 100 lifecycle policies per Region.

- You can add up to 45 tags per resource.

The following considerations apply to lifecycle policies:

- A policy does not begin creating snapshots or AMIs until you set its activation status to *enabled*. You can configure a policy to be enabled upon creation.
- The first snapshot or AMI creation operation starts within one hour after the specified start time. Subsequent snapshot or AMI creation operations start within one hour of their scheduled time.
- If you modify a policy by removing or changing its target tags, the EBS volumes or instances with those tags are no longer managed by the policy.
- If you modify a schedule name for a policy, the snapshots or AMIs created under the old schedule name are no longer affected by the policy.
- If you modify a time-based retention schedule to use a new time interval, the new interval is used only for new snapshots or AMIs created after the change. The new schedule does not affect the retention schedule of snapshots or AMIs created before the change.
- You cannot change the retention schedule of a policy from count-based to time-based after creation. To make this change, you must create a new policy.
- If you disable a policy with an age-based retention schedule, the snapshots or AMIs that are set to expire while the policy is disabled are retained indefinitely. You must delete the snapshots or deregister the AMIs manually. When you enable the policy again, Amazon Data Lifecycle Manager resumes deleting snapshots or deregistering AMIs as their retention periods expire.
- If you delete the resource to which a policy with count-based retention applies, the policy no longer manages the previously created snapshots or AMIs. You must manually delete the snapshots or deregister the AMIs if they are no longer needed.
- If you delete the resource to which a policy with age-based retention applies, the policy continues to delete snapshots or deregister AMIs on the defined schedule, up to, but not including, the last snapshot or AMI. You must manually delete the last snapshot or deregister the last AMI if it is no longer needed.
- You can create multiple policies to back up an EBS volume or an Amazon EC2 instance. For example, if an EBS volume has two tags, where tag *A* is the target for policy *A* to create a snapshot every 12 hours, and tag *B* is the target for policy *B* to create a snapshot every 24 hours, Amazon Data Lifecycle Manager creates snapshots according to the schedules for both policies. Alternatively, you can achieve the same result by creating a single policy that has multiple schedules. For example, you can create a single policy that targets only tag *A*, and specify two schedules—one for every 12 hours and one for every 24 hours.
- If you create a policy that targets instances, and new volumes are attached to the instance after the policy has been created, the newly-added volumes are included in the backup at the next policy run. All volumes attached to the instance at the time of the policy run are included.
- For AMI lifecycle policies, when the AMI retention threshold is reached, the oldest AMI is deregistered and its backing snapshots are deleted.
- If a policy with a custom cron-based schedule and age-based or count-based retention rule is configured to create only one snapshot or AMI, the policy will not automatically delete that snapshot or AMI when the retention threshold is reached. You must manually delete the snapshot or deregister the AMI if it is no longer needed.

The following considerations apply to snapshot lifecycle policies and [fast snapshot restore \(p. 1553\)](#):

- A snapshot that is enabled for fast snapshot restore remains enabled even if you delete or disable the lifecycle policy, disable fast snapshot restore for the lifecycle policy, or disable fast snapshot restore for the Availability Zone. You can disable fast snapshot restore for these snapshots manually.
- If you enable fast snapshot restore and you exceed the maximum number of snapshots that can be enabled for fast snapshot restore, Amazon Data Lifecycle Manager creates snapshots as scheduled

but does not enable them for fast snapshot restore. After a snapshot that is enabled for fast snapshot restore is deleted, the next snapshot that Amazon Data Lifecycle Manager creates is enabled for fast snapshot restore.

- When you enable fast snapshot restore for a snapshot, it takes 60 minutes per TiB to optimize the snapshot. We recommend that you create a schedule that ensures that each snapshot is fully optimized before Amazon Data Lifecycle Manager creates the next snapshot.
- You are billed for each minute that fast snapshot restore is enabled for a snapshot in a particular Availability Zone. Charges are pro-rated with a minimum of one hour. For more information, see [Pricing and Billing \(p. 1558\)](#).

Note

Depending on the configuration of your lifecycle policies, you could have multiple snapshots enabled for fast snapshot restore simultaneously.

The following considerations apply to snapshot lifecycle policies and [Multi-Attach \(p. 1377\)](#) enabled volumes:

- When creating a lifecycle policy based on instance tags for Multi-Volume snapshots, Amazon Data Lifecycle Manager initiates a snapshot of the volume for each attached instance. Use the *timestamp* tag to identify the set of time-consistent snapshots that are created from the attached instances.

The following considerations apply to sharing snapshots across accounts:

- You can only share snapshots that are unencrypted or that are encrypted using a customer managed key.
- You can't share snapshots that are encrypted with the default EBS encryption KMS key.
- If you share encrypted snapshots, then you must also share the KMS key that was used to encrypt the source volume with the target accounts. For more information, see [Allowing users in other accounts to use a KMS key](#) in the *AWS Key Management Service Developer Guide*.

The following considerations apply to cross-account copy event policies:

- You can only copy snapshots that are unencrypted or that are encrypted using a customer managed key.
- You can create a cross-account copy event policy that copies snapshots that are shared outside of Amazon Data Lifecycle Manager.
- If you want to encrypt snapshots in the target account, then the IAM role selected for the cross-account copy event policy must have permission to use the required KMS key.

The following considerations apply to EBS-backed AMI policies and AMI deprecation:

- If you increase the AMI deprecation count for a schedule with count-based retention, the change is applied to all AMIs (existing and new) created by the schedule.
- If you increase the AMI deprecation period for a schedule with age-based retention, the change is applied to new AMIs only. Existing AMIs are not affected.
- If you remove the AMI deprecation rule from a schedule, Amazon Data Lifecycle Manager will not cancel deprecation for AMIs that were previously deprecated by that schedule.
- If you decrease the AMI deprecation count or period for a schedule, Amazon Data Lifecycle Manager will not cancel deprecation for AMIs that were previously deprecated by that schedule.
- If you manually deprecate an AMI that was created by an AMI policy, Amazon Data Lifecycle Manager will not override the deprecation.
- If you manually cancel deprecation for an AMI that was previously deprecated by an AMI policy, Amazon Data Lifecycle Manager will not override the cancellation.

- If an AMI is created by multiple conflicting schedules, and one or more of those schedules do not have an AMI deprecation rule, Amazon Data Lifecycle Manager will not deprecate that AMI.
- If an AMI is created by multiple conflicting schedules, and all of those schedules have an AMI deprecation rule, Amazon Data Lifecycle Manager will use the deprecation rule with the latest deprecation date.

The following considerations apply to snapshots policies and snapshot archiving:

- If you manually archive a snapshot that was created by a policy, and that snapshot is in the archive tier when the policy's retention threshold is reached, Amazon Data Lifecycle Manager will not delete the snapshot. Amazon Data Lifecycle Manager does not manage snapshots while they are stored in the archive tier. If you no longer need snapshots that are stored in the archive tier, you must manually delete them.

The following considerations apply to snapshot policies and Recycle Bin:

- If Amazon Data Lifecycle Manager deletes a snapshot and sends it to the Recycle Bin when the policy's retention threshold is reached, and you manually restore the snapshot from the Recycle Bin, you must manually delete that snapshot when it is no longer needed. Amazon Data Lifecycle Manager will not automatically delete the snapshot.
- If you manually delete a snapshot that was created by a policy, and that snapshot is in the Recycle Bin when the policy's retention threshold is reached, Amazon Data Lifecycle Manager will not delete the snapshot. Amazon Data Lifecycle Manager does not manage the snapshots while they are stored in the Recycle Bin.

If the snapshot is restored from the Recycle Bin before the policy's retention threshold is reached, Amazon Data Lifecycle Manager will delete the snapshot when the policy's retention threshold is reached.

If the snapshot is restored from the Recycle Bin after the policy's retention threshold is reached, Amazon Data Lifecycle Manager will no longer delete the snapshot. You must manually delete the snapshot when it is no longer needed.

Automate snapshot lifecycles

The following procedure shows you how to use Amazon Data Lifecycle Manager to automate Amazon EBS snapshot lifecycles.

Use one of the following procedures to create a snapshot lifecycle policy.

New console

To create a snapshot policy

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic Block Store, Lifecycle Manager**, and then choose **Create lifecycle policy**.
3. On the **Select policy type** screen, choose **EBS snapshot policy** and then choose **Next**.
4. In the **Target resources** section, do the following:
 - a. For **Target resource types**, choose the type of resource to back up. Choose **Volume** to create snapshots of individual volumes, or choose **Instance** to create multi-volume snapshots from the volumes attached to an instance.
 - b. (For AWS Outpost customers only) For **Target resource location**, specify where the source resources are located.

- If the source resources are located in an AWS Region, choose **AWS Region**. Amazon Data Lifecycle Manager backs up all resources of the specified type that have matching target tags in the current Region only. If the resource is located in a Region, snapshots created by the policy will be stored in the same Region.
 - If the source resources are located on an Outpost in your account, choose **AWS Outpost**. Amazon Data Lifecycle Manager backs up all resources of the specified type that have matching target tags across all of the Outposts in your account. If the resource is located on an Outpost, snapshots created by the policy can be stored in the same Region or on the same Outpost as the resource.
 - If you do not have any Outposts in your account, this option is hidden and AWS Region is selected for you.
- c. For **Target resource tags**, choose the resource tags that identify the volumes or instances to back up. Only resources that have the specified tag key and value pairs are backed up by the policy.
 5. For **Description**, enter a brief description for the policy.
 6. For **IAM role**, choose the IAM role that has permissions to manage snapshots and to describe volumes and instances. To use the default role provided by Amazon Data Lifecycle Manager, choose **Default role**. Alternatively, to use a custom IAM role that you previously created, choose **Choose another role** and then select the role to use.
 7. For **Policy tags**, add the tags to apply to the lifecycle policy. You can use these tags to identify and categorize your policies.
 8. For **Policy status after creation**, choose **Enable policy** to start the policy runs at the next scheduled time, or **Disable policy** to prevent the policy from running. If you do not enable the policy now, it will not start creating snapshots until you manually enable it after creation.
 9. Choose **Next**.
 10. On the **Configure schedule** screen, configure the policy schedules. A policy can have up to 4 schedules. Schedule 1 is mandatory. Schedules 2, 3, and 4 are optional. For each policy schedule that you add, do the following:
 - a. In the **Schedule details** section do the following:
 - i. For **Schedule name**, specify a descriptive name for the schedule.
 - ii. For **Frequency** and the related fields, configure the interval between policy runs. You can configure policy runs on a daily, weekly, monthly, or yearly schedule. Alternatively, choose **Custom cron expression** to specify an interval of up to one year. For more information, see [Cron expressions](#) in the *Amazon CloudWatch Events User Guide*.
 - iii. For **Starting at**, specify the time at which the policy runs are scheduled to start. The first policy run starts within an hour after the scheduled time. The time must be entered in the hh:mm UTC format.
 - iv. For **Retention type**, specify the retention policy for snapshots created by the schedule. You can retain snapshots based on either their total count or their age.

For count-based retention, the range is 1 to 1000. After the maximum count is reached, the oldest snapshot is deleted when a new one is created.

For age-based retention, the range is 1 day to 100 years. After the retention period of each snapshot expires, it is deleted.
 - b. (For AWS Outposts customers only) For **Snapshot destination**, specify the destination for snapshots created by the policy.

Note

All schedules must have the same retention type. You can specify the retention type for Schedule 1 only. Schedules 2, 3, and 4 inherit the retention type from Schedule 1. Each schedule can have its own retention count or period.

- v. (For AWS Outposts customers only) For **Snapshot destination**, specify the destination for snapshots created by the policy.

- If the policy targets resources in a Region, snapshots must be created in the same Region. AWS Region is selected for you.
- If the policy targets resources on an Outpost, you can choose to create snapshots on the same Outpost as the source resource, or in the Region that is associated with the Outpost.
- If you do not have any Outposts in your account, this option is hidden and AWS Region is selected for you.

- b. In the **Tagging** section, do the following:
 - i. To copy all of the user-defined tags from the source volume to the snapshots created by the schedule, select **Copy tags from source**.
 - ii. To specify additional tags to assign to snapshots created by this schedule, choose **Add tags**.
- c. To enable fast snapshot restore for snapshots created by the schedule, in the **Fast snapshot restore** section, select **Enable fast snapshot restore**. If you enable fast snapshot restore, you must choose the Availability Zones in which to enable it. If the schedule uses an age-based retention schedule, you must specify the period for which to enable fast snapshot restore for each snapshot. If the schedule uses count-based retention, you must specify the maximum number of snapshots to enable for fast snapshot restore.

If the schedule creates snapshots on an Outpost, you can't enable fast snapshot restore. Fast snapshot restore is not supported with local snapshots that are stored on an Outpost.

Note

You are billed for each minute that fast snapshot restore is enabled for a snapshot in a particular Availability Zone. Charges are pro-rated with a minimum of one hour.

- d. To copy snapshots created by the schedule to an Outpost or to a different Region, in the **Cross-Region copy** section, select **Enable cross-Region copy**.

If the schedule creates snapshots in a Region, you can copy the snapshots to up to three additional Regions or Outposts in your account. You must specify a separate cross-Region copy rule for each destination Region or Outpost.

For each Region or Outpost, you can choose different retention policies and you can choose whether to copy all tags or no tags. If the source snapshot is encrypted, or if encryption by default is enabled, the copied snapshots are encrypted. If the source snapshot is unencrypted, you can enable encryption. If you do not specify a KMS key, the snapshots are encrypted using the default KMS key for EBS encryption in each destination Region. If you specify a KMS key for the destination Region, then the selected IAM role must have access to the KMS key.

Note

You must ensure that you do not exceed the number of concurrent snapshot copies per Region.

If the policy creates snapshots on an Outpost, then you can't copy the snapshots to a Region or to another Outpost and the cross-Region copy settings are not available.

- e. In the **Cross-account sharing**, configure the policy to automatically share the snapshots created by the schedule with other AWS accounts. Do the following:
 - i. To enable sharing with other AWS accounts, select **Enable cross-account sharing**.
 - ii. To add the accounts with which to share the snapshots, choose **Add account**, enter the 12-digit AWS account ID, and choose **Add**.

- iii. To automatically unshare shared snapshots after a specific period, select **Unshare automatically**. If you choose to automatically unshare shared snapshots, the period after which to automatically unshare the snapshots cannot be longer than the period for which the policy retains its snapshots. For example, if the policy's retention configuration retains snapshots for a period of 5 days, you can configure the policy to automatically unshare shared snapshots after periods up to 4 days. This applies to policies with age-based and count-based snapshot retention configurations.

If you do not enable automatic unsharing, the snapshot is shared until it is deleted.

Note

You can only share snapshots that are unencrypted or that are encrypted using a customer managed key. You can't share snapshots that are encrypted with the default EBS encryption KMS key. If you share encrypted snapshots, then you must also share the KMS key that was used to encrypt the source volume with the target accounts. For more information, see [Allowing users in other accounts to use a KMS key](#) in the *AWS Key Management Service Developer Guide*.

- f. To add additional schedules, choose **Add another schedule**, which is located at the top of the screen. For each additional schedule, complete the fields as described previously in this topic.
 - g. After you have added the required schedules, choose **Review policy**.
11. Review the policy summary, and then choose **Create policy**.

Old console

To create a snapshot policy

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic Block Store, Lifecycle Manager**, and then choose **Create lifecycle policy**.
3. Provide the following information for your policy as needed:
 - **Description**—A description of the policy.
 - **Policy type**—The type of policy to create. Choose **EBS snapshot policy**.
 - **Resource type**—The type of resource to back up. Choose **Volume** to create snapshots of individual volumes, or choose **Instance** to create multi-volume snapshots from the volumes attached to an instance.
 - **Resource location**—The location of the resources to backup. If the source resources are located in an AWS Region, choose **AWS Region**. If the source resources are located on an Outpost in your account, choose **AWS Outpost**. If you choose AWS Outpost, Amazon Data Lifecycle Manager backs up all resources of the specified type that have matching target tags across all of the Outposts in your account.

If you do not have any Outposts in your account, then **AWS Region** is selected by default.

Note

If the resource is located in a Region, snapshots created by the policy will be stored in the same Region. If the resource is located on an Outpost, snapshots created by the policy can be stored in the same Region or on the same Outpost as the resource.

- **Target with these tags**—The resource tags that identify the volumes or instances to back up. Only resources that have the specified tag key and value pairs are backed up by the policy.
- **Policy tags**—The tags to apply to the lifecycle policy.

4. For **IAM role**, choose the IAM role that has permissions to create, delete, and describe snapshots and to describe volumes and instances. AWS provides a default role, or you can create a custom IAM role.
5. Add the policy schedules. Schedule 1 is mandatory. Schedules 2, 3, and 4 are optional. For each policy schedule that you add, specify the following information:
 - **Schedule name**—A name for the schedule.
 - **Frequency**—The interval between policy runs. You can configure policy runs on a daily, weekly, monthly, or yearly schedule. Alternatively, choose **Custom cron expression** to specify an interval of up to one year. For more information, see [Cron expressions in the Amazon CloudWatch Events User Guide](#).
 - **Starting at hh:mm UTC**—The time at which the policy runs are scheduled to start. The first policy run starts within an hour after the scheduled time.
 - **Retention type**—You can retain snapshots based on either their total count or their age. For count-based retention, the range is 1 to 1000. After the maximum count is reached, the oldest snapshot is deleted when a new one is created. For age-based retention, the range is 1 day to 100 years. After the retention period of each snapshot expires, it is deleted. The retention period should be greater than or equal to the interval.

Note

All schedules must have the same retention type. You can specify the retention type for Schedule 1 only. Schedules 2, 3, and 4 inherit the retention type from Schedule 1. Each schedule can have its own retention count or period.

- **Snapshot destination**—Specifies the destination for snapshots created by the policy. To create snapshots in the same AWS Region as the source resource, choose **AWS Region**. To create snapshots on an Outpost, choose **AWS Outpost**.

If the policy targets resources in a Region, snapshots are created in the same Region, and cannot be created on an Outpost.

If the policy targets resources on an Outpost, snapshots can be created on the same Outpost as the source resource, or in the Region that is associated with the Outpost.

- **Copy tags from source**—Choose whether to copy all of the user-defined tags from the source volume to the snapshots created by the schedule.
- **Variable tags**—If the source resource is an instance, you can choose to automatically tag your snapshots with the following variable tags:
 - **instance-id**—The ID of the source instance.
 - **timestamp**—The date and time of the policy run.
- **Additional tags**—Specify any additional tags to assign to the snapshots created by this schedule.
- **Fast snapshot restore**—Choose whether to enable fast snapshot restore for all snapshots that are created by the schedule. If you enable fast snapshot restore, you must choose the Availability Zones in which to enable it. You are billed for each minute that fast snapshot restore is enabled for a snapshot in a particular Availability Zone. Charges are pro-rated with a minimum of one hour. You can also specify the maximum number of snapshots that can be enabled for fast snapshot restore.

If the policy creates snapshots on an Outpost, you can't enable fast snapshot restore. Fast snapshot restore is not supported with local snapshots that are stored on an Outpost.

- **Cross region copy**—If the policy creates snapshots in a Region, then you can copy the snapshots to up to three additional Regions or Outposts in your account. You must specify a separate cross-Region copy rule for each destination Region or Outpost.

For each Region or Outpost, you can choose different retention policies and you can choose whether to copy all tags or no tags. If the source snapshot is encrypted, or if encryption by

default is enabled, the copied snapshots are encrypted. If the source snapshot is unencrypted, you can enable encryption. If you do not specify a KMS key, the snapshots are encrypted using the default KMS key for EBS encryption in each destination Region. If you specify a KMS key for the destination Region, then the selected IAM role must have access to the KMS key.

You must ensure that you do not exceed the number of concurrent snapshot copies per Region.

If the policy creates snapshots on an Outpost, then you can't copy the snapshots to a Region or to another Outpost and the cross-Region copy settings are not available.

6. For **Policy status after creation**, choose **Enable policy** to start the policy runs at the next scheduled time, or **Disable policy** to prevent the policy from running.
7. Choose **Create Policy**.

Command line

Use the [create-lifecycle-policy](#) command to create a snapshot lifecycle policy. For **PolicyType**, specify **EBS_SNAPSHOT_MANAGEMENT**.

Note

To simplify the syntax, the following examples use a JSON file, `policyDetails.json`, that includes the policy details.

Example 1—Snapshot lifecycle policy

This example creates a snapshot lifecycle policy that creates snapshots of all volumes that have a tag key of `costcenter` with a value of `115`. The policy includes two schedules. The first schedule creates a snapshot every day at 03:00 UTC. The second schedule creates a weekly snapshot every Friday at 17:00 UTC.

```
aws dlm create-lifecycle-policy \
--description "My volume policy" \
--state ENABLED --execution-role-arn
arn:aws:iam::12345678910:role/AWSDataLifecycleManagerDefaultRole \
--policy-details file://policyDetails.json
```

The following is an example of the `policyDetails.json` file.

```
{
    "PolicyType": "EBS_SNAPSHOT_MANAGEMENT",
    "ResourceTypes": [
        "VOLUME"
    ],
    "TargetTags": [
        {
            "Key": "costcenter",
            "Value": "115"
        }
    ],
    "Schedules": [
        {
            "Name": "DailySnapshots",
            "TagsToAdd": [
                {
                    "Key": "type",
                    "Value": "myDailySnapshot"
                }
            ],
            "CreateRule": {
                "Interval": 24,
                "IntervalUnit": "HOURS",
                "Times": [
                    "03:00"
                ]
            }
        }
    ]
}
```

```
        },
        "RetainRule": {
            "Count": 5
        },
        "CopyTags": false
    },
    {
        "Name": "WeeklySnapshots",
        "TagsToAdd": [
            {
                "Key": "type",
                "Value": "myWeeklySnapshot"
            }
        ],
        "CreateRule": {
            "CronExpression": "cron(0 17 ? * FRI *)"
        },
        "RetainRule": {
            "Count": 5
        },
        "CopyTags": false
    }
]}
```

Upon success, the command returns the ID of the newly created policy. The following is example output.

```
{
    "PolicyId": "policy-0123456789abcdef0"
}
```

Example 2—Snapshot lifecycle policy that automates local snapshots of Outpost resources

This example creates a snapshot lifecycle policy that creates snapshots of volumes tagged with `team=dev` across all of your Outposts. The policy creates the snapshots on the same Outposts as the source volumes. The policy creates snapshots every 12 hours starting at 00:00 UTC.

```
aws dlm create-lifecycle-policy \
--description "My local snapshot policy" \
--state ENABLED --execution-role-arn
arn:aws:iam::12345678910:role/AWSDataLifecycleManagerDefaultRole \
--policy-details file://policyDetails.json
```

The following is an example of the `policyDetails.json` file.

```
{
    "PolicyType": "EBS_SNAPSHOT_MANAGEMENT",
    "ResourceTypes": "VOLUME",
    "ResourceLocations": "OUTPOST",
    "TargetTags": [
        {
            "Key": "team",
            "Value": "dev"
        }
    ],
    "Schedules": [
        {
            "Name": "on-site backup",
            "CreateRule": {
                "Interval": 12,
                "IntervalUnit": "HOURS",
                "Times": [
                    "00:00"
                ]
            },
            "Location": [
                "OUTPOST_LOCAL"
            ]
        }
    ]
}
```

```
        ],
        },
        "RetainRule": {
            "Count": 1
        },
        "CopyTags": false
    }
}]}
```

Example 3—Snapshot lifecycle policy that creates snapshots in a Region and copies them to an Outpost

The following example policy creates snapshots of volumes that are tagged with `team=dev`. Snapshots are created in the same Region as the source volume. Snapshots are created every 12 hours starting at 00:00 UTC, and retains a maximum of 1 snapshot. The policy also copies the snapshots to Outpost `arn:aws:outposts:us-east-1:123456789012:outpost/op-1234567890abcdef0`, encrypts the copied snapshots using the default encryption KMS key, and retains the copies for 1 month.

```
aws dlm create-lifecycle-policy \
--description "Copy snapshots to Outpost" \
--state ENABLED --execution-role-arn
arn:aws:iam::12345678910:role/AWSDataLifecycleManagerDefaultRole \
--policy-details file://policyDetails.json
```

The following is an example of the `policyDetails.json` file.

```
{
    "PolicyType": "EBS_SNAPSHOT_MANAGEMENT",
    "ResourceTypes": "VOLUME",
    "ResourceLocations": "CLOUD",
    "TargetTags": [
        {
            "Key": "team",
            "Value": "dev"
        }
    ],
    "Schedules": [
        {
            "Name": "on-site backup",
            "CopyTags": false,
            "CreateRule": {
                "Interval": 12,
                "IntervalUnit": "HOURS",
                "Times": [
                    "00:00"
                ],
                "Location": "CLOUD"
            },
            "RetainRule": {
                "Count": 1
            },
            "CrossRegionCopyRules" : [
                {
                    "Target": "arn:aws:outposts:us-east-1:123456789012:outpost/
op-1234567890abcdef0",
                    "Encrypted": true,
                    "CopyTags": true,
                    "RetainRule": {
                        "Interval": 1,
                        "IntervalUnit": "MONTHS"
                    }
                }
            ]
        }
    ]
}
```

Automate AMI lifecycles

The following procedure shows you how to use Amazon Data Lifecycle Manager to automate EBS-backed AMI lifecycles.

Use one of the following procedures to create an AMI lifecycle policy.

New console

To create an AMI policy

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic Block Store, Lifecycle Manager**, and then choose **Create lifecycle policy**.
3. On the **Select policy type** screen, choose **EBS-backed AMI policy**, and then choose **Next**.
4. In the **Target resources** section, for **Target resource tags**, choose the resource tags that identify the volumes or instances to back up. The policy backs up only the resources that have the specified tag key and value pairs.
5. For **Description**, enter a brief description for the policy.
6. For **IAM role**, choose the IAM role that has permissions to manage AMIs and snapshot and to describe instances. To use the default role provided by Amazon Data Lifecycle Manager, choose **Default role**. Alternatively, to use a custom IAM role that you previously created, choose **Choose another role**, and then select the role to use.
7. For **Policy tags**, add the tags to apply to the lifecycle policy. You can use these tags to identify and categorize your policies.
8. For **Policy status after creation**, choose **Enable policy** to start running the policy at the next scheduled time, or **Disable policy** to prevent the policy from running. If you do not enable the policy now, it will not start creating AMIs until you manually enable it after creation.
9. In the **Instance reboot** section, indicate whether instances should be rebooted before AMI creation. To prevent the targeted instances from being rebooted, choose **No**. Choosing **No** could cause data consistency issues. To reboot instances before AMI creation, choose **Yes**. Choosing this ensures data consistency, but could result in multiple targeted instances rebooting simultaneously.
10. Choose **Next**.
11. On the **Configure schedule** screen, configure the policy schedules. A policy can have up to four schedules. Schedule 1 is mandatory. Schedules 2, 3, and 4 are optional. For each policy schedule that you add, do the following:
 - a. In the **Schedule details** section do the following:
 - i. For **Schedule name**, specify a descriptive name for the schedule.
 - ii. For **Frequency** and the related fields, configure the interval between policy runs. You can configure policy runs on a daily, weekly, monthly, or yearly schedule. Alternatively, choose **Custom cron expression** to specify an interval of up to one year. For more information, see [Cron expressions](#) in the *Amazon CloudWatch Events User Guide*.
 - iii. For **Starting at**, specify the time to start the policy runs. The first policy run starts within an hour after the time that you schedule. You must enter the time in the `hh:mm` UTC format.
 - iv. For **Retention type**, specify the retention policy for AMIs created by the schedule. You can retain AMIs based on either their total count or their age.

For count-based retention, the range is 1 to 1000. After the maximum count is reached, the oldest AMI is deregistered when a new one is created.

For age-based retention, the range is 1 day to 100 years. After the retention period of each AMI expires, it is deregistered.

Note

All schedules must have the same retention type. You can specify the retention type for Schedule 1 only. Schedules 2, 3, and 4 inherit the retention type from Schedule 1. Each schedule can have its own retention count or period.

- b. In the **Tagging** section, do the following:
 - i. To copy all of the user-defined tags from the source instance to the AMIs created by the schedule, select **Copy tags from source**.
 - ii. By default, AMIs created by the schedule are automatically tagged with the ID of the source instance. To prevent this automatic tagging from happening, for **Variable tags**, remove the `instance-id:$(instance-id)` tile.
 - iii. To specify additional tags to assign to AMIs created by this schedule, choose **Add tags**.
- c. To deprecate AMIs when they should no longer be used, in the **AMI deprecation** section, select **Enable AMI deprecation for this schedule** and then specify the AMI deprecation rule. The AMI deprecation rule specifies when AMIs are to be deprecated.

If the schedule uses count-based AMI retention, you must specify the number of oldest AMIs to deprecate. The deprecation count must be less than or equal to the schedule's AMI retention count, and it can't be greater than 1000. For example, if the schedule is configured to retain a maximum of 5 AMIs, then you can configure the scheduled to deprecate up to old 5 oldest AMIs.

If the schedule uses age-based AMI retention, you must specify the period after which AMIs are to be deprecated. The deprecation count must be less than or equal to the schedule's AMI retention period, and it can't be greater than 10 years (120 months, 520 weeks, or 3650 days). For example, if the schedule is configured to retain AMIs for 10 days, then you can configure the scheduled to deprecate AMIs after periods up to 10 days after creation.

- d. To copy AMIs created by the schedule to different Regions, in the **Cross-Region copy** section, select **Enable cross-Region copy**. You can copy AMIs to up to three additional Regions in your account. You must specify a separate cross-Region copy rule for each destination Region.

For each destination Region, you can specify the following:

- A retention policy for the AMI copy. When the retention period expires, the copy in the destination Region is automatically deregistered.
- Encryption status for the AMI copy. If the source AMI is encrypted, or if encryption by default is enabled, the copied AMIs are always encrypted. If the source AMI is unencrypted and encryption by default is disabled, you can optionally enable encryption. If you do not specify a KMS key, the AMIs are encrypted using the default KMS key for EBS encryption in each destination Region. If you specify a KMS key for the destination Region, then the selected IAM role must have access to the KMS key.
- A deprecation rule for the AMI copy. When the deprecation period expires, the AMI copy is automatically deprecated. The deprecation period must be less than or equal to the copy retention period, and it can't be greater than 10 years.
- Whether to copy all tags or no tags from the source AMI.

Note

Do not exceed the number of concurrent AMI copies per Region.

- e. To add additional schedules, choose **Add another schedule**, which is located at the top of the screen. For each additional schedule, complete the fields as described previously in this topic.
 - f. After you have added the required schedules, choose **Review policy**.
12. Review the policy summary, and then choose **Create policy**.

Console

To create an AMI lifecycle policy

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic Block Store, Lifecycle Manager**, and then choose **Create lifecycle policy**.
3. Provide the following information for your policy as needed:
 - **Description**—A description of the policy.
 - **Policy type**—The type of policy to create. Choose **EBS-backed AMI policy**.
 - **Target with these tags**—The resource tags that identify the instances to back up. Only instances that have the specified tag key and value pairs are backed up by the policy.
 - **Policy tags**—The tags to apply to the lifecycle policy.
4. For **IAM role**, choose the IAM role that has permissions to manage images. AWS provides a default roles, or you can create a custom IAM role.
5. Add the policy schedules. Schedule 1 is mandatory. Schedules 2, 3, and 4 are optional. For each policy schedule that you add, specify the following information:
 - **Schedule name**—A name for the schedule.
 - **Frequency**—The interval between policy runs. You can configure policy runs on a daily, weekly, monthly, or yearly schedule. Alternatively, choose **Custom cron expression** to specify an interval of up to one year. For more information, see [Cron expressions](#) in the *Amazon CloudWatch Events User Guide*.
 - **Starting at hh:mm UTC**— The time at which the policy runs are scheduled to start. The first policy run starts within an hour after the scheduled time.
 - **Retention type**—You can retain AMIs based on either their total count or their age. For count-based retention, the range is 1 to 1000. After the maximum count is reached, the oldest AMI is deleted when a new one is created. For age-based retention, the range is 1 day to 100 years. After the retention period of each AMI expires, it is deleted. The retention period should be greater than or equal to the interval.

Note

All schedules must have the same retention type. You can specify the retention type for Schedule 1 only. Schedules 2, 3, and 4 inherit the retention type from Schedule 1. Each schedule can have its own retention count or period.

- **Copy tags from source**—Choose whether to copy all of the user-defined tags from the source instance to the AMIs created by the schedule.
- **Dynamic tags**—You can choose to automatically tag your AMIs with the ID of the source instance.
- **Additional tags**—Specify any additional tags to assign to the AMIs created by this schedule.
- **Enable cross Region copy**— You can copy AMIs to up to three additional Regions.

For each Region, you can choose different retention policies and you can choose whether to copy all tags or no tags. If the source AMI is encrypted, or if encryption by default is enabled, the copied AMIs are encrypted. If the AMI is unencrypted, you can enable encryption. If you do not specify a KMS key, the AMIs are encrypted using the default KMS key for EBS encryption

in each destination Region. If you specify a KMS key for the destination Region, then the selected IAM role must have access to the KMS key.

Do not exceed the number of concurrent AMI copies per Region.

6. Indicate whether instances should be rebooted before AMI creation. To prevent the targeted instances from being rebooted, for **Reboot Instance at policy run**, choose **No**. Choosing this option could cause data consistency issues. To reboot instances before AMI creation, for **Reboot Instance at policy run**, choose **Yes**. Choosing this ensures data consistency but could result in multiple targeted instances rebooting simultaneously.
7. For **Policy status after creation**, choose **Enable policy** to start the policy runs at the next scheduled time, or **Disable policy** to prevent the policy from running.
8. Choose **Create Policy**.

Command line

Use the [create-lifecycle-policy](#) command to create an AMI lifecycle policy. For **PolicyType**, specify **IMAGE_MANAGEMENT**.

Note

To simplify the syntax, the following examples use a JSON file, `policyDetails.json`, that includes the policy details.

Example 1: Age-based retention and AMI deprecation

This example creates an AMI lifecycle policy that creates AMIs of all instances that have a tag key of `purpose` with a value of `production` without rebooting the targeted instances. The policy includes one schedule that creates an AMI every day at 01:00 UTC. The policy retains AMIs for 2 days and deprecates them after 1 day. It also copies the tags from the source instance to the AMIs that it creates.

```
aws dlm create-lifecycle-policy \
--description "My AMI policy" \
--state ENABLED --execution-role-arn
arn:aws:iam::12345678910:role/AWSDataLifecycleManagerDefaultRoleForAMIManagement \
--policy-details file://policyDetails.json
```

The following is an example of the `policyDetails.json` file.

```
{
    "PolicyType": "IMAGE_MANAGEMENT",
    "ResourceTypes": [
        "INSTANCE"
    ],
    "TargetTags": [
        {
            "Key": "purpose",
            "Value": "production"
        }
    ],
    "Schedules": [
        {
            "Name": "DailyAMIs",
            "TagsToAdd": [
                {
                    "Key": "type",
                    "Value": "myDailyAMI"
                }
            ],
            "CreateRule": {
                "Interval": 24,
                "IntervalUnit": "HOURS",
                "Times": [
                    "01:00"
                ]
            }
        }
    ]
}
```

```
        "RetainRule": {
            "Interval" : 2,
            "IntervalUnit" : "DAYS"
        },
        "DeprecateRule": {
            "Interval" : 1,
            "IntervalUnit" : "DAYS"
        },
        "CopyTags": true
    }
],
"Parameters" : {
    "NoReboot":true
}
}
```

Upon success, the command returns the ID of the newly created policy. The following is example output.

```
{
    "PolicyId": "policy-9876543210abcdef0"
}
```

Example 2: Count-based retention and AMI deprecation with cross-Region copy

This example creates an AMI lifecycle policy that creates AMIs of all instances that have a tag key of purpose with a value of production and reboots the target instances. The policy includes one schedule that creates an AMI every 6 hours starting at 17:30 UTC. The policy retains 3 AMIs and automatically deprecates the 2 oldest AMIs. It also has a cross-Region copy rule that copies AMIs to us-east-1, retains 2 AMI copies, and automatically deprecates the oldest AMI.

```
aws dlm create-lifecycle-policy \
--description "My AMI policy" \
--state ENABLED \
--execution-role-arn
arn:aws:iam::12345678910:role/AWSDataLifecycleManagerDefaultRoleForAMIManagement \
--policy-details file://policyDetails.json
```

The following is an example of the `policyDetails.json` file.

```
{
    "PolicyType": "IMAGE_MANAGEMENT",
    "ResourceTypes" : [
        "INSTANCE"
    ],
    "TargetTags": [{
        "Key": "purpose",
        "Value": "production"
    }],
    "Parameters" : {
        "NoReboot": true
    },
    "Schedules" : [{
        "Name" : "Schedule1",
        "CopyTags": true,
        "CreateRule" : {
            "Interval": 6,
            "IntervalUnit": "HOURS",
            "Times" : ["17:30"]
        },
        "RetainRule": {
            "Count" : 3
        }
    }]
}
```

```
        },
        "DeprecateRule": {
            "Count" : 2
        },
        "CrossRegionCopyRules": [
            {
                "TargetRegion": "us-east-1",
                "Encrypted": true,
                "RetainRule": {
                    "IntervalUnit": "DAYS",
                    "Interval": 2
                },
                "DeprecateRule": {
                    "IntervalUnit": "DAYS",
                    "Interval": 1
                },
                "CopyTags": true
            }
        ]
    }
}
```

Automate cross-account snapshot copies

Automating cross-account snapshot copies enables you to copy your Amazon EBS snapshots to specific Regions in an isolated account and encrypt those snapshots with an encryption key. This enables you to protect yourself against data loss in the event of your account being compromised.

Automating cross-account snapshot copies involves two accounts:

- **Source account**—The source account is the account that creates and shares the snapshots with the target account. In this account, you must create an EBS snapshot policy that creates snapshots at set intervals and then shares them with other AWS accounts.
- **Target account**—The target account is the account with destination account with which the snapshots are shared, and it is the account that creates copies of the shared snapshots. In this account, you must create a cross-account copy event policy that automatically copies snapshots that are shared with it by one or more specified source accounts.

Topics

- [Create cross-account snapshot copy policies \(p. 1503\)](#)
- [Specify snapshot description filters \(p. 1511\)](#)

Create cross-account snapshot copy policies

To prepare the source and target accounts for cross-account snapshot copying, you need to perform the following steps:

Topics

- [Step 1: Create the EBS snapshot policy \(Source account\) \(p. 1503\)](#)
- [Step 2: Share the customer managed key \(Source account\) \(p. 1504\)](#)
- [Step 3: Create cross-account copy event policy \(Target account\) \(p. 1505\)](#)
- [Step 4: Allow IAM role to use the required KMS keys \(Target account\) \(p. 1508\)](#)

Step 1: Create the EBS snapshot policy (Source account)

In the source account, create an EBS snapshot policy that will create the snapshots and share them with the required target accounts.

When you create the policy, ensure that you enable cross-account sharing and that you specify the target AWS accounts with which to share the snapshots. These are the accounts with which the snapshots are to be shared. If you are sharing encrypted snapshots, then you must give the selected target accounts permission to use the KMS key used to encrypt the source volume. For more information, see [Step 2: Share the customer managed key \(Source account\) \(p. 1504\)](#).

Note

You can only share snapshots that are unencrypted or that are encrypted using a customer managed key. You can't share snapshots that are encrypted with the default EBS encryption KMS key. If you share encrypted snapshots, then you must also share the KMS key that was used to encrypt the source volume with the target accounts. For more information, see [Allowing users in other accounts to use a KMS key](#) in the *AWS Key Management Service Developer Guide*.

For more information about creating an EBS snapshot policy, see [Automate snapshot lifecycles \(p. 1490\)](#).

Use one of the following methods to create the EBS snapshot policy.

Step 2: Share the customer managed key (Source account)

If you are sharing encrypted snapshots, you must grant the IAM role and the target AWS accounts (that you selected in the previous step) permissions to use the customer managed key that was used to encrypt the source volume.

Note

Perform this step only if you are sharing encrypted snapshots. If you are sharing unencrypted snapshots, skip this step.

Console

1. Open the AWS KMS console at <https://console.aws.amazon.com/kms>.
2. To change the AWS Region, use the Region selector in the upper-right corner of the page.
3. In the navigation pane, choose **Customer managed key** and then select the KMS key that you need to share with the target accounts.

Make note of the KMS key ARN, you'll need this later.

4. On the **Key policy** tab, scroll down to the **Key users** section. Choose **Add**, enter the name of the IAM role that you selected in the previous step, and then choose **Add**.
5. On the **Key policy** tab, scroll down to the **Other AWS accounts** section. Choose **Add other AWS accounts**, and then add all of the target AWS accounts that you chose to share the snapshots with in the previous step.
6. Choose **Save changes**.

Command line

Use the `get-key-policy` command to retrieve the key policy that is currently attached to the KMS key.

For example, the following command retrieves the key policy for a KMS key with an ID of `9d5e2b3d-e410-4a27-a958-19e220d83a1e` and writes it to a file named `snapshotKey.json`.

```
$ aws kms get-key-policy \
--policy-name default --key-id 9d5e2b3d-e410-4a27-a958-19e220d83a1e \
--query Policy --output text > snapshotKey.json
```

Open the key policy using your preferred text editor. Add the ARN of the IAM role that you specified when you created the snapshot policy and the ARNs of the target accounts with which to share the KMS key.

For example, in the following policy, we added the ARN of the default IAM role, and the ARN of the root account for target account 222222222222.

```
{  
    "Sid" : "Allow use of the key",  
    "Effect" : "Allow",  
    "Principal" : {  
        "AWS" : [  
            "arn:aws:iam::111111111111:role/service-role/  
AWSDataLifecycleManagerDefaultRole",  
            "arn:aws:iam::222222222222:root"  
        ]  
    },  
    "Action" : [  
        "kms:Encrypt",  
        "kms:Decrypt",  
        "kms:ReEncrypt*",  
        "kms:GenerateDataKey*",  
        "kms:DescribeKey"  
    ],  
    "Resource" : "*"  
},  
{  
    "Sid" : "Allow attachment of persistent resources",  
    "Effect" : "Allow",  
    "Principal" : {  
        "AWS" : [  
            "arn:aws:iam::111111111111:role/service-role/  
AWSDataLifecycleManagerDefaultRole",  
            "arn:aws:iam::222222222222:root"  
        ]  
    },  
    "Action" : [  
        "kms>CreateGrant",  
        "kms>ListGrants",  
        "kms:RevokeGrant"  
    ],  
    "Resource" : "*",  
    "Condition" : {  
        "Bool" : {  
            "kms:GrantIsForAWSResource" : "true"  
        }  
    }  
}
```

Save and close the file. Then use the [put-key-policy](#) command to attach the updated key policy to the KMS key.

```
$ aws kms put-key-policy \  
--policy-name default --key-id 9d5e2b3d-e410-4a27-a958-19e220d83a1e  
--policy file://snapshotKey.json
```

Step 3: Create cross-account copy event policy (*Target account*)

In the target account, you must create a cross-account copy event policy that will automatically copy snapshots that are shared by the required source accounts.

This policy runs in the target account only when one of the specified source accounts shares snapshot with the account.

Use one of the following methods to create the cross-account copy event policy.

New console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic Block Store, Lifecycle Manager**, and then choose **Create lifecycle policy**.
3. On the **Select policy type** screen, choose **Cross-account copy event policy**, and then choose **Next**.
4. For **Policy description**, enter a brief description for the policy.
5. For **Policy tags**, add the tags to apply to the lifecycle policy. You can use these tags to identify and categorize your policies.
6. In the **Event settings** section, define the snapshot sharing event that will cause the policy to run. Do the following:
 - a. For **Sharing accounts**, specify the source AWS accounts from which you want to copy the shared snapshots. Choose **Add account**, enter the 12-digit AWS account ID, and then choose **Add**.
 - b. For **Filter by description**, enter the required snapshot description using a regular expression. Only snapshots that are shared by the specified source accounts and that have descriptions that match the specified filter are copied by the policy. For more information, see [Specify snapshot description filters \(p. 1511\)](#).
7. For **IAM role**, choose the IAM role that has permissions to perform snapshot copy actions. To use the default role provided by Amazon Data Lifecycle Manager, choose **Default role**. Alternatively, to use a custom IAM role that you previously created, choose **Choose another role** and then select the role to use.

If you are copying encrypted snapshots, you must grant the selected IAM role permissions to use the encryption KMS key used to encrypt the source volume. Similarly, if you are encrypting the snapshot in the destination Region using a different KMS key, you must grant the IAM role permission to use the destination KMS key. For more information, see [Step 4: Allow IAM role to use the required KMS keys \(Target account\) \(p. 1508\)](#).

8. In the **Copy action** section, define the snapshot copy actions that the policy should perform when it is activated. The policy can copy snapshots to up to three Regions. You must specify a separate copy rule for each destination Region. For each rule that you add, do the following:
 - a. For **Name**, enter a descriptive name for the copy action.
 - b. For **Target Region**, select the Region to which to copy the snapshots.
 - c. For **Expire**, specify how long to retain the snapshot copies in the target Region after creation.
 - d. To encrypt the snapshot copy, for **Encryption**, select **Enable encryption**. If the source snapshot is encrypted, or if encryption by default is enabled for your account, the snapshot copy is always encrypted, even if you do not enable encryption here. If the source snapshot is unencrypted and encryption by default is not enabled for your account, you can choose to enable or disable encryption. If you enable encryption, but do not specify a KMS key, the snapshots are encrypted using the default encryption KMS key in each destination Region. If you specify a KMS key for the destination Region, you must have access to the KMS key.
9. To add additional snapshot copy actions, choose **Add new Regions**.
10. For **Policy status after creation**, choose **Enable policy** to start the policy runs at the next scheduled time, or **Disable policy** to prevent the policy from running. If you do not enable the policy now, it will not start copying snapshots until you manually enable it after creation.
11. Choose **Create policy**.

Old console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Lifecycle Manager** and then choose **Create Lifecycle Policy**.
3. For **Policy Type**, choose **Cross-account copy event policy**. For **Description**, enter a brief description for the policy.
4. In the **Cross-account copy event settings** section, for **Copy snapshots shared by**, enter the source AWS accounts from which you want to copy the shared snapshots.
5. For **Snapshot description filter**, enter the required snapshot description using a regular expression. Only snapshots that are shared by the specified sources accounts and that have descriptions that match the specified filter are copied by the policy. For more information, see [Specify snapshot description filters \(p. 1511\)](#).
6. For **IAM role**, choose the IAM role that has permissions to perform the snapshot copy action. AWS provides a default role, or you can create a custom IAM role.

If you are copying encrypted snapshots, you must grant the selected IAM role permissions to use the encryption KMS key used to encrypt the source volume. Similarly, if you are encrypting the snapshot in the destination Region using a different KMS key, you must grant the IAM role permission to use the destination KMS key. For more information, see [Step 4: Allow IAM role to use the required KMS keys \(Target account\) \(p. 1508\)](#).

7. In the **Copy settings** section, you can configure the policy to copy snapshots to up to three Regions in the target account. Do the following:
 - a. For **Name**, enter a descriptive name for the copy action.
 - b. For **Target Region**, select the Region to which to copy the snapshots.
 - c. For **Retain copy for**, specify how long to retain the snapshot copies in the target Region after creation.
 - d. For **Encryption**, select **Enable** to encrypt the snapshot copy in the target Region. If the source snapshot is encrypted, or if encryption by default is enabled for your account, the snapshot copy is always encrypted, even if you do not enable encryption here. If the source snapshot is unencrypted and encryption by default is not enabled for your account, you can choose to enable or disable encryption. If you enable encryption, but do not specify a KMS key, the snapshots are encrypted using the default encryption KMS key in each destination Region. If you specify a KMS key for the destination Region, you must have access to the KMS key.
 - e. (Optional) To copy the snapshot to additional Regions, choose **Add additional region**, and then complete the required fields.
8. For **Policy status after creation**, choose **Enable** policy to start the policy runs at the next scheduled time.
9. Choose **Create Policy**.

Command line

Use the [create-lifecycle-policy](#) command to create a policy. To create a cross-account copy event policy, for **PolicyType**, specify **EVENT_BASED_POLICY**.

For example, the following command creates a cross-account copy event policy in target account 222222222222. The policy copies snapshots that are shared by source account 111111111111. The policy copies snapshots to sa-east-1 and eu-west-2. Snapshots copied to sa-east-1 are unencrypted and they are retained for 3 days. Snapshots copied to eu-west-2 are encrypted using KMS key 8af79514-350d-4c52-bac8-8985e84171c7 and they are retained for 1 month. The policy uses the default IAM role.

```
$ aws dlm create-lifecycle-policy \
--description "Copy policy" \
--state ENABLED --execution-role-arn arn:aws:iam::222222222222:role/service-role/
AWSDataLifecycleManagerDefaultRole \
```

```
--policy-details file://policyDetails.json
```

The following shows the contents of the policyDetails.json file.

```
{  
    "PolicyType" : "EVENT_BASED_POLICY",  
    "EventSource" : {  
        "Type" : "MANAGED_CWE",  
        "Parameters": {  
            "EventType" : "shareSnapshot",  
            "SnapshotOwner": ["111111111111"]  
        }  
    },  
    "Actions" : [{  
        "Name" :"Copy Snapshot to Sao Paulo and London",  
        "CrossRegionCopy" : [{  
            "Target" : "sa-east-1",  
            "EncryptionConfiguration" : {  
                "Encrypted" : false  
            },  
            "RetainRule" : {  
                "Interval" : 3,  
                "IntervalUnit" : "DAYS"  
            }  
        },  
        {  
            "Target" : "eu-west-2",  
            "EncryptionConfiguration" : {  
                "Encrypted" : true,  
                "CmkArn" : "arn:aws:kms:eu-west-2:222222222222:key/8af79514-350d-4c52-  
bac8-8985e84171c7"  
            },  
            "RetainRule" : {  
                "Interval" : 1,  
                "IntervalUnit" : "MONTHS"  
            }  
        }]  
    }]
```

Upon success, the command returns the ID of the newly created policy. The following is example output.

```
{  
    "PolicyId": "policy-9876543210abcdef0"  
}
```

Step 4: Allow IAM role to use the required KMS keys (*Target account*)

If you are copying encrypted snapshots, you must grant the IAM role (that you selected in the previous step) permissions to use the customer managed key that was used to encrypt the source volume.

Note

Only perform this step if you are copying encrypted snapshots. If you are copying unencrypted snapshots, skip this step.

Use one of the following methods to add the required policies to the IAM role.

Console

1. Open the IAM console at <https://console.aws.amazon.com/iam/>.

2. In the navigation pane, select **Roles**. Search for and select the IAM role that you selected when you created the cross-account copy event policy in the previous step. If you chose to use the default role, the role is named **AWSDataLifecycleManagerDefaultRole**.
3. Choose **Add inline policy** and then select the **JSON** tab.
4. Replace the existing policy with the following, and specify the ARN of the KMS key that was used to encrypt the source volumes and that was shared with you by the source account in Step 2.

Note

If you are copying from multiple source accounts, then you must specify the corresponding KMS key ARN from each source account.

In the following example, the policy grants the IAM role permission to use KMS key 1234abcd-12ab-34cd-56ef-1234567890ab, which was shared by source account 111111111111, and KMS key 4567dcba-23ab-34cd-56ef-0987654321yz, which exists in target account 222222222222.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "kms:RevokeGrant",  
                "kms>CreateGrant",  
                "kms>ListGrants"  
            ],  
            "Resource": [  
                "arn:aws:kms:us-  
east-1:111111111111:key/1234abcd-12ab-34cd-56ef-1234567890ab",  
                "arn:aws:kms:us-  
east-1:222222222222:key/4567dcba-23ab-34cd-56ef-0987654321yz"  
            ],  
            "Condition": {  
                "Bool": {  
                    "kms:GrantIsForAWSResource": "true"  
                }  
            }  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "kms:Encrypt",  
                "kms:Decrypt",  
                "kms:ReEncrypt*",  
                "kms:GenerateDataKey*",  
                "kms:DescribeKey"  
            ],  
            "Resource": [  
                "arn:aws:kms:us-  
east-1:111111111111:key/1234abcd-12ab-34cd-56ef-1234567890ab",  
                "arn:aws:kms:us-  
east-1:222222222222:key/4567dcba-23ab-34cd-56ef-0987654321yz"  
            ]  
        }  
    ]  
}
```

5. Choose **Review policy**
6. For **Name**, enter a descriptive name for the policy, and then choose **Create policy**.

Command line

Using your preferred text editor, create a new JSON file named `policyDetails.json`. Add the following policy and specify the ARN of the KMS key that was used to encrypt the source volumes and that was shared with you by the source account in Step 2.

Note

If you are copying from multiple source accounts, then you must specify the corresponding KMS key ARN from each source account.

In the following example, the policy grants the IAM role permission to use KMS key `1234abcd-12ab-34cd-56ef-1234567890ab`, which was shared by source account `111111111111`, and KMS key `4567dcba-23ab-34cd-56ef-0987654321yz`, which exists in target account `222222222222`.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "kms:RevokeGrant",
                "kms>CreateGrant",
                "kms>ListGrants"
            ],
            "Resource": [
                "arn:aws:kms:us-
east-1:111111111111:key/1234abcd-12ab-34cd-56ef-1234567890ab",
                "arn:aws:kms:us-
east-1:222222222222:key/4567dcba-23ab-34cd-56ef-0987654321yz"
            ],
            "Condition": {
                "Bool": {
                    "kms:GrantIsForAWSResource": "true"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": [
                "kms:Encrypt",
                "kms:Decrypt",
                "kms:ReEncrypt*",
                "kms:GenerateDataKey*",
                "kms:DescribeKey"
            ],
            "Resource": [
                "arn:aws:kms:us-
east-1:111111111111:key/1234abcd-12ab-34cd-56ef-1234567890ab",
                "arn:aws:kms:us-
east-1:222222222222:key/4567dcba-23ab-34cd-56ef-0987654321yz"
            ]
        }
    ]
}
```

Save and close the file. Then use the [put-role-policy](#) command to add the policy to the IAM role.

For example

```
$ aws iam put-role-policy \
--role-name AWSDataLifecycleManagerDefaultRole \
--policy-name CopyPolicy \
```

```
--policy-document file://AdminPolicy.json
```

Specify snapshot description filters

When you create the snapshot copy policy in the target account, you must specify a snapshot description filter. The snapshot description filter enables you to specify an additional level of filtering that lets you control which snapshots are copied by the policy. This means that a snapshot is only copied by the policy if it is shared by one of the specified source accounts, and it has a snapshot description that matches the specified filter. In other words, if a snapshot is shared by one of the specified source accounts, but it does not have a description that matches the specified filter, it is not copied by the policy.

The snapshot filter description must be specified using a regular expression. It is a mandatory field when creating cross-account copy event policies using the console and the command line. The following are example regular expressions that can be used:

- .*—This filter matches all snapshot descriptions. If you use this expression the policy will copy all snapshots that are shared by one of the specified source accounts.
- Created for policy: policy-0123456789abcdef0.*—This filter matches only snapshots that are created by a policy with an ID of policy-0123456789abcdef0. If you use an expression like this, only snapshots that are shared with your account by one of the specified source accounts, and that have been created by a policy with the specified ID are copied by the policy.
- .*production.*—This filter matches any snapshot that has the word production anywhere in its description. If you use this expression the policy will copy all snapshots that are shared by one of the specified source accounts and that have the specified text in their description.

View, modify, and delete lifecycle policies

Use the following procedures to view, modify and delete existing lifecycle policies.

Topics

- [View lifecycle policies \(p. 1511\)](#)
- [Modify lifecycle policies \(p. 1512\)](#)
- [Delete lifecycle policies \(p. 1381\)](#)

View lifecycle policies

Use one of the following procedures to view a lifecycle policy.

Console

To view a lifecycle policy

- Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
- In the navigation pane, choose **Elastic Block Store, Lifecycle Manager**.
- Select a lifecycle policy from the list. The **Details** tab displays information about the policy.

Command line

Use the `get-lifecycle-policy` command to display information about a lifecycle policy.

```
aws dlm get-lifecycle-policy --policy-id policy-0123456789abcdef0
```

The following is example output. It includes the information that you specified, plus metadata inserted by AWS.

```
{  
    "Policy": {  
        "Description": "My first policy",  
        "DateCreated": "2018-05-15T00:16:21+0000",  
        "State": "ENABLED",  
        "ExecutionRoleArn":  
            "arn:aws:iam::210774411744:role/AWSDataLifecycleManagerDefaultRole",  
        "PolicyId": "policy-0123456789abcdef0",  
        "DateModified": "2018-05-15T00:16:22+0000",  
        "PolicyDetails": {  
            "PolicyType": "EBS_SNAPSHOT_MANAGEMENT",  
            "ResourceTypes": [  
                "VOLUME"  
            ],  
            "TargetTags": [  
                {  
                    "Value": "115",  
                    "Key": "costcenter"  
                }  
            ],  
            "Schedules": [  
                {  
                    "TagsToAdd": [  
                        {  
                            "Value": "myDailySnapshot",  
                            "Key": "type"  
                        }  
                    ],  
                    "RetainRule": {  
                        "Count": 5  
                    },  
                    "CopyTags": false,  
                    "CreateRule": {  
                        "Interval": 24,  
                        "IntervalUnit": "HOURS",  
                        "Times": [  
                            "03:00"  
                        ]  
                    },  
                    "Name": "DailySnapshots"  
                }  
            ]  
        }  
    }  
}
```

Modify lifecycle policies

Use one of the following procedures to modify a lifecycle policy.

Console

To modify a lifecycle policy

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic Block Store, Lifecycle Manager**.
3. Select a lifecycle policy from the list.
4. Choose **Actions, Modify Lifecycle Policy**.

5. Modify the policy settings as needed. For example, you can modify the schedule, add or remove tags, or enable or disable the policy.
6. Choose **Update policy**.

Command line

Use the [update-lifecycle-policy](#) command to modify the information in a lifecycle policy. To simplify the syntax, this example references a JSON file, `policyDetailsUpdated.json`, that includes the policy details.

```
aws dlm update-lifecycle-policy --state DISABLED --execution-role-arn
arn:aws:iam::12345678910:role/AWSDataLifecycleManagerDefaultRole" --policy-details
file://policyDetailsUpdated.json
```

The following is an example of the `policyDetailsUpdated.json` file.

```
{
    "ResourceTypes": [
        "VOLUME"
    ],
    "TargetTags": [
        {
            "Key": "costcenter",
            "Value": "120"
        }
    ],
    "Schedules": [
        {
            "Name": "DailySnapshots",
            "TagsToAdd": [
                {
                    "Key": "type",
                    "Value": "myDailySnapshot"
                }
            ],
            "CreateRule": {
                "Interval": 12,
                "IntervalUnit": "HOURS",
                "Times": [
                    "15:00"
                ]
            },
            "RetainRule": {
                "Count": 5
            },
            "CopyTags": false
        }
    ]
}
```

To view the updated policy, use the [get-lifecycle-policy](#) command. You can see that the state, the value of the tag, the snapshot interval, and the snapshot start time were changed.

Delete lifecycle policies

Use one of the following procedures to delete a lifecycle policy.

Note

When you delete a lifecycle policy, the snapshots or AMIs created by that policy are not automatically deleted. If you no longer need the snapshots or AMIs, you must delete them manually.

Old console

To delete a lifecycle policy

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Elastic Block Store, Lifecycle Manager**.
3. Select a lifecycle policy from the list.
4. Choose **Actions, Delete Lifecycle Policy**.
5. When prompted for confirmation, choose **Delete Lifecycle Policy**.

Command line

Use the [delete-lifecycle-policy](#) command to delete a lifecycle policy and free up the target tags specified in the policy for reuse.

Note

You can delete snapshots created only by Amazon Data Lifecycle Manager.

```
aws dlm delete-lifecycle-policy --policy-id policy-0123456789abcdef0
```

The [Amazon Data Lifecycle Manager API Reference](#) provides descriptions and syntax for each of the actions and data types for the Amazon Data Lifecycle Manager Query API.

Alternatively, you can use one of the AWS SDKs to access the API in a way that's tailored to the programming language or platform that you're using. For more information, see [AWS SDKs](#).

AWS Identity and Access Management

Access to Amazon Data Lifecycle Manager requires credentials. Those credentials must have permissions to access AWS resources, such as instances, volumes, snapshots, and AMIs. The following sections provide details about how you can use AWS Identity and Access Management (IAM), and help secure access to your resources.

Topics

- [AWS managed policies \(p. 1514\)](#)
- [IAM service roles \(p. 1517\)](#)
- [Permissions for IAM users \(p. 1520\)](#)
- [Permissions for encryption \(p. 1521\)](#)

AWS managed policies

An AWS managed policy is a standalone policy that is created and administered by AWS. AWS managed policies are designed to provide permissions for many common use cases. AWS managed policies make it more efficient for you to assign appropriate permissions to users, groups, and roles, than if you had to write the policies yourself.

However, you can't change the permissions defined in AWS managed policies. AWS occasionally updates the permissions defined in an AWS managed policy. When this occurs, the update affects all principal entities (users, groups, and roles) that the policy is attached to.

Amazon Data Lifecycle Manager provides two AWS managed policies for common use cases. These policies make it more efficient to define the appropriate permissions and control access to your resources. The AWS managed policies provided by Amazon Data Lifecycle Manager are designed to be attached to roles that you pass to Amazon Data Lifecycle Manager.

The following are the AWS managed policies that Amazon Data Lifecycle Manager provides. You can also find these AWS managed policies in the **Policies** section of the IAM console.

AWSDataLifecycleManagerServiceRole

The **AWSDataLifecycleManagerServiceRole** policy provides appropriate permissions to Amazon Data Lifecycle Manager to create and manage Amazon EBS snapshot policies and cross-account copy event policies.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CreateSnapshot",  
                "ec2:CreateSnapshots",  
                "ec2>DeleteSnapshot",  
                "ec2:DescribeInstances",  
                "ec2:DescribeVolumes",  
                "ec2:DescribeSnapshots",  
                "ec2:EnableFastSnapshotRestores",  
                "ec2:DescribeFastSnapshotRestores",  
                "ec2:DisableFastSnapshotRestores",  
                "ec2:CopySnapshot",  
                "ec2:ModifySnapshotAttribute",  
                "ec2:DescribeSnapshotAttribute"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2>CreateTags"  
            ],  
            "Resource": "arn:aws:ec2:::snapshot/*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "events:PutRule",  
                "events:DeleteRule",  
                "events:DescribeRule",  
                "events:EnableRule",  
                "events:DisableRule",  
                "events>ListTargetsByRule",  
                "events:PutTargets",  
                "events:RemoveTargets"  
            ],  
            "Resource": "arn:aws:events::rule/AwsDataLifecycleRule.managed-cwe.*"  
        }  
    ]  
}
```

AWSDataLifecycleManagerServiceRoleForAMIManagement

The **AWSDataLifecycleManagerServiceRoleForAMIManagement** policy provides appropriate permissions to Amazon Data Lifecycle Manager to create and manage Amazon EBS-backed AMI policies.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "ec2:CreateTags",  
            "Resource": [  
                "arn:aws:ec2:*::snapshot/*",  
                "arn:aws:ec2:*::image/*"  
            ]  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DescribeImages",  
                "ec2:DescribeInstances",  
                "ec2:DescribeImageAttribute",  
                "ec2:DescribeVolumes",  
                "ec2:DescribeSnapshots",  
                "ec2:EnableImageDeprecation",  
                "ec2:DisableImageDeprecation"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": "ec2>DeleteSnapshot",  
            "Resource": "arn:aws:ec2:*::snapshot/*"  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:ResetImageAttribute",  
                "ec2:DeregisterImage",  
                "ec2>CreateImage",  
                "ec2:CopyImage",  
                "ec2:ModifyImageAttribute"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

AWS managed policy updates

AWS services maintain and update AWS managed policies. You can't change the permissions in AWS managed policies. Services occasionally add additional permissions to an AWS managed policy to support new features. This type of update affects all identities (users, groups, and roles) where the policy is attached. Services are most likely to update an AWS managed policy when a new feature is launched or when new operations become available. Services do not remove permissions from an AWS managed policy, so policy updates won't break your existing permissions.

The following table provides details about updates to AWS managed policies for Amazon Data Lifecycle Manager since this service began tracking these changes. For automatic alerts about changes to this page, subscribe to the RSS feed on the [Document history \(p. 1782\)](#).

Change	Description	Date
AWSDataLifecycleManagerDefaultRoleForAMIManagement — Added permissions to support AMI deprecation.	Lifecycle Manager added the <code>ec2:EnableImageDeprecation</code> and <code>ec2:DisableImageDeprecation</code> actions to grant EBS-backed AMI policies permission to enable and disable AMI deprecation.	August 23, 2021
Amazon Data Lifecycle Manager started tracking changes	Amazon Data Lifecycle Manager started tracking changes for its AWS managed policies.	August 23, 2021

IAM service roles

An AWS Identity and Access Management (IAM) role is similar to a user, in that it is an AWS identity with permissions policies that determine what the identity can and can't do in AWS. However, instead of being uniquely associated with one person, a role is intended to be assumable by anyone who needs it. A service role is a role that an AWS service assumes to perform actions on your behalf. As a service that performs backup operations on your behalf, Amazon Data Lifecycle Manager requires that you pass it a role to assume when performing policy operations on your behalf. For more information about IAM roles, see [IAM Roles](#) in the *IAM User Guide*.

The role that you pass to Amazon Data Lifecycle Manager must have an IAM policy with the permissions that enable Amazon Data Lifecycle Manager to perform actions associated with policy operations, such as creating snapshots and AMIs, copying snapshots and AMIs, deleting snapshots, and deregistering AMIs. Different permissions are required for each of the Amazon Data Lifecycle Manager policy types. The role must also have Amazon Data Lifecycle Manager listed as a trusted entity, which enables Amazon Data Lifecycle Manager to assume the role.

Topics

- [Default service roles for Amazon Data Lifecycle Manager \(p. 1517\)](#)
- [Custom service roles for Amazon Data Lifecycle Manager \(p. 1518\)](#)

Default service roles for Amazon Data Lifecycle Manager

Amazon Data Lifecycle Manager uses the following default service roles:

- **AWSDataLifecycleManagerDefaultRole**—default role for managing snapshots. It trusts only the `dlm.amazonaws.com` service to assume the role and it allows Amazon Data Lifecycle Manager to perform the actions required by snapshot and cross-account snapshot copy policies on your behalf. This role uses the `AWSDataLifecycleManagerServiceRole` AWS managed policy.
- **AWSDataLifecycleManagerDefaultRoleForAMIManagement**—default role for managing AMIs. It trusts only the `dlm.amazonaws.com` service to assume the role and it allows Amazon Data Lifecycle Manager to perform the actions required by EBS-backed AMI policies on your behalf. This role uses the `AWSDataLifecycleManagerServiceRoleForAMIManagement` AWS managed policy.

If you are using the Amazon Data Lifecycle Manager console, Amazon Data Lifecycle Manager automatically creates the **AWSDataLifecycleManagerDefaultRole** service role the first time you create a snapshot or cross-account snapshot copy policy, and it automatically creates the **AWSDataLifecycleManagerDefaultRoleForAMIManagement** service role the first time you create an EBS-backed AMI policy.

If you are not using the console, you can manually create the service roles using the [create-default-role](#) command. For `--resource-type`, specify `snapshot` to create `AWSDataLifecycleManagerDefaultRole`, or `image` to create `AWSDataLifecycleManagerDefaultRoleForAMIManagement`.

```
$ aws dlm create-default-role --resource-type snapshot|image
```

If you delete the default service roles, and then need to create them again, you can use the same process to recreate them in your account.

Custom service roles for Amazon Data Lifecycle Manager

As an alternative to using the default service roles, you can create custom IAM roles with the required permissions and then select them when you create a lifecycle policy.

To create a custom IAM role

1. Create roles with the following permissions.
 - Permissions required for managing snapshot lifecycle policies

```
        "events>ListTargetsByRule",
        "events>PutTargets",
        "events>RemoveTargets"
    ],
    "Resource": "arn:aws:events:*::rule/AwsDataLifecycleRule.managed-cwe.*"
}
]
```

- Permissions required for managing AMI lifecycle policies

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2>CreateTags",
            "Resource": [
                "arn:aws:ec2::snapshot/*",
                "arn:aws:ec2::image/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2>DescribeImages",
                "ec2>DescribeInstances",
                "ec2>DescribeImageAttribute",
                "ec2>DescribeVolumes",
                "ec2>DescribeSnapshots"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": "ec2>DeleteSnapshot",
            "Resource": "arn:aws:ec2::snapshot/*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2>ResetImageAttribute",
                "ec2>DeregisterImage",
                "ec2>CreateImage",
                "ec2>CopyImage",
                "ec2>ModifyImageAttribute"
            ],
            "Resource": "*"
        }
    ]
}
```

For more information, see [Creating a Role](#) in the *IAM User Guide*.

2. Add a trust relationship to the roles.
 - a. In the IAM console, choose **Roles**.
 - b. Select the roles that you created, and then choose **Trust relationships**.
 - c. Choose **Edit Trust Relationship**, add the following policy, and then choose **Update Trust Policy**.

```
{
    "Version": "2012-10-17",
    "Statement": [{

```

```
"Effect": "Allow",
"Principal": {
    "Service": "dlm.amazonaws.com"
},
>Action": "sts:AssumeRole"
}]}
```

We recommend that you use the `aws:SourceAccount` and `aws:SourceArn` condition keys to protect yourself against the [confused deputy problem](#). For example, you could add the following condition block to the previous trust policy. The `aws:SourceAccount` is the owner of the lifecycle policy and the `aws:SourceArn` is the ARN of the lifecycle policy. If you don't know the lifecycle policy ID, you can replace that portion of the ARN with a wildcard (*) and then update the trust policy after you create the lifecycle policy.

```
"Condition": {
    "StringEquals": {
        "aws:SourceAccount": "account_id"
    },
    "ArnLike": {
        "aws:SourceArn": "arn:partition:dlm:region:account_id:policy/policy_id"
    }
}
```

Permissions for IAM users

An IAM user must have the following permissions to use Amazon Data Lifecycle Manager.

Note

The `ec2:DescribeAvailabilityZones`, `ec2:DescribeRegions`, `kms>ListAliases`, and `kms:DescribeKey` permissions are required for console users only. If console access is not required, you can remove the permissions.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "dlm:*",
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": "iam:PassRole",
            "Resource": [
                "arn:aws:iam::accound_id:role/service-role/AWSDataLifecycleManagerDefaultRole",
                "arn:aws:iam::accound_id:role/service-role/AWSDataLifecycleManagerDefaultRoleForAMIManagement"
            ]
        },
        {
            "Effect": "Allow",
            "Action": "iam>ListRoles",
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeAvailabilityZones",
                "ec2:DescribeRegions",
                "kms:ListAliases",
                "kms:DescribeKey"
            ]
        }
    ]
}
```

```
        "kms:ListAliases",
        "kms:DescribeKey"
    ],
    "Resource": "*"
}
]
```

For more information, see [Changing Permissions for an IAM User](#) in the *IAM User Guide*.

Permissions for encryption

If the source volume is encrypted, ensure that the Amazon Data Lifecycle Manager default roles (`AWSDataLifecycleManagerDefaultRole` and `AWSDataLifecycleManagerDefaultRoleForAMIManagement`) have permission to use the KMS keys used to encrypt the volume.

If you enable **Cross Region copy** for unencrypted snapshots or AMIs backed by unencrypted snapshots, and choose to enable encryption in the destination Region, ensure that the default roles have permission to use the KMS key needed to perform the encryption in the destination Region.

If you enable **Cross Region copy** for encrypted snapshots or AMIs backed by encrypted snapshots, ensure that the default roles have permission to use both the source and destination KMS keys.

For more information, see [Allowing users in other accounts to use a KMS key](#) in the *AWS Key Management Service Developer Guide*.

Monitor the lifecycle of snapshots and AMIs

You can use the following features to monitor the lifecycle of your snapshots and AMIs.

Features

- [Console and AWS CLI \(p. 1521\)](#)
- [AWS CloudTrail \(p. 1521\)](#)
- [Monitor your policies using CloudWatch Events \(p. 1521\)](#)
- [Monitor your policies using Amazon CloudWatch \(p. 1522\)](#)

Console and AWS CLI

You can view your lifecycle policies using the Amazon EC2 console or the AWS CLI. Each snapshot and AMI created by a policy has a timestamp and policy-related tags. You can filter snapshots and AMIs using these tags to verify that your backups are being created as you intend. For information about viewing lifecycle policies using the console, see [View lifecycle policies \(p. 1511\)](#).

AWS CloudTrail

With AWS CloudTrail, you can track user activity and API usage to demonstrate compliance with internal policies and regulatory standards. For more information, see the [AWS CloudTrail User Guide](#).

Monitor your policies using CloudWatch Events

Amazon EBS and Amazon Data Lifecycle Manager emit events related to lifecycle policy actions. You can use AWS Lambda and Amazon CloudWatch Events to handle event notifications programmatically. Events are emitted on a best effort basis. For more information, see the [Amazon CloudWatch Events User Guide](#).

The following events are available:

Note

No events are emitted for AMI lifecycle policy actions.

- `createSnapshot`—An Amazon EBS event emitted when a `CreateSnapshot` action succeeds or fails. For more information, see [Amazon CloudWatch Events for Amazon EBS \(p. 1609\)](#).
- `DLM Policy State Change`—An Amazon Data Lifecycle Manager event emitted when a lifecycle policy enters an error state. The event contains a description of what caused the error. The following is an example of an event when the permissions granted by the IAM role are insufficient.

```
{  
    "version": "0",  
    "id": "01234567-0123-0123-0123-0123456789ab",  
    "detail-type": "DLM Policy State Change",  
    "source": "aws.dlm",  
    "account": "123456789012",  
    "time": "2018-05-25T13:12:22Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:dml:us-east-1:123456789012:policy/policy-0123456789abcdef"  
    ],  
    "detail": {  
        "state": "ERROR",  
        "cause": "Role provided does not have sufficient permissions",  
        "policy_id": "arn:aws:dml:us-east-1:123456789012:policy/policy-0123456789abcdef"  
    }  
}
```

The following is an example of an event when a limit is exceeded.

```
{  
    "version": "0",  
    "id": "01234567-0123-0123-0123-0123456789ab",  
    "detail-type": "DLM Policy State Change",  
    "source": "aws.dlm",  
    "account": "123456789012",  
    "time": "2018-05-25T13:12:22Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:dml:us-east-1:123456789012:policy/policy-0123456789abcdef"  
    ],  
    "detail": {  
        "state": "ERROR",  
        "cause": "Maximum allowed active snapshot limit exceeded",  
        "policy_id": "arn:aws:dml:us-east-1:123456789012:policy/policy-0123456789abcdef"  
    }  
}
```

Monitor your policies using Amazon CloudWatch

You can monitor your Amazon Data Lifecycle Manager lifecycle policies using CloudWatch, which collects raw data and processes it into readable, near real-time metrics. You can use these metrics to see exactly how many Amazon EBS snapshots and EBS-backed AMIs are created, deleted, and copied by your policies over time. You can also set alarms that watch for certain thresholds, and send notifications or take actions when those thresholds are met.

Metrics are kept for a period of 15 months, so that you can access historical information and gain a better understanding of how your lifecycle policies perform over an extended period.

For more information about Amazon CloudWatch, see the [Amazon CloudWatch User Guide](#).

Topics

- [Supported metrics \(p. 1523\)](#)
- [View CloudWatch metrics for your policies \(p. 1526\)](#)
- [Graph metrics for your policies \(p. 1526\)](#)

Supported metrics

The `Data Lifecycle Manager` namespace includes the following metrics for Amazon Data Lifecycle Manager lifecycle policies. The supported metrics differ by policy type.

All metrics can be measured on the `DLMPolicyId` dimension. The most useful statistics are `sum` and `average`, and the unit of measure is `count`.

Choose a tab to view the metrics supported by that policy type.

EBS snapshot policies

Metric	Description
<code>ResourcesTargeted</code>	The number of resources targeted by the tags specified in a snapshot or EBS-backed AMI policy.
<code>SnapshotsCreateStart</code>	The number of snapshot create actions initiated by a snapshot policy. Each action is recorded only once, even if there are multiple subsequent retries. If a snapshot create action fails, Amazon Data Lifecycle Manager sends a <code>SnapshotsCreateFailed</code> metric.
<code>SnapshotsCreateComp</code>	The number of snapshots created by a snapshot policy. This includes successful retries within 60 minutes of the scheduled time.
<code>SnapshotsCreateFail</code>	The number of snapshots that could not be created by a snapshot policy. This includes unsuccessful retries within 60 minutes from the scheduled time.
<code>SnapshotsSharedComp</code>	The number of snapshots shared across accounts by a snapshot policy.
<code>SnapshotsDeleteComp</code>	The number of snapshots deleted by a snapshot or EBS-backed AMI policy. This metric applies only to snapshots created by the policy. It does not apply to cross-Region snapshot copies created by the policy. This metric includes snapshots that are deleted when an EBS-backed AMI policy deregisters AMIs.
<code>SnapshotsDeleteFail</code>	The number of snapshots that could not be deleted by a snapshot or EBS-backed AMI policy. This metric applies only to snapshots created by the policy. It does not apply to cross-Region snapshot copies created by the policy. This metric includes snapshots that are deleted when an EBS-backed AMI policy deregisters AMIs.

Metric	Description
SnapshotsCopiedRegion	The number of cross-Region snapshot copy actions initiated by a snapshot policy.
SnapshotsCopiedRegion	The number of cross-Region snapshot copies created by a snapshot policy. This includes successful retries within 24 hours of the scheduled time.
SnapshotsCopiedRegion	The number of cross-Region snapshot copies that could not be created by a snapshot policy. This includes unsuccessful retries within 24 hours from the scheduled time.
SnapshotsCopiedRegion	The number of cross-Region snapshot copies deleted, as designated by the retention rule, by a snapshot policy.
SnapshotsCopiedRegion	The number of cross-Region snapshot copies that could not be deleted, as designated by the retention rule, by a snapshot policy.

EBS-backed AMI policies

The following metrics can be used with EBS-backed AMI policies:

Metric	Description
ResourcesTargeted	The number of resources targeted by the tags specified in a snapshot or EBS-backed AMI policy.
SnapshotsDeleteCompleted	The number of snapshots deleted by a snapshot or EBS-backed AMI policy. This metric applies only to snapshots created by the policy. It does not apply to cross-Region snapshot copies created by the policy. This metric includes snapshots that are deleted when an EBS-backed AMI policy deregisters AMIs.
SnapshotsDeleteFailed	The number of snapshots that could not be deleted by a snapshot or EBS-backed AMI policy. This metric applies only to snapshots created by the policy. It does not apply to cross-Region snapshot copies created by the policy. This metric includes snapshots that are deleted when an EBS-backed AMI policy deregisters AMIs.
SnapshotsCopiedRegion	The number of cross-Region snapshot copies deleted, as designated by the retention rule, by a snapshot policy.
SnapshotsCopiedRegion	The number of cross-Region snapshot copies that could not be deleted, as designated by the retention rule, by a snapshot policy.
ImagesCreateStarted	The number of CreateImage actions initiated by an EBS-backed AMI policy.
ImagesCreateCompleted	The number of AMIs created by an EBS-backed AMI policy.
ImagesCreateFailed	The number of AMIs that could not be created by an EBS-backed AMI policy.
ImagesDeregisterCompleted	The number of AMIs deregistered by an EBS-backed AMI policy.

Metric	Description
ImagesDeregisterFailed	The number of AMIs that could not be deregistered by an EBS-backed AMI policy.
ImagesCopiedRegionStart	The number of cross-Region copy actions initiated by an EBS-backed AMI policy.
ImagesCopiedRegionComplete	The number of cross-Region AMI copies created by an EBS-backed AMI policy.
ImagesCopiedRegionFailed	The number of cross-Region AMI copies that could not be created by an EBS-backed AMI policy.
ImagesCopiedRegionDeleted	The number of cross-Region AMI copies deregistered, as designated by the retention rule, by an EBS-backed AMI policy.
ImagesCopiedRegionNotDeleted	The number of cross-Region AMI copies that could not be deregistered, as designated by the retention rule, by an EBS-backed AMI policy.
EnableImageDeprecationCompleted	The number of AMIs that were marked for deprecation by an EBS-backed AMI policy.
EnableImageDeprecationFailed	The number of AMIs that could not be marked for deprecation by an EBS-backed AMI policy.
EnableCopiedImageDeprecationCompleted	The number of cross-Region AMI copies that were marked for deprecation by an EBS-backed AMI policy.
EnableCopiedImageDeprecationFailed	The number of cross-Region AMI copies that could not be marked for deprecation by an EBS-backed AMI policy.

Cross-account copy event policies

The following metrics can be used with cross-account copy event policies:

Metric	Description
SnapshotsCopiedAccountStart	The number of cross-account snapshot copy actions initiated by a cross-account copy event policy.
SnapshotsCopiedAccountComplete	The number of snapshots copied from another account by a cross-account copy event policy. This includes successful retries within 24 hours of the scheduled time.
SnapshotsCopiedAccountFailed	The number of snapshots that could not be copied from another account by a cross-account copy event policy. This includes unsuccessful retries within 24 hours of the scheduled time.
SnapshotsCopiedAccountDeleted	The number of cross-Region snapshot copies deleted, as designated by the retention rule, by a cross-account copy event policy.
SnapshotsCopiedAccountNotDeleted	The number of cross-Region snapshot copies that could not be deleted, as designated by the retention rule, by a cross-account copy event policy.

[View CloudWatch metrics for your policies](#)

You can use the AWS Management Console or the command line tools to list the metrics that Amazon Data Lifecycle Manager sends to Amazon CloudWatch.

Amazon EC2 console

To view metrics using the Amazon EC2 console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Lifecycle Manager**.
3. Select a policy in the grid and then choose the **Monitoring** tab.

CloudWatch console

To view metrics using the Amazon CloudWatch console

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Metrics**.
3. Select the **EBS** namespace and then select **Data Lifecycle Manager metrics**.

AWS CLI

To list all the available metrics for Amazon Data Lifecycle Manager

Use the [list-metrics](#) command.

```
$ aws cloudwatch list-metrics --namespace AWS/EBS
```

To list all the metrics for a specific policy

Use the [list-metrics](#) command and specify the **DLMPolicyId** dimension.

```
$ aws cloudwatch list-metrics --namespace AWS/EBS --dimensions  
Name=DLMPolicyId,Value=abcdef01234567890
```

To list a single metric across all policies

Use the [list-metrics](#) command and specify the **--metric-name** option.

```
$ aws cloudwatch list-metrics --namespace AWS/EBS --metric-  
name SnapshotsCreateCompleted
```

[Graph metrics for your policies](#)

After you create a policy, you can open the Amazon EC2 console and view the monitoring graphs for the policy on the **Monitoring** tab. Each graph is based on one of the available Amazon EC2 metrics.

The following graphs metrics are available:

- Resources targeted (based on **ResourcesTargeted**)
- Snapshot creation started (based on **SnapshotsCreateStarted**)

- Snapshot creation completed (based on `SnapshotsCreateCompleted`)
- Snapshot creation failed (based on `SnapshotsCreateFailed`)
- Snapshot sharing completed (based on `SnapshotsSharedCompleted`)
- Snapshot deletion completed (based on `SnapshotsDeleteCompleted`)
- Snapshot deletion failed (based on `SnapshotsDeleteFailed`)
- Snapshot cross-Region copy started (based on `SnapshotsCopiedRegionStarted`)
- Snapshot cross-Region copy completed (based on `SnapshotsCopiedRegionCompleted`)
- Snapshot cross-Region copy failed (based on `SnapshotsCopiedRegionFailed`)
- Snapshot cross-Region copy deletion completed (based on `SnapshotsCopiedRegionDeleteCompleted`)
- Snapshot cross-Region copy deletion failed (based on `SnapshotsCopiedRegionDeleteFailed`)
- Snapshot cross-account copy started (based on `SnapshotsCopiedAccountStarted`)
- Snapshot cross-account copy completed (based on `SnapshotsCopiedAccountCompleted`)
- Snapshot cross-account copy failed (based on `SnapshotsCopiedAccountFailed`)
- Snapshot cross-account copy deletion completed (based on `SnapshotsCopiedAccountDeleteCompleted`)
- Snapshot cross-account copy deletion failed (based on `SnapshotsCopiedAccountDeleteFailed`)
- AMI creation started (based on `ImagesCreateStarted`)
- AMI creation completed (based on `ImagesCreateCompleted`)
- AMI creation failed (based on `ImagesCreateFailed`)
- AMI deregistration completed (based on `ImagesDeregisterCompleted`)
- AMI deregistration failed (based on `ImagesDeregisterFailed`)
- AMI cross-Region copy started (based on `ImagesCopiedRegionStarted`)
- AMI cross-Region copy completed (based on `ImagesCopiedRegionCompleted`)
- AMI cross-Region copy failed (based on `ImagesCopiedRegionFailed`)
- AMI cross-Region copy deregistration completed (based on `ImagesCopiedRegionDeregisterCompleted`)
- AMI cross-Region copy deregister failed (based on `ImagesCopiedRegionDeregisteredFailed`)
- AMI enable deprecation completed (based on `EnableImageDeprecationCompleted`)
- AMI enable deprecation failed (based on `EnableImageDeprecationFailed`)
- AMI cross-Region copy enable deprecation completed (based on `EnableCopiedImageDeprecationCompleted`)
- AMI cross-Region copy enable deprecation failed (based on `EnableCopiedImageDeprecationFailed`)

Create a CloudWatch alarm for a policy

You can create a CloudWatch alarm that monitors CloudWatch metrics for your policies. CloudWatch will automatically send you a notification when the metric reaches a threshold that you specify. You can create a CloudWatch alarm using the CloudWatch console.

For more information about creating alarms using the CloudWatch console, see the following topic in the *Amazon CloudWatch User Guide*.

- [Create a CloudWatch Alarm Based on a Static Threshold](#)
- [Create a CloudWatch Alarm Based on Anomaly Detection](#)

Example use cases

The following are example use cases.

Topics

- [Example 1: ResourcesTargeted metric \(p. 1528\)](#)
- [Example 2: SnapshotDeleteFailed metric \(p. 1528\)](#)
- [Example 3: SnapshotsCopiedRegionFailed metric \(p. 1529\)](#)

Example 1: ResourcesTargeted metric

You can use the `ResourcesTargeted` metric to monitor the total number of resources that are targeted by a specific policy each time it is run. This enables you to trigger an alarm when the number of targeted resources is below or above an expected threshold.

For example, if you expect your daily policy to create backups of no more than 50 volumes, you can create an alarm that sends an email notification when the `sum` for `ResourcesTargeted` is greater than 50 over a 1 hour period. In this way, you can ensure that no snapshots have been unexpectedly created from volumes that have been incorrectly tagged.

You can use the following command to create this alarm:

```
$ aws cloudwatch put-metric-alarm \
--alarm-name resource-targeted-monitor \
--alarm-description "Alarm when policy targets more than 50 resources" \
--metric-name ResourcesTargeted \
--namespace AWS/EBS \
--statistic Sum \
--period 3600 \
--threshold 50 \
--comparison-operator GreaterThanThreshold \
--dimensions "Name=DLMPolicyId,Value=pol<u>i</u>cy_id" \
--evaluation-periods 1 \
--alarm-actions sns<u>_topic_arn</u>
```

Example 2: SnapshotDeleteFailed metric

You can use the `SnapshotDeleteFailed` metric to monitor for failures to delete snapshots as per the policy's snapshot retention rule.

For example, if you've created a policy that should automatically delete snapshots every twelve hours, you can create an alarm that notifies your engineering team when the `sum` of `SnapshotDeletionFailed` is greater than 0 over a 1 hour period. This could help to investigate improper snapshot retention and to ensure that your storage costs are not increased by unnecessary snapshots.

You can use the following command to create this alarm:

```
$ aws cloudwatch put-metric-alarm \
--alarm-name snapshot-deletion-failed-monitor \
--alarm-description "Alarm when snapshot deletions fail" \
--metric-name SnapshotsDeleteFailed \
--namespace AWS/EBS \
--statistic Sum \
--period 3600 \
--threshold 0 \
--comparison-operator GreaterThanThreshold \
--dimensions "Name=DLMPolicyId,Value=pol<u>i</u>cy_id" \
```

```
--evaluation-periods 1 \
--alarm-actions sns\_topic\_arn
```

Example 3: SnapshotsCopiedRegionFailed metric

Use the `SnapshotsCopiedRegionFailed` metric to identify when your policies fail to copy snapshots to other Regions.

For example, if your policy copies snapshots across Regions daily, you can create an alarm that sends an SMS to your engineering team when the sum of `SnapshotCrossRegionCopyFailed` is greater than 0 over a 1 hour period. This can be useful for verifying whether subsequent snapshots in the lineage were successfully copied by the policy.

You can use the following command to create this alarm:

```
$ aws cloudwatch put-metric-alarm \
--alarm-name snapshot-copy-region-failed-monitor \
--alarm-description "Alarm when snapshot copy fails" \
--metric-name SnapshotsCopiedRegionFailed \
--namespace AWS/EBS \
--statistic Sum \
--period 3600 \
--threshold 0 \
--comparison-operator GreaterThanThreshold \
--dimensions "Name=DLMPolicyId,Value=policy\_id" \
--evaluation-periods 1 \
--alarm-actions sns\_topic\_arn
```

Managing policies that report failed actions

For more information about what to do when one of your policies reports an unexpected non-zero value for a failed action metric, see the [What should I do if Amazon Data Lifecycle Manager reports failed actions in CloudWatch metrics?](#) AWS Knowledge Center article.

Amazon EBS data services

Amazon EBS provides the following data services.

Data services

- [Amazon EBS Elastic Volumes \(p. 1529\)](#)
- [Amazon EBS encryption \(p. 1542\)](#)
- [Amazon EBS fast snapshot restore \(p. 1553\)](#)

Amazon EBS Elastic Volumes

With Amazon EBS Elastic Volumes, you can increase the volume size, change the volume type, or adjust the performance of your EBS volumes. If your instance supports Elastic Volumes, you can do so without detaching the volume or restarting the instance. This enables you to continue using your application while the changes take effect.

There is no charge to modify the configuration of a volume. You are charged for the new volume configuration after volume modification starts. For more information, see the [Amazon EBS Pricing](#) page.

Contents

- [Requirements when modifying volumes \(p. 1530\)](#)

- [Request modifications to your EBS volumes \(p. 1531\)](#)
- [Monitor the progress of volume modifications \(p. 1535\)](#)
- [Extend a Linux file system after resizing a volume \(p. 1538\)](#)

Requirements when modifying volumes

The following requirements and limitations apply when you modify an Amazon EBS volume. To learn more about the general requirements for EBS volumes, see [Constraints on the size and configuration of an EBS volume \(p. 1368\)](#).

Topics

- [Supported instance types \(p. 1530\)](#)
- [Requirements for Linux volumes \(p. 1530\)](#)
- [Limitations \(p. 1531\)](#)

Supported instance types

Elastic Volumes are supported on the following instances:

- All [current-generation instances \(p. 241\)](#)
- The following previous-generation instances: C1, C3, CC2, CR1, G2, I2, M1, M3, and R3

If your instance type does not support Elastic Volumes, see [Modify an EBS volume if Elastic Volumes is not supported \(p. 1535\)](#).

Requirements for Linux volumes

Linux AMIs require a GUID partition table (GPT) and GRUB 2 for boot volumes that are 2 TiB (2,048 GiB) or larger. Many Linux AMIs today still use the MBR partitioning scheme, which only supports boot volume sizes up to 2 TiB. If your instance does not boot with a boot volume larger than 2 TiB, the AMI you are using may be limited to a boot volume size of less than 2 TiB. Non-boot volumes do not have this limitation on Linux instances. For requirements affecting Windows volumes, see [Requirements for Windows volumes](#) in the *Amazon EC2 User Guide for Windows Instances*.

Before attempting to resize a boot volume beyond 2 TiB, you can determine whether the volume is using MBR or GPT partitioning by running the following command on your instance:

```
[ec2-user ~]$ sudo gdisk -l /dev/xvda
```

An Amazon Linux instance with GPT partitioning returns the following information:

```
GPT fdisk (gdisk) version 0.8.10

Partition table scan:
  MBR: protective
  BSD: not present
  APM: not present
  GPT: present

Found valid GPT with protective MBR; using GPT.
```

A SUSE instance with MBR partitioning returns the following information:

```
GPT fdisk (gdisk) version 0.8.8
```

```
Partition table scan:  
  MBR: MBR only  
  BSD: not present  
  APM: not present  
  GPT: not present
```

Limitations

- There are limits to the maximum aggregated storage that can be requested across volume modifications. For more information, see [Amazon EBS service quotas](#) in the *Amazon Web Services General Reference*.
- After modifying a volume, you must wait at least six hours and ensure that the volume is in the `in-use` or `available` state before you can modify the same volume. This is sometimes referred to as a cooldown period.
- If the volume was attached before November 3, 2016 23:40 UTC, you must initialize Elastic Volumes support. For more information, see [Initializing Elastic Volumes Support \(p. 1533\)](#).
- If you encounter an error message while attempting to modify an EBS volume, or if you are modifying an EBS volume attached to a previous-generation instance type, take one of the following steps:
 - For a non-root volume, detach the volume from the instance, apply the modifications, and then re-attach the volume.
 - For a root volume, stop the instance, apply the modifications, and then restart the instance.
- Modification time is increased for volumes that are not fully initialized. For more information see [Initialize Amazon EBS volumes \(p. 1593\)](#).
- The new volume size can't exceed the supported capacity of its file system and partitioning scheme. For more information, see [Constraints on the size and configuration of an EBS volume \(p. 1368\)](#).
- If you modify the volume type of a volume, the size and performance must be within the limits of the target volume type. For more information, see [Amazon EBS volume types \(p. 1352\)](#)
- You can't decrease the size of an EBS volume. However, you can create a smaller volume and then migrate your data to it using an application-level tool such as rsync.
- After provisioning over 32,000 IOPS on an existing `io1` or `io2` volume, you might need to detach and re-attach the volume, or restart the instance to see the full performance improvements.
- For `io2` volumes, you can't increase the size beyond 16 TiB or the IOPS beyond 64,000 while the volume is attached to an instance type that does not support `io2` Block Express volumes. Currently, only R5b instances support `io2` Block Express volumes. For more information, see [io2 Block Express volumes \(p. 1359\)](#)
- You can't modify the size or provisioned IOPS of an `io2` volume that is attached to an R5B instance.
- You can't modify the volume type of Multi-Attach enabled `io2` volumes.
- You can't modify the volume type, size, or Provisioned IOPS of Multi-Attach enabled `io1` volumes.
- A `gp2` volume that is attached to an instance as a root volume can't be modified to an `st1` or `sc1` volume. If detached and modified to `st1` or `sc1`, it can't be re-attached to an instance as the root volume.
- While `m3.medium` instances fully support volume modification, `m3.large`, `m3.xlarge`, and `m3.2xlarge` instances might not support all volume modification features.

Request modifications to your EBS volumes

With Elastic Volumes, you can dynamically increase the size, increase or decrease the performance, and change the volume type of your Amazon EBS volumes without detaching them.

Use the following process when modifying a volume:

1. (Optional) Before modifying a volume that contains valuable data, it is a best practice to create a snapshot of the volume in case you need to roll back your changes. For more information, see [Create Amazon EBS snapshots \(p. 1407\)](#).
2. Request the volume modification.
3. Monitor the progress of the volume modification. For more information, see [Monitor the progress of volume modifications \(p. 1535\)](#).
4. If the size of the volume was modified, extend the volume's file system to take advantage of the increased storage capacity. For more information, see [Extend a Linux file system after resizing a volume \(p. 1538\)](#).

Contents

- [Modify an EBS volume using Elastic Volumes \(p. 1532\)](#)
- [Initialize Elastic Volumes support \(if needed\) \(p. 1533\)](#)
- [Modify an EBS volume if Elastic Volumes is not supported \(p. 1535\)](#)

Modify an EBS volume using Elastic Volumes

You can only increase volume size. You can increase or decrease volume performance. If you are not changing the volume type, then volume size and performance modifications must be within the limits of the current volume type. If you are changing the volume type, then volume size and performance modifications must be within the limits of the target volume type.

Note

You can't cancel or undo a volume modification request after it has been submitted.

To modify an EBS volume, use one of the following methods.

New console

To modify an EBS volume using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Select the volume to modify and choose **Actions, Modify volume**.
4. The **Modify volume** screen displays the volume ID and the volume's current configuration, including type, size, IOPS, and throughput. Set new configuration values as follows:
 - To modify the type, choose a value for **Volume type**.
 - To modify the size, enter a new value for **Size**.
 - (gp3, io1, and io2 only) To modify the IOPS, enter a new value for **IOPS**.
 - (gp3 only) To modify the throughput, enter a new value for **Throughput**.
5. After you have finished changing the volume settings, choose **Modify**. When prompted for confirmation, choose **Modify**.
6. Modifying volume size has no practical effect until you also extend the volume's file system to make use of the new storage capacity. For more information, see [Extend a Linux file system after resizing a volume \(p. 1538\)](#).

Old console

To modify an EBS volume using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Volumes**, select the volume to modify, and then choose **Actions, Modify Volume**.

3. The **Modify Volume** window displays the volume ID and the volume's current configuration, including type, size, IOPS, and throughput. Set new configuration values as follows:
 - To modify the type, choose a value for **Volume Type**.
 - To modify the size, enter a new value for **Size**.
 - To modify the IOPS, if the volume type is gp3, io1, or io2, enter a new value for **IOPS**.
 - To modify the throughput, if the volume type is gp3, enter a new value for **Throughput**.
4. After you have finished changing the volume settings, choose **Modify**. When prompted for confirmation, choose **Yes**.
5. Modifying volume size has no practical effect until you also extend the volume's file system to make use of the new storage capacity. For more information, see [Extend a Linux file system after resizing a volume \(p. 1538\)](#).

AWS CLI

To modify an EBS volume using the AWS CLI

Use the [modify-volume](#) command to modify one or more configuration settings for a volume. For example, if you have a volume of type gp2 with a size of 100 GiB, the following command changes its configuration to a volume of type io1 with 10,000 IOPS and a size of 200 GiB.

```
aws ec2 modify-volume --volume-type io1 --iops 10000 --size 200 --volume-id vol-1111111111111111
```

The following is example output:

```
{  
    "VolumeModification": {  
        "TargetSize": 200,  
        "TargetVolumeType": "io1",  
        "ModificationState": "modifying",  
        "VolumeId": "vol-1111111111111111",  
        "TargetIops": 10000,  
        "StartTime": "2017-01-19T22:21:02.959Z",  
        "Progress": 0,  
        "OriginalVolumeType": "gp2",  
        "OriginalIops": 300,  
        "OriginalSize": 100  
    }  
}
```

Modifying volume size has no practical effect until you also extend the volume's file system to make use of the new storage capacity. For more information, see [Extend a Linux file system after resizing a volume \(p. 1538\)](#).

Initialize Elastic Volumes support (if needed)

Before you can modify a volume that was attached to an instance before November 3, 2016 23:40 UTC, you must initialize volume modification support using one of the following actions:

- Detach and attach the volume
- Stop and start the instance

Use one of the following procedures to determine whether your instances are ready for volume modification.

New console

To determine whether your instances are ready using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. On the navigation pane, choose **Instances**.
3. Choose the **Show/Hide Columns** icon (the gear). Select the **Launch time** attribute column and then choose **Confirm**.
4. Sort the list of instances by the **Launch Time** column. For each instance that was started before the cutoff date, choose the **Storage** tab and check the **Attachment time** column to see when its volumes were attached.

Old console

To determine whether your instances are ready using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. On the navigation pane, choose **Instances**.
3. Choose the **Show/Hide Columns** icon (the gear). Select the **Launch Time** and **Block Devices** attributes and then choose **Close**.
4. Sort the list of instances by the **Launch Time** column. For instances that were started before the cutoff date, check when the devices were attached. In the following example, you must initialize volume modification for the first instance because it was started before the cutoff date and its root volume was attached before the cutoff date. The other instances are ready because they were started after the cutoff date.

Instance ID	Launch Time	Block Devices
i-e905622e	February 25, 2016 at 1:49:35 PM UTC-8	/dev/xvda=vol-e6b46410 attached:2016-02-25T21:49:35.000Z.true
i-719f99a8	December 8, 2016 at 2:21:51 PM UTC-8	/dev/xvda=vol-bad60e7a attached:2016-01-15T18:36:12.000Z.true
i-006b02c1b78381e57	May 17, 2017 at 1:52:52 PM UTC-7	/dev/sda1=vol-0de9250441c73024c attached:2017-05-17T20:52:53.000Z.true, xvdb=vol-0863a86c393496d3d attached:2017-05-17T20:52:53.000Z.false
i-e3d172ed	May 17, 2017 at 2:48:54 PM UTC-7	/dev/sda1=vol-04c34d0b attached:2015-01-21T21:19:46.000Z.true

AWS CLI

To determine whether your instances are ready using the CLI

Use the following [describe-instances](#) command to determine whether the volume was attached before November 3, 2016 23:40 UTC.

```
aws ec2 describe-instances --query "Reservations[*].Instances[*].  
[InstanceId,LaunchTime<='2016-11-01',BlockDeviceMappings[*]  
[Ebs.AttachTime<='2016-11-01']]" --output text
```

The first line of the output for each instance shows its ID and whether it was started before the cutoff date (True or False). The first line is followed by one or more lines that show whether each EBS volume was attached before the cutoff date (True or False). In the following example output, you must initialize volume modification for the first instance because it was started before the cutoff date and its root volume was attached before the cutoff date. The other instances are ready because they were started after the cutoff date.

```
i-e905622e          True  
True  
i-719f99a8          False  
True  
i-006b02c1b78381e57  False  
False
```

False	
i-e3d172ed	False
True	

Modify an EBS volume if Elastic Volumes is not supported

If you are using a supported instance type, you can use Elastic Volumes to dynamically modify the size, performance, and volume type of your Amazon EBS volumes without detaching them.

If you cannot use Elastic Volumes but you need to modify the root (boot) volume, you must stop the instance, modify the volume, and then restart the instance.

After the instance has started, you can check the file system size to see if your instance recognizes the larger volume space. On Linux, use the **df -h** command to check the file system size.

```
[ec2-user ~]$ df -h
Filesystem      Size  Used Avail Use% Mounted on
/dev/xvda1      7.9G  943M  6.9G  12% /
tmpfs           1.9G     0  1.9G   0% /dev/shm
```

If the size does not reflect your newly expanded volume, you must extend the file system of your device so that your instance can use the new space. For more information, see [Extend a Linux file system after resizing a volume \(p. 1538\)](#).

Monitor the progress of volume modifications

When you modify an EBS volume, it goes through a sequence of states. The volume enters the modifying state, the optimizing state, and finally the completed state. At this point, the volume is ready to be further modified.

Note

Rarely, a transient AWS fault can result in a failed state. This is not an indication of volume health; it merely indicates that the modification to the volume failed. If this occurs, retry the volume modification.

While the volume is in the optimizing state, your volume performance is in between the source and target configuration specifications. Transitional volume performance will be no less than the source volume performance. If you are downgrading IOPS, transitional volume performance is no less than the target volume performance.

Volume modification changes take effect as follows:

- Size changes usually take a few seconds to complete and take effect after the volume has transitioned to the Optimizing state.
- Performance (IOPS) changes can take from a few minutes to a few hours to complete and are dependent on the configuration change being made.
- It might take up to 24 hours for a new configuration to take effect, and in some cases more, such as when the volume has not been fully initialized. Typically, a fully used 1-TiB volume takes about 6 hours to migrate to a new performance configuration.

To monitor the progress of a volume modification, use one of the following methods.

New console

To monitor progress of a modification using the Amazon EC2 console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.

2. In the navigation pane, choose **Volumes**.
3. Select the volume.
4. The **Volume state** column and the **Volume state** field in the **Details** tab contain information in the following format: *volume-state - modification-state (progress%)*.

The possible volume states are **creating**, **available**, **in-use**, **deleting**, **deleted**, and **error**.

The possible code states are **modifying**, **optimizing**, and **completed**.

Old console

To monitor progress of a modification using the Amazon EC2 console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Volumes**.
3. Select the volume.
4. The **State** column and the **State** field in the details pane contain information in the following format: *volume-state - modification-state (progress%)*. The possible volume states are **creating**, **available**, **in-use**, **deleting**, **deleted**, and **error**. The possible modification states are **modifying**, **optimizing**, and **completed**. Shortly after the volume modification is completed, we remove the modification state and progress, leaving only the volume state.

In this example, the modification state of the selected volume is **optimizing**. The modification state of the next volume is **modifying**.

Name	Volume ID	Size	Volume Type	IOPS	Snapshot	Created	Availability Zone	State
vol-0d0da54cd90f5...	8 GiB	gp2	100	snap-09aa45c...	January 9, 2020 at ...	eu-west-1b	● in-use

5. Choose the text in the **State** field in the details pane to display information about the most recent modification action, as shown in the previous step.

AWS CLI

To monitor progress of a modification using the AWS CLI

Use the **describe-volumes-modifications** command to view the progress of one or more volume modifications. The following example describes the volume modifications for two volumes.

```
aws ec2 describe-volumes-modifications --volume-ids vol-1111111111111111 vol-2222222222222222
```

In the following example output, the volume modifications are still in the modifying state. Progress is reported as a percentage.

```
{  
    "VolumesModifications": [  
        {  
            "TargetSize": 200,  
            "TargetVolumeType": "io1",  
            "ModificationState": "modifying",  
            "VolumeId": "vol-1111111111111111",  
            "TargetIops": 10000,  
            "StartTime": "2017-01-19T22:21:02.959Z",  
            "Progress": 0,  
            "OriginalVolumeType": "gp2",  
            "OriginalIops": 300,  
            "OriginalSize": 100  
        },  
        {  
            "TargetSize": 2000,  
            "TargetVolumeType": "sc1",  
            "ModificationState": "modifying",  
            "VolumeId": "vol-2222222222222222",  
            "StartTime": "2017-01-19T22:23:22.158Z",  
            "Progress": 0,  
            "OriginalVolumeType": "gp2",  
            "OriginalIops": 300,  
            "OriginalSize": 1000  
        }  
    ]  
}
```

The next example describes all volumes with a modification state of either optimizing or completed, and then filters and formats the results to show only modifications that were initiated on or after February 1, 2017:

```
aws ec2 describe-volumes-modifications --filters Name=modification-state,Values="optimizing","completed" --query "VolumesModifications[?StartTime>='2017-02-01'].{ID:VolumeId,STATE:ModificationState}"
```

The following is example output with information about two volumes:

```
[  
    {  
        "STATE": "optimizing",  
        "ID": "vol-06397e7a0eEXAMPLE"  
    },  
    {  
        "STATE": "completed",  
        "ID": "vol-ba74e18c2aEXAMPLE"  
    }  
]
```

CloudWatch Events console

With CloudWatch Events, you can create a notification rule for volume modification events. You can use your rule to generate a notification message using [Amazon SNS](#) or to invoke a [Lambda function](#) in response to matching events. Events are emitted on a best effort basis.

To monitor progress of a modification using CloudWatch Events

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.

2. Choose **Events, Create rule**.
3. For **Build event pattern to match events by service**, choose **Custom event pattern**.
4. For **Build custom event pattern**, replace the contents with the following and choose **Save**.

```
{  
    "source": [  
        "aws.ec2"  
    ],  
    "detail-type": [  
        "EBS Volume Notification"  
    ],  
    "detail": {  
        "event": [  
            "modifyVolume"  
        ]  
    }  
}
```

The following is example event data:

```
{  
    "version": "0",  
    "id": "01234567-0123-0123-0123-012345678901",  
    "detail-type": "EBS Volume Notification",  
    "source": "aws.ec2",  
    "account": "012345678901",  
    "time": "2017-01-12T21:09:07Z",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:012345678901:volume/vol-03a55cf56513fa1b6"  
    ],  
    "detail": {  
        "result": "optimizing",  
        "cause": "",  
        "event": "modifyVolume",  
        "request-id": "01234567-0123-0123-0123-0123456789ab"  
    }  
}
```

Extend a Linux file system after resizing a volume

After you [increase the size of an EBS volume \(p. 1531\)](#), you must use file system-specific commands to extend the file system to the larger size. You can resize the file system as soon as the volume enters the optimizing state.

Important

Before extending a file system that contains valuable data, it is best practice to create a snapshot of the volume, in case you need to roll back your changes. For more information, see [Create Amazon EBS snapshots \(p. 1407\)](#). If your Linux AMI uses the MBR partitioning scheme, you are limited to a boot volume size of up to 2 TiB. For more information, see [Requirements for Linux volumes \(p. 1530\)](#) and [Constraints on the size and configuration of an EBS volume \(p. 1368\)](#).

The process for extending a file system on Linux is as follows:

1. Your EBS volume might have a partition that contains the file system and data. Increasing the size of a volume does not increase the size of the partition. Before you extend the file system on a resized volume, check whether the volume has a partition that must be extended to the new size of the volume.

2. Use a file system-specific command to resize each file system to the new volume capacity.

For information about extending a Windows file system, see [Extend a Windows file system after resizing a volume](#) in the *Amazon EC2 User Guide for Windows Instances*.

The following examples walk you through the process of extending a Linux file system. For file systems and partitioning schemes other than the ones shown here, refer to the documentation for those file systems and partitioning schemes for instructions.

Note

If you are using logical volumes on the Amazon EBS volume, you must use Logical Volume Manager (LVM) to extend the logical volume. For instructions on how to do this, see the [Extend the logical volume](#) section in the [How do I create an LVM logical volume on an entire EBS volume?](#) AWS Knowledge Center article.

Examples

- [Example: Extend the file system of NVMe EBS volumes \(p. 1539\)](#)
- [Example: Extend the file system of EBS volumes \(p. 1541\)](#)

[Example: Extend the file system of NVMe EBS volumes](#)

For this example, suppose that you have an instance built on the [Nitro System \(p. 247\)](#), such as an M5 instance. You resized the boot volume from 8 GB to 16 GB and an additional volume from 8 GB to 30 GB. Use the following procedure to extend the file system of the resized volumes.

To extend the file system of NVMe EBS volumes

1. [Connect to your instance \(p. 611\)](#).
2. To verify the file system for each volume, use the **df -hT** command.

```
[ec2-user ~]$ df -hT
```

The following is example output for an instance that has a boot volume with an XFS file system and an additional volume with an XFS file system. The naming convention `/dev/nvme[0-26]n1` indicates that the volumes are exposed as NVMe block devices.

```
[ec2-user ~]$ df -hT
Filesystem      Type  Size  Used Avail Use% Mounted on
/dev/nvme0n1p1  xfs   8.0G  1.6G  6.5G  20% /
/dev/nvme1n1    xfs   8.0G   33M  8.0G   1% /data
...
...
```

3. To check whether the volume has a partition that must be extended, use the **lsblk** command to display information about the NVMe block devices attached to your instance.

```
[ec2-user ~]$ lsblk
NAME      MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT
nvme1n1    259:0    0  30G  0 disk /data
nvme0n1    259:1    0  16G  0 disk
##nvme0n1p1 259:2    0   8G  0 part /
##nvme0n1p128 259:3   0   1M  0 part
```

This example output shows the following:

- The root volume, `/dev/nvme0n1`, has a partition, `/dev/nvme0n1p1`. While the size of the root volume reflects the new size, 16 GB, the size of the partition reflects the original size, 8 GB, and must be extended before you can extend the file system.

- The volume `/dev/nvme1n1` has no partitions. The size of the volume reflects the new size, 30 GB.
4. For volumes that have a partition, such as the root volume shown in the previous step, use the **growpart** command to extend the partition. Notice that there is a space between the device name and the partition number.

```
[ec2-user ~]$ sudo growpart /dev/nvme0n1 1
```

5. (Optional) To verify that the partition reflects the increased volume size, use the **lsblk** command again.

```
[ec2-user ~]$ lsblk
NAME      MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT
nvme1n1    259:0   0   30G  0 disk /
nvme0n1    259:1   0   16G  0 disk
##nvme0n1p1 259:2   0   16G  0 part /
##nvme0n1p128 259:3  0    1M  0 part
```

6. To verify the size of the file system for each volume, use the **df -h** command. In this example output, both file systems reflect the original volume size, 8 GB.

```
[ec2-user ~]$ df -h
Filesystem      Size  Used Avail Use% Mounted on
/dev/nvme0n1p1  8.0G  1.6G  6.5G  20% /
/dev/nvme1n1    8.0G  33M   8.0G   1% /data
...
```

7. To extend the file system on each volume, use the correct command for your file system, as follows:
- [XFS file system] To extend the file system on each volume, use the **xfs_growfs** command. In this example, `/` and `/data` are the volume mount points shown in the output for **df -h**.

```
[ec2-user ~]$ sudo xfs_growfs -d /
[ec2-user ~]$ sudo xfs_growfs -d /data
```

If the XFS tools are not already installed, you can install them as follows.

```
[ec2-user ~]$ sudo yum install xfsprogs
```

- [ext4 file system] To extend the file system on each volume, use the **resize2fs** command.

```
[ec2-user ~]$ sudo resize2fs /dev/nvme0n1p1
[ec2-user ~]$ sudo resize2fs /dev/nvme1n1
```

- [Other file system] To extend the file system on each volume, refer to the documentation for your file system for instructions.
8. (Optional) To verify that each file system reflects the increased volume size, use the **df -h** command again.

```
[ec2-user ~]$ df -h
Filesystem      Size  Used Avail Use% Mounted on
/dev/nvme0n1p1  16G  1.6G  15G  10% /
/dev/nvme1n1    30G  33M   30G   1% /data
...
```

Example: Extend the file system of EBS volumes

For this example, suppose that you have resized the boot volume of an instance, such as a T2 instance, from 8 GB to 16 GB and an additional volume from 8 GB to 30 GB. Use the following procedure to extend the file system of the resized volumes.

To extend the file system of EBS volumes

1. [Connect to your instance \(p. 611\)](#).
2. To verify the file system in use for each volume, use the **df -hT** command.

```
[ec2-user ~]$ df -hT
```

The following is example output for an instance that has a boot volume with an ext4 file system and an additional volume with an XFS file system.

```
[ec2-user ~]$ df -hT
Filesystem      Type  Size  Used Avail Use% Mounted on
/dev/xvda1     ext4  8.0G  1.9G  6.2G  24% /
/dev/xvdf1     xfs   8.0G   45M  8.0G   1% /data
...
```

3. To check whether the volume has a partition that must be extended, use the **lsblk** command to display information about the block devices attached to your instance.

```
[ec2-user ~]$ lsblk
NAME   MAJ:MIN RM SIZE RO TYPE MOUNTPOINT
xvda   202:0    0  16G  0 disk
##xvda1 202:1    0   8G  0 part /
xvdf   202:80   0   30G  0 disk
##xvdf1 202:81   0   8G  0 part /data
```

This example output shows the following:

- The root volume, `/dev/xvda`, has a partition, `/dev/xvda1`. While the size of the volume is 16 GB, the size of the partition is still 8 GB and must be extended.
 - The volume `/dev/xvdf` has a partition, `/dev/xvdf1`. While the size of the volume is 30G, the size of the partition is still 8 GB and must be extended.
4. For volumes that have a partition, such as the volumes shown in the previous step, use the **growpart** command to extend the partition. Notice that there is a space between the device name and the partition number.

```
[ec2-user ~]$ sudo growpart /dev/xvda 1
[ec2-user ~]$ sudo growpart /dev/xvdf 1
```

5. (Optional) To verify that the partitions reflect the increased volume size, use the **lsblk** command again.

```
[ec2-user ~]$ lsblk
NAME   MAJ:MIN RM SIZE RO TYPE MOUNTPOINT
xvda   202:0    0  16G  0 disk
##xvda1 202:1    0  16G  0 part /
xvdf   202:80   0   30G  0 disk
##xvdf1 202:81   0   30G  0 part /data
```

6. To verify the size of the file system for each volume, use the **df -h** command. In this example output, both file systems reflect the original volume size, 8 GB.

```
[ec2-user ~]$ df -h
Filesystem      Size  Used Avail Use% Mounted on
/dev/xvda1       8.0G  1.9G  6.2G  24% /
/dev/xvdf1       8.0G   45M  8.0G   1% /data
...
```

7. To extend the file system on each volume, use the correct command for your file system, as follows:

- [XFS volumes] To extend the file system on each volume, use the **xfs_growfs** command. In this example, / and /data are the volume mount points shown in the output for **df -h**.

```
[ec2-user ~]$ sudo xfs_growfs -d /
[ec2-user ~]$ sudo xfs_growfs -d /data
```

If the XFS tools are not already installed, you can install them as follows.

```
[ec2-user ~]$ sudo yum install xfsprogs
```

- [ext4 volumes] To extend the file system on each volume, use the **resize2fs** command.

```
[ec2-user ~]$ sudo resize2fs /dev/xvda1
[ec2-user ~]$ sudo resize2fs /dev/xvdf1
```

- [Other file system] To extend the file system on each volume, refer to the documentation for your file system for instructions.

8. (Optional) To verify that each file system reflects the increased volume size, use the **df -h** command again.

```
[ec2-user ~]$ df -h
Filesystem      Size  Used Avail Use% Mounted on
/dev/xvda1       16G   1.9G  14G  12% /
/dev/xvdf1       30G   45M  30G   1% /data
...
```

Amazon EBS encryption

Use Amazon EBS encryption as a straight-forward encryption solution for your EBS resources associated with your EC2 instances. With Amazon EBS encryption, you aren't required to build, maintain, and secure your own key management infrastructure. Amazon EBS encryption uses AWS KMS keys when creating encrypted volumes and snapshots.

Encryption operations occur on the servers that host EC2 instances, ensuring the security of both data-at-rest and data-in-transit between an instance and its attached EBS storage.

You can attach both encrypted and unencrypted volumes to an instance simultaneously.

Contents

- [How EBS encryption works \(p. 1543\)](#)
- [Requirements \(p. 1544\)](#)
- [Default KMS key for EBS encryption \(p. 1545\)](#)
- [Encryption by default \(p. 1545\)](#)
- [Encrypt EBS resources \(p. 1546\)](#)
- [Encryption scenarios \(p. 1547\)](#)

- Set encryption defaults using the API and CLI (p. 1552)

How EBS encryption works

You can encrypt both the boot and data volumes of an EC2 instance.

When you create an encrypted EBS volume and attach it to a supported instance type, the following types of data are encrypted:

- Data at rest inside the volume
- All data moving between the volume and the instance
- All snapshots created from the volume
- All volumes created from those snapshots

EBS encrypts your volume with a data key using the industry-standard AES-256 algorithm. Your data key is stored on disk with your encrypted data, but not before EBS encrypts it with your KMS key. Your data key never appears on disk in plaintext. The same data key is shared by snapshots of the volume and any subsequent volumes created from those snapshots. For more information, see [Data keys](#) in the *AWS Key Management Service Developer Guide*.

Amazon EC2 works with AWS KMS to encrypt and decrypt your EBS volumes in slightly different ways depending on whether the snapshot from which you create an encrypted volume is encrypted or unencrypted.

How EBS encryption works when the snapshot is encrypted

When you create an encrypted volume from an encrypted snapshot that you own, Amazon EC2 works with AWS KMS to encrypt and decrypt your EBS volumes as follows:

1. Amazon EC2 sends a [GenerateDataKeyWithoutPlaintext](#) request to AWS KMS, specifying the KMS key that you chose for volume encryption.
2. AWS KMS generates a new data key, encrypts it under the KMS key that you chose for volume encryption, and sends the encrypted data key to Amazon EBS to be stored with the volume metadata.
3. When you attach the encrypted volume to an instance, Amazon EC2 sends a [CreateGrant](#) request to AWS KMS so that it can decrypt the data key.
4. AWS KMS decrypts the encrypted data key and sends the decrypted data key to Amazon EC2.
5. Amazon EC2 uses the plaintext data key in hypervisor memory to encrypt disk I/O to the volume. The plaintext data key persists in memory as long as the volume is attached to the instance.

How EBS encryption works when the snapshot is unencrypted

When you create an encrypted volume from unencrypted snapshot, Amazon EC2 works with AWS KMS to encrypt and decrypt your EBS volumes as follows:

1. Amazon EC2 sends a [CreateGrant](#) request to AWS KMS, so that it can encrypt the volume that is created from the snapshot.
2. Amazon EC2 sends a [GenerateDataKeyWithoutPlaintext](#) request to AWS KMS, specifying the KMS key that you chose for volume encryption.
3. AWS KMS generates a new data key, encrypts it under the KMS key that you chose for volume encryption, and sends the encrypted data key to Amazon EBS to be stored with the volume metadata.
4. Amazon EC2 sends a [Decrypt](#) request to AWS KMS to get the encryption key to encrypt the volume data.

5. When you attach the encrypted volume to an instance, Amazon EC2 sends a [CreateGrant](#) request to AWS KMS, so that it can decrypt the data key.
6. When you attach the encrypted volume to an instance, Amazon EC2 sends a [Decrypt](#) request to AWS KMS, specifying the encrypted data key.
7. AWS KMS decrypts the encrypted data key and sends the decrypted data key to Amazon EC2.
8. Amazon EC2 uses the plaintext data key in hypervisor memory to encrypt disk I/O to the volume. The plaintext data key persists in memory as long as the volume is attached to the instance.

For more information, see [How Amazon Elastic Block Store \(Amazon EBS\) uses AWS KMS](#) and [Amazon EC2 example two](#) in the *AWS Key Management Service Developer Guide*.

Requirements

Before you begin, verify that the following requirements are met.

Supported volume types

Encryption is supported by all EBS volume types. You can expect the same IOPS performance on encrypted volumes as on unencrypted volumes, with a minimal effect on latency. You can access encrypted volumes the same way that you access unencrypted volumes. Encryption and decryption are handled transparently, and they require no additional action from you or your applications.

Supported instance types

Amazon EBS encryption is available on all [current generation \(p. 241\)](#) instance types and the following [previous generation \(p. 245\)](#) instance types: A1, C3, cr1.8xlarge, G2, I2, M3, and R3.

Permissions for IAM users

When you configure a KMS key as the default key for EBS encryption, the default KMS key policy allows any IAM user with access to the required KMS actions to use this KMS key to encrypt or decrypt EBS resources. You must grant IAM users permission to call the following actions in order to use EBS encryption:

- `kms:CreateGrant`
- `kms:Decrypt`
- `kms:DescribeKey`
- `kms:GenerateDataKeyWithoutPlainText`
- `kms:ReEncrypt`

To follow the principle of least privilege, do not allow full access to `kms:CreateGrant`. Instead, allow the user to create grants on the KMS key only when the grant is created on the user's behalf by an AWS service, as shown in the following example.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "kms>CreateGrant",  
            "Resource": [  
                "arn:aws:kms:us-east-2:123456789012:key/abcd1234-a123-456d-a12b-  
a123b4cd56ef"  
            ],  
            "Condition": {  
                "StringEquals": {"aws:RequesterPrincipal": "arn:aws:lambda:us-east-2:  
123456789012:function:my-function"}  
        }  
    ]  
}
```

```
        "Bool": {
            "kms:GrantIsForAWSResource": true
        }
    }
}
```

For more information, see [Allows access to the AWS account and enables IAM policies](#) in the **Default key policy** section in the *AWS Key Management Service Developer Guide*.

Default KMS key for EBS encryption

Amazon EBS automatically creates a unique AWS managed key in each Region where you store AWS resources. This KMS key has the alias `alias/aws/ebs`. By default, Amazon EBS uses this KMS key for encryption. Alternatively, you can specify a symmetric customer managed key that you created as the default KMS key for EBS encryption. Using your own KMS key gives you more flexibility, including the ability to create, rotate, and disable KMS keys.

Important

Amazon EBS does not support asymmetric encryption KMS keys. For more information, see [Using symmetric and asymmetric encryption KMS keys](#) in the *AWS Key Management Service Developer Guide*.

New console

To configure the default KMS key for EBS encryption for a Region

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, select the Region.
3. From the navigation pane, select **EC2 Dashboard**.
4. In the upper-right corner of the page, choose **Account Attributes, EBS encryption**.
5. Choose **Manage**.
6. For **Default encryption key**, choose a symmetric customer managed key.
7. Choose **Update EBS encryption**.

Old console

To configure the default KMS key for EBS encryption for a Region

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, select the Region.
3. From the navigation pane, select **EC2 Dashboard**.
4. In the upper-right corner of the page, choose **Account Attributes, Settings**.
5. Choose **Change the default key** and then choose an available KMS key.
6. Choose **Save settings**.

Encryption by default

You can configure your AWS account to enforce the encryption of the new EBS volumes and snapshot copies that you create. For example, Amazon EBS encrypts the EBS volumes created when you launch an instance and the snapshots that you copy from an unencrypted snapshot. For examples of transitioning from unencrypted to encrypted EBS resources, see [Encrypt unencrypted resources \(p. 1547\)](#).

Encryption by default has no effect on existing EBS volumes or snapshots.

Considerations

- Encryption by default is a Region-specific setting. If you enable it for a Region, you cannot disable it for individual volumes or snapshots in that Region.
- When you enable encryption by default, you can launch an instance only if the instance type supports EBS encryption. For more information, see [Supported instance types \(p. 1544\)](#).
- If you copy a snapshot and encrypt it to a new KMS key, a complete (non-incremental) copy is created. This results in additional storage costs.
- When migrating servers using AWS Server Migration Service (SMS), do not turn on encryption by default. If encryption by default is already on and you are experiencing delta replication failures, turn off encryption by default. Instead, enable AMI encryption when you create the replication job.

New console

To enable encryption by default for a Region

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, select the Region.
3. From the navigation pane, select **EC2 Dashboard**.
4. In the upper-right corner of the page, choose **Account Attributes, EBS encryption**.
5. Choose **Manage**.
6. Select **Enable**. You keep the AWS managed key with the alias `alias/aws/ebs` created on your behalf as the default encryption key, or choose a symmetric customer managed key.
7. Choose **Update EBS encryption**.

Old console

To enable encryption by default for a Region

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, select the Region.
3. From the navigation pane, select **EC2 Dashboard**.
4. In the upper-right corner of the page, choose **Account Attributes, Settings**.
5. Under **EBS Storage**, select **Always encrypt new EBS volumes**.
6. Choose **Save settings**.

You cannot change the KMS key that is associated with an existing snapshot or encrypted volume. However, you can associate a different KMS key during a snapshot copy operation so that the resulting copied snapshot is encrypted by the new KMS key.

Encrypt EBS resources

You encrypt EBS volumes by enabling encryption, either using [encryption by default \(p. 1545\)](#) or by enabling encryption when you create a volume that you want to encrypt.

When you encrypt a volume, you can specify the symmetric encryption KMS key to use to encrypt the volume. If you do not specify a KMS key, the KMS key that is used for encryption depends on the encryption state of the source snapshot and its ownership. For more information, see the [encryption outcomes table \(p. 1551\)](#).

Note

If you are using the API or AWS CLI to specify a KMS key, be aware that AWS authenticates the KMS key asynchronously. If you specify a KMS key ID, an alias, or an ARN that is not valid, the action can appear to complete, but it eventually fails.

You cannot change the KMS key that is associated with an existing snapshot or volume. However, you can associate a different KMS key during a snapshot copy operation so that the resulting copied snapshot is encrypted by the new KMS key.

[Encrypt an empty volume on creation](#)

When you create a new, empty EBS volume, you can encrypt it by enabling encryption for the specific volume creation operation. If you enabled EBS encryption by default, the volume is automatically encrypted using your default KMS key for EBS encryption. Alternatively, you can specify a different symmetric encryption KMS key for the specific volume creation operation. The volume is encrypted by the time it is first available, so your data is always secured. For detailed procedures, see [Create an Amazon EBS volume \(p. 1371\)](#).

By default, the KMS key that you selected when creating a volume encrypts the snapshots that you make from the volume and the volumes that you restore from those encrypted snapshots. You cannot remove encryption from an encrypted volume or snapshot, which means that a volume restored from an encrypted snapshot, or a copy of an encrypted snapshot, is always encrypted.

Public snapshots of encrypted volumes are not supported, but you can share an encrypted snapshot with specific accounts. For detailed directions, see [Share an Amazon EBS snapshot \(p. 1441\)](#).

[Encrypt unencrypted resources](#)

You cannot directly encrypt existing unencrypted volumes or snapshots. However, you can create encrypted volumes or snapshots from unencrypted volumes or snapshots. If you enable encryption by default, Amazon EBS automatically encrypts new volumes and snapshots using your default KMS key for EBS encryption. Otherwise, you can enable encryption when you create an individual volume or snapshot, using either the default KMS key for EBS encryption or a symmetric customer managed key. For more information, see [Create an Amazon EBS volume \(p. 1371\)](#) and [Copy an Amazon EBS snapshot \(p. 1413\)](#).

To encrypt the snapshot copy to a customer managed key, you must both enable encryption and specify the KMS key, as shown in [Copy an unencrypted snapshot \(encryption by default not enabled\) \(p. 1549\)](#).

Important

Amazon EBS does not support asymmetric encryption KMS keys. For more information, see [Using Symmetric and Asymmetric encryption KMS keys](#) in the *AWS Key Management Service Developer Guide*.

You can also apply new encryption states when launching an instance from an EBS-backed AMI. This is because EBS-backed AMIs include snapshots of EBS volumes that can be encrypted as described. For more information, see [Use encryption with EBS-backed AMIs \(p. 203\)](#).

[Encryption scenarios](#)

When you create an encrypted EBS resource, it is encrypted by your account's default KMS key for EBS encryption unless you specify a different customer managed key in the volume creation parameters or the block device mapping for the AMI or instance. For more information, see [Default KMS key for EBS encryption \(p. 1545\)](#).

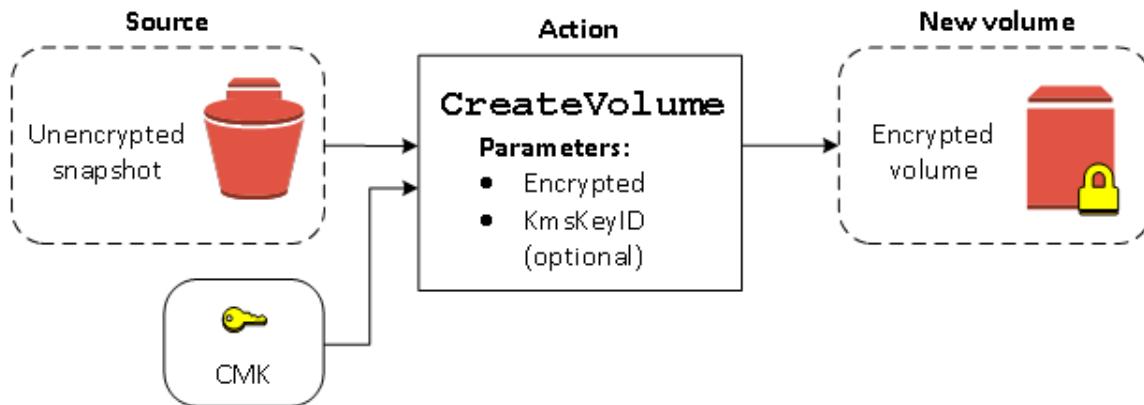

The following examples illustrate how you can manage the encryption state of your volumes and snapshots. For a full list of encryption cases, see the [encryption outcomes table \(p. 1551\)](#).

[Examples](#)

- [Restore an unencrypted volume \(encryption by default not enabled\) \(p. 1548\)](#)
- [Restore an unencrypted volume \(encryption by default enabled\) \(p. 1548\)](#)
- [Copy an unencrypted snapshot \(encryption by default not enabled\) \(p. 1549\)](#)
- [Copy an unencrypted snapshot \(encryption by default enabled\) \(p. 1549\)](#)
- [Re-encrypt an encrypted volume \(p. 1549\)](#)
- [Re-encrypt an encrypted snapshot \(p. 1550\)](#)
- [Migrate data between encrypted and unencrypted volumes \(p. 1550\)](#)
- [Encryption outcomes \(p. 1551\)](#)

Restore an unencrypted volume (encryption by default not enabled)

Without encryption by default enabled, a volume restored from an unencrypted snapshot is unencrypted by default. However, you can encrypt the resulting volume by setting the `Encrypted` parameter and, optionally, the `KmsKeyId` parameter. The following diagram illustrates the process.

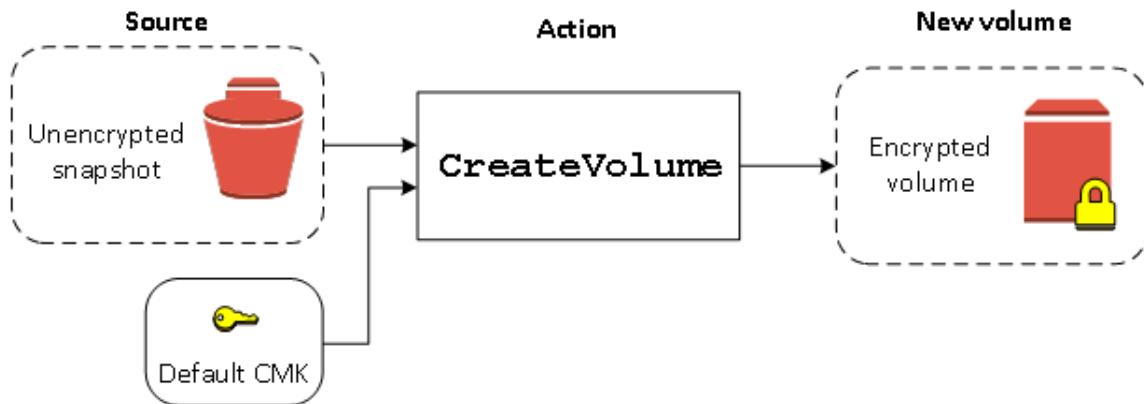

If you leave out the `KmsKeyId` parameter, the resulting volume is encrypted using your default KMS key for EBS encryption. You must specify a KMS key ID to encrypt the volume to a different KMS key.

For more information, see [Create a volume from a snapshot \(p. 1373\)](#).

Restore an unencrypted volume (encryption by default enabled)

When you have enabled encryption by default, encryption is mandatory for volumes restored from unencrypted snapshots, and no encryption parameters are required for your default KMS key to be used. The following diagram shows this simple default case:

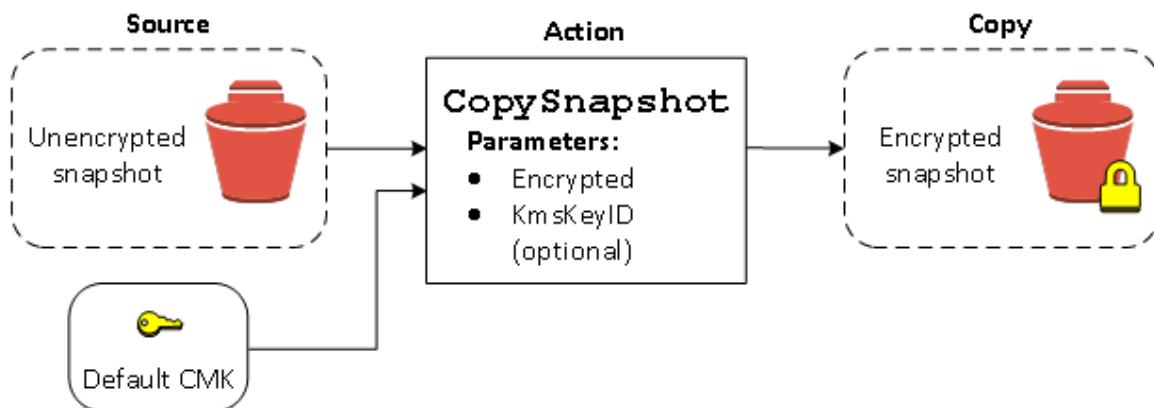

If you want to encrypt the restored volume to a symmetric customer managed key, you must supply both the `Encrypted` and `KmsKeyId` parameters as shown in [Restore an unencrypted volume \(encryption by default not enabled\) \(p. 1548\)](#).

[Copy an unencrypted snapshot \(encryption by default not enabled\)](#)

Without encryption by default enabled, a copy of an unencrypted snapshot is unencrypted by default. However, you can encrypt the resulting snapshot by setting the `Encrypted` parameter and, optionally, the `KmsKeyId` parameter. If you omit `KmsKeyId`, the resulting snapshot is encrypted by your default KMS key. You must specify a KMS key ID to encrypt the volume to a different symmetric encryption KMS key.

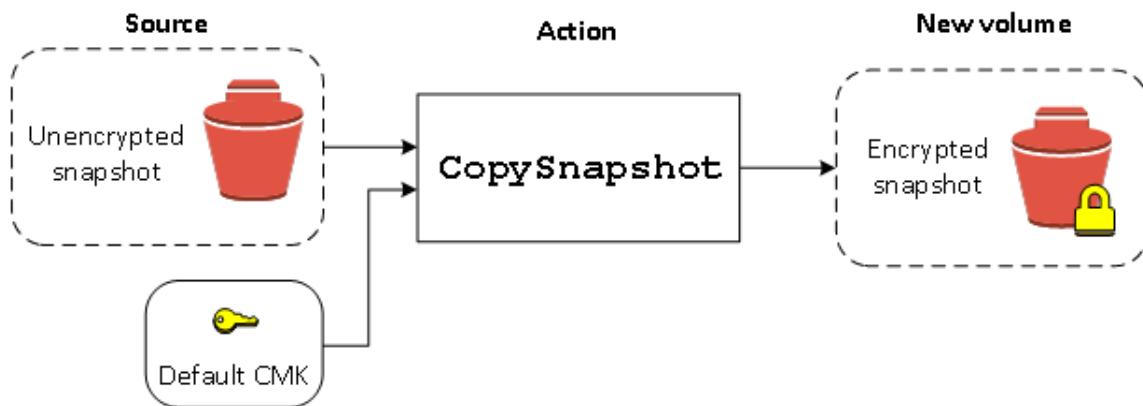

The following diagram illustrates the process.

You can encrypt an EBS volume by copying an unencrypted snapshot to an encrypted snapshot and then creating a volume from the encrypted snapshot. For more information, see [Copy an Amazon EBS snapshot \(p. 1413\)](#).

[Copy an unencrypted snapshot \(encryption by default enabled\)](#)

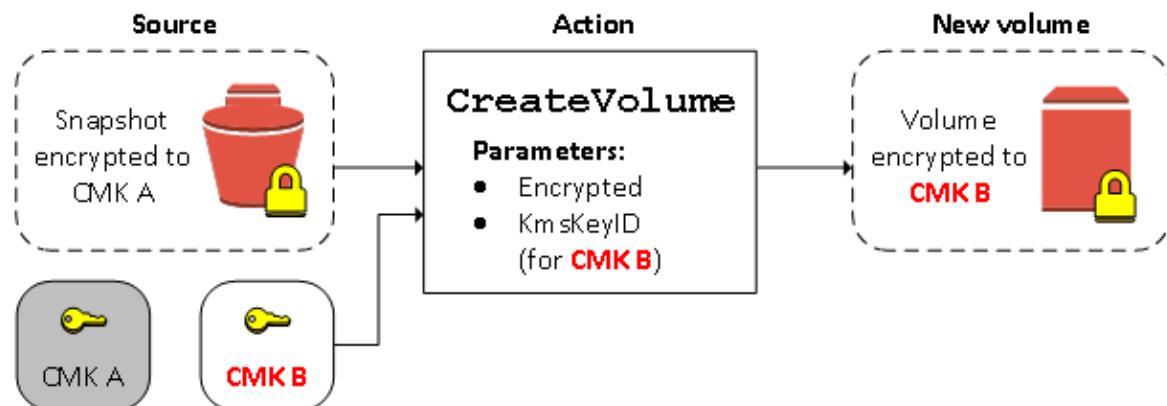

When you have enabled encryption by default, encryption is mandatory for copies of unencrypted snapshots, and no encryption parameters are required if your default KMS key is used. The following diagram illustrates this default case:

[Re-encrypt an encrypted volume](#)

When the `CreateVolume` action operates on an encrypted snapshot, you have the option of re-encrypting it with a different KMS key. The following diagram illustrates the process. In this example, you own two KMS keys, KMS key A and KMS key B. The source snapshot is encrypted by KMS key A.

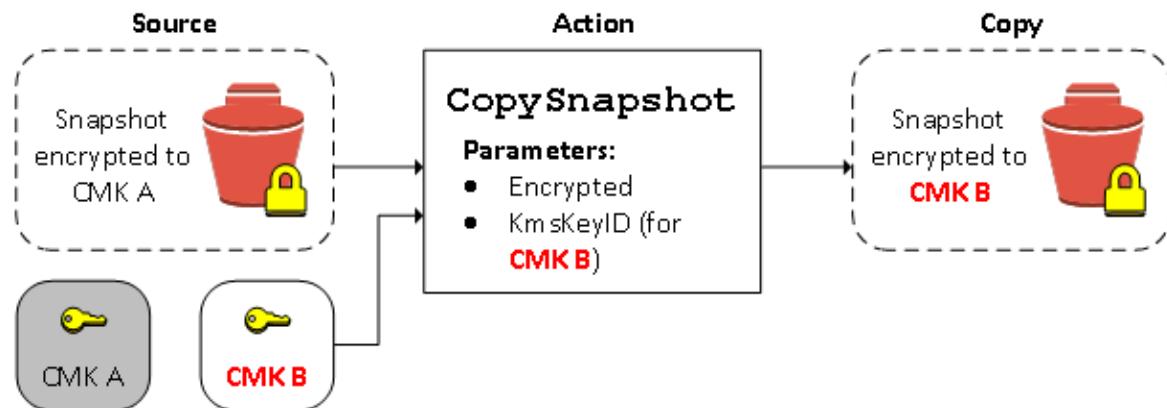

During volume creation, with the KMS key ID of KMS key B specified as a parameter, the source data is automatically decrypted, then re-encrypted by KMS key B.

For more information, see [Create a volume from a snapshot \(p. 1373\)](#).

[Re-encrypt an encrypted snapshot](#)

The ability to encrypt a snapshot during copying allows you to apply a new symmetric encryption KMS key to an already-encrypted snapshot that you own. Volumes restored from the resulting copy are only accessible using the new KMS key. The following diagram illustrates the process. In this example, you own two KMS keys, KMS key A and KMS key B. The source snapshot is encrypted by KMS key A. During copy, with the KMS key ID of KMS key B specified as a parameter, the source data is automatically re-encrypted by KMS key B.

In a related scenario, you can choose to apply new encryption parameters to a copy of a snapshot that has been shared with you. By default, the copy is encrypted with a KMS key shared by the snapshot's owner. However, we recommend that you create a copy of the shared snapshot using a different KMS key that you control. This protects your access to the volume if the original KMS key is compromised, or if the owner revokes the KMS key for any reason. For more information, see [Encryption and snapshot copying \(p. 1415\)](#).

[Migrate data between encrypted and unencrypted volumes](#)

When you have access to both an encrypted and unencrypted volume, you can freely transfer data between them. EC2 carries out the encryption and decryption operations transparently.

For example, use the `rsync` command to copy the data. In the following command, the source data is located in `/mnt/source` and the destination volume is mounted at `/mnt/destination`.

```
[ec2-user ~]$ sudo rsync -avh --progress /mnt/source/ /mnt/destination/
```

Encryption outcomes

The following table describes the encryption outcome for each possible combination of settings.

Is encryption enabled?	Is encryption by default enabled?	Source of volume	Default (no customer managed key specified)	Custom (customer managed key specified)
No	No	New (empty) volume	Unencrypted	N/A
No	No	Unencrypted snapshot that you own	Unencrypted	
No	No	Encrypted snapshot that you own	Encrypted by same key	
No	No	Unencrypted snapshot that is shared with you	Unencrypted	
No	No	Encrypted snapshot that is shared with you	Encrypted by default customer managed key*	
Yes	No	New volume	Encrypted by default customer managed key	Encrypted by a specified customer managed key**
Yes	No	Unencrypted snapshot that you own	Encrypted by default customer managed key	
Yes	No	Encrypted snapshot that you own	Encrypted by same key	
Yes	No	Unencrypted snapshot that is shared with you	Encrypted by default customer managed key	
Yes	No	Encrypted snapshot that is shared with you	Encrypted by default customer managed key	
No	Yes	New (empty) volume	Encrypted by default customer managed key	N/A
No	Yes	Unencrypted snapshot that you own	Encrypted by default customer managed key	
No	Yes	Encrypted snapshot that you own	Encrypted by same key	
No	Yes	Unencrypted snapshot that is shared with you	Encrypted by default customer managed key	

Is encryption enabled?	Is encryption by default enabled?	Source of volume	Default (no customer managed key specified)	Custom (customer managed key specified)
No	Yes	Encrypted snapshot that is shared with you	Encrypted by default customer managed key	
Yes	Yes	New volume	Encrypted by default customer managed key	Encrypted by a specified customer managed key
Yes	Yes	Unencrypted snapshot that you own	Encrypted by default customer managed key	
Yes	Yes	Encrypted snapshot that you own	Encrypted by same key	
Yes	Yes	Unencrypted snapshot that is shared with you	Encrypted by default customer managed key	
Yes	Yes	Encrypted snapshot that is shared with you	Encrypted by default customer managed key	

* This is the default customer managed key used for EBS encryption for the AWS account and Region. By default this is a unique AWS managed key for EBS, or you can specify a customer managed key. For more information, see [Default KMS key for EBS encryption \(p. 1545\)](#).

** This is a customer managed key specified for the volume at launch time. This customer managed key is used instead of the default customer managed key for the AWS account and Region.

Set encryption defaults using the API and CLI

You can manage encryption by default and the default KMS key using the following API actions and CLI commands.

API action	CLI command	Description
DisableEbsEncryptionByDefault	<code>disable-ebs-encryption-by-default</code>	Disables encryption by default.
EnableEbsEncryptionByDefault	<code>enable-ebs-encryption-by-default</code>	Enables encryption by default.
GetEbsDefaultKmsKeyId	<code>get-ebs-default-kms-key-id</code>	Describes the default KMS key.
GetEbsEncryptionByDefault	<code>get-ebs-encryption-by-default</code>	Indicates whether encryption by default is enabled.
ModifyEbsDefaultKmsKeyId	<code>modify-ebs-default-kms-key-id</code>	Changes the default KMS key used to encrypt EBS volumes.

API action	CLI command	Description
ResetEbsDefaultKmsKeyId	<code>reset-ebs-default-kms-key-id</code>	Resets the AWS managed key as the default KMS key used to encrypt EBS volumes.

Amazon EBS fast snapshot restore

Amazon EBS fast snapshot restore (FSR) enables you to create a volume from a snapshot that is fully initialized at creation. This eliminates the latency of I/O operations on a block when it is accessed for the first time. Volumes that are created using fast snapshot restore instantly deliver all of their provisioned performance.

To get started, enable fast snapshot restore for specific snapshots in specific Availability Zones. Each snapshot and Availability Zone pair refers to one fast snapshot restore. When you create a volume from one of these snapshots in one of its enabled Availability Zones, the volume is restored using fast snapshot restore.

Fast snapshot restore must be explicitly enabled on a per-snapshot basis. If you create a new snapshot from a volume that was restored from a fast snapshot restore-enabled snapshot, the new snapshot is not automatically enabled for fast snapshot restore. You must explicitly enable it for the new snapshot.

The number of volumes that you can restore with the full performance benefit of fast snapshot restore is determined by volume creation credits for the snapshot. For more information see [Volume creation credits \(p. 1553\)](#).

You can enable fast snapshot restore for snapshots that you own and for public and private snapshots that are shared with you.

Contents

- [Volume creation credits \(p. 1553\)](#)
- [Manage fast snapshot restore \(p. 1554\)](#)
- [Monitor fast snapshot restore \(p. 1558\)](#)
- [Fast snapshot restore quotas \(p. 1558\)](#)
- [Pricing and Billing \(p. 1558\)](#)

Volume creation credits

The number of volumes that receive the full performance benefit of fast snapshot restore is determined by the volume creation credits for the snapshot. There is one credit bucket per snapshot per Availability Zone. Each volume that you create from a snapshot with fast snapshot restore enabled consumes one credit from the credit bucket. You must have at least one credit in the bucket to create an initialized volume from the snapshot. If you create a volume but there is less than one credit in the bucket, the volume is created without benefit of fast snapshot restore.

When you enable fast snapshot restore for a snapshot that is shared with you, you get a separate credit bucket for the shared snapshot in your account. If you create volumes from the shared snapshot, the credits are consumed from your credit bucket; they are not consumed from the snapshot owner's credit bucket.

The size of a credit bucket and the rate at which it refills depends on the size of the snapshot, not the size of the volumes created from the snapshot.

When you enable fast snapshot restore for a snapshot, the credit bucket starts with zero credits, and it gets filled at a set rate until it reaches its maximum credit capacity. Also, as you consume credits, the credit bucket is refilled over time until it reaches its maximum credit capacity.

The fill rate for a credit bucket is calculated as follows:

```
MIN (10, (1024 ÷ snapshot_size_gib))
```

And the size of the credit bucket is calculated as follows:

```
MAX (1, MIN (10, (1024 ÷ snapshot_size_gib)))
```

For example, if you enable fast snapshot restore for a snapshot with a size of 128 GiB, the fill rate is 0.1333 credits per minute.

```
MIN (10, (1024 ÷ 128))
= MIN (10, 8)
= 8 credits per hour
= 0.1333 credits per minute
```

And the maximum size of the credit bucket is 8 credits.

```
MAX (1, MIN (10, (1024 ÷ 128)))
= MAX (1, MIN (10, 8))
= MAX (1, 8)
= 8 credits
```

In this example, when you enable fast snapshot restore, the credit bucket starts with zero credits. After 8 minutes, the credit bucket has enough credits to create one initialized volume ($0.1333 \text{ credits} \times 8 \text{ minutes} = 1.066 \text{ credits}$). When the credit bucket is full, you can create 8 initialized volumes simultaneously (8 credits). When the bucket is below its maximum capacity, it refills with 0.1333 credits per minute.

You can use Cloudwatch metrics to monitor the size of your credit buckets and the number of credits available in each bucket. For more information, see [Fast snapshot restore metrics \(p. 1608\)](#).

After you create a volume from a snapshot with fast snapshot restore enabled, you can describe the volume using [describe-volumes](#) and check the `fastRestored` field in the output to determine whether the volume was created as an initialized volume using fast snapshot restore.

Manage fast snapshot restore

Topics

- [Enable or disable fast snapshot restore \(p. 1554\)](#)
- [View the fast snapshot restore state for a snapshot \(p. 1556\)](#)
- [View volumes restored using fast snapshot restore \(p. 1557\)](#)

Enable or disable fast snapshot restore

Fast snapshot restore is disabled for a snapshot by default. You can enable or disable fast snapshot restore for snapshots that you own and for snapshots that are shared with you. When you enable or disable fast snapshot restore for a snapshot, the changes apply to your account only.

Note

When you enable fast snapshot restore for a snapshot, your account is billed for each minute that fast snapshot restore is enabled in a particular Availability Zone. Charges are pro-rated and have a minimum of one hour.

When you delete a snapshot that you own, fast snapshot restore is automatically disabled for that snapshot in your account. If you enabled fast snapshot restore for a snapshot that is shared with you, and the snapshot owner deletes or unshares it, fast snapshot restore is automatically disabled for the shared snapshot in your account.

If you enabled fast snapshot restore for a snapshot that is shared with you, and it has been encrypted using a custom CMK, fast snapshot restore is not automatically disabled for the snapshot when the snapshot owner revokes your access to the custom CMK. You must manually disable fast snapshot restore for that snapshot.

Use one of the following methods to enable or disable fast snapshot restore for a snapshot that you own or for a snapshot that is shared with you.

New console

To enable or disable fast snapshot restore

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Snapshots**.
3. Select the snapshot, and choose **Actions, Manage fast snapshot restore**.
4. The **Fast snapshot restore settings** section lists all of the Availability Zones, Local Zones, and Wavelength Zones in which you can enable fast snapshot restore for the selected snapshot. The **Current status** volume indicates whether fast snapshot restore is current enabled or disabled for each zone.

To enable fast snapshot restore in a zone where it is currently disabled, select the zone, choose **Enable**, and then to confirm, choose **Enable**.

To disable fast snapshot restore in a zone where it is currently enabled, select the zone, and then choose **Disable**.

5. After you have made the required changes, choose **Close**.

Old console

To enable or disable fast snapshot restore

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Snapshots**.
3. Select the snapshot.
4. Choose **Actions, Manage Fast Snapshot Restore**.
5. Select or deselect Availability Zones, and then choose **Save**.
6. To track the state of fast snapshot restore as it is enabled, see **Fast Snapshot Restore** on the **Description** tab.

AWS CLI

To manage fast snapshot restore using the AWS CLI

- [enable-fast-snapshot-restores](#)
- [disable-fast-snapshot-restores](#)
- [describe-fast-snapshot-restores](#)

Note

After you enable fast snapshot restore for a snapshot, it enters the optimizing state. Snapshots that are in the optimizing state provide some performance benefits when using them to restore volumes. They start to provide the full performance benefits of fast snapshot restore only after they enter the enabled state.

View the fast snapshot restore state for a snapshot

Fast snapshot restore for a snapshot can be in one of the following states.

- **enabling** — A request was made to enable fast snapshot restore.
- **optimizing** — Fast snapshot restore is being enabled. It takes 60 minutes per TiB to optimize a snapshot. Snapshots in this state offer some performance benefit when restoring volumes.
- **enabled** — Fast snapshot restore is enabled. Snapshots in this state offer the full performance benefit when restoring volumes.
- **disabling** — A request was made to disable fast snapshot restore, or a request to enable fast snapshot restore failed.
- **disabled** — Fast snapshot restore is disabled. You can enable fast snapshot restore again as needed.

Use one of the following methods to view the state of fast snapshot restore for a snapshot that you own or for a snapshot that is shared with you.

New console

To view the state of fast snapshot restore using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Snapshots**.
3. Select the snapshot.
4. On the **Details** tab, **Fast snapshot restore**, indicates the state of fast snapshot restore.

Old console

To view the state of fast snapshot restore using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Snapshots**.
3. Select the snapshot.
4. On the **Description** tab, see **Fast Snapshot Restore**, which indicates the state of fast snapshot restore. For example, it might show a state of "2 Availability Zones optimizing" or "2 Availability Zones enabled".

AWS CLI

To view snapshots with fast snapshot restore enabled using the AWS CLI

Use the [describe-fast-snapshot-restores](#) command to describe the snapshots that are enabled for fast snapshot restore.

```
aws ec2 describe-fast-snapshot-restores --filters Name=state,Values=enabled
```

The following is example output.

```
{  
    "FastSnapshotRestores": [  
        {  
            "SnapshotId": "snap-0e946653493cb0447",  
            "AvailabilityZone": "us-east-2a",  
            "State": "enabled",  
            "StateTransitionReason": "Client.UserInitiated - Lifecycle state transition",  
            "OwnerId": "123456789012",  
            "EnablingTime": "2020-01-25T23:57:49.596Z",  
            "OptimizingTime": "2020-01-25T23:58:25.573Z",  
            "EnabledTime": "2020-01-25T23:59:29.852Z"  
        },  
        {  
            "SnapshotId": "snap-0e946653493cb0447",  
            "AvailabilityZone": "us-east-2b",  
            "State": "enabled",  
            "StateTransitionReason": "Client.UserInitiated - Lifecycle state transition",  
            "OwnerId": "123456789012",  
            "EnablingTime": "2020-01-25T23:57:49.596Z",  
            "OptimizingTime": "2020-01-25T23:58:25.573Z",  
            "EnabledTime": "2020-01-25T23:59:29.852Z"  
        }  
    ]  
}
```

View volumes restored using fast snapshot restore

When you create a volume from a snapshot that is enabled for fast snapshot restore in the Availability Zone for the volume, it is restored using fast snapshot restore.

Use the [describe-volumes](#) command to view volumes that were created from a snapshot that is enabled for fast snapshot restore.

```
aws ec2 describe-volumes --filters Name=fast-restored,Values=true
```

The following is example output.

```
{  
    "Volumes": [  
        {  
            "Attachments": [],  
            "AvailabilityZone": "us-east-2a",  
            "CreateTime": "2020-01-26T00:34:11.093Z",  
            "Encrypted": true,  
            "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/8c5b2c63-b9bc-45a3-a87a-5513e232e843",  
            "Size": 20,  
            "SnapshotId": "snap-0e946653493cb0447",  
            "State": "available",  
            "VolumeId": "vol-0d371921d4ca797b0",  
            "Iops": 100,  
            "VolumeType": "gp2",  
            "FastRestored": true  
        }  
    ]  
}
```

Monitor fast snapshot restore

Amazon EBS emits Amazon CloudWatch events when the fast snapshot restore state for a snapshot changes. For more information, see [EBS fast snapshot restore events \(p. 1617\)](#).

Fast snapshot restore quotas

You can enable up to 50 snapshots for fast snapshot restore per Region. The quota applies to snapshots that you own and snapshots that are shared with you. If you enable fast snapshot restore for a snapshot that is shared with you, it counts towards your fast snapshot restore quota. It does not count towards the snapshot owner's fast snapshot restore quota.

Pricing and Billing

You are billed for each minute that fast snapshot restore is enabled for a snapshot in a particular Availability Zone. Charges are pro-rated with a minimum of one hour.

For example, if you enable fast snapshot restore for one snapshot in `us-East-1a` for one month (30 days), you are billed **\$540** (1 snapshot x 1 AZ x 720 hours x \$0.75 per hour). If you enable fast snapshot restore for two snapshots in `us-east-1a`, `us-east-1b`, and `us-east-1c` for the same period, you are billed **\$3240** (2 snapshots x 3 AZs x 720 hours x \$0.75 per hour).

If you enable fast snapshot restore for a public or private snapshot that is shared with you, your account is billed; the snapshot owner is not billed. When a snapshot that is shared with you is deleted or unshared by the snapshot owner, fast snapshot restore is disabled for the snapshot in your account and billing is stopped.

For more information, see [Amazon EBS pricing](#).

Amazon EBS and NVMe on Linux instances

EBS volumes are exposed as NVMe block devices on instances built on the [Nitro System \(p. 247\)](#). The device names are `/dev/nvme0n1`, `/dev/nvme1n1`, and so on. The device names that you specify in a block device mapping are renamed using NVMe device names (`/dev/nvme[0-26]n1`). The block device driver can assign NVMe device names in a different order than you specified for the volumes in the block device mapping.

The EBS performance guarantees stated in [Amazon EBS Product Details](#) are valid regardless of the block-device interface.

Contents

- [Install or upgrade the NVMe driver \(p. 1558\)](#)
- [Identify the EBS device \(p. 1559\)](#)
- [Work with NVMe EBS volumes \(p. 1561\)](#)
- [I/O operation timeout \(p. 1562\)](#)
- [Abort command \(p. 1562\)](#)

Install or upgrade the NVMe driver

To access NVMe volumes, the NVMe drivers must be installed. Instances can support NVMe EBS volumes, NVMe instance store volumes, both types of NVMe volumes, or no NVMe volumes. For more information, see [Summary of networking and storage features \(p. 248\)](#).

The following AMIs include the required NVMe drivers:

- Amazon Linux 2

- Amazon Linux AMI 2018.03
- Ubuntu 14.04 (with `linux-aws` kernel) or later
- Red Hat Enterprise Linux 7.4 or later
- SUSE Linux Enterprise Server 12 SP2 or later
- CentOS 7.4.1708 or later
- FreeBSD 11.1 or later
- Debian GNU/Linux 9 or later

For more information about NVMe drivers on Windows instances, see [Amazon EBS and NVMe on Windows Instances](#) in the *Amazon EC2 User Guide for Windows Instances*.

To confirm that your instance has the NVMe driver

You can confirm that your instance has the NVMe driver and check the driver version using the following command. If the instance has the NVMe driver, the command returns information about the driver.

```
$ modinfo nvme
```

To update the NVMe driver

If your instance has the NVMe driver, you can update the driver to the latest version using the following procedure.

1. Connect to your instance.
2. Update your package cache to get necessary package updates as follows.

- For Amazon Linux 2, Amazon Linux, CentOS, and Red Hat Enterprise Linux:

```
[ec2-user ~]$ sudo yum update -y
```

- For Ubuntu and Debian:

```
[ec2-user ~]$ sudo apt-get update -y
```

3. Ubuntu 16.04 and later include the `linux-aws` package, which contains the NVMe and ENA drivers required by Nitro-based instances. Upgrade the `linux-aws` package to receive the latest version as follows:

```
[ec2-user ~]$ sudo apt-get install --only-upgrade -y linux-aws
```

For Ubuntu 14.04, you can install the latest `linux-aws` package as follows:

```
[ec2-user ~]$ sudo apt-get install linux-aws
```

4. Reboot your instance to load the latest kernel version.

```
sudo reboot
```

5. Reconnect to your instance after it has rebooted.

Identify the EBS device

EBS uses single-root I/O virtualization (SR-IOV) to provide volume attachments on Nitro-based instances using the NVMe specification. These devices rely on standard NVMe drivers on the operating

system. These drivers typically discover attached devices by scanning the PCI bus during instance boot, and create device nodes based on the order in which the devices respond, not on how the devices are specified in the block device mapping. In Linux, NVMe device names follow the pattern `/dev/nvme<x>n<y>`, where `<x>` is the enumeration order, and, for EBS, `<y>` is 1. Occasionally, devices can respond to discovery in a different order in subsequent instance starts, which causes the device name to change. Additionally, the device name assigned by the block device driver can be different from the name specified in the block device mapping.

We recommend that you use stable identifiers for your EBS volumes within your instance, such as one of the following:

- For Nitro-based instances, the block device mappings that are specified in the Amazon EC2 console when you are attaching an EBS volume or during `AttachVolume` or `RunInstances` API calls are captured in the vendor-specific data field of the NVMe controller identification. With Amazon Linux AMIs later than version 2017.09.01, we provide a udev rule that reads this data and creates a symbolic link to the block-device mapping.
- The EBS volume ID and the mount point are stable between instance state changes. The NVMe device name can change depending on the order in which the devices respond during instance boot. We recommend using the EBS volume ID and the mount point for consistent device identification.
- NVMe EBS volumes have the EBS volume ID set as the serial number in the device identification. Use the `lsblk -o +SERIAL` command to list the serial number.
- The NVMe device name format can vary depending on whether the EBS volume was attached during or after the instance launch. NVMe device names for volumes attached after instance launch include the `/dev/` prefix, while NVMe device names for volumes attached during instance launch do not include the `/dev/` prefix. If you are using an Amazon Linux or FreeBSD AMI, use the `sudo ebsnvme-id /dev/nvme0n1 -u` command for a consistent NVMe device name. For other distributions, use the `sudo ebsnvme-id /dev/nvme0n1 -u` command to determine the NVMe device name.
- When a device is formatted, a UUID is generated that persists for the life of the filesystem. A device label can be specified at the same time. For more information, see [Make an Amazon EBS volume available for use on Linux \(p. 1382\)](#) and [Boot from the wrong volume \(p. 1750\)](#).

Amazon Linux AMIs

With Amazon Linux AMI 2017.09.01 or later (including Amazon Linux 2), you can run the `ebsnvme-id` command as follows to map the NVMe device name to a volume ID and device name:

The following example shows the command and output for a volume attached during instance launch. Note that the NVMe device name does not include the `/dev/` prefix.

```
[ec2-user ~]$ sudo /sbin/ebsnvme-id /dev/nvme0n1
Volume ID: vol-01324f611e2463981
sda
```

The following example shows the command and output for a volume attached after instance launch. Note that the NVMe device name includes the `/dev/` prefix.

```
[ec2-user ~]$ sudo /sbin/ebsnvme-id /dev/nvme1n1
Volume ID: vol-064784f1011136656
/dev/sdf
```

Amazon Linux also creates a symbolic link from the device name in the block device mapping (for example, `/dev/sdf`), to the NVMe device name.

FreeBSD AMIs

Starting with FreeBSD 12.2-RELEASE, you can run the `ebsnvme-id` command as shown above. Pass either the name of the NVMe device (for example, `nvme0`) or the disk device (for example, `nvd0`

or `nda0`). FreeBSD also creates symbolic links to the disk devices (for example, `/dev/aws/disk/ebs/volume_id`).

Other Linux AMIs

With a kernel version of 4.2 or later, you can run the `nvme id-ctrl` command as follows to map an NVMe device to a volume ID. First, install the NVMe command line package, `nvme-cli`, using the package management tools for your Linux distribution. For download and installation instructions for other distributions, refer to the documentation specific to your distribution.

The following example gets the volume ID and NVMe device name for a volume that was attached during instance launch. Note that the NVMe device name does not include the `/dev/` prefix. The device name is available through the NVMe controller vendor-specific extension (bytes 384:4095 of the controller identification):

```
[ec2-user ~]$ sudo nvme id-ctrl -v /dev/nvme0n1
NVME Identify Controller:
vid      : 0x1d0f
ssvid    : 0x1d0f
sn      : vol01234567890abcdef
mn      : Amazon Elastic Block Store
...
0000: 2f 64 65 76 2f 73 64 6a 20 20 20 20 20 20 20 "sda..."
```

The following example gets the volume ID and NVMe device name for a volume that was attached after instance launch. Note that the NVMe device name includes the `/dev/` prefix.

```
[ec2-user ~]$ sudo nvme id-ctrl -v /dev/nvme1n1
NVME Identify Controller:
vid      : 0x1d0f
ssvid    : 0x1d0f
sn      : volabcdef01234567890
mn      : Amazon Elastic Block Store
...
0000: 2f 64 65 76 2f 73 64 6a 20 20 20 20 20 20 20 20 "/dev/sdf..."
```

The `lsblk` command lists available devices and their mount points (if applicable). This helps you determine the correct device name to use. In this example, `/dev/nvme0n1p1` is mounted as the root device and `/dev/nvme1n1` is attached but not mounted.

```
[ec2-user ~]$ lsblk
NAME      MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT
nvme1n1    259:3   0  100G  0 disk
nvme0n1    259:0   0     8G  0 disk
nvme0n1p1  259:1   0     8G  0 part /
nvme0n1p128 259:2   0     1M  0 part
```

Work with NVMe EBS volumes

To format and mount an NVMe EBS volume, see [Make an Amazon EBS volume available for use on Linux \(p. 1382\)](#).

If you are using Linux kernel 4.2 or later, any change you make to the volume size of an NVMe EBS volume is automatically reflected in the instance. For older Linux kernels, you might need to detach and attach the EBS volume or reboot the instance for the size change to be reflected. With Linux kernel 3.19 or later, you can use the `hdparm` command as follows to force a rescan of the NVMe device:

```
[ec2-user ~]$ sudo hdparm -z /dev/nvme1n1
```

When you detach an NVMe EBS volume, the instance does not have an opportunity to flush the file system caches or metadata before detaching the volume. Therefore, before you detach an NVMe EBS volume, you should first sync and unmount it. If the volume fails to detach, you can attempt a `force-detach` command as described in [Detach an Amazon EBS volume from a Linux instance \(p. 1400\)](#).

I/O operation timeout

EBS volumes attached to Nitro-based instances use the default NVMe driver provided by the operating system. Most operating systems specify a timeout for I/O operations submitted to NVMe devices. The default timeout is 30 seconds and can be changed using the `nvme_core.io_timeout` boot parameter. For most Linux kernels earlier than version 4.6, this parameter is `nvme.io_timeout`.

If I/O latency exceeds the value of this timeout parameter, the Linux NVMe driver fails the I/O and returns an error to the filesystem or application. Depending on the I/O operation, your filesystem or application can retry the error. In some cases, your filesystem might be remounted as read-only.

For an experience similar to EBS volumes attached to Xen instances, we recommend setting `nvme_core.io_timeout` to the highest value possible. For current kernels, the maximum is 4294967295, while for earlier kernels the maximum is 255. Depending on the version of Linux, the timeout might already be set to the supported maximum value. For example, the timeout is set to 4294967295 by default for Amazon Linux AMI 2017.09.01 and later.

You can verify the maximum value for your Linux distribution by writing a value higher than the suggested maximum to `/sys/module/nvme_core/parameters/io_timeout` and checking for the Numerical result out of range error when attempting to save the file.

Abort command

The Abort command is an NVMe Admin command that is issued to abort a specific command that was previously submitted to the controller. This command is typically issued by the device driver to storage devices that have exceeded the I/O operation timeout threshold. Amazon EC2 instance types that support the Abort command by default will abort a specific command that was previously submitted to the controller of the attached Amazon EBS device to which an Abort command is issued.

The following instance types support the Abort command for all attached Amazon EBS volumes by default: R5b, R6i, M6i, M6a, C6gn, C6i, X2gd, X2iezn, Im4gn, Is4gen.

Other instance types take no action when Abort commands are issued to attached Amazon EBS volumes.

Amazon EBS devices with NVMe device version 1.4 or higher support the Abort command.

For more information, see section [5.1 Abort command](#) of the [NVM Express Base Specification](#).

Amazon EBS-optimized instances

An Amazon EBS-optimized instance uses an optimized configuration stack and provides additional, dedicated capacity for Amazon EBS I/O. This optimization provides the best performance for your EBS volumes by minimizing contention between Amazon EBS I/O and other traffic from your instance.

EBS-optimized instances deliver dedicated bandwidth to Amazon EBS. When attached to an EBS-optimized instance, General Purpose SSD (`gp2` and `gp3`) volumes are designed to deliver their baseline and burst performance 99% of the time, and Provisioned IOPS SSD (`io1` and `io2`) volumes are designed to deliver their provisioned performance 99.9% of the time. Both Throughput Optimized HDD (`st1`) and Cold HDD (`sc1`) guarantee performance consistency of 90% of burst throughput 99% of the time. Non-compliant periods are approximately uniformly distributed, targeting 99% of expected total throughput each hour. For more information, see [Amazon EBS volume types \(p. 1352\)](#).

Contents

- [Supported instance types \(p. 1563\)](#)
- [Get maximum performance \(p. 1585\)](#)
- [View instances types that support EBS optimization \(p. 1585\)](#)
- [Enable EBS optimization at launch \(p. 1586\)](#)
- [Enable EBS optimization for an existing instance \(p. 1587\)](#)

Supported instance types

The following tables show which instance types support EBS optimization. They include the dedicated bandwidth to Amazon EBS, the typical maximum aggregate throughput that can be achieved on that connection with a streaming read workload and 128 KiB I/O size, and the maximum IOPS the instance can support if you are using a 16 KiB I/O size. Choose an EBS–optimized instance that provides more dedicated Amazon EBS throughput than your application needs; otherwise, the connection between Amazon EBS and Amazon EC2 can become a performance bottleneck.

EBS optimized by default

The following table lists the instance types that support EBS optimization and EBS optimization is enabled by default. There is no need to enable EBS optimization and no effect if you disable EBS optimization.

Note

You can also view this information programatically using the AWS CLI. For more information, see [View instances types that support EBS optimization \(p. 1585\)](#).

EBS optimization supported

The following table lists the instance types that support EBS optimization but EBS optimization is not enabled by default. You can enable EBS optimization when you launch these instances or after they are running. Instances must have EBS optimization enabled to achieve the level of performance described. When you enable EBS optimization for an instance that is not EBS-optimized by default, you pay an additional low, hourly fee for the dedicated capacity. For pricing information, see EBS-Optimized Instances on the [Amazon EC2 Pricing, On-Demand Pricing page](#).

Note

You can also view this information programmatically using the AWS CLI. For more information, see [View instances types that support EBS optimization \(p. 1585\)](#).

Instance size	Maximum bandwidth (Mbps)	Maximum throughput (MB/s, 128 KiB I/O)	Maximum IOPS (16 KiB I/O)
c1.xlarge	1,000	125	8,000
c3.xlarge	500	62.5	4,000
c3.2xlarge	1,000	125	8,000
c3.4xlarge	2,000	250	16,000
g2.2xlarge	1,000	125	8,000
i2.xlarge	500	62.5	4,000
i2.2xlarge	1,000	125	8,000
i2.4xlarge	2,000	250	16,000
m1.large	500	62.5	4,000
m1.xlarge	1,000	125	8,000
m2.2xlarge	500	62.5	4,000
m2.4xlarge	1,000	125	8,000
m3.xlarge	500	62.5	4,000
m3.2xlarge	1,000	125	8,000
r3.xlarge	500	62.5	4,000
r3.2xlarge	1,000	125	8,000

Instance size	Maximum bandwidth (Mbps)	Maximum throughput (MB/s, 128 KiB I/O)	Maximum IOPS (16 KiB I/O)
r3.4xlarge	2,000	250	16,000

The `i2.8xlarge`, `c3.8xlarge`, and `r3.8xlarge` instances do not have dedicated EBS bandwidth and therefore do not offer EBS optimization. On these instances, network traffic and Amazon EBS traffic share the same 10-gigabit network interface.

Get maximum performance

You can use the `EBSIOBalance%` and `EBSByteBalance%` metrics to help you determine whether your instances are sized correctly. You can view these metrics in the CloudWatch console and set an alarm that is triggered based on a threshold you specify. These metrics are expressed as a percentage. Instances with a consistently low balance percentage are candidates to size up. Instances where the balance percentage never drops below 100% are candidates for downsizing. For more information, see [Monitor your instances using CloudWatch \(p. 975\)](#).

The high memory instances are designed to run large in-memory databases, including production deployments of the SAP HANA in-memory database, in the cloud. To maximize EBS performance, use high memory instances with an even number of `io1` or `io2` volumes with identical provisioned performance. For example, for IOPS heavy workloads, use four `io1` or `io2` volumes with 40,000 provisioned IOPS to get the maximum 160,000 instance IOPS. Similarly, for throughput heavy workloads, use six `io1` or `io2` volumes with 48,000 provisioned IOPS to get the maximum 4,750 MB/s throughput. For additional recommendations, see [Storage Configuration for SAP HANA](#).

Considerations

- G4dn, I3en, Inf1, M5a, M5ad, R5a, R5ad, T3, T3a, and Z1d instances launched after February 26, 2020 provide the maximum performance listed in the table above. To get the maximum performance from an instance launched before February 26, 2020, stop and start it.
- C5, C5d, C5n, M5, M5d, M5n, M5dn, R5, R5d, R5n, R5dn, and P3dn instances launched after December 3, 2019 provide the maximum performance listed in the table above. To get the maximum performance from an instance launched before December 3, 2019, stop and start it.
- `u-6tb1.metal`, `u-9tb1.metal`, and `u-12tb1.metal` instances launched after March 12, 2020 provide the performance in the table above. Instances of these types launched before March 12, 2020 might provide lower performance. To get the maximum performance from an instance launched before March 12, 2020, contact your account team to upgrade the instance at no additional cost.

View instances types that support EBS optimization

You can use the AWS CLI to view the instances types in the current Region that support EBS optimization.

To view the instance types that support EBS optimization and that have it enabled by default

Use the following [describe-instance-types](#) command.

```
aws ec2 describe-instance-types \
--query 'InstanceTypes[].[{InstanceType: InstanceType, "MaxBandwidth(Mb/s)": EbsInfo.EbsOptimizedInfo.MaximumBandwidthInMbps, MaxIOPS: EbsInfo.EbsOptimizedInfo.MaximumIops, "MaxThroughput(MBps)": EbsInfo.EbsOptimizedInfo.MaximumThroughputInMBps}]' \
--filters Name=ebs-info.ebs-optimized-support,Values=default --output=table
```

Example output for eu-west-1:

DescribeInstanceTypes					
EBSOptimized	InstanceType	MaxBandwidth(Mb/s)	MaxIOPS	MaxThroughput(MB/s)	
default	m5dn.8xlarge	6800	30000	850.0	
default	m6gd.xlarge	4750	20000	593.75	
default	c4.4xlarge	2000	16000	250.0	
default	r4.16xlarge	14000	75000	1750.0	
default	m5ad.large	2880	16000	360.0	
...					

To view the instance types that support EBS optimization but do not have it enabled by default

Use the following [describe-instance-types](#) command.

```
aws ec2 describe-instance-types \
--query 'InstanceTypes[].[InstanceType:InstanceType,"MaxBandwidth(Mb/s)":EbsInfo.EbsOptimizedInfo.MaximumBandwidthInMbps,MaxIOPS:EbsInfo.EbsOptimizedInfo.MaximumIops,"MaxThroughput(MB/s)":EbsInfo.EbsOptimizedInfo.MaximumThroughputInMBps}' \
--filters Name=ebs-info.ebs-optimized-support,Values=supported --output=table
```

Example output for eu-west-1:

DescribeInstanceTypes					
EBSOptimized	InstanceType	MaxBandwidth(Mb/s)	MaxIOPS	MaxThroughput(MB/s)	
supported	m2.4xlarge	1000	8000	125.0	
supported	i2.2xlarge	1000	8000	125.0	
supported	r3.4xlarge	2000	16000	250.0	
supported	m3.xlarge	500	4000	62.5	
supported	r3.2xlarge	1000	8000	125.0	
...					

Enable EBS optimization at launch

You can enable optimization for an instance by setting its attribute for EBS optimization.

To enable Amazon EBS optimization when launching an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Launch Instance**.
3. In **Step 1: Choose an Amazon Machine Image (AMI)**, select an AMI.
4. In **Step 2: Choose an Instance Type**, select an instance type that is listed as supporting Amazon EBS optimization.
5. In **Step 3: Configure Instance Details**, complete the fields that you need and choose **Launch as EBS-optimized instance**. If the instance type that you selected in the previous step doesn't support

Amazon EBS optimization, this option is not present. If the instance type that you selected is Amazon EBS-optimized by default, this option is selected and you can't deselect it.

6. Follow the directions to complete the wizard and launch your instance.

To enable EBS optimization when launching an instance using the command line

You can use one of the following commands with the corresponding option. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [run-instances](#) with `--ebs-optimized` (AWS CLI)
- [New-EC2Instance](#) with `-EbsOptimized` (AWS Tools for Windows PowerShell)

Enable EBS optimization for an existing instance

You can enable or disable optimization for an existing instance by modifying its Amazon EBS-optimized instance attribute. If the instance is running, you must stop it first.

Warning

When you stop an instance, the data on any instance store volumes is erased. To keep data from instance store volumes, be sure to back it up to persistent storage.

To enable EBS optimization for an existing instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**, and select the instance.
3. To stop the instance, choose **Actions**, **Instance state**, **Stop instance**. It can take a few minutes for the instance to stop.
4. With the instance still selected, choose **Actions**, **Instance settings**, **Change instance type**.
5. For **Change Instance Type**, do one of the following:
 - If the instance type of your instance is Amazon EBS-optimized by default, **EBS-optimized** is selected and you can't change it. You can choose **Cancel**, because Amazon EBS optimization is already enabled for the instance.
 - If the instance type of your instance supports Amazon EBS optimization, choose **EBS-optimized** and then choose **Apply**.
 - If the instance type of your instance does not support Amazon EBS optimization, you can't choose **EBS-optimized**. You can select an instance type from **Instance type** that supports Amazon EBS optimization, choose **EBS-optimized**, and then choose **Apply**.
6. Choose **Instance state**, **Start instance**.

To enable EBS optimization for an existing instance using the command line

1. If the instance is running, use one of the following commands to stop it:
 - [stop-instances](#) (AWS CLI)
 - [Stop-EC2Instance](#) (AWS Tools for Windows PowerShell)
2. To enable EBS optimization, use one of the following commands with the corresponding option:
 - [modify-instance-attribute](#) with `--ebs-optimized` (AWS CLI)
 - [Edit-EC2InstanceAttribute](#) with `-EbsOptimized` (AWS Tools for Windows PowerShell)

Amazon EBS volume performance on Linux instances

Several factors, including I/O characteristics and the configuration of your instances and volumes, can affect the performance of Amazon EBS. Customers who follow the guidance on our Amazon EBS and Amazon EC2 product detail pages typically achieve good performance out of the box. However, there are some cases where you may need to do some tuning in order to achieve peak performance on the platform. This topic discusses general best practices as well as performance tuning that is specific to certain use cases. We recommend that you tune performance with information from your actual workload, in addition to benchmarking, to determine your optimal configuration. After you learn the basics of working with EBS volumes, it's a good idea to look at the I/O performance you require and at your options for increasing Amazon EBS performance to meet those requirements.

AWS updates to the performance of EBS volume types might not immediately take effect on your existing volumes. To see full performance on an older volume, you might first need to perform a [ModifyVolume](#) action on it. For more information, see [Modifying the Size, IOPS, or Type of an EBS Volume on Linux](#).

Contents

- [Amazon EBS performance tips \(p. 1588\)](#)
- [I/O characteristics and monitoring \(p. 1590\)](#)

- [RAID configuration on Linux \(p. 1595\)](#)
- [Benchmark EBS volumes \(p. 1599\)](#)

Amazon EBS performance tips

These tips represent best practices for getting optimal performance from your EBS volumes in a variety of user scenarios.

Use EBS-optimized instances

On instances without support for EBS-optimized throughput, network traffic can contend with traffic between your instance and your EBS volumes; on EBS-optimized instances, the two types of traffic are kept separate. Some EBS-optimized instance configurations incur an extra cost (such as C3, R3, and M3), while others are always EBS-optimized at no extra cost (such as M4, C4, C5, and D2). For more information, see [Amazon EBS-optimized instances \(p. 1562\)](#).

Understand how performance is calculated

When you measure the performance of your EBS volumes, it is important to understand the units of measure involved and how performance is calculated. For more information, see [I/O characteristics and monitoring \(p. 1590\)](#).

Understand your workload

There is a relationship between the maximum performance of your EBS volumes, the size and number of I/O operations, and the time it takes for each action to complete. Each of these factors (performance, I/O, and latency) affects the others, and different applications are more sensitive to one factor or another. For more information, see [Benchmark EBS volumes \(p. 1599\)](#).

Be aware of the performance penalty When initializing volumes from snapshots

There is a significant increase in latency when you first access each block of data on a new EBS volume that was created from a snapshot. You can avoid this performance hit using one of the following options:

- Access each block prior to putting the volume into production. This process is called *initialization* (formerly known as pre-warming). For more information, see [Initialize Amazon EBS volumes \(p. 1593\)](#).
- Enable fast snapshot restore on a snapshot to ensure that the EBS volumes created from it are fully-initialized at creation and instantly deliver all of their provisioned performance. For more information, see [Amazon EBS fast snapshot restore \(p. 1553\)](#).

Factors that can degrade HDD performance

When you create a snapshot of a Throughput Optimized HDD (`st1`) or Cold HDD (`sc1`) volume, performance may drop as far as the volume's baseline value while the snapshot is in progress. This behavior is specific to these volume types. Other factors that can limit performance include driving more throughput than the instance can support, the performance penalty encountered while initializing volumes created from a snapshot, and excessive amounts of small, random I/O on the volume. For more information about calculating throughput for HDD volumes, see [Amazon EBS volume types \(p. 1352\)](#).

Your performance can also be impacted if your application isn't sending enough I/O requests. This can be monitored by looking at your volume's queue length and I/O size. The queue length is the number of pending I/O requests from your application to your volume. For maximum consistency, HDD-backed volumes must maintain a queue length (rounded to the nearest whole number) of 4 or more when performing 1 MiB sequential I/O. For more information about ensuring consistent performance of your volumes, see [I/O characteristics and monitoring \(p. 1590\)](#)

Increase read-ahead for high-throughput, read-heavy workloads on `st1` and `sc1`

Some workloads are read-heavy and access the block device through the operating system page cache (for example, from a file system). In this case, to achieve the maximum throughput, we recommend that you configure the read-ahead setting to 1 MiB. This is a per-block-device setting that should only be applied to your HDD volumes.

To examine the current value of read-ahead for your block devices, use the following command:

```
[ec2-user ~]$ sudo blockdev --report /dev/<device>
```

Block device information is returned in the following format:

RO	RA	SSZ	BSZ	StartSec	Size	Device
rw	256	512	4096	4096	8587820544	/dev/<device>

The device shown reports a read-ahead value of 256 (the default). Multiply this number by the sector size (512 bytes) to obtain the size of the read-ahead buffer, which in this case is 128 KiB. To set the buffer value to 1 MiB, use the following command:

```
[ec2-user ~]$ sudo blockdev --setra 2048 /dev/<device>
```

Verify that the read-ahead setting now displays 2,048 by running the first command again.

Only use this setting when your workload consists of large, sequential I/Os. If it consists mostly of small, random I/Os, this setting will actually degrade your performance. In general, if your workload consists mostly of small or random I/Os, you should consider using a General Purpose SSD (`gp2` and `gp3`) volume rather than an `st1` or `sc1` volume.

Use a modern Linux kernel

Use a modern Linux kernel with support for indirect descriptors. Any Linux kernel 3.8 and above has this support, as well as any current-generation EC2 instance. If your average I/O size is at or near 44

KiB, you may be using an instance or kernel without support for indirect descriptors. For information about deriving the average I/O size from Amazon CloudWatch metrics, see [I/O characteristics and monitoring \(p. 1590\)](#).

To achieve maximum throughput on `st1` or `sc1` volumes, we recommend applying a value of 256 to the `xen_blkfront.max` parameter (for Linux kernel versions below 4.6) or the `xen_blkfront.max_indirect_segments` parameter (for Linux kernel version 4.6 and above). The appropriate parameter can be set in your OS boot command line.

For example, in an Amazon Linux AMI with an earlier kernel, you can add it to the end of the kernel line in the GRUB configuration found in `/boot/grub/menu.lst`:

```
kernel /boot/vmlinuz-4.4.5-15.26.amzn1.x86_64 root=LABEL=/ console=ttyS0
xen_blkfront.max=256
```

For a later kernel, the command would be similar to the following:

```
kernel /boot/vmlinuz-4.9.20-11.31.amzn1.x86_64 root=LABEL=/ console=tty1 console=ttyS0
xen_blkfront.max_indirect_segments=256
```

Reboot your instance for this setting to take effect.

For more information, see [Configuring GRUB \(p. 231\)](#). Other Linux distributions, especially those that do not use the GRUB boot loader, may require a different approach to adjusting the kernel parameters.

For more information about EBS I/O characteristics, see the [Amazon EBS: Designing for Performance](#) re:Invent presentation on this topic.

Use RAID 0 to maximize utilization of instance resources

Some instance types can drive more I/O throughput than what you can provision for a single EBS volume. You can join multiple volumes together in a RAID 0 configuration to use the available bandwidth for these instances. For more information, see [RAID configuration on Linux \(p. 1595\)](#).

Track performance using Amazon CloudWatch

Amazon Web Services provides performance metrics for Amazon EBS that you can analyze and view with Amazon CloudWatch and status checks that you can use to monitor the health of your volumes. For more information, see [Monitor the status of your volumes \(p. 1392\)](#).

I/O characteristics and monitoring

On a given volume configuration, certain I/O characteristics drive the performance behavior for your EBS volumes. SSD-backed volumes—General Purpose SSD (`gp2` and `gp3`) and Provisioned IOPS SSD (`io1` and `io2`)—deliver consistent performance whether an I/O operation is random or sequential. HDD-backed volumes—Throughput Optimized HDD (`st1`) and Cold HDD (`sc1`)—deliver optimal performance only when I/O operations are large and sequential. To understand how SSD and HDD volumes will perform in your application, it is important to know the connection between demand on the volume, the quantity of IOPS available to it, the time it takes for an I/O operation to complete, and the volume's throughput limits.

Topics

- [IOPS \(p. 1591\)](#)
- [Volume queue length and latency \(p. 1592\)](#)
- [I/O size and volume throughput limits \(p. 1592\)](#)

- [Monitor I/O characteristics using CloudWatch \(p. 1592\)](#)
- [Related resources \(p. 1593\)](#)

IOPS

IOPS are a unit of measure representing input/output operations per second. The operations are measured in KiB, and the underlying drive technology determines the maximum amount of data that a volume type counts as a single I/O. I/O size is capped at 256 KiB for SSD volumes and 1,024 KiB for HDD volumes because SSD volumes handle small or random I/O much more efficiently than HDD volumes.

When small I/O operations are physically sequential, Amazon EBS attempts to merge them into a single I/O operation up to the maximum I/O size. Similarly, when I/O operations are larger than the maximum I/O size, Amazon EBS attempts to split them into smaller I/O operations. The following table shows some examples.

Volume type	Maximum I/O size	I/O operations from your application	Number of IOPS	Notes
SSD	256 KiB	1 x 1024 KiB I/O operation	4 (1,024÷256=4)	Amazon EBS splits the 1,024 I/O operation into four smaller 256 KiB operations.
		8 x sequential 32 KiB I/O operations	1 (8x32=256)	Amazon EBS merges the eight sequential 32 KiB I/O operations into a single 256 KiB operation.
		8 random 32 KiB I/O operations	8	Amazon EBS counts random I/O operations separately.
HDD	1,024 KiB	1 x 1024 KiB I/O operation	1	The I/O operation is already equal to the maximum I/O size. It is not merged or split.
		8 x sequential 128 KiB I/O operations	1 (8x128=1,024)	Amazon EBS merges the eight sequential 128 KiB I/O operations into a single 1,024 KiB I/O operation.
		8 random 32 KiB I/O operations	8	Amazon EBS counts random I/O operations separately.

Consequently, when you create an SSD-backed volume supporting 3,000 IOPS (either by provisioning a Provisioned IOPS SSD volume at 3,000 IOPS or by sizing a General Purpose SSD volume at 1,000 GiB),

and you attach it to an EBS-optimized instance that can provide sufficient bandwidth, you can transfer up to 3,000 I/Os of data per second, with throughput determined by I/O size.

Volume queue length and latency

The volume queue length is the number of pending I/O requests for a device. Latency is the true end-to-end client time of an I/O operation, in other words, the time elapsed between sending an I/O to EBS and receiving an acknowledgement from EBS that the I/O read or write is complete. Queue length must be correctly calibrated with I/O size and latency to avoid creating bottlenecks either on the guest operating system or on the network link to EBS.

Optimal queue length varies for each workload, depending on your particular application's sensitivity to IOPS and latency. If your workload is not delivering enough I/O requests to fully use the performance available to your EBS volume, then your volume might not deliver the IOPS or throughput that you have provisioned.

Transaction-intensive applications are sensitive to increased I/O latency and are well-suited for SSD-backed volumes. You can maintain high IOPS while keeping latency down by maintaining a low queue length and a high number of IOPS available to the volume. Consistently driving more IOPS to a volume than it has available can cause increased I/O latency.

Throughput-intensive applications are less sensitive to increased I/O latency, and are well-suited for HDD-backed volumes. You can maintain high throughput to HDD-backed volumes by maintaining a high queue length when performing large, sequential I/O.

I/O size and volume throughput limits

For SSD-backed volumes, if your I/O size is very large, you may experience a smaller number of IOPS than you provisioned because you are hitting the throughput limit of the volume. For example, a gp2 volume under 1,000 GiB with burst credits available has an IOPS limit of 3,000 and a volume throughput limit of 250 MiB/s. If you are using a 256 KiB I/O size, your volume reaches its throughput limit at 1000 IOPS ($1000 \times 256 \text{ KiB} = 250 \text{ MiB}$). For smaller I/O sizes (such as 16 KiB), this same volume can sustain 3,000 IOPS because the throughput is well below 250 MiB/s. (These examples assume that your volume's I/O is not hitting the throughput limits of the instance.) For more information about the throughput limits for each EBS volume type, see [Amazon EBS volume types \(p. 1352\)](#).

For smaller I/O operations, you may see a higher-than-provisioned IOPS value as measured from inside your instance. This happens when the instance operating system merges small I/O operations into a larger operation before passing them to Amazon EBS.

If your workload uses sequential I/Os on HDD-backed `st1` and `sc1` volumes, you may experience a higher than expected number of IOPS as measured from inside your instance. This happens when the instance operating system merges sequential I/Os and counts them in 1,024 KiB-sized units. If your workload uses small or random I/Os, you may experience a lower throughput than you expect. This is because we count each random, non-sequential I/O toward the total IOPS count, which can cause you to hit the volume's IOPS limit sooner than expected.

Whatever your EBS volume type, if you are not experiencing the IOPS or throughput you expect in your configuration, ensure that your EC2 instance bandwidth is not the limiting factor. You should always use a current-generation, EBS-optimized instance (or one that includes 10 Gb/s network connectivity) for optimal performance. For more information, see [Amazon EBS-optimized instances \(p. 1562\)](#). Another possible cause for not experiencing the expected IOPS is that you are not driving enough I/O to the EBS volumes.

Monitor I/O characteristics using CloudWatch

You can monitor these I/O characteristics with each volume's [CloudWatch volume metrics \(p. 1604\)](#). Important metrics to consider include the following:

- `BurstBalance`
- `VolumeReadBytes`
- `VolumeWriteBytes`
- `VolumeReadOps`
- `VolumeWriteOps`
- `VolumeQueueLength`

`BurstBalance` displays the burst bucket balance for gp2, st1, and sc1 volumes as a percentage of the remaining balance. When your burst bucket is depleted, volume I/O (for gp2 volumes) or volume throughput (for st1 and sc1 volumes) is throttled to the baseline. Check the `BurstBalance` value to determine whether your volume is being throttled for this reason. For a complete list of the available Amazon EBS metrics, see [Amazon EBS metrics \(p. 1603\)](#) and [Amazon EBS metrics for Nitro-based instances \(p. 982\)](#).

HDD-backed st1 and sc1 volumes are designed to perform best with workloads that take advantage of the 1,024 KiB maximum I/O size. To determine your volume's average I/O size, divide `VolumeWriteBytes` by `VolumeWriteOps`. The same calculation applies to read operations. If average I/O size is below 64 KiB, increasing the size of the I/O operations sent to an st1 or sc1 volume should improve performance.

Note

If average I/O size is at or near 44 KiB, you might be using an instance or kernel without support for indirect descriptors. Any Linux kernel 3.8 and above has this support, as well as any current-generation instance.

If your I/O latency is higher than you require, check `VolumeQueueLength` to make sure your application is not trying to drive more IOPS than you have provisioned. If your application requires a greater number of IOPS than your volume can provide, you should consider using a larger gp2 volume with a higher base performance level or an io1 or io2 volume with more provisioned IOPS to achieve faster latencies.

Related resources

For more information about Amazon EBS I/O characteristics, see the following re:Invent presentation: [Amazon EBS: Designing for Performance](#).

Initialize Amazon EBS volumes

Empty EBS volumes receive their maximum performance the moment that they are created and do not require initialization (formerly known as pre-warming).

For volumes that were created from snapshots, the storage blocks must be pulled down from Amazon S3 and written to the volume before you can access them. This preliminary action takes time and can cause a significant increase in the latency of I/O operations the first time each block is accessed. Volume performance is achieved after all blocks have been downloaded and written to the volume.

Important

While initializing Provisioned IOPS SSD volumes that were created from snapshots, the performance of the volume may drop below 50 percent of its expected level, which causes the volume to display a warning state in the **I/O Performance** status check. This is expected, and you can ignore the warning state on Provisioned IOPS SSD volumes while you are initializing them. For more information, see [EBS volume status checks \(p. 1392\)](#).

For most applications, amortizing the initialization cost over the lifetime of the volume is acceptable. To avoid this initial performance hit in a production environment, you can use one of the following options:

- Force the immediate initialization of the entire volume. For more information, see [Initialize Amazon EBS volumes on Linux \(p. 1594\)](#).

- Enable fast snapshot restore on a snapshot to ensure that the EBS volumes created from it are fully-initialized at creation and instantly deliver all of their provisioned performance. For more information, see [Amazon EBS fast snapshot restore \(p. 1553\)](#).

Initialize Amazon EBS volumes on Linux

Empty EBS volumes receive their maximum performance the moment that they are available and do not require initialization (formerly known as pre-warming). For volumes that have been created from snapshots, use the **dd** or **fio** utilities to read from all of the blocks on a volume. All existing data on the volume will be preserved.

For information about initializing Amazon EBS volumes on Windows, see [Initializing Amazon EBS volumes on Windows](#).

To initialize a volume created from a snapshot on Linux

1. Attach the newly-restored volume to your Linux instance.
2. Use the **lsblk** command to list the block devices on your instance.

```
[ec2-user ~]$ lsblk
NAME  MAJ:MIN RM SIZE RO TYPE MOUNTPOINT
xvdf  202:80   0 30G  0 disk
xvda1 202:1    0  8G  0 disk /
```

Here you can see that the new volume, `/dev/xvdf`, is attached, but not mounted (because there is no path listed under the `MOUNTPOINT` column).

3. Use the **dd** or **fio** utilities to read all of the blocks on the device. The **dd** command is installed by default on Linux systems, but **fio** is considerably faster because it allows multi-threaded reads.

Note

This step may take several minutes up to several hours, depending on your EC2 instance bandwidth, the IOPS provisioned for the volume, and the size of the volume.

[dd] The `if` (input file) parameter should be set to the drive you wish to initialize. The `of` (output file) parameter should be set to the Linux null virtual device, `/dev/null`. The `bs` parameter sets the block size of the read operation; for optimal performance, this should be set to 1 MB.

Important

Incorrect use of **dd** can easily destroy a volume's data. Be sure to follow precisely the example command below. Only the `if=/dev/xvdf` parameter will vary depending on the name of the device you are reading.

```
[ec2-user ~]$ sudo dd if=/dev/xvdf of=/dev/null bs=1M
```

[fio] If you have **fio** installed on your system, use the following command to initialize your volume. The `--filename` (input file) parameter should be set to the drive you wish to initialize.

```
[ec2-user ~]$ sudo fio --filename=/dev/xvdf --rw=read --bs=128k --iodepth=32 --
ioengine=libaio --direct=1 --name=volume-initialize
```

To install **fio** on Amazon Linux, use the following command:

```
sudo yum install -y fio
```

To install **fio** on Ubuntu, use the following command:

```
sudo apt-get install -y fio
```

When the operation is finished, you will see a report of the read operation. Your volume is now ready for use. For more information, see [Make an Amazon EBS volume available for use on Linux \(p. 1382\)](#).

RAID configuration on Linux

With Amazon EBS, you can use any of the standard RAID configurations that you can use with a traditional bare metal server, as long as that particular RAID configuration is supported by the operating system for your instance. This is because all RAID is accomplished at the software level.

Amazon EBS volume data is replicated across multiple servers in an Availability Zone to prevent the loss of data from the failure of any single component. This replication makes Amazon EBS volumes ten times more reliable than typical commodity disk drives. For more information, see [Amazon EBS Availability and Durability](#) in the Amazon EBS product detail pages.

Note

You should avoid booting from a RAID volume. Grub is typically installed on only one device in a RAID array, and if one of the mirrored devices fails, you may be unable to boot the operating system.

If you need to create a RAID array on a Windows instance, see [RAID configuration on Windows](#) in the *Amazon EC2 User Guide for Windows Instances*.

Contents

- [RAID configuration options \(p. 1595\)](#)
- [Create a RAID 0 array on Linux \(p. 1596\)](#)
- [Create snapshots of volumes in a RAID array \(p. 1598\)](#)

RAID configuration options

Creating a RAID 0 array allows you to achieve a higher level of performance for a file system than you can provision on a single Amazon EBS volume. Use RAID 0 when I/O performance is of the utmost importance. With RAID 0, I/O is distributed across the volumes in a stripe. If you add a volume, you get the straight addition of throughput and IOPS. However, keep in mind that performance of the stripe is limited to the worst performing volume in the set, and that the loss of a single volume in the set results in a complete data loss for the array.

The resulting size of a RAID 0 array is the sum of the sizes of the volumes within it, and the bandwidth is the sum of the available bandwidth of the volumes within it. For example, two 500 GiB `io1` volumes with 4,000 provisioned IOPS each create a 1000 GiB RAID 0 array with an available bandwidth of 8,000 IOPS and 1,000 MiB/s of throughput.

Important

RAID 5 and RAID 6 are not recommended for Amazon EBS because the parity write operations of these RAID modes consume some of the IOPS available to your volumes. Depending on the configuration of your RAID array, these RAID modes provide 20-30% fewer usable IOPS than a RAID 0 configuration. Increased cost is a factor with these RAID modes as well; when using identical volume sizes and speeds, a 2-volume RAID 0 array can outperform a 4-volume RAID 6 array that costs twice as much.

RAID 1 is also not recommended for use with Amazon EBS. RAID 1 requires more Amazon EC2 to Amazon EBS bandwidth than non-RAID configurations because the data is written to multiple volumes simultaneously. In addition, RAID 1 does not provide any write performance improvement.

Create a RAID 0 array on Linux

This documentation provides a basic RAID 0 setup example.

Before you perform this procedure, you need to decide how large your RAID 0 array should be and how many IOPS you want to provision.

Use the following procedure to create a RAID 0 array. Note that you can get directions for Windows instances from [Create a RAID 0 array on Windows](#) in the *Amazon EC2 User Guide for Windows Instances*.

To create a RAID 0 array on Linux

1. Create the Amazon EBS volumes for your array. For more information, see [Create an Amazon EBS volume \(p. 1371\)](#).

Important

Create volumes with identical size and IOPS performance values for your array. Make sure you do not create an array that exceeds the available bandwidth of your EC2 instance. For more information, see [Amazon EBS-optimized instances \(p. 1562\)](#).

2. Attach the Amazon EBS volumes to the instance that you want to host the array. For more information, see [Attach an Amazon EBS volume to an instance \(p. 1375\)](#).
3. Use the **mdadm** command to create a logical RAID device from the newly attached Amazon EBS volumes. Substitute the number of volumes in your array for **number_of_volumes** and the device names for each volume in the array (such as /dev/xvdf) for **device_name**. You can also substitute **MY_RAID** with your own unique name for the array.

Note

You can list the devices on your instance with the **lsblk** command to find the device names.

To create a RAID 0 array, run the following command (note the --level=0 option to stripe the array):

```
[ec2-user ~]$ sudo mdadm --create --verbose /dev/md0 --level=0 --name=MY_RAID --raid-devices=number_of_volumes device_name1 device_name2
```

4. Allow time for the RAID array to initialize and synchronize. You can track the progress of these operations with the following command:

```
[ec2-user ~]$ sudo cat /proc/mdstat
```

The following is example output:

```
Personalities : [raid0]
md0 : active raid0 xvdc[1] xvdb[0]
      41910272 blocks super 1.2 512k chunks

unused devices: <none>
```

In general, you can display detailed information about your RAID array with the following command:

```
[ec2-user ~]$ sudo mdadm --detail /dev/md0
```

The following is example output:

```
/dev/md0:
      Version : 1.2
      Creation Time : Wed May 19 11:12:56 2021
```

```
Raid Level : raid0
Array Size : 41910272 (39.97 GiB 42.92 GB)
Raid Devices : 2
Total Devices : 2
Persistence : Superblock is persistent

Update Time : Wed May 19 11:12:56 2021
State : clean
Active Devices : 2
Working Devices : 2
Failed Devices : 0
Spare Devices : 0

Chunk Size : 512K

Consistency Policy : none

Name : MY_RAID
UUID : 646aa723:db31bbc7:13c43daf:d5c51e0c
Events : 0

Number  Major  Minor  RaidDevice State
0        202     16      0        active sync   /dev/sdb
1        202     32      1        active sync   /dev/sdc
```

5. Create a file system on your RAID array, and give that file system a label to use when you mount it later. For example, to create an ext4 file system with the label **MY_RAID**, run the following command:

```
[ec2-user ~]$ sudo mkfs.ext4 -L MY_RAID /dev/md0
```

Depending on the requirements of your application or the limitations of your operating system, you can use a different file system type, such as ext3 or XFS (consult your file system documentation for the corresponding file system creation command).

6. To ensure that the RAID array is reassembled automatically on boot, create a configuration file to contain the RAID information:

```
[ec2-user ~]$ sudo mdadm --detail --scan | sudo tee -a /etc/mdadm.conf
```

Note

If you are using a Linux distribution other than Amazon Linux, you might need to modify this command. For example, you might need to place the file in a different location, or you might need to add the **--examine** parameter. For more information, run **man mdadm.conf** on your Linux instance.

7. Create a new ramdisk image to properly preload the block device modules for your new RAID configuration:

```
[ec2-user ~]$ sudo dracut -H -f /boot/initramfs-$(uname -r).img $(uname -r)
```

8. Create a mount point for your RAID array.

```
[ec2-user ~]$ sudo mkdir -p /mnt/raid
```

9. Finally, mount the RAID device on the mount point that you created:

```
[ec2-user ~]$ sudo mount LABEL=MY_RAID /mnt/raid
```

Your RAID device is now ready for use.

10. (Optional) To mount this Amazon EBS volume on every system reboot, add an entry for the device to the /etc/fstab file.

- Create a backup of your /etc/fstab file that you can use if you accidentally destroy or delete this file while you are editing it.

```
[ec2-user ~]$ sudo cp /etc/fstab /etc/fstab.orig
```

- Open the /etc/fstab file using your favorite text editor, such as **nano** or **vim**.
- Comment out any lines starting with "UUID=" and, at the end of the file, add a new line for your RAID volume using the following format:

```
device_label mount_point file_system_type fs_mntops fs_freq fs_passno
```

The last three fields on this line are the file system mount options, the dump frequency of the file system, and the order of file system checks done at boot time. If you don't know what these values should be, then use the values in the example below for them (`defaults,nofail 0 2`). For more information about /etc/fstab entries, see the **fstab** manual page (by entering **man fstab** on the command line). For example, to mount the ext4 file system on the device with the label MY_RAID at the mount point /mnt/raid, add the following entry to /etc/fstab.

Note

If you ever intend to boot your instance without this volume attached (for example, so this volume could move back and forth between different instances), you should add the `nofail` mount option that allows the instance to boot even if there are errors in mounting the volume. Debian derivatives, such as Ubuntu, must also add the `nobootwait` mount option.

LABEL=MY_RAID	/mnt/raid	ext4	defaults,nofail	0	2
---------------	-----------	------	-----------------	---	---

- After you've added the new entry to /etc/fstab, you need to check that your entry works. Run the **sudo mount -a** command to mount all file systems in /etc/fstab.

```
[ec2-user ~]$ sudo mount -a
```

If the previous command does not produce an error, then your /etc/fstab file is OK and your file system will mount automatically at the next boot. If the command does produce any errors, examine the errors and try to correct your /etc/fstab.

Warning

Errors in the /etc/fstab file can render a system unbootable. Do not shut down a system that has errors in the /etc/fstab file.

- (Optional) If you are unsure how to correct /etc/fstab errors, you can always restore your backup /etc/fstab file with the following command.

```
[ec2-user ~]$ sudo mv /etc/fstab.orig /etc/fstab
```

Create snapshots of volumes in a RAID array

If you want to back up the data on the EBS volumes in a RAID array using snapshots, you must ensure that the snapshots are consistent. This is because the snapshots of these volumes are created independently. To restore EBS volumes in a RAID array from snapshots that are out of sync would degrade the integrity of the array.

To create a consistent set of snapshots for your RAID array, use [EBS multi-volume snapshots](#). Multi-volume snapshots allow you to take point-in-time, data coordinated, and crash-consistent snapshots across multiple EBS volumes attached to an EC2 instance. You do not have to stop your instance to coordinate between volumes to ensure consistency because snapshots are automatically taken across multiple EBS volumes. For more information, see the steps for creating multi-volume snapshots under [Creating Amazon EBS snapshots](#).

Benchmark EBS volumes

You can test the performance of Amazon EBS volumes by simulating I/O workloads. The process is as follows:

1. Launch an EBS-optimized instance.
2. Create new EBS volumes.
3. Attach the volumes to your EBS-optimized instance.
4. Configure and mount the block device.
5. Install a tool to benchmark I/O performance.
6. Benchmark the I/O performance of your volumes.
7. Delete your volumes and terminate your instance so that you don't continue to incur charges.

Important

Some of the procedures result in the destruction of existing data on the EBS volumes you benchmark. The benchmarking procedures are intended for use on volumes specially created for testing purposes, not production volumes.

Set up your instance

To get optimal performance from EBS volumes, we recommend that you use an EBS-optimized instance. EBS-optimized instances deliver dedicated throughput between Amazon EC2 and Amazon EBS, with instance. EBS-optimized instances deliver dedicated bandwidth between Amazon EC2 and Amazon EBS, with specifications depending on the instance type. For more information, see [Amazon EBS-optimized instances \(p. 1562\)](#).

To create an EBS-optimized instance, choose **Launch as an EBS-Optimized instance** when launching the instance using the Amazon EC2 console, or specify `--ebs-optimized` when using the command line. Be sure that you launch a current-generation instance that supports this option. For more information, see [Amazon EBS-optimized instances \(p. 1562\)](#).

Set up Provisioned IOPS SSD or General Purpose SSD volumes

To create Provisioned IOPS SSD (`io1` and `io2`) or General Purpose SSD (`gp2` and `gp3`) volumes using the Amazon EC2 console, for **Volume type**, choose **Provisioned IOPS SSD (io1)**, **Provisioned IOPS SSD (io2)**, **General Purpose SSD (gp2)**, or **General Purpose SSD (gp3)**. At the command line, specify `io1`, `io2`, `gp2`, or `gp3` for the `--volume-type` parameter. For `io1`, `io2`, and `gp3` volumes, specify the number of I/O operations per second (IOPS) for the `--iops` parameter. For more information, see [Amazon EBS volume types \(p. 1352\)](#) and [Create an Amazon EBS volume \(p. 1371\)](#).

For the example tests, we recommend that you create a RAID 0 array with 6 volumes, which offers a high level of performance. Because you are charged by gigabytes provisioned (and the number of provisioned IOPS for `io1`, `io2`, and `gp3` volumes), not the number of volumes, there is no additional cost for creating multiple, smaller volumes and using them to create a stripe set. If you're using Oracle Orion to benchmark your volumes, it can simulate striping the same way that Oracle ASM does, so we recommend that you let Orion do the striping. If you are using a different benchmarking tool, you need to stripe the volumes yourself.

For instructions on how to create a RAID 0 array with 6 volumes, see [Create a RAID 0 array on Linux \(p. 1596\)](#).

Set up Throughput Optimized HDD (st1) or Cold HDD (sc1) volumes

To create an st1 volume, choose **Throughput Optimized HDD** when creating the volume using the Amazon EC2 console, or specify **--type st1** when using the command line. To create an sc1 volume, choose **Cold HDD** when creating the volume using the Amazon EC2 console, or specify **--type sc1** when using the command line. For information about creating EBS volumes, see [Create an Amazon EBS volume \(p. 1371\)](#). For information about attaching these volumes to your instance, see [Attach an Amazon EBS volume to an instance \(p. 1375\)](#).

AWS provides a JSON template for use with AWS CloudFormation that simplifies this setup procedure. Access the [template](#) and save it as a JSON file. AWS CloudFormation allows you to configure your own SSH keys and offers an easier way to set up a performance test environment to evaluate st1 volumes. The template creates a current-generation instance and a 2 TiB st1 volume, and attaches the volume to the instance at `/dev/xvdf`.

To create an HDD volume using the template

1. Open the AWS CloudFormation console at <https://console.aws.amazon.com/cloudformation>.
2. Choose **Create Stack**.
3. Choose **Upload a Template to Amazon S3** and select the JSON template you previously obtained.
4. Give your stack a name like “ebs-perf-testing”, and select an instance type (the default is r3.8xlarge) and SSH key.
5. Choose **Next** twice, and then choose **Create Stack**.
6. After the status for your new stack moves from **CREATE_IN_PROGRESS** to **COMPLETE**, choose **Outputs** to get the public DNS entry for your new instance, which will have a 2 TiB st1 volume attached to it.
7. Connect using SSH to your new stack as user **ec2-user**, with the hostname obtained from the DNS entry in the previous step.
8. Proceed to [Install benchmark tools \(p. 1600\)](#).

Install benchmark tools

The following table lists some of the possible tools you can use to benchmark the performance of EBS volumes.

Tool	Description
fio	<p>For benchmarking I/O performance. (Note that fio has a dependency on <code>libaio-devel</code>.)</p> <p>To install fio on Amazon Linux, run the following command:</p> <div style="border: 1px solid black; padding: 5px;"><pre>[ec2-user ~]\$ sudo yum install -y fio</pre></div> <p>To install fio on Ubuntu, run the following command:</p> <div style="border: 1px solid black; padding: 5px;"><pre>sudo apt-get install -y fio</pre></div>
Oracle Orion Calibration Tool	For calibrating the I/O performance of storage systems to be used with Oracle databases.

These benchmarking tools support a wide variety of test parameters. You should use commands that approximate the workloads your volumes will support. These commands provided below are intended as examples to help you get started.

Choose the volume queue length

Choosing the best volume queue length based on your workload and volume type.

Queue length on SSD-backed volumes

To determine the optimal queue length for your workload on SSD-backed volumes, we recommend that you target a queue length of 1 for every 1000 IOPS available (baseline for General Purpose SSD volumes and the provisioned amount for Provisioned IOPS SSD volumes). Then you can monitor your application performance and tune that value based on your application requirements.

Increasing the queue length is beneficial until you achieve the provisioned IOPS, throughput or optimal system queue length value, which is currently set to 32. For example, a volume with 3,000 provisioned IOPS should target a queue length of 3. You should experiment with tuning these values up or down to see what performs best for your application.

Queue length on HDD-backed volumes

To determine the optimal queue length for your workload on HDD-backed volumes, we recommend that you target a queue length of at least 4 while performing 1MiB sequential I/Os. Then you can monitor your application performance and tune that value based on your application requirements. For example, a 2 TiB st1 volume with burst throughput of 500 MiB/s and IOPS of 500 should target a queue length of 4, 8, or 16 while performing 1,024 KiB, 512 KiB, or 256 KiB sequential I/Os respectively. You should experiment with tuning these values value up or down to see what performs best for your application.

Disable C-states

Before you run benchmarking, you should disable processor C-states. Temporarily idle cores in a supported CPU can enter a C-state to save power. When the core is called on to resume processing, a certain amount of time passes until the core is again fully operational. This latency can interfere with processor benchmarking routines. For more information about C-states and which EC2 instance types support them, see [Processor state control for your EC2 instance](#).

Disable C-states on Linux

You can disable C-states on Amazon Linux, RHEL, and CentOS as follows:

1. Get the number of C-states.

```
$ cpupower idle-info | grep "Number of idle states:"
```

2. Disable the C-states from c1 to cN. Ideally, the cores should be in state c0.

```
$ for i in `seq 1 $((N-1))` ; do cpupower idle-set -d $i; done
```

Perform benchmarking

The following procedures describe benchmarking commands for various EBS volume types.

Run the following commands on an EBS-optimized instance with attached EBS volumes. If the EBS volumes were created from snapshots, be sure to initialize them before benchmarking. For more information, see [Initialize Amazon EBS volumes \(p. 1593\)](#).

When you are finished testing your volumes, see the following topics for help cleaning up: [Delete an Amazon EBS volume \(p. 1402\)](#) and [Terminate your instance \(p. 661\)](#).

Benchmark Provisioned IOPS SSD and General Purpose SSD volumes

Run **fio** on the RAID 0 array that you created.

The following command performs 16 KB random write operations.

```
[ec2-user ~]$ sudo fio --directory=/mnt/p_iops_volo --ioengine=psync --  
name fio_test_file --direct=1 --rw=randwrite --bs=16k --size=1G --numjobs=16 --time_based  
--runtime=180 --group_reporting --norandommap
```

The following command performs 16 KB random read operations.

```
[ec2-user ~]$ sudo fio --directory=/mnt/p_iops_volo --name fio_test_file --direct=1 --  
rw=randread --bs=16k --size=1G --numjobs=16 --time_based --runtime=180 --group_reporting --  
norandommap
```

For more information about interpreting the results, see this tutorial: [Inspecting disk IO performance with fio](#).

Benchmark st1 and sc1 volumes

Run **fio** on your st1 or sc1 volume.

Note

Prior to running these tests, set buffered I/O on your instance as described in [Increase read-ahead for high-throughput, read-heavy workloads on st1 and sc1 \(p. 1589\)](#).

The following command performs 1 MiB sequential read operations against an attached st1 block device (e.g., /dev/xvdf):

```
[ec2-user ~]$ sudo fio --filename=/dev/<device> --direct=1 --rw=read --randrepeat=0  
--ioengine=libaio --bs=1024k --iodepth=8 --time_based=1 --runtime=180 --  
name=fio_direct_read_test
```

The following command performs 1 MiB sequential write operations against an attached st1 block device:

```
[ec2-user ~]$ sudo fio --filename=/dev/<device> --direct=1 --rw=write --randrepeat=0  
--ioengine=libaio --bs=1024k --iodepth=8 --time_based=1 --runtime=180 --  
name=fio_direct_write_test
```

Some workloads perform a mix of sequential reads and sequential writes to different parts of the block device. To benchmark such a workload, we recommend that you use separate, simultaneous **fio** jobs for reads and writes, and use the **fio offset_increment** option to target different block device locations for each job.

Running this workload is a bit more complicated than a sequential-write or sequential-read workload. Use a text editor to create a fio job file, called **fio_rw_mix.cfg** in this example, that contains the following:

```
[global]  
clocksource=clock_gettime  
randrepeat=0  
runtime=180  
  
[sequential-write]  
bs=1M  
ioengine=libaio  
direct=1  
iodepth=8  
filename=/dev/<device>
```

```
do_verify=0
rw=write
rwmixread=0
rwmixwrite=100

[sequential-read]
bs=1M
ioengine=libaio
direct=1
iodepth=8
filename=/dev/<device>
do_verify=0
rw=read
rwmixread=100
rwmixwrite=0
offset=100g
```

Then run the following command:

```
[ec2-user ~]$ sudo fio fio_rw_mix.cfg
```

For more information about interpreting the results, see this tutorial: [Inspecting disk I/O performance with fio](#).

Multiple **fio** jobs for direct I/O, even though using sequential read or write operations, can result in lower than expected throughput for `st1` and `sc1` volumes. We recommend that you use one direct I/O job and use the `iodepth` parameter to control the number of concurrent I/O operations.

Amazon CloudWatch metrics for Amazon EBS

Amazon CloudWatch metrics are statistical data that you can use to view, analyze, and set alarms on the operational behavior of your volumes.

Data is available automatically in 1-minute periods at no charge.

When you get data from CloudWatch, you can include a `Period` request parameter to specify the granularity of the returned data. This is different than the period that we use when we collect the data (1-minute periods). We recommend that you specify a period in your request that is equal to or greater than the collection period to ensure that the returned data is valid.

You can get the data using either the CloudWatch API or the Amazon EC2 console. The console takes the raw data from the CloudWatch API and displays a series of graphs based on the data. Depending on your needs, you might prefer to use either the data from the API or the graphs in the console.

Topics

- [Amazon EBS metrics \(p. 1603\)](#)
- [Dimensions for Amazon EBS metrics \(p. 1608\)](#)
- [Graphs in the Amazon EC2 console \(p. 1608\)](#)

Amazon EBS metrics

Amazon Elastic Block Store (Amazon EBS) sends data points to CloudWatch for several metrics. All Amazon EBS volume types automatically send 1-minute metrics to CloudWatch, but only when the volume is attached to an instance.

Metrics

- [Volume metrics for volumes attached to all instance types \(p. 1604\)](#)
- [Volume metrics for volumes attached to Nitro-based instance types \(p. 1607\)](#)

- [Fast snapshot restore metrics \(p. 1608\)](#)

Volume metrics for volumes attached to all instance types

The AWS/EBS namespace includes the following metrics for EBS volumes that are attached to all instance types. To get information about the available disk space from the operating system on an instance, see [View free disk space \(p. 1388\)](#).

Note

- Some metrics have differences on instances that are built on the Nitro System. For a list of these instance types, see [Instances built on the Nitro System \(p. 247\)](#).
- The AWS/EC2 namespace includes additional Amazon EBS metrics for volumes that are attached to Nitro-based instances that are not bare metal instances. For more information about these metrics see, [Amazon EBS metrics for Nitro-based instances \(p. 982\)](#).

Metric	Description
VolumeReadBytes	<p>Provides information on the read operations in a specified period of time. The Sum statistic reports the total number of bytes transferred during the period. The Average statistic reports the average size of each read operation during the period, except on volumes attached to a Nitro-based instance, where the average represents the average over the specified period. The SampleCount statistic reports the total number of read operations during the period, except on volumes attached to a Nitro-based instance, where the sample count represents the number of data points used in the statistical calculation. For Xen instances, data is reported only when there is read activity on the volume.</p> <p>The Minimum and Maximum statistics on this metric are supported only by volumes attached to Nitro-based instances.</p> <p>Units: Bytes</p>
VolumeWriteBytes	<p>Provides information on the write operations in a specified period of time. The Sum statistic reports the total number of bytes transferred during the period. The Average statistic reports the average size of each write operation during the period, except on volumes attached to a Nitro-based instance, where the average represents the average over the specified period. The SampleCount statistic reports the total number of write operations during the period, except on volumes attached to a Nitro-based instance, where the sample count represents the number of data points used in the statistical calculation. For Xen instances, data is reported only when there is write activity on the volume.</p> <p>The Minimum and Maximum statistics on this metric are supported only by volumes attached to Nitro-based instances.</p> <p>Units: Bytes</p>
VolumeReadOps	The total number of read operations in a specified period of time. Note: read operations are counted on completion.

Metric	Description
	<p>To calculate the average read operations per second (read IOPS) for the period, divide the total read operations in the period by the number of seconds in that period.</p> <p>The Minimum and Maximum statistics on this metric are supported only by volumes attached to Nitro-based instances.</p> <p>Units: Count</p>
VolumeWriteOps	<p>The total number of write operations in a specified period of time. Note: write operations are counted on completion.</p> <p>To calculate the average write operations per second (write IOPS) for the period, divide the total write operations in the period by the number of seconds in that period.</p> <p>The Minimum and Maximum statistics on this metric are supported only by volumes attached to Nitro-based instances.</p> <p>Units: Count</p>
VolumeTotalReadTime	<p>Note This metric is not supported with Multi-Attach enabled volumes.</p> <p>The total number of seconds spent by all read operations that completed in a specified period of time. If multiple requests are submitted at the same time, this total could be greater than the length of the period. For example, for a period of 1 minutes (60 seconds): if 150 operations completed during that period, and each operation took 1 second, the value would be 150 seconds. For Xen instances, data is reported only when there is read activity on the volume.</p> <p>The Average statistic on this metric is not relevant for volumes attached to Nitro-based instances.</p> <p>The Minimum and Maximum statistics on this metric are supported only by volumes attached to Nitro-based instances.</p> <p>Units: Seconds</p>

Metric	Description
VolumeTotalWriteTime	<p>Note This metric is not supported with Multi-Attach enabled volumes.</p> <p>The total number of seconds spent by all write operations that completed in a specified period of time. If multiple requests are submitted at the same time, this total could be greater than the length of the period. For example, for a period of 1 minute (60 seconds): if 150 operations completed during that period, and each operation took 1 second, the value would be 150 seconds. For Xen instances, data is reported only when there is write activity on the volume.</p> <p>The Average statistic on this metric is not relevant for volumes attached to Nitro-based instances.</p> <p>The Minimum and Maximum statistics on this metric are supported only by volumes attached to Nitro-based instances.</p> <p>Units: Seconds</p>
VolumeIdleTime	<p>Note This metric is not supported with Multi-Attach enabled volumes.</p> <p>The total number of seconds in a specified period of time when no read or write operations were submitted.</p> <p>The Average statistic on this metric is not relevant for volumes attached to Nitro-based instances.</p> <p>The Minimum and Maximum statistics on this metric are supported only by volumes attached to Nitro-based instances.</p> <p>Units: Seconds</p>
VolumeQueueLength	<p>The number of read and write operation requests waiting to be completed in a specified period of time.</p> <p>The Sum statistic on this metric is not relevant for volumes attached to Nitro-based instances.</p> <p>The Minimum and Maximum statistics on this metric are supported only by volumes attached to Nitro-based instances.</p> <p>Units: Count</p>

Metric	Description
VolumeThroughputPercentage	<p>Note This metric is not supported with Multi-Attach enabled volumes.</p> <p>Used with Provisioned IOPS SSD volumes only. The percentage of I/O operations per second (IOPS) delivered of the total IOPS provisioned for an Amazon EBS volume. Provisioned IOPS SSD volumes deliver their provisioned performance 99.9 percent of the time.</p> <p>During a write, if there are no other pending I/O requests in a minute, the metric value will be 100 percent. Also, a volume's I/O performance may become degraded temporarily due to an action you have taken (for example, creating a snapshot of a volume during peak usage, running the volume on a non-EBS-optimized instance, or accessing data on the volume for the first time).</p> <p>Units: Percent</p>
VolumeConsumedReadWriteOps	<p>Used with Provisioned IOPS SSD volumes only. The total amount of read and write operations (normalized to 256K capacity units) consumed in a specified period of time.</p> <p>I/O operations that are smaller than 256K each count as 1 consumed IOPS. I/O operations that are larger than 256K are counted in 256K capacity units. For example, a 1024K I/O would count as 4 consumed IOPS.</p> <p>Units: Count</p>
BurstBalance	<p>Used with General Purpose SSD (gp2), Throughput Optimized HDD (st1), and Cold HDD (sc1) volumes only. Provides information about the percentage of I/O credits (for gp2) or throughput credits (for st1 and sc1) remaining in the burst bucket. Data is reported to CloudWatch only when the volume is active. If the volume is not attached, no data is reported.</p> <p>The Sum statistic on this metric is not relevant for volumes attached to instances built on the Nitro System.</p> <p>If the baseline performance of the volume exceeds the maximum burst performance, credits are never spent. If the volume is attached to an instance built on the Nitro System, the burst balance is not reported. For other instances, the reported burst balance is 100%. For more information, see I/O Credits and burst performance (p. 1355).</p> <p>Units: Percent</p>

Volume metrics for volumes attached to Nitro-based instance types

The AWS/EC2 namespace includes additional Amazon EBS metrics for volumes that are attached to Nitro-based instances that are not bare metal instances. For more information about these metrics see, [Amazon EBS metrics for Nitro-based instances \(p. 982\)](#).

Fast snapshot restore metrics

AWS/EBS namespace includes the following metrics for [fast snapshot restore \(p. 1553\)](#).

Metric	Description
FastSnapshotRestoreCreditsBudget	The maximum number of volume create credits that can be accumulated. This metric is reported per snapshot per Availability Zone. The most meaningful statistic is Average . The results for the Minimum and Maximum statistics are the same as for Average and could be used instead.
FastSnapshotRestoreCreditsBalance	The number of volume create credits available. This metric is reported per snapshot per Availability Zone. The most meaningful statistic is Average . The results for the Minimum and Maximum statistics are the same as for Average and could be used instead.

Dimensions for Amazon EBS metrics

The supported dimension is the volume ID (`VolumeId`). All available statistics are filtered by volume ID.

For the [volume metrics \(p. 1604\)](#), the supported dimension is the volume ID (`VolumeId`). All available statistics are filtered by volume ID.

For the [fast snapshot restore metrics \(p. 1608\)](#), the supported dimensions are the snapshot ID (`SnapshotId`) and the Availability Zone (`AvailabilityZone`).

Graphs in the Amazon EC2 console

After you create a volume, you can view the volume's monitoring graphs in the Amazon EC2 console. Select a volume on the **Volumes** page in the console and choose **Monitoring**. The following table lists the graphs that are displayed. The column on the right describes how the raw data metrics from the CloudWatch API are used to produce each graph. The period for all the graphs is 5 minutes.

Graph	Description using raw metrics
Read Bandwidth (KiB/s)	<code>Sum(VolumeReadBytes) / Period / 1024</code>
Write Bandwidth (KiB/s)	<code>Sum(VolumeWriteBytes) / Period / 1024</code>
Read Throughput (IOPS)	<code>Sum(VolumeReadOps) / Period</code>
Write Throughput (IOPS)	<code>Sum(VolumeWriteOps) / Period</code>
Avg Queue Length (Operations)	<code>Avg(VolumeQueueLength)</code>
% Time Spent Idle	<code>Sum(VolumeIdleTime) / Period * 100</code>
Avg Read Size (KiB/Operation)	<code>Avg(VolumeReadBytes) / 1024</code> For Nitro-based instances, the following formula derives Average Read Size using CloudWatch Metric Math :

Graph	Description using raw metrics
	$(\text{Sum}(\text{VolumeReadBytes}) / \text{Sum}(\text{VolumeReadOps})) / 1024$ <p>The <code>VolumeReadBytes</code> and <code>VolumeReadOps</code> metrics are available in the EBS CloudWatch console.</p>
Avg Write Size (KiB/Operation)	$\text{Avg}(\text{VolumeWriteBytes}) / 1024$ <p>For Nitro-based instances, the following formula derives Average Write Size using CloudWatch Metric Math:</p> $(\text{Sum}(\text{VolumeWriteBytes}) / \text{Sum}(\text{VolumeWriteOps})) / 1024$ <p>The <code>VolumeWriteBytes</code> and <code>VolumeWriteOps</code> metrics are available in the EBS CloudWatch console.</p>
Avg Read Latency (ms/Operation)	$\text{Avg}(\text{VolumeTotalReadTime}) \times 1000$ <p>For Nitro-based instances, the following formula derives Average Read Latency using CloudWatch Metric Math:</p> $(\text{Sum}(\text{VolumeTotalReadTime}) / \text{Sum}(\text{VolumeReadOps})) \times 1000$ <p>The <code>VolumeTotalReadTime</code> and <code>VolumeReadOps</code> metrics are available in the EBS CloudWatch console.</p>
Avg Write Latency (ms/Operation)	$\text{Avg}(\text{VolumeTotalWriteTime}) \times 1000$ <p>For Nitro-based instances, the following formula derives Average Write Latency using CloudWatch Metric Math:</p> $(\text{Sum}(\text{VolumeTotalWriteTime}) / \text{Sum}(\text{VolumeWriteOps})) \times 1000$ <p>The <code>VolumeTotalWriteTime</code> and <code>VolumeWriteOps</code> metrics are available in the EBS CloudWatch console.</p>

For the average latency graphs and average size graphs, the average is calculated over the total number of operations (read or write, whichever is applicable to the graph) that completed during the period.

Amazon CloudWatch Events for Amazon EBS

Amazon EBS emits notifications based on Amazon CloudWatch Events for a variety of volume, snapshot, and encryption status changes. With CloudWatch Events, you can establish rules that trigger programmatic actions in response to a change in volume, snapshot, or encryption key state. For example, when a snapshot is created, you can trigger an AWS Lambda function to share the completed snapshot with another account or copy it to another Region for disaster-recovery purposes.

Events in CloudWatch are represented as JSON objects. The fields that are unique to the event are contained in the "detail" section of the JSON object. The "event" field contains the event name. The "result" field contains the completed status of the action that triggered the event. For more information, see [Event Patterns in CloudWatch Events](#) in the *Amazon CloudWatch Events User Guide*.

For more information, see [Using Events](#) in the *Amazon CloudWatch User Guide*.

Contents

- [EBS volume events \(p. 1610\)](#)
- [EBS volume modification events \(p. 1613\)](#)
- [EBS snapshot events \(p. 1613\)](#)
- [EBS Snapshots Archive events \(p. 1617\)](#)
- [EBS fast snapshot restore events \(p. 1617\)](#)
- [Using AWS Lambda to handle CloudWatch events \(p. 1618\)](#)

EBS volume events

Amazon EBS sends events to CloudWatch Events when the following volume events occur.

Events

- [Create volume \(createVolume\) \(p. 1610\)](#)
- [Delete volume \(deleteVolume\) \(p. 1611\)](#)
- [Volume attach or reattach \(attachVolume, reattachVolume\) \(p. 1612\)](#)

Create volume (createVolume)

The `createVolume` event is sent to your AWS account when an action to create a volume completes. However it is not saved, logged, or archived. This event can have a result of either `available` or `failed`. Creation will fail if an invalid AWS KMS key was provided, as shown in the examples below.

Event data

The listing below is an example of a JSON object emitted by EBS for a successful `createVolume` event.

```
{  
    "version": "0",  
    "id": "01234567-0123-0123-0123-012345678901",  
    "detail-type": "EBS Volume Notification",  
    "source": "aws.ec2",  
    "account": "012345678901",  
    "time": "yyyy-mm-ddThh:mm:ssZ",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:012345678901:volume/vol-01234567"  
    ],  
    "detail": {  
        "result": "available",  
        "cause": "",  
        "event": "createVolume",  
        "request-id": "01234567-0123-0123-0123-0123456789ab"  
    }  
}
```

The listing below is an example of a JSON object emitted by EBS after a failed `createVolume` event. The cause for the failure was a disabled KMS key.

```
{  
    "version": "0",  
    "id": "01234567-0123-0123-0123-0123456789ab",  
    "detail-type": "EBS Volume Notification",  
    "source": "aws.ec2",  
    "account": "012345678901",  
    "time": "yyyy-mm-ddThh:mm:ssZ",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2:us-east-1:012345678901:volume/vol-01234567"  
    ],  
    "detail": {  
        "result": "failed",  
        "cause": "KMS key not found",  
        "event": "createVolume",  
        "request-id": "01234567-0123-0123-0123-0123456789ab"  
    }  
}
```

```
"account": "012345678901",
"time": "yyyy-mm-ddThh:mm:ssZ",
"region": "sa-east-1",
"resources": [
    "arn:aws:ec2:sa-east-1:0123456789ab:volume/vol-01234567",
],
"detail": {
    "event": "createVolume",
    "result": "failed",
    "cause": "arn:aws:kms:sa-east-1:0123456789ab:key/01234567-0123-0123-0123-0123456789ab
is disabled.",
    "request-id": "01234567-0123-0123-0123-0123456789ab",
}
}
```

The following is an example of a JSON object that is emitted by EBS after a failed `createVolume` event. The cause for the failure was a KMS key pending import.

```
{
    "version": "0",
    "id": "01234567-0123-0123-0123-0123456789ab",
    "detail-type": "EBS Volume Notification",
    "source": "aws.ec2",
    "account": "012345678901",
    "time": "yyyy-mm-ddThh:mm:ssZ",
    "region": "sa-east-1",
    "resources": [
        "arn:aws:ec2:sa-east-1:0123456789ab:volume/vol-01234567",
    ],
    "detail": {
        "event": "createVolume",
        "result": "failed",
        "cause": "arn:aws:kms:sa-east-1:0123456789ab:key/01234567-0123-0123-0123-0123456789ab
is pending import.",
        "request-id": "01234567-0123-0123-0123-0123456789ab",
    }
}
```

Delete volume (`deleteVolume`)

The `deleteVolume` event is sent to your AWS account when an action to delete a volume completes. However it is not saved, logged, or archived. This event has the result `deleted`. If the deletion does not complete, the event is never sent.

Event data

The listing below is an example of a JSON object emitted by EBS for a successful `deleteVolume` event.

```
{
    "version": "0",
    "id": "01234567-0123-0123-0123-012345678901",

Volume attach or reattach (attachVolume, reattachVolume)

The `attachVolume` or `reattachVolume` event is sent to your AWS account if a volume fails to attach or reattach to an instance. However it is not saved, logged, or archived. If you use a KMS key to encrypt an EBS volume and the KMS key becomes invalid, EBS will emit an event if that KMS key is later used to attach or reattach to an instance, as shown in the examples below.

Event data

The listing below is an example of a JSON object emitted by EBS after a failed `attachVolume` event. The cause for the failure was a KMS key pending deletion.

Note

AWS may attempt to reattach to a volume following routine server maintenance.

EBS volume modification events

Amazon EBS sends `modifyVolume` events to CloudWatch Events when a volume is modified. However it is not saved, logged, or archived.

```
{
    "version": "0",
    "id": "01234567-0123-0123-0123-012345678901",
    "detail-type": "EBS Volume Notification",

    }
}
```

EBS snapshot events

Amazon EBS sends events to CloudWatch Events when the following volume events occur.

Events

- [Create snapshot \(createSnapshot\) \(p. 1613\)](#)
- [Create snapshots \(createSnapshots\) \(p. 1614\)](#)
- [Copy snapshot \(copySnapshot\) \(p. 1615\)](#)
- [Share snapshot \(shareSnapshot\) \(p. 1616\)](#)

Create snapshot (createSnapshot)

The `createSnapshot` event is sent to your AWS account when an action to create a snapshot completes. However it is not saved, logged, or archived. This event can have a result of either succeeded or failed.

Event data

The listing below is an example of a JSON object emitted by EBS for a successful `createSnapshot` event. In the detail section, the `source` field contains the ARN of the source volume. The `startTime` and `endTime` fields indicate when creation of the snapshot started and completed.

```
{
    "version": "0",
    "id": "01234567-0123-0123-0123-012345678901",
    "detail-type": "EBS Snapshot Notification",
    "source": "aws.ec2",
    "account": "012345678901",
    "time": "yyyy-mm-ddThh:mm:ssZ",
    "region": "us-east-1",
```

```
"resources": [
    "arn:aws:ec2:us-west-2::snapshot/snap-01234567"
],
"detail": {
    "event": "createSnapshot",
    "result": "succeeded",
    "cause": "",
    "request-id": "",
    "snapshot_id": "arn:aws:ec2:us-west-2::snapshot/snap-01234567",
    "source": "arn:aws:ec2:us-west-2::volume/vol-01234567",
    "startTime": "yyyy-mm-ddThh:mm:ssZ",
    "endTime": "yyyy-mm-ddThh:mm:ssZ "
}
```

Create snapshots (createSchemas)

The `createSchemas` event is sent to your AWS account when an action to create a multi-volume snapshot completes. This event can have a result of either succeeded or failed.

Event data

The listing below is an example of a JSON object emitted by EBS for a successful `createSchemas` event. In the detail section, the `source` field contains the ARNs of the source volumes of the multi-volume snapshot set. The `startTime` and `endTime` fields indicate when creation of the snapshot started and completed.

```
{
    "version": "0",
    "id": "01234567-0123-0123-0123-012345678901",
    "detail-type": "EBS Multi-Volume Snapshots Completion Status",
    "source": "aws.ec2",
    "account": "012345678901",
    "time": "yyyy-mm-ddThh:mm:ssZ",
    "region": "us-east-1",
    "resources": [
        "arn:aws:ec2:us-east-1::snapshot/snap-01234567",
        "arn:aws:ec2:us-east-1::snapshot/snap-012345678"
    ],
    "detail": {
        "event": "createSchemas",
        "result": "succeeded",
        "cause": "",
        "request-id": "",
        "startTime": "yyyy-mm-ddThh:mm:ssZ",
        "endTime": "yyyy-mm-ddThh:mm:ssZ",
        "snapshots": [
            {
                "snapshot_id": "arn:aws:ec2:us-east-1::snapshot/snap-01234567",
                "source": "arn:aws:ec2:us-east-1::volume/vol-01234567",
                "status": "completed"
            },
            {
                "snapshot_id": "arn:aws:ec2:us-east-1::snapshot/snap-012345678",
                "source": "arn:aws:ec2:us-east-1::volume/vol-012345678",
                "status": "completed"
            }
        ]
    }
}
```

The listing below is an example of a JSON object emitted by EBS after a failed `createSchemas` event. The cause for the failure was one or more snapshots for the multi-volume snapshot set failed to

complete. The values of `snapshot_id` are the ARNs of the failed snapshots. `startTime` and `endTime` represent when the `create-snapshots` action started and ended.

```
{  
    "version": "0",  
    "id": "01234567-0123-0123-0123-012345678901",

    "account": "012345678901",  
    "time": "yyyy-mm-ddThh:mm:ssZ",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2::us-east-1:snapshot/snap-01234567",  
        "arn:aws:ec2::us-east-1:snapshot/snap-012345678"  
    ],  
    "detail": {  
        "event": "createSnapshots",  
        "result": "failed",  
        "cause": "Snapshot snap-01234567 is in status error",  
        "request-id": "",  
        "startTime": "yyyy-mm-ddThh:mm:ssZ",  
        "endTime": "yyyy-mm-ddThh:mm:ssZ",  
        "snapshots": [  
            {  
                "snapshot_id": "arn:aws:ec2::us-east-1:snapshot/snap-01234567",  
                "source": "arn:aws:ec2::us-east-1:volume/vol-01234567",  
                "status": "error"  
            },  
            {  
                "snapshot_id": "arn:aws:ec2::us-east-1:snapshot/snap-012345678",  
                "source": "arn:aws:ec2::us-east-1:volume/vol-012345678",  
                "status": "error"  
            }  
        ]  
    }  
}
```

Copy snapshot (`copySnapshot`)

The `copySnapshot` event is sent to your AWS account when an action to copy a snapshot completes. However it is not saved, logged, or archived. This event can have a result of either `succeeded` or `failed`.

Event data

The listing below is an example of a JSON object emitted by EBS after a successful `copySnapshot` event. The value of `snapshot_id` is the ARN of the newly created snapshot. In the `detail` section, the value of `source` is the ARN of the source snapshot. `startTime` and `endTime` represent when the `copy-snapshot` action started and ended.

```
{  
    "version": "0",  
    "id": "01234567-0123-0123-0123-012345678901",  
    "detail-type": "EBS Snapshot Notification",  
    "source": "aws.ec2",  
    "account": "123456789012",  
    "time": "yyyy-mm-ddThh:mm:ssZ",  
    "region": "us-east-1",  
    "resources": [  
        "arn:aws:ec2::us-west-2:snapshot/snap-01234567"  
    ],  
    "detail": {
```

```
    "event": "copySnapshot",
    "result": "succeeded",
    "cause": "",
    "request-id": "",
    "snapshot_id": "arn:aws:ec2:us-west-2::snapshot/snap-01234567",
    "source": "arn:aws:ec2:eu-west-1::snapshot/snap-76543210",
    "startTime": "yyyy-mm-ddThh:mm:ssZ",
    "endTime": "yyyy-mm-ddThh:mm:ssZ",
    "Incremental": "true"
}
}
```

The listing below is an example of a JSON object emitted by EBS after a failed copySnapshot event. The cause for the failure was an invalid source snapshot ID. The value of snapshot_id is the ARN of the failed snapshot. In the detail section, the value of source is the ARN of the source snapshot. startTime and endTime represent when the copy-snapshot action started and ended.

```
{
  "version": "0",
  "id": "01234567-0123-0123-0123-012345678901",
  "detail-type": "EBS Snapshot Notification",
  "source": "aws.ec2",
  "account": "123456789012",
  "time": "yyyy-mm-ddThh:mm:ssZ",
  "region": "us-east-1",
  "resources": [
    "arn:aws:ec2:us-west-2::snapshot/snap-01234567"
  ],
  "detail": {
    "event": "copySnapshot",
    "result": "failed",
    "cause": "Source snapshot ID is not valid",
    "request-id": "",
    "snapshot_id": "arn:aws:ec2:us-west-2::snapshot/snap-01234567",
    "source": "arn:aws:ec2:eu-west-1::snapshot/snap-76543210",
    "startTime": "yyyy-mm-ddThh:mm:ssZ",
    "endTime": "yyyy-mm-ddThh:mm:ssZ"
  }
}
```

Share snapshot (shareSnapshot)

The shareSnapshot event is sent to your AWS account when another account shares a snapshot with it. However it is not saved, logged, or archived. The result is always succeeded.

Event data

The following is an example of a JSON object emitted by EBS after a completed shareSnapshot event. In the detail section, the value of source is the AWS account number of the user that shared the snapshot with you. startTime and endTime represent when the share-snapshot action started and ended. The shareSnapshot event is emitted only when a private snapshot is shared with another user. Sharing a public snapshot does not trigger the event.

```
{
  "version": "0",
  "id": "01234567-0123-0123-0123-012345678901",
  "detail-type": "EBS Snapshot Notification",
  "source": "aws.ec2",
  "account": "012345678901",
  "time": "yyyy-mm-ddThh:mm:ssZ",
  "region": "us-east-1",
  "resources": [

```

```
    "arn:aws:ec2:us-west-2::snapshot/snap-01234567"
],
"detail": {
    "event": "shareSnapshot",
    "result": "succeeded",
    "cause": "",
    "request-id": "",
    "snapshot_id": "arn:aws:ec2:us-west-2::snapshot/snap-01234567",
    "source": "012345678901",
    "startTime": "yyyy-mm-ddThh:mm:ssZ",
    "endTime": "yyyy-mm-ddThh:mm:ssZ"
}
}
```

EBS Snapshots Archive events

Amazon EBS emits events related to snapshot archiving actions. For more information, see [Monitor snapshot archiving \(p. 1436\)](#).

EBS fast snapshot restore events

Amazon EBS sends events to CloudWatch Events when the state of fast snapshot restore for a snapshot changes. Events are emitted on a best effort basis.

The following is example data for this event.

```
{
    "version": "0",
    "id": "01234567-0123-0123-0123-012345678901",
    "detail-type": "EBS Fast Snapshot Restore State-change Notification",
    "source": "aws.ec2",
    "account": "123456789012",
    "time": "yyyy-mm-ddThh:mm:ssZ",
    "region": "us-east-1",
    "resources": [
        "arn:aws:ec2:us-east-1::snapshot/snap-03a55cf56513fa1b6"
    ],
    "detail": {
        "snapshot-id": "snap-1234567890abcdef0",
        "state": "optimizing",
        "zone": "us-east-1a",
        "message": "Client.UserInitiated - Lifecycle state transition"
    }
}
```

The possible values for state are enabling, optimizing, enabled, disabling, and disabled.

The possible values for message are as follows:

Client.InvalidSnapshot.InvalidState – The requested snapshot transitioned to an invalid state (Error)

A request to enable fast snapshot restore failed and the state transitioned to disabling or disabled. Fast snapshot restore cannot be enabled for this snapshot.

Client.UserInitiated

The state successfully transitioned to enabling or disabling.

Client.UserInitiated – Lifecycle state transition

The state successfully transitioned to optimizing, enabled, or disabled.

`Server.InsufficientCapacity` – There was insufficient capacity available to satisfy the request

A request to enable fast snapshot restore failed due to insufficient capacity, and the state transitioned to disabling or disabled. Wait and then try again.

`Server.InternalError` – An internal error caused the operation to fail

A request to enable fast snapshot restore failed due to an internal error, and the state transitioned to disabling or disabled. Wait and then try again.

`Client.InvalidSnapshot.InvalidState` – The requested snapshot was deleted or access permissions were revoked

The fast snapshot restore state for the snapshot has transitioned to disabling or disabled because the snapshot was deleted or unshared by the snapshot owner. Fast snapshot restore cannot be enabled for a snapshot that has been deleted or is no longer shared with you.

Using AWS Lambda to handle CloudWatch events

You can use Amazon EBS and CloudWatch Events to automate your data-backup workflow. This requires you to create an IAM policy, a AWS Lambda function to handle the event, and an Amazon CloudWatch Events rule that matches incoming events and routes them to the Lambda function.

The following procedure uses the `createSnapshot` event to automatically copy a completed snapshot to another Region for disaster recovery.

To copy a completed snapshot to another Region

1. Create an IAM policy, such as the one shown in the following example, to provide permissions to use the `CopySnapshot` action and write to the CloudWatch Events log. Assign the policy to the IAM user that will handle the CloudWatch event.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "logs:CreateLogGroup",  
                "logs:CreateLogStream",  
                "logs:PutLogEvents"  
            ],  
            "Resource": "arn:aws:logs:*:*:  
        },  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:CopySnapshot"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

2. Define a function in Lambda that will be available from the CloudWatch console. The sample Lambda function below, written in Node.js, is invoked by CloudWatch when a matching `createSnapshot` event is emitted by Amazon EBS (signifying that a snapshot was completed). When invoked, the function copies the snapshot from `us-east-2` to `us-east-1`.

```
// Sample Lambda function to copy an EBS snapshot to a different Region
```

```
var AWS = require('aws-sdk');
var ec2 = new AWS.EC2();

// define variables
var destinationRegion = 'us-east-1';
var sourceRegion = 'us-east-2';
console.log ('Loading function');

//main function
exports.handler = (event, context, callback) => {

    // Get the EBS snapshot ID from the CloudWatch event details
    var snapshotArn = event.detail.snapshot_id.split('/');
    const snapshotId = snapshotArn[1];
    const description = `Snapshot copy from ${snapshotId} in ${sourceRegion}.`;
    console.log ("snapshotId:", snapshotId);

    // Load EC2 class and update the configuration to use destination Region to
    // initiate the snapshot.
    AWS.config.update({region: destinationRegion});
    var ec2 = new AWS.EC2();

    // Prepare variables for ec2.modifySnapshotAttribute call
    const copySnapshotParams = {
        Description: description,
        DestinationRegion: destinationRegion,
        SourceRegion: sourceRegion,
        SourceSnapshotId: snapshotId
    };

    // Execute the copy snapshot and log any errors
    ec2.copySnapshot(copySnapshotParams, (err, data) => {
        if (err) {
            const errorMessage = `Error copying snapshot ${snapshotId} to Region
${destinationRegion}.`;
            console.log(errorMessage);
            console.log(err);
            callback(errorMessage);
        } else {
            const successMessage = `Successfully started copy of snapshot ${snapshotId}
to Region ${destinationRegion}.`;
            console.log(successMessage);
            console.log(data);
            callback(null, successMessage);
        }
    });
};

};
```

To ensure that your Lambda function is available from the CloudWatch console, create it in the Region where the CloudWatch event will occur. For more information, see the [AWS Lambda Developer Guide](#).

3. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
4. In the navigation panel, expand **Events** and choose **Rules**, and then choose **Create rule**.
5. Select **Event Pattern..**. For **Service Name**, choose **EC2**, and for **Event Type**, choose **EBS Snapshot Notification**.
6. Select **Specific event(s)** and then choose **createSnapshot**.
7. Select **Specific result(s)** and then choose **succeeded**.
8. In the **Targets** section, choose **Add target**, and then for **Function**, choose the Lambda function that you created previously.
9. Choose **Configure details**.

10. On the **Configure rule details** page, enter values for **Name** and **Description**. Select the **State** check box to activate the function.
11. Choose **Create rule**.

Your rule should now appear on the **Rules** tab. In the example shown, the event that you configured should be emitted by EBS the next time you copy a snapshot.

Amazon EBS quotas

To view the quotas for your Amazon EBS resources, open the Service Quotas console at <https://console.aws.amazon.com/servicequotas/>. In the navigation pane, choose **AWS services**, and select **Amazon Elastic Block Store (Amazon EBS)**.

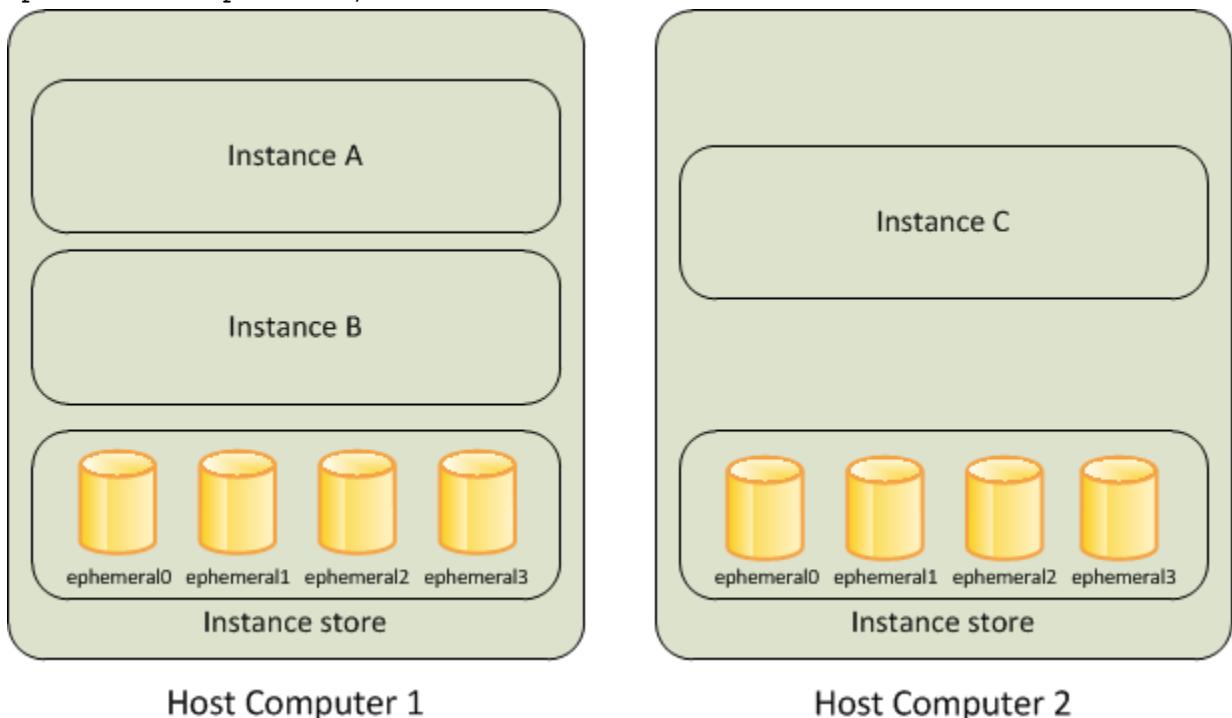

For a list of Amazon EBS service quotas, see [Amazon Elastic Block Store endpoints and quotas](#) in the *AWS General Reference*.

Amazon EC2 instance store

An *instance store* provides temporary block-level storage for your instance. This storage is located on disks that are physically attached to the host computer. Instance store is ideal for temporary storage of information that changes frequently, such as buffers, caches, scratch data, and other temporary content, or for data that is replicated across a fleet of instances, such as a load-balanced pool of web servers.

An instance store consists of one or more instance store volumes exposed as block devices. The size of an instance store as well as the number of devices available varies by instance type.

The virtual devices for instance store volumes are `ephemeral[0-23]`. Instance types that support one instance store volume have `ephemeral0`. Instance types that support two instance store volumes have `ephemeral0` and `ephemeral1`, and so on.

- [Instance store swap volumes \(p. 1635\)](#)
- [Optimize disk performance for instance store volumes \(p. 1637\)](#)

Instance store lifetime

You can specify instance store volumes for an instance only when you launch it. You can't detach an instance store volume from one instance and attach it to a different instance.

The data in an instance store persists only during the lifetime of its associated instance. If an instance reboots (intentionally or unintentionally), data in the instance store persists. However, data in the instance store is lost under any of the following circumstances:

- The underlying disk drive fails
- The instance stops
- The instance hibernates
- The instance terminates

Therefore, do not rely on instance store for valuable, long-term data. Instead, use more durable data storage, such as Amazon S3, Amazon EBS, or Amazon EFS.

When you stop, hibernate, or terminate an instance, every block of storage in the instance store is reset. Therefore, your data cannot be accessed through the instance store of another instance.

If you create an AMI from an instance, the data on its instance store volumes isn't preserved and isn't present on the instance store volumes of the instances that you launch from the AMI.

If you change the instance type, an instance store will not be attached to the new instance type. For more information, see [Change the instance type \(p. 382\)](#).

Instance store volumes

The instance type determines the size of the instance store available and the type of hardware used for the instance store volumes. Instance store volumes are included as part of the instance's usage cost. You must specify the instance store volumes that you'd like to use when you launch the instance (except for NVMe instance store volumes, which are available by default). Then format and mount the instance store volumes before using them. You can't make an instance store volume available after you launch the instance. For more information, see [Add instance store volumes to your EC2 instance \(p. 1630\)](#).

Some instance types use NVMe or SATA-based solid state drives (SSD) to deliver high random I/O performance. This is a good option when you need storage with very low latency, but you don't need the data to persist when the instance terminates or you can take advantage of fault-tolerant architectures. For more information, see [SSD instance store volumes \(p. 1634\)](#).

The data on NVMe instance store volumes and some HDD instance store volumes is encrypted at rest. For more information, see [Data protection in Amazon EC2 \(p. 1237\)](#).

The following table provides the quantity, size, type, and performance optimizations of instance store volumes available on each supported instance type. For a complete list of instance types, including EBS-only types, see [Amazon EC2 Instance Types](#).

* Volumes attached to certain instances suffer a first-write penalty unless initialized. For more information, see [Optimize disk performance for instance store volumes \(p. 1637\)](#).

** For more information, see [Instance store volume TRIM support \(p. 1635\)](#).

† The c1.medium and m1.small instance types also include a 900 MB instance store swap volume, which may not be automatically enabled at boot time. For more information, see [Instance store swap volumes \(p. 1635\)](#).

To query instance store volume information using the AWS CLI

You can use the [describe-instance-types](#) AWS CLI command to display information about an instance type, such as its instance store volumes. The following example displays the total size of instance storage for all R5 instances with instance store volumes.

```
aws ec2 describe-instance-types \
  --filters "Name=instance-type,Values=r5*" "Name=instance-storage-supported,Values=true"
  \
  --query "InstanceTypes[].[InstanceType, InstanceStorageInfo.TotalSizeInGB]" \
  --output table
```

Example output

```
-----+
|  DescribeInstanceTypes  |
+-----+-----+
| r5ad.24xlarge | 3600  |
| r5ad.12xlarge | 1800  |
| r5dn.8xlarge  | 1200  |
```

r5ad.8xlarge 1200		
r5ad.large 75		
r5d.4xlarge 600		
. . .		
r5dn.2xlarge 300		
r5d.12xlarge 1800		
+	-----+-----+	

The following example displays the complete instance storage details for the specified instance type.

```
aws ec2 describe-instance-types \
    --filters "Name=instance-type,Values=r5d.4xlarge" \
    --query "InstanceTypes[ ].InstanceStorageInfo"
```

The example output shows that this instance type has two 300 GB NVMe SSD volumes, for a total of 600 GB of instance storage.

```
[  
  {  
    "TotalSizeInGB": 600,  
    "Disks": [  
      {  
        "SizeInGB": 300,  
        "Count": 2,  
        "Type": "ssd"  
      }  
    ],  
    "NvmeSupport": "required"  
  }  
]
```

Add instance store volumes to your EC2 instance

You specify the EBS volumes and instance store volumes for your instance using a block device mapping. Each entry in a block device mapping includes a device name and the volume that it maps to. The default block device mapping is specified by the AMI you use. Alternatively, you can specify a block device mapping for the instance when you launch it.

All the NVMe instance store volumes supported by an instance type are automatically enumerated and assigned a device name on instance launch; including them in the block device mapping for the AMI or the instance has no effect. For more information, see [Block device mappings \(p. 1654\)](#).

A block device mapping always specifies the root volume for the instance. The root volume is either an Amazon EBS volume or an instance store volume. For more information, see [Storage for the root device \(p. 106\)](#). The root volume is mounted automatically. For instances with an instance store volume for the root volume, the size of this volume varies by AMI, but the maximum size is 10 GB.

You can use a block device mapping to specify additional EBS volumes when you launch your instance, or you can attach additional EBS volumes after your instance is running. For more information, see [Amazon EBS volumes \(p. 1349\)](#).

You can specify the instance store volumes for your instance only when you launch it. You can't attach instance store volumes to an instance after you've launched it.

If you change the instance type, an instance store will not be attached to the new instance type. For more information, see [Change the instance type \(p. 382\)](#).

The number and size of available instance store volumes for your instance varies by instance type. Some instance types do not support instance store volumes. If the number of instance store volumes in a block

device mapping exceeds the number of instance store volumes available to an instance, the additional volumes are ignored. For more information about the instance store volumes supported by each instance type, see [Instance store volumes \(p. 1621\)](#).

If the instance type you choose for your instance supports non-NVMe instance store volumes, you must add them to the block device mapping for the instance when you launch it. NVMe instance store volumes are available by default. After you launch an instance, you must ensure that the instance store volumes for your instance are formatted and mounted before you can use them. The root volume of an instance store-backed instance is mounted automatically.

Contents

- [Add instance store volumes to an AMI \(p. 1631\)](#)
- [Add instance store volumes to an instance \(p. 1632\)](#)
- [Make instance store volumes available on your instance \(p. 1633\)](#)

Add instance store volumes to an AMI

You can create an AMI with a block device mapping that includes instance store volumes. If you launch an instance with an instance type that supports instance store volumes and an AMI that specifies instance store volumes in its block device mapping, the instance includes these instance store volumes. If the number of instance store volumes in the block device mapping exceeds the number of instance store volumes available to the instance, the additional instance store volumes are ignored.

Considerations

- For M3 instances, specify instance store volumes in the block device mapping of the instance, not the AMI. Amazon EC2 might ignore instance store volumes that are specified only in the block device mapping of the AMI.
- When you launch an instance, you can omit non-NVMe instance store volumes specified in the AMI block device mapping or add instance store volumes.

New console

To add instance store volumes to an Amazon EBS-backed AMI using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and select the instance.
3. Choose **Actions, Image and templates, Create image**.
4. On the **Create image** page, enter a meaningful name and description for your image.
5. For each instance store volume to add, choose **Add volume**, from **Volume type** select an instance store volume, and from **Device** select a device name. (For more information, see [Device names on Linux instances \(p. 1652\)](#).) The number of available instance store volumes depends on the instance type. For instances with NVMe instance store volumes, the device mapping of these volumes depends on the order in which the operating system enumerates the volumes.
6. Choose **Create image**.

Old console

To add instance store volumes to an Amazon EBS-backed AMI using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and select the instance.
3. Choose **Actions, Image, Create Image**.

4. In the **Create Image** dialog box, type a meaningful name and description for your image.
5. For each instance store volume to add, choose **Add New Volume**, from **Volume Type** select an instance store volume, and from **Device** select a device name. (For more information, see [Device names on Linux instances \(p. 1652\)](#).) The number of available instance store volumes depends on the instance type. For instances with NVMe instance store volumes, the device mapping of these volumes depends on the order in which the operating system enumerates the volumes.
6. Choose **Create Image**.

To add instance store volumes to an AMI using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [create-image](#) or [register-image](#) (AWS CLI)
- [New-EC2Image](#) and [Register-EC2Image](#) (AWS Tools for Windows PowerShell)

Add instance store volumes to an instance

When you launch an instance, the default block device mapping is provided by the specified AMI. If you need additional instance store volumes, you must add them to the instance as you launch it. You can also omit devices specified in the AMI block device mapping.

Considerations

- For M3 instances, you might receive instance store volumes even if you do not specify them in the block device mapping for the instance.
- For HS1 instances, no matter how many instance store volumes you specify in the block device mapping of an AMI, the block device mapping for an instance launched from the AMI automatically includes the maximum number of supported instance store volumes. You must explicitly remove the instance store volumes that you don't want from the block device mapping for the instance before you launch it.

To update the block device mapping for an instance using the console

1. Open the Amazon EC2 console.
2. From the dashboard, choose **Launch instance**.
3. In **Step 1: Choose an Amazon Machine Image (AMI)**, select the AMI to use and choose **Select**.
4. Follow the wizard to complete **Step 1: Choose an Amazon Machine Image (AMI)**, **Step 2: Choose an Instance Type**, and **Step 3: Configure Instance Details**.
5. In **Step 4: Add Storage**, modify the existing entries as needed. For each instance store volume to add, choose **Add New Volume**, from **Volume Type** select an instance store volume, and from **Device** select a device name. The number of available instance store volumes depends on the instance type.
6. Complete the wizard and launch the instance.
7. (Optional) To view the instance store volumes available on your instance, run the **lsblk** command.

To update the block device mapping for an instance using the command line

You can use one of the following options commands with the corresponding command. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- **--block-device-mappings** with [run-instances](#) (AWS CLI)
- **-BlockDeviceMapping** with [New-EC2Instance](#) (AWS Tools for Windows PowerShell)

Make instance store volumes available on your instance

After you launch an instance, the instance store volumes are available to the instance, but you can't access them until they are mounted. For Linux instances, the instance type determines which instance store volumes are mounted for you and which are available for you to mount yourself. For Windows instances, the EC2Config service mounts the instance store volumes for an instance. The block device driver for the instance assigns the actual volume name when mounting the volume, and the name assigned can be different than the name that Amazon EC2 recommends.

Many instance store volumes are pre-formatted with the ext3 file system. SSD-based instance store volumes that support TRIM instruction are not pre-formatted with any file system. However, you can format volumes with the file system of your choice after you launch your instance. For more information, see [Instance store volume TRIM support \(p. 1635\)](#). For Windows instances, the EC2Config service reformats the instance store volumes with the NTFS file system.

You can confirm that the instance store devices are available from within the instance itself using instance metadata. For more information, see [View the instance block device mapping for instance store volumes \(p. 1662\)](#).

For Windows instances, you can also view the instance store volumes using Windows Disk Management. For more information, see [List disks using Windows Disk Management](#).

For Linux instances, you can view and mount the instance store volumes as described in the following procedure.

To make an instance store volume available on Linux

1. Connect to the instance using an SSH client. For more information, see [Connect to your Linux instance \(p. 611\)](#).
2. Use the `df -h` command to view the volumes that are formatted and mounted.

```
[ec2-user ~]$ df -h
Filesystem      Size  Used Avail Use% Mounted on
devtmpfs        3.8G   72K  3.8G   1% /dev
tmpfs          3.8G     0  3.8G   0% /dev/shm
/dev/nvme0n1p1  7.9G  1.2G  6.6G  15% /
```

3. Use the `lsblk` to view any volumes that were mapped at launch but not formatted and mounted.

```
[ec2-user ~]$ lsblk
NAME      MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT
nvme0n1    259:1    0   8G  0 disk
##nvme0n1p1 259:2    0   8G  0 part /
##nvme0n1p128 259:3   0   1M  0 part
nvme1n1    259:0    0 69.9G 0 disk
```

4. To format and mount an instance store volume that was mapped only, do the following:

- a. Create a file system on the device using the `mkfs` command.

```
[ec2-user ~]$ sudo mkfs -t xfs /dev/nvme1n1
```

- b. Create a directory on which to mount the device using the `mkdir` command.

```
[ec2-user ~]$ sudo mkdir /data
```

- c. Mount the device on the newly created directory using the `mount` command.

```
[ec2-user ~]$ sudo mount /dev/nvme1n1 /data
```

For instructions on how to mount an attached volume automatically after reboot, see [Automatically mount an attached volume after reboot \(p. 1384\)](#).

SSD instance store volumes

To ensure the best IOPS performance from your SSD instance store volumes on Linux, we recommend that you use the most recent version of Amazon Linux, or another Linux AMI with a kernel version of 3.8 or later. If you do not use a Linux AMI with a kernel version of 3.8 or later, your instance won't achieve the maximum IOPS performance available for these instance types.

Like other instance store volumes, you must map the SSD instance store volumes for your instance when you launch it. The data on an SSD instance volume persists only for the life of its associated instance. For more information, see [Add instance store volumes to your EC2 instance \(p. 1630\)](#).

NVMe SSD volumes

Some instances offer non-volatile memory express (NVMe) solid state drives (SSD) instance store volumes. For more information about the type of instance store volume supported by each instance type, see [Instance store volumes \(p. 1621\)](#).

To access NVMe volumes, the [NVMe drivers \(p. 1558\)](#) must be installed. The following AMIs meet this requirement:

- Amazon Linux 2
- Amazon Linux AMI 2018.03
- Ubuntu 14.04 (with `linux-aws` kernel) or later
- Red Hat Enterprise Linux 7.4 or later
- SUSE Linux Enterprise Server 12 SP2 or later
- CentOS 7.4.1708 or later
- FreeBSD 11.1 or later
- Debian GNU/Linux 9 or later

After you connect to your instance, you can list the NVMe devices using the `lspci` command. The following is example output for an `i3.8xlarge` instance, which supports four NVMe devices.

```
[ec2-user ~]$ lspci
00:00.0 Host bridge: Intel Corporation 440FX - 82441FX PMC [Natoma] (rev 02)
00:01.0 ISA bridge: Intel Corporation 82371SB PIIX3 ISA [Natoma/Triton II]
00:01.1 IDE interface: Intel Corporation 82371SB PIIX3 IDE [Natoma/Triton II]
00:01.3 Bridge: Intel Corporation 82371AB/EB/MB PIIX4 ACPI (rev 01)
00:02.0 VGA compatible controller: Cirrus Logic GD 5446
00:03.0 Ethernet controller: Device 1d0f:ec20
00:17.0 Non-Volatile memory controller: Device 1d0f:cd01
00:18.0 Non-Volatile memory controller: Device 1d0f:cd01
00:19.0 Non-Volatile memory controller: Device 1d0f:cd01
00:1a.0 Non-Volatile memory controller: Device 1d0f:cd01
00:1f.0 Unassigned class [ff80]: XenSource, Inc. Xen Platform Device (rev 01)
```

If you are using a supported operating system but you do not see the NVMe devices, verify that the NVMe module is loaded using the following command.

- Amazon Linux, Amazon Linux 2, Ubuntu 14/16, Red Hat Enterprise Linux, SUSE Linux Enterprise Server, CentOS 7

```
$ lsmod | grep nvme
```

nvme	48813 0
------	---------

- Ubuntu 18

```
$ cat /lib/modules/$(uname -r)/modules.builtin | grep nvme
s/nvme/host/nvme-core.ko
kernel/drivers/nvme/host/nvme.ko
kernel/drivers/nvmem/nvmem_core.ko
```

The NVMe volumes are compliant with the NVMe 1.0e specification. You can use the NVMe commands with your NVMe volumes. With Amazon Linux, you can install the `nvme-cli` package from the repo using the `yum install` command. With other supported versions of Linux, you can download the `nvme-cli` package if it's not available in the image.

The data on NVMe instance storage is encrypted using an XTS-AES-256 block cipher implemented in a hardware module on the instance. The encryption keys are generated using the hardware module and are unique to each NVMe instance storage device. All encryption keys are destroyed when the instance is stopped or terminated and cannot be recovered. You cannot disable this encryption and you cannot provide your own encryption key.

Non-NVMe SSD volumes

The following instances support instance store volumes that use non-NVMe SSDs to deliver high random I/O performance: C3, G2, I2, M3, R3, and X1. For more information about the instance store volumes supported by each instance type, see [Instance store volumes \(p. 1621\)](#).

Instance store volume TRIM support

Some instance types support SSD volumes with TRIM. For more information, see [Instance store volumes \(p. 1621\)](#).

Instance store volumes that support TRIM are fully trimmed before they are allocated to your instance. These volumes are not formatted with a file system when an instance launches, so you must format them before they can be mounted and used. For faster access to these volumes, you should skip the TRIM operation when you format them.

With instance store volumes that support TRIM, you can use the TRIM command to notify the SSD controller when you no longer need data that you've written. This provides the controller with more free space, which can reduce write amplification and increase performance. On Linux, use the `fstrim` command to enable periodic TRIM.

Instance store swap volumes

Swap space in Linux can be used when a system requires more memory than it has been physically allocated. When swap space is enabled, Linux systems can swap infrequently used memory pages from physical memory to swap space (either a dedicated partition or a swap file in an existing file system) and free up that space for memory pages that require high-speed access.

Note

Using swap space for memory paging is not as fast or efficient as using RAM. If your workload is regularly paging memory into swap space, you should consider migrating to a larger instance type with more RAM. For more information, see [Change the instance type \(p. 382\)](#).

The `c1.medium` and `m1.small` instance types have a limited amount of physical memory to work with, and they are given a 900 MiB swap volume at launch time to act as virtual memory for Linux AMIs. Although the Linux kernel sees this swap space as a partition on the root device, it is actually a separate instance store volume, regardless of your root device type.

Amazon Linux automatically enables and uses this swap space, but your AMI may require some additional steps to recognize and use this swap space. To see if your instance is using swap space, you can use the **swapon -s** command.

```
[ec2-user ~]$ swapon -s
Filename                                Type      Size   Used   Priority
/dev/xvda3                               partition 917500  0       -1
```

The above instance has a 900 MiB swap volume attached and enabled. If you don't see a swap volume listed with this command, you may need to enable swap space for the device. Check your available disks using the **lsblk** command.

```
[ec2-user ~]$ lsblk
NAME MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT
xvda1 202:1   0   8G  0 disk /
xvda3 202:3   0  896M 0 disk
```

Here, the swap volume **xvda3** is available to the instance, but it is not enabled (notice that the **MOUNTPOINT** field is empty). You can enable the swap volume with the **swapon** command.

Note

You must prepend /dev/ to the device name listed by **lsblk**. Your device may be named differently, such as **sda3**, **sde3**, or **xvde3**. Use the device name for your system in the command below.

```
[ec2-user ~]$ sudo swapon /dev/xvda3
```

Now the swap space should show up in **lsblk** and **swapon -s** output.

```
[ec2-user ~]$ lsblk
NAME MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT
xvda1 202:1   0   8G  0 disk /
xvda3 202:3   0  896M 0 disk [SWAP]
[ec2-user ~]$ swapon -s
Filename                                Type      Size   Used   Priority
/dev/xvda3                               partition 917500  0       -1
```

You also need to edit your **/etc/fstab** file so that this swap space is automatically enabled at every system boot.

```
[ec2-user ~]$ sudo vim /etc/fstab
```

Append the following line to your **/etc/fstab** file (using the swap device name for your system):

```
/dev/xvda3      none    swap    sw    0     0
```

To use an instance store volume as swap space

Any instance store volume can be used as swap space. For example, the **m3.medium** instance type includes a 4 GB SSD instance store volume that is appropriate for swap space. If your instance store volume is much larger (for example, 350 GB), you may consider partitioning the volume with a smaller swap partition of 4-8 GB and the rest for a data volume.

Note

This procedure applies only to instance types that support instance storage. For a list of supported instance types, see [Instance store volumes \(p. 1621\)](#).

1. List the block devices attached to your instance to get the device name for your instance store volume.

```
[ec2-user ~]$ lsblk -p
NAME      MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT
/dev/xvdb  202:16   0   4G  0 disk /media/ephemeral0
/dev/xvda1 202:1    0   8G  0 disk /
```

In this example, the instance store volume is `/dev/xvdb`. Because this is an Amazon Linux instance, the instance store volume is formatted and mounted at `/media/ephemeral0`; not all Linux operating systems do this automatically.

2. (Optional) If your instance store volume is mounted (it lists a `MOUNTPOINT` in the `lsblk` command output), unmount it with the following command.

```
[ec2-user ~]$ sudo umount /dev/xvdb
```

3. Set up a Linux swap area on the device with the `mkswap` command.

```
[ec2-user ~]$ sudo mkswap /dev/xvdb
mkswap: /dev/xvdb: warning: wiping old ext3 signature.
Setting up swapspace version 1, size = 4188668 KiB
no label, UUID=b4f63d28-67ed-46f0-b5e5-6928319e620b
```

4. Enable the new swap space.

```
[ec2-user ~]$ sudo swapon /dev/xvdb
```

5. Verify that the new swap space is being used.

```
[ec2-user ~]$ swapon -s
Filename  Type  Size Used Priority
/dev/xvdb            partition 4188668 0 -1
```

6. Edit your `/etc/fstab` file so that this swap space is automatically enabled at every system boot.

```
[ec2-user ~]$ sudo vim /etc/fstab
```

If your `/etc/fstab` file has an entry for `/dev/xvdb` (or `/dev/sdb`) change it to match the line below; if it does not have an entry for this device, append the following line to your `/etc/fstab` file (using the swap device name for your system):

```
/dev/xvdb      none      swap      sw  0      0
```

Important

Instance store volume data is lost when an instance is stopped or hibernated; this includes the instance store swap space formatting created in [Step 3 \(p. 1637\)](#). If you stop and restart an instance that has been configured to use instance store swap space, you must repeat [Step 1 \(p. 1637\)](#) through [Step 5 \(p. 1637\)](#) on the new instance store volume.

Optimize disk performance for instance store volumes

Because of the way that Amazon EC2 virtualizes disks, the first write to any location on some instance store volumes performs more slowly than subsequent writes. For most applications, amortizing this

cost over the lifetime of the instance is acceptable. However, if you require high disk performance, we recommend that you initialize your drives by writing once to every drive location before production use.

Note

Some instance types with direct-attached solid state drives (SSD) and TRIM support provide maximum performance at launch time, without initialization. For information about the instance store for each instance type, see [Instance store volumes \(p. 1621\)](#).

If you require greater flexibility in latency or throughput, we recommend using Amazon EBS.

To initialize the instance store volumes, use the following dd commands, depending on the store to initialize (for example, /dev/sdb or /dev/nvme1n1).

Note

Make sure to unmount the drive before performing this command.

Initialization can take a long time (about 8 hours for an extra large instance).

To initialize the instance store volumes, use the following commands on the m1.large, m1.xlarge, c1.xlarge, m2.xlarge, m2.2xlarge, and m2.4xlarge instance types:

```
dd if=/dev/zero of=/dev/sdb bs=1M
dd if=/dev/zero of=/dev/sdc bs=1M
dd if=/dev/zero of=/dev/sdd bs=1M
dd if=/dev/zero of=/dev/sde bs=1M
```

To perform initialization on all instance store volumes at the same time, use the following command:

```
dd if=/dev/zero bs=1M|tee /dev/sdb|tee /dev/sdc|tee /dev/sde > /dev/sdd
```

Configuring drives for RAID initializes them by writing to every drive location. When configuring software-based RAID, make sure to change the minimum reconstruction speed:

```
echo $((30*1024)) > /proc/sys/dev/raid/speed_limit_min
```

File storage

Cloud file storage is a method for storing data in the cloud that provides servers and applications access to data through shared file systems. This compatibility makes cloud file storage ideal for workloads that rely on shared file systems and provides simple integration without code changes.

There are many file storage solutions that exist, ranging from a single node file server on a compute instance using block storage as the underpinnings with no scalability or few redundancies to protect the data, to a do-it-yourself clustered solution, to a fully-managed solution. The following content introduces some of the storage services provided by AWS for use with Linux.

Contents

- [Use Amazon S3 with Amazon EC2 \(p. 1638\)](#)
- [Use Amazon EFS with Amazon EC2 \(p. 1640\)](#)

Use Amazon S3 with Amazon EC2

Amazon S3 is a repository for internet data. Amazon S3 provides access to reliable, fast, and inexpensive data storage infrastructure. It is designed to make web-scale computing easier by enabling you to store and retrieve any amount of data, at any time, from within Amazon EC2 or anywhere on the web. Amazon

S3 stores data objects redundantly on multiple devices across multiple facilities and allows concurrent read or write access to these data objects by many separate clients or application threads. You can use the redundant data stored in Amazon S3 to recover quickly and reliably from instance or application failures.

Amazon EC2 uses Amazon S3 for storing Amazon Machine Images (AMIs). You use AMIs for launching EC2 instances. In case of instance failure, you can use the stored AMI to immediately launch another instance, thereby allowing for fast recovery and business continuity.

Amazon EC2 also uses Amazon S3 to store snapshots (backup copies) of the data volumes. You can use snapshots for recovering data quickly and reliably in case of application or system failures. You can also use snapshots as a baseline to create multiple new data volumes, expand the size of an existing data volume, or move data volumes across multiple Availability Zones, thereby making your data usage highly scalable. For more information about using data volumes and snapshots, see [Amazon Elastic Block Store \(p. 1347\)](#).

Objects are the fundamental entities stored in Amazon S3. Every object stored in Amazon S3 is contained in a bucket. Buckets organize the Amazon S3 namespace at the highest level and identify the account responsible for that storage. Amazon S3 buckets are similar to internet domain names. Objects stored in the buckets have a unique key value and are retrieved using a URL. For example, if an object with a key value /photos/mygarden.jpg is stored in the [DOC-EXAMPLE-BUCKET1](#) bucket, then it is addressable using the URL <https://DOC-EXAMPLE-BUCKET1.s3.amazonaws.com/photos/mygarden.jpg>.

For more information about the features of Amazon S3, see the [Amazon S3 product page](#).

Usage examples

Given the benefits of Amazon S3 for storage, you might decide to use this service to store files and data sets for use with EC2 instances. There are several ways to move data to and from Amazon S3 to your instances. In addition to the examples discussed below, there are a variety of tools that people have written that you can use to access your data in Amazon S3 from your computer or your instance. Some of the common ones are discussed in the AWS forums.

If you have permission, you can copy a file to or from Amazon S3 and your instance using one of the following methods.

GET or wget

Note

This method works for public objects only. If the object is not public, you receive an `ERROR 403: Forbidden` message. If you receive this error, you must use either the Amazon S3 console, AWS CLI, AWS API, AWS SDK, or AWS Tools for Windows PowerShell, and you must have the required permissions. For more information, see [Identity and access management in Amazon S3](#) and [Downloading an object](#) in the [Amazon S3 User Guide](#).

The **wget** utility is an HTTP and FTP client that allows you to download public objects from Amazon S3. It is installed by default in Amazon Linux and most other distributions, and available for download on Windows. To download an Amazon S3 object, use the following command, substituting the URL of the object to download.

```
[ec2-user ~]$ wget https://my_bucket.s3.amazonaws.com/path-to-file
```

AWS Command Line Interface

The AWS Command Line Interface (AWS CLI) is a unified tool to manage your AWS services. The AWS CLI enables users to authenticate themselves and download restricted items from Amazon S3 and also to upload items. For more information, such as how to install and configure the tools, see the [AWS Command Line Interface detail page](#).

The **aws s3 cp** command is similar to the Unix **cp** command. You can copy files from Amazon S3 to your instance, copy files from your instance to Amazon S3, and copy files from one Amazon S3 location to another.

Use the following command to copy an object from Amazon S3 to your instance.

```
[ec2-user ~]$ aws s3 cp s3://my_bucket/my_folder/my_file.ext my_copied_file.ext
```

Use the following command to copy an object from your instance back into Amazon S3.

```
[ec2-user ~]$ aws s3 cp my_copied_file.ext s3://my_bucket/my_folder/my_file.ext
```

The **aws s3 sync** command can synchronize an entire Amazon S3 bucket to a local directory location. This can be helpful for downloading a data set and keeping the local copy up-to-date with the remote set. If you have the proper permissions on the Amazon S3 bucket, you can push your local directory back up to the cloud when you are finished by reversing the source and destination locations in the command.

Use the following command to download an entire Amazon S3 bucket to a local directory on your instance.

```
[ec2-user ~]$ aws s3 sync s3://remote_s3_bucket local_directory
```

Amazon S3 API

If you are a developer, you can use an API to access data in Amazon S3. For more information, see the [Amazon Simple Storage Service User Guide](#). You can use this API and its examples to help develop your application and integrate it with other APIs and SDKs, such as the boto Python interface.

Use Amazon EFS with Amazon EC2

Amazon EFS provides scalable file storage for use with Amazon EC2. You can use an EFS file system as a common data source for workloads and applications running on multiple instances. For more information, see the [Amazon Elastic File System product page](#).

Important

Amazon EFS is not supported on Windows instances.

You can mount an EFS file system to your instance in the following ways:

Topics

- [Create an EFS file system using Amazon EFS Quick Create \(p. 1640\)](#)
- [Create an EFS file system and mount it to your instance \(p. 1641\)](#)

Create an EFS file system using Amazon EFS Quick Create

You can create an EFS file system and mount it to your instance at the time of launch using the Amazon EFS Quick Create feature of the Instance Launch Wizard.

When you create an EFS file system using EFS Quick Create, the file system is created with the following service recommended settings:

- Automatic backups turned on. For more information, see [Using AWS Backup with Amazon EFS](#) in the [Amazon Elastic File System User Guide](#).
- Mount targets in each default subnet in the selected VPC, using the VPC's default security group. For more information, see [Managing file system network accessibility](#) in the [Amazon Elastic File System User Guide](#).

- General Purpose performance mode. For more information, see [Performance Modes](#) in the *Amazon Elastic File System User Guide*.
- Bursting throughput mode. For more information, see [Throughput Modes](#) in the *Amazon Elastic File System User Guide*.
- Encryption of data at rest enabled using your default key for Amazon EFS (aws/elasticfilesystem). For more information, see [Encrypting Data at Rest](#) in the *Amazon Elastic File System User Guide*.
- Amazon EFS lifecycle management enabled with a 30-day policy. For more information, see [EFS lifecycle management](#) in the *Amazon Elastic File System User Guide*.

To create an EFS file system using Amazon EFS Quick Create

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Launch Instance**.
3. On the **Choose an AMI** page, choose a Linux AMI.
4. On the **Choose an Instance Type** page, select an instance type and then choose **Next: Configure Instance Details**.
5. On the **Configure Instance Details** page, for **File systems**, choose **Create new file system**, enter a name for the new file system, and then choose **Create**.

To enable access to the file system, the following security groups are automatically created and attached to the instance and the mount targets of the file system.

- **Instance security group**—Includes no inbound rules and an outbound rule that allows traffic over the NFS 2049 port.
- **File system mount targets security group**—Includes an inbound rule that allows traffic over the NFS 2049 port from the instance security group (described above), and an outbound rule that allows traffic over the NFS 2049 port.

You can also choose to manually create and attach the security groups. To do this, clear **Automatically create and attach the required security groups**.

Configure the remaining settings as needed and choose **Next: Add Storage**.

6. On the **Add Storage** page, specify the volumes to attach to the instances, in addition to the volumes specified by the AMI (such as the root device volume). Ensure that you provision enough storage for the Nvidia CUDA Toolkit. Then choose **Next: Add Tags**.
7. On the **Add Tags** page, specify a tag that you can use to identify the temporary instance, and then choose **Next: Configure Security Group**.
8. On the **Configure Security Group** page, review the security groups and then choose **Review and Launch**.
9. On the **Review Instance Launch** page, review the settings, and then choose **Launch** to choose a key pair and to launch your instance.

Create an EFS file system and mount it to your instance

In this tutorial, you create an EFS file system and two Linux instances that can share data using the file system.

Tasks

- [Prerequisites \(p. 1642\)](#)
- [Step 1: Create an EFS file system \(p. 1642\)](#)
- [Step 2: Mount the file system \(p. 1642\)](#)

- [Step 3: Test the file system \(p. 1643\)](#)
- [Step 4: Clean up \(p. 1644\)](#)

Prerequisites

- Create a security group (for example, efs-sg) to associate with the EC2 instances and EFS mount target, and add the following rules:
 - Allow inbound SSH connections to the EC2 instances from your computer (the source is the CIDR block for your network).
 - Allow inbound NFS connections to the file system via the EFS mount target from the EC2 instances that are associated with this security group (the source is the security group itself). For more information, see [Amazon EFS rules \(p. 1343\)](#), and [Creating security Groups](#) in the *Amazon Elastic File System User Guide*.
- Create a key pair. You must specify a key pair when you configure your instances or you can't connect to them. For more information, see [Create a key pair \(p. 5\)](#).

Step 1: Create an EFS file system

Amazon EFS enables you to create a file system that multiple instances can mount and access at the same time. For more information, see [Creating Resources for Amazon EFS](#) in the *Amazon Elastic File System User Guide*.

To create a file system

1. Open the Amazon Elastic File System console at <https://console.aws.amazon.com/efs/>.
2. Choose **Create file system**.
3. (Optional) For **Name**, enter a name for the file system. This creates a tag with **Name** as the key and the name of the file system as the value.
4. For **Virtual Private Cloud (VPC)**, select the VPC to use for your instances.
5. Choose **Create**.
6. After the file system is created, note the file system ID. It is used later in this tutorial.
7. Choose the file system ID.
8. On the file systems page, choose **Network, Manage**. View the mount targets that Amazon EFS creates in each Availability Zone in the Region in which your VPC resides. For each Availability Zone for your instances, ensure that the value for **Security groups** is the security group that you created in [Prerequisites \(p. 1642\)](#).
9. Choose **Save**.

Step 2: Mount the file system

Use the following procedure to launch two `t2.micro` instances. Note that T2 instances must be launched in a subnet. You can use a default VPC or a nondefault VPC.

Note

There are other ways that you can mount the volume (for example, on an already running instance). For more information, see [Mounting File Systems](#) in the *Amazon Elastic File System User Guide*.

To launch two instances and mount an EFS file system

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. Choose **Launch Instance**.

3. For **Step 1: Choose an Amazon Machine Image (AMI)**, select an Amazon Linux AMI.
4. For **Step 2: Choose an Instance Type**, keep the default instance type, t2.micro, and choose **Next: Configure Instance Details**.
5. For **Step 3: Configure Instance Details**, do the following:
 - a. For **Number of instances**, enter **2**.
 - b. [Default VPC] If you have a default VPC, it is the default value for **Network**. Keep the default VPC and the default value for **Subnet** to use the default subnet in the Availability Zone that Amazon EC2 chooses for your instances.
[Nondefault VPC] Select your VPC for **Network**, and a public subnet from **Subnet**.
 - c. [Nondefault VPC] For **Auto-assign Public IP**, choose **Enable**. Otherwise, your instances do not get public IP addresses or public DNS names.
 - d. For **File systems**, choose **Add file system**. Ensure that the value matches the file system ID that you created in [Step 1: Create an EFS file system \(p. 1642\)](#). The path shown next to the file system ID is the mount point that the instance will use, which you can change. Under **Advanced Details**, the **User data** is automatically generated, and includes the commands needed to mount the file system.
 - e. Advance to Step 6 of the wizard.
6. On the **Configure Security Group** page, choose **Select an existing security group** and select the security group that you created in [Prerequisites \(p. 1642\)](#). Then choose **Review and Launch**.
7. On the **Review Instance Launch** page, choose **Launch**.
8. In the **Select an existing key pair or create a new key pair** dialog box, select **Choose an existing key pair** and choose your key pair. Select the acknowledgment check box, and choose **Launch Instances**.
9. In the navigation pane, choose **Instances** to see the status of your instances. Initially, their status is **Pending**. After the status changes to **running**, your instances are ready for use.

Your instance is now configured to mount the Amazon EFS file system at launch and whenever it's rebooted.

Step 3: Test the file system

You can connect to your instances and verify that the file system is mounted to the directory that you specified (for example, `/mnt/efs`).

To verify that the file system is mounted

1. Connect to your instances. For more information, see [Connect to your Linux instance \(p. 611\)](#).
2. From the terminal window for each instance, run the `df -T` command to verify that the EFS file system is mounted.

```
$ df -T
Filesystem      Type            1K-blocks      Used   Available Use% Mounted on
/dev/xvda1      ext4           8123812    1949800       6073764  25% /
devtmpfs        devtmpfs        4078468        56       4078412  1% /dev
tmpfs          tmpfs           4089312        0       4089312  0% /dev/shm
efs-dns         nfs4          9007199254740992        0     9007199254740992  0% /mnt/efs
```

Note that the name of the file system, shown in the example output as `efs-dns`, has the following form.

```
file-system-id.efs.aws-region.amazonaws.com:/
```

3. (Optional) Create a file in the file system from one instance, and then verify that you can view the file from the other instance.

- a. From the first instance, run the following command to create the file.

```
$ sudo touch /mnt/efs/test-file.txt
```

- b. From the second instance, run the following command to view the file.

```
$ ls /mnt/efs  
test-file.txt
```

Step 4: Clean up

When you are finished with this tutorial, you can terminate the instances and delete the file system.

To terminate the instances

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instances to terminate.
4. Choose **Instance state, Terminate instance**.
5. Choose **Terminate** when prompted for confirmation.

To delete the file system

1. Open the Amazon Elastic File System console at <https://console.aws.amazon.com/efs/>.
2. Select the file system to delete.
3. Choose **Actions, Delete file system**.
4. When prompted for confirmation, enter the file system ID and choose **Delete file system**.

Instance volume limits

The maximum number of volumes that your instance can have depends on the operating system and instance type. When considering how many volumes to add to your instance, you should consider whether you need increased I/O bandwidth or increased storage capacity.

Contents

- [Nitro System volume limits \(p. 1644\)](#)
- [Linux-specific volume limits \(p. 1645\)](#)
- [Bandwidth versus capacity \(p. 1645\)](#)

Nitro System volume limits

Instances built on the [Nitro System \(p. 247\)](#) support a maximum number of attachments, which are shared between network interfaces, EBS volumes, and NVMe instance store volumes. Every instance has at least one network interface attachment. NVMe instance store volumes are automatically attached. For more information, see [Elastic network interfaces \(p. 1091\)](#) and [Instance store volumes \(p. 1621\)](#).

Most of these instances support a maximum of 28 attachments. For example, if you have no additional network interface attachments on an EBS-only instance, you can attach up to 27 EBS volumes to it. If you have one additional network interface on an instance with 2 NVMe instance store volumes, you can attach 24 EBS volumes to it.

For other instances, the following limits apply:

- d3.8xlarge and d3en.12xlarge instances support a maximum of 3 EBS volumes.
- inf1.xlarge and inf1.2xlarge instances support a maximum of 26 EBS volumes.
- inf1.6xlarge instances support a maximum of 23 EBS volumes.
- inf1.24xlarge instances support a maximum of 11 EBS volumes.
- Most bare metal instances support a maximum of 31 EBS volumes.
- mac1.metal instances support a maximum of 16 EBS volumes.
- High memory virtualized instances support a maximum of 27 EBS volumes.
- High memory bare metal instances support a maximum of 19 EBS volumes.

If you launched a u-6tb1.metal, u-9tb1.metal, or u-12tb1.metal high memory bare metal instance before March 12, 2020, it supports a maximum of 14 EBS volumes. To attach up to 19 EBS volumes to these instances, contact your account team to upgrade the instance at no additional cost.

Linux-specific volume limits

Attaching more than 40 volumes can cause boot failures. This number includes the root volume, plus any attached instance store volumes and EBS volumes. If you experience boot problems on an instance with a large number of volumes, stop the instance, detach any volumes that are not essential to the boot process, and then reattach the volumes after the instance is running.

Important

Attaching more than 40 volumes to a Linux instance is supported on a best effort basis only and is not guaranteed.

Bandwidth versus capacity

For consistent and predictable bandwidth use cases, use EBS-optimized or 10 Gigabit network connectivity instances and General Purpose SSD or Provisioned IOPS SSD volumes. Follow the guidance in [Amazon EBS-optimized instances \(p. 1562\)](#) to match the IOPS you have provisioned for your volumes to the bandwidth available from your instances for maximum performance. For RAID configurations, many administrators find that arrays larger than 8 volumes have diminished performance returns due to increased I/O overhead. Test your individual application performance and tune it as required.

Amazon EC2 instance root device volume

When you launch an instance, the *root device volume* contains the image used to boot the instance. When we introduced Amazon EC2, all AMIs were backed by Amazon EC2 instance store, which means the root device for an instance launched from the AMI is an instance store volume created from a template stored in Amazon S3. After we introduced Amazon EBS, we introduced AMIs that are backed by Amazon EBS. This means that the root device for an instance launched from the AMI is an Amazon EBS volume created from an Amazon EBS snapshot.

You can choose between AMIs backed by Amazon EC2 instance store and AMIs backed by Amazon EBS. We recommend that you use AMIs backed by Amazon EBS, because they launch faster and use persistent storage.

Important

Only the following instance types support an instance store volume as the root device: C3, D2, G2, I2, M3, and R3.

For more information about the device names Amazon EC2 uses for your root volumes, see [Device names on Linux instances \(p. 1652\)](#).

Contents

- [Root device storage concepts \(p. 1646\)](#)
- [Choose an AMI by root device type \(p. 1647\)](#)
- [Determine the root device type of your instance \(p. 1648\)](#)
- [Change the root volume to persist \(p. 1649\)](#)
- [Change the initial size of the root volume \(p. 1652\)](#)

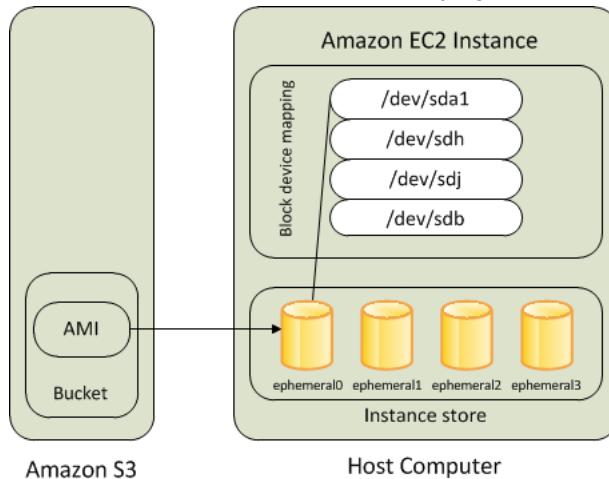

Root device storage concepts

You can launch an instance from either an instance store-backed AMI or an Amazon EBS-backed AMI. The description of an AMI includes which type of AMI it is; you'll see the root device referred to in some places as either `ebs` (for Amazon EBS-backed) or `instance store` (for instance store-backed). This is important because there are significant differences between what you can do with each type of AMI. For more information about these differences, see [Storage for the root device \(p. 106\)](#).

Instance store-backed instances

Instances that use instance stores for the root device automatically have one or more instance store volumes available, with one volume serving as the root device volume. When an instance is launched, the image that is used to boot the instance is copied to the root volume. Note that you can optionally use additional instance store volumes, depending on the instance type.

Any data on the instance store volumes persists as long as the instance is running, but this data is deleted when the instance is terminated (instance store-backed instances do not support the **Stop** action) or if it fails (such as if an underlying drive has issues).

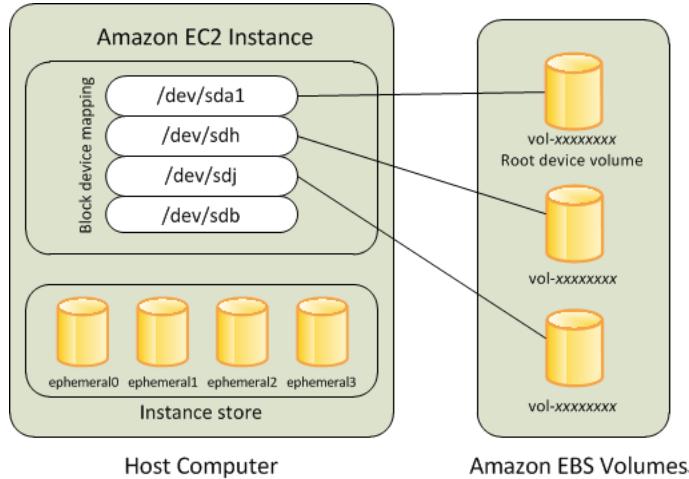

After an instance store-backed instance fails or terminates, it cannot be restored. If you plan to use Amazon EC2 instance store-backed instances, we highly recommend that you distribute the data on your instance stores across multiple Availability Zones. You should also back up critical data from your instance store volumes to persistent storage on a regular basis.

For more information, see [Amazon EC2 instance store \(p. 1620\)](#).

Amazon EBS-backed instances

Instances that use Amazon EBS for the root device automatically have an Amazon EBS volume attached. When you launch an Amazon EBS-backed instance, we create an Amazon EBS volume for each Amazon EBS snapshot referenced by the AMI you use. You can optionally use other Amazon EBS volumes or instance store volumes, depending on the instance type.

An Amazon EBS-backed instance can be stopped and later restarted without affecting data stored in the attached volumes. There are various instance- and volume-related tasks you can do when an Amazon EBS-backed instance is in a stopped state. For example, you can modify the properties of the instance, change its size, or update the kernel it is using, or you can attach your root volume to a different running instance for debugging or any other purpose.

If an Amazon EBS-backed instance fails, you can restore your session by following one of these methods:

- Stop and then start again (try this method first).
- Automatically snapshot all relevant volumes and create a new AMI. For more information, see [Create an Amazon EBS-backed Linux AMI \(p. 144\)](#).
- Attach the volume to the new instance by following these steps:
 1. Create a snapshot of the root volume.
 2. Register a new AMI using the snapshot.
 3. Launch a new instance from the new AMI.
 4. Detach the remaining Amazon EBS volumes from the old instance.
 5. Reattach the Amazon EBS volumes to the new instance.

For more information, see [Amazon EBS volumes \(p. 1349\)](#).

Choose an AMI by root device type

The AMI that you specify when you launch your instance determines the type of root device volume that your instance has. You can view AMIs by root device type using one of the following methods.

Console

To choose an Amazon EBS-backed AMI using the console

1. Open the Amazon EC2 console.
2. In the navigation pane, choose **AMIs**.

3. From the filter lists, select the image type (such as **Public images**). In the search bar choose **Platform** to select the operating system (such as **Amazon Linux**), and **Root Device Type** to select **EBS images**.
4. (Optional) To get additional information to help you make your choice, choose the **Show/Hide Columns** icon, update the columns to display, and choose **Close**.
5. Choose an AMI and write down its AMI ID.

To choose an instance store-backed AMI using the console

1. Open the Amazon EC2 console.
2. In the navigation pane, choose **AMIs**.
3. From the filter lists, select the image type (such as **Public images**). In the search bar, choose **Platform** to select the operating system (such as **Amazon Linux**), and **Root Device Type** to select **Instance store**.
4. (Optional) To get additional information to help you make your choice, choose the **Show/Hide Columns** icon, update the columns to display, and choose **Close**.
5. Choose an AMI and write down its AMI ID.

AWS CLI

To verify the type of the root device volume of an AMI using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [describe-images \(AWS CLI\)](#)
- [Get-EC2Image \(AWS Tools for Windows PowerShell\)](#)

Determine the root device type of your instance

New console

To determine the root device type of an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**, and select the instance.
3. On the **Storage** tab, under **Root device details**, check the value of **Root device type** as follows:
 - If the value is **EBS**, this is an Amazon EBS-backed instance.
 - If the value is **INSTANCE-STORE**, this is an instance store-backed instance.

Old console

To determine the root device type of an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**, and select the instance.
3. On the **Description** tab, check the value of **Root device type** as follows:
 - If the value is **ebs**, this is an Amazon EBS-backed instance.

- If the value is `instance-store`, this is an instance store-backed instance.

AWS CLI

To determine the root device type of an instance using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [describe-instances](#) (AWS CLI)
- [Get-EC2Instance](#) (AWS Tools for Windows PowerShell)

Change the root volume to persist

By default, the root volume for an AMI backed by Amazon EBS is deleted when the instance terminates. You can change the default behavior to ensure that the volume persists after the instance terminates. To change the default behavior, set the `DeleteOnTermination` attribute to `false` using a block device mapping.

Tasks

- [Configure the root volume to persist during instance launch \(p. 1649\)](#)
- [Configure the root volume to persist for an existing instance \(p. 1650\)](#)
- [Confirm that a root volume is configured to persist \(p. 1651\)](#)

Configure the root volume to persist during instance launch

You can configure the root volume to persist when you launch an instance using the Amazon EC2 console or the command line tools.

Console

To configure the root volume to persist when you launch an instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and then choose **Launch instances**.
3. On the **Choose an Amazon Machine Image (AMI)** page, select the AMI to use and choose **Select**.
4. Follow the wizard to complete the **Choose an Instance Type** and **Configure Instance Details** pages.
5. On the **Add Storage** page, deselect **Delete On Termination** for the root volume.
6. Complete the remaining wizard pages, and then choose **Launch**.

AWS CLI

To configure the root volume to persist when you launch an instance using the AWS CLI

Use the `run-instances` command and include a block device mapping that sets the `DeleteOnTermination` attribute to `false`.

```
$ aws ec2 run-instances --block-device-mappings file://mapping.json ...other parameters...
```

Specify the following in `mapping.json`.

```
[  
  {  
    "DeviceName": "/dev/sda1",  
    "Ebs": {  
      "DeleteOnTermination": false  
    }  
  }  
]
```

Tools for Windows PowerShell

To configure the root volume to persist when you launch an instance using the Tools for Windows PowerShell

Use the [New-EC2Instance](#) command and include a block device mapping that sets the `DeleteOnTermination` attribute to `false`.

```
C:\> $ebs = New-Object Amazon.EC2.Model.EbsBlockDevice  
C:\> $ebs.DeleteOnTermination = $false  
C:\> $bdm = New-Object Amazon.EC2.Model.BlockDeviceMapping  
C:\> $bdm.DeviceName = "dev/xvda"  
C:\> $bdm.Ebs = $ebs  
C:\> New-EC2Instance -ImageId ami-0abcdef1234567890 -BlockDeviceMapping $bdm ...other  
parameters...
```

Configure the root volume to persist for an existing instance

You can configure the root volume to persist for a running instance using the command line tools only.

AWS CLI

To configure the root volume to persist for an existing instance using the AWS CLI

Use the [modify-instance-attribute](#) command with a block device mapping that sets the `DeleteOnTermination` attribute to `false`.

```
aws ec2 modify-instance-attribute --instance-id i-1234567890abcdef0 --block-device-  
mappings file:/mapping.json
```

Specify the following in `mapping.json`.

```
[  
  {  
    "DeviceName": "/dev/xvda",  
    "Ebs": {  
      "DeleteOnTermination": false  
    }  
  }  
]
```

Tools for Windows PowerShell

To configure the root volume to persist for an existing instance using the AWS Tools for Windows PowerShell

Use the [Edit-EC2InstanceAttribute](#) command with a block device mapping that sets the DeleteOnTermination attribute to false.

```
C:\> $ebs = New-Object Amazon.EC2.Model.EbsInstanceBlockDeviceSpecification
C:\> $ebs.DeleteOnTermination = $false
C:\> $bdm = New-Object Amazon.EC2.Model.InstanceBlockDeviceMappingSpecification
C:\> $bdm.DeviceName = "/dev/xvda"
C:\> $bdm.Ebs = $ebs
C:\> Edit-EC2InstanceAttribute -InstanceId i-1234567890abcdef0 -BlockDeviceMapping $bdm
```

Confirm that a root volume is configured to persist

You can confirm that a root volume is configured to persist using the Amazon EC2 console or the command line tools.

New console

To confirm that a root volume is configured to persist using the Amazon EC2 console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and then select the instance.
3. In the **Storage** tab, under **Block devices**, locate the entry for the root volume. If **Delete on termination** is **No**, the volume is configured to persist.

Old console

To confirm that a root volume is configured to persist using the Amazon EC2 console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and then select the instance.
3. In the **Description** tab, choose the entry for **Root device**. If **Delete on termination** is **False**, the volume is configured to persist.

AWS CLI

To confirm that a root volume is configured to persist using the AWS CLI

Use the [describe-instances](#) command and verify that the DeleteOnTermination attribute in the BlockDeviceMappings response element is set to false.

```
$ aws ec2 describe-instances --instance-id i-1234567890abcdef0
```

```
...
  "BlockDeviceMappings": [
    {
      "DeviceName": "/dev/sda1",
      "Ebs": {
        "Status": "attached",
        "DeleteOnTermination": false,
        "VolumeId": "vol-1234567890abcdef0",
        "AttachTime": "2013-07-19T02:42:39.000Z"
      }
    }
  ...
}
```

Tools for Windows PowerShell

To confirm that a root volume is configured to persist using the AWS Tools for Windows PowerShell

Use the [Get-EC2Instance](#) and verify that the `DeleteOnTermination` attribute in the `BlockDeviceMappings` response element is set to `false`.

```
C:\> (Get-EC2Instance -InstanceId i-i-1234567890abcdef0).Instances.BlockDeviceMappings.Ebs
```

Change the initial size of the root volume

By default, the size of the root volume is determined by the size of the snapshot. You can increase the initial size of the root volume using the block device mapping of the instance as follows.

1. Determine the device name of the root volume specified in the AMI, as described in [View the EBS volumes in an AMI block device mapping \(p. 1659\)](#).
2. Confirm the size of the snapshot specified in the AMI block device mapping, as described in [View Amazon EBS snapshot information \(p. 1439\)](#).
3. Override the size of the root volume using the instance block device mapping, as described in [Update the block device mapping when launching an instance \(p. 1659\)](#), specifying a volume size that is larger than the snapshot size.

For example, the following entry for the instance block device mapping increases the size of the root volume, `/dev/xvda`, to 100 GiB. You can omit the snapshot ID in the instance block device mapping because the snapshot ID is already specified in the AMI block device mapping.

```
{  
    "DeviceName": "/dev/xvda",  
    "Ebs": {  
        "VolumeSize": 100  
    }  
}
```

For more information, see [Block device mappings \(p. 1654\)](#).

Device names on Linux instances

When you attach a volume to your instance, you include a device name for the volume. This device name is used by Amazon EC2. The block device driver for the instance assigns the actual volume name when mounting the volume, and the name assigned can be different from the name that Amazon EC2 uses.

The number of volumes that your instance can support is determined by the operating system. For more information, see [Instance volume limits \(p. 1644\)](#).

Contents

- [Available device names \(p. 1653\)](#)
- [Device name considerations \(p. 1653\)](#)

For information about device names on Windows instances, see [Device naming on Windows instances](#) in the *Amazon EC2 User Guide for Windows Instances*.

Available device names

There are two types of virtualization available for Linux instances: paravirtual (PV) and hardware virtual machine (HVM). The virtualization type of an instance is determined by the AMI used to launch the instance. All instance types support HVM AMIs. Some previous generation instance types support PV AMIs. Be sure to note the virtualization type of your AMI because the recommended and available device names that you can use depend on the virtualization type of your instance. For more information, see [Linux AMI virtualization types \(p. 108\)](#).

The following table lists the available device names that you can specify in a block device mapping or when attaching an EBS volume.

Virtualization type	Available	Reserved for root	Recommended for EBS volumes	Instance store volumes
Paravirtual	/dev/sd[a-z] /dev/sd[a-z][1-15] /dev/hd[a-z] /dev/hd[a-z][1-15]	/dev/sda1	/dev/sd[f-p] /dev/sd[f-p][1-6]	/dev/sd[b-e]
HVM	/dev/sd[a-z] /dev/xvd[b-c][a-z]	Differs by AMI /dev/sda1 or /dev/xvda	/dev/sd[f-p] * /dev/sd[b-h] (h1.16xlarge) /dev/sd[b-y] (d2.8xlarge) /dev/sd[b-i] (i2.8xlarge)	/dev/sd[b-e] /dev/sd[b-h] (h1.16xlarge) /dev/sd[b-y] (d2.8xlarge) /dev/sd[b-i] (i2.8xlarge) **

* The device names that you specify for NVMe EBS volumes in a block device mapping are renamed using NVMe device names (/dev/nvme[0-26]n1). The block device driver can assign NVMe device names in a different order than you specified for the volumes in the block device mapping.

** NVMe instance store volumes are automatically enumerated and assigned an NVMe device name.

For more information about instance store volumes, see [Amazon EC2 instance store \(p. 1620\)](#). For more information about NVMe EBS volumes (Nitro-based instances), including how to identify the EBS device, see [Amazon EBS and NVMe on Linux instances \(p. 1558\)](#).

Device name considerations

Keep the following in mind when selecting a device name:

- Although you can attach your EBS volumes using the device names used to attach instance store volumes, we strongly recommend that you don't because the behavior can be unpredictable.
- The number of NVMe instance store volumes for an instance depends on the size of the instance. NVMe instance store volumes are automatically enumerated and assigned an NVMe device name (/dev/nvme[0-26]n1).

- Depending on the block device driver of the kernel, the device could be attached with a different name than you specified. For example, if you specify a device name of /dev/sdh, your device could be renamed /dev/xvdh or /dev/hdh. In most cases, the trailing letter remains the same. In some versions of Red Hat Enterprise Linux (and its variants, such as CentOS), the trailing letter could change (/dev/sda could become /dev/xvde). In these cases, the trailing letter of each device name is incremented the same number of times. For example, if /dev/sdb is renamed /dev/xvdf, then /dev/sdc is renamed /dev/xvdg. Amazon Linux creates a symbolic link for the name you specified to the renamed device. Other operating systems could behave differently.
- HVM AMIs do not support the use of trailing numbers on device names, except for /dev/sda1, which is reserved for the root device, and /dev/sda2. While using /dev/sda2 is possible, we do not recommend using this device mapping with HVM instances.
- When using PV AMIs, you cannot attach volumes that share the same device letters both with and without trailing digits. For example, if you attach a volume as /dev/sdc and another volume as /dev/sdc1, only /dev/sdc is visible to the instance. To use trailing digits in device names, you must use trailing digits on all device names that share the same base letters (such as /dev/sdc1, /dev/sdc2, /dev/sdc3).
- Some custom kernels might have restrictions that limit use to /dev/sd[f-p] or /dev/sd[f-p][1-6]. If you're having trouble using /dev/sd[q-z] or /dev/sd[q-z][1-6], try switching to /dev/sd[f-p] or /dev/sd[f-p][1-6].

Block device mappings

Each instance that you launch has an associated root device volume, which is either an Amazon EBS volume or an instance store volume. You can use block device mapping to specify additional EBS volumes or instance store volumes to attach to an instance when it's launched. You can also attach additional EBS volumes to a running instance; see [Attach an Amazon EBS volume to an instance \(p. 1375\)](#). However, the only way to attach instance store volumes to an instance is to use block device mapping to attach the volumes as the instance is launched.

For more information about root device volumes, see [Change the root volume to persist \(p. 1649\)](#).

Contents

- [Block device mapping concepts \(p. 1654\)](#)
- [AMI block device mapping \(p. 1657\)](#)
- [Instance block device mapping \(p. 1659\)](#)

Block device mapping concepts

A *block device* is a storage device that moves data in sequences of bytes or bits (blocks). These devices support random access and generally use buffered I/O. Examples include hard disks, CD-ROM drives, and flash drives. A block device can be physically attached to a computer or accessed remotely as if it were physically attached to the computer.

Amazon EC2 supports two types of block devices:

- Instance store volumes (virtual devices whose underlying hardware is physically attached to the host computer for the instance)
- EBS volumes (remote storage devices)

A *block device mapping* defines the block devices (instance store volumes and EBS volumes) to attach to an instance. You can specify a block device mapping as part of creating an AMI so that the mapping is used by all instances launched from the AMI. Alternatively, you can specify a block device mapping when you launch an instance, so this mapping overrides the one specified in the AMI from which you

launched the instance. Note that all NVMe instance store volumes supported by an instance type are automatically enumerated and assigned a device name on instance launch; including them in your block device mapping has no effect.

Contents

- [Block device mapping entries \(p. 1655\)](#)
- [Block device mapping instance store caveats \(p. 1655\)](#)
- [Example block device mapping \(p. 1656\)](#)
- [How devices are made available in the operating system \(p. 1657\)](#)

Block device mapping entries

When you create a block device mapping, you specify the following information for each block device that you need to attach to the instance:

- The device name used within Amazon EC2. The block device driver for the instance assigns the actual volume name when mounting the volume. The name assigned can be different from the name that Amazon EC2 recommends. For more information, see [Device names on Linux instances \(p. 1652\)](#).

For Instance store volumes, you also specify the following information:

- The virtual device: `ephemeral[0-23]`. Note that the number and size of available instance store volumes for your instance varies by instance type.

For NVMe instance store volumes, the following information also applies:

- These volumes are automatically enumerated and assigned a device name; including them in your block device mapping has no effect.

For EBS volumes, you also specify the following information:

- The ID of the snapshot to use to create the block device (`snap-xxxxxxx`). This value is optional as long as you specify a volume size.
- The size of the volume, in GiB. The specified size must be greater than or equal to the size of the specified snapshot.
- Whether to delete the volume on instance termination (`true` or `false`). The default value is `true` for the root device volume and `false` for attached volumes. When you create an AMI, its block device mapping inherits this setting from the instance. When you launch an instance, it inherits this setting from the AMI.
- The volume type, which can be `gp2` and `gp3` for General Purpose SSD, `io1` and `io2` for Provisioned IOPS SSD, `st1` for Throughput Optimized HDD, `sc1` for Cold HDD, or `standard` for Magnetic. The default value is `gp2`.
- The number of input/output operations per second (IOPS) that the volume supports. (Used only with `io1` and `io2` volumes.)

Block device mapping instance store caveats

There are several caveats to consider when launching instances with AMIs that have instance store volumes in their block device mappings.

- Some instance types include more instance store volumes than others, and some instance types contain no instance store volumes at all. If your instance type supports one instance store volume, and

your AMI has mappings for two instance store volumes, then the instance launches with one instance store volume.

- Instance store volumes can only be mapped at launch time. You cannot stop an instance without instance store volumes (such as the t2.micro), change the instance to a type that supports instance store volumes, and then restart the instance with instance store volumes. However, you can create an AMI from the instance and launch it on an instance type that supports instance store volumes, and map those instance store volumes to the instance.
- If you launch an instance with instance store volumes mapped, and then stop the instance and change it to an instance type with fewer instance store volumes and restart it, the instance store volume mappings from the initial launch still show up in the instance metadata. However, only the maximum number of supported instance store volumes for that instance type are available to the instance.

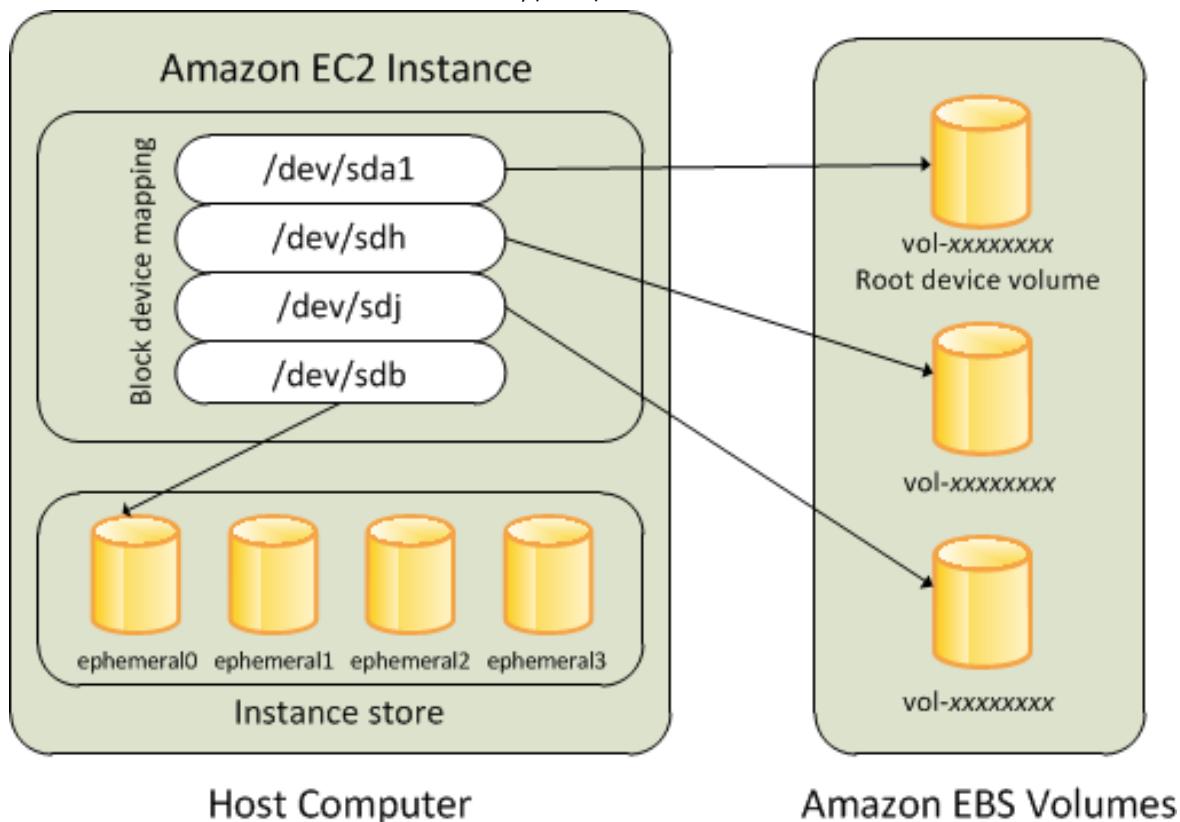

Note

When an instance is stopped, all data on the instance store volumes is lost.

- Depending on instance store capacity at launch time, M3 instances may ignore AMI instance store block device mappings at launch unless they are specified at launch. You should specify instance store block device mappings at launch time, even if the AMI you are launching has the instance store volumes mapped in the AMI, to ensure that the instance store volumes are available when the instance launches.

Example block device mapping

This figure shows an example block device mapping for an EBS-backed instance. It maps /dev/sdb to ephemeral0 and maps two EBS volumes, one to /dev/sdh and the other to /dev/sdj. It also shows the EBS volume that is the root device volume, /dev/sda1.

Note that this example block device mapping is used in the example commands and APIs in this topic. You can find example commands and APIs that create block device mappings in [Specify a](#)

[block device mapping for an AMI \(p. 1657\)](#) and [Update the block device mapping when launching an instance \(p. 1659\)](#).

How devices are made available in the operating system

Device names like `/dev/sdh` and `xvdh` are used by Amazon EC2 to describe block devices. The block device mapping is used by Amazon EC2 to specify the block devices to attach to an EC2 instance. After a block device is attached to an instance, it must be mounted by the operating system before you can access the storage device. When a block device is detached from an instance, it is unmounted by the operating system and you can no longer access the storage device.

With a Linux instance, the device names specified in the block device mapping are mapped to their corresponding block devices when the instance first boots. The instance type determines which instance store volumes are formatted and mounted by default. You can mount additional instance store volumes at launch, as long as you don't exceed the number of instance store volumes available for your instance type. For more information, see [Amazon EC2 instance store \(p. 1620\)](#). The block device driver for the instance determines which devices are used when the volumes are formatted and mounted. For more information, see [Attach an Amazon EBS volume to an instance \(p. 1375\)](#).

AMI block device mapping

Each AMI has a block device mapping that specifies the block devices to attach to an instance when it is launched from the AMI. An AMI that Amazon provides includes a root device only. To add more block devices to an AMI, you must create your own AMI.

Contents

- [Specify a block device mapping for an AMI \(p. 1657\)](#)
- [View the EBS volumes in an AMI block device mapping \(p. 1659\)](#)

Specify a block device mapping for an AMI

There are two ways to specify volumes in addition to the root volume when you create an AMI. If you've already attached volumes to a running instance before you create an AMI from the instance, the block device mapping for the AMI includes those same volumes. For EBS volumes, the existing data is saved to a new snapshot, and it's this new snapshot that's specified in the block device mapping. For instance store volumes, the data is not preserved.

For an EBS-backed AMI, you can add EBS volumes and instance store volumes using a block device mapping. For an instance store-backed AMI, you can add instance store volumes only by modifying the block device mapping entries in the image manifest file when registering the image.

Note

For M3 instances, you must specify instance store volumes in the block device mapping for the instance when you launch it. When you launch an M3 instance, instance store volumes specified in the block device mapping for the AMI may be ignored if they are not specified as part of the instance block device mapping.

To add volumes to an AMI using the console

1. Open the Amazon EC2 console.
2. In the navigation pane, choose **Instances**.
3. Select an instance and choose **Actions, Image and templates, Create image**.
4. Enter a name and a description for the image.
5. The instance volumes appear under **Instance volumes**. To add another volume, choose **Add volume**.

6. For **Volume type**, choose the volume type. For **Device** choose the device name. For an EBS volume, you can specify additional details, such as a snapshot, volume size, volume type, IOPS, and encryption state.
7. Choose **Create image**.

To add volumes to an AMI using the command line

Use the [create-image](#) AWS CLI command to specify a block device mapping for an EBS-backed AMI. Use the [register-image](#) AWS CLI command to specify a block device mapping for an instance store-backed AMI.

Specify the block device mapping using the `--block-device-mappings` parameter. Arguments encoded in JSON can be supplied either directly on the command line or by reference to a file:

```
--block-device-mappings [mapping, ...]  
--block-device-mappings [file://mapping.json]
```

To add an instance store volume, use the following mapping.

```
{  
    "DeviceName": "/dev/sdf",  
    "VirtualName": "ephemeral0"  
}
```

To add an empty 100 GiB gp2 volume, use the following mapping.

```
{  
    "DeviceName": "/dev/sdg",  
    "Ebs": {  
        "VolumeSize": 100  
    }  
}
```

To add an EBS volume based on a snapshot, use the following mapping.

```
{  
    "DeviceName": "/dev/sdh",  
    "Ebs": {  
        "SnapshotId": "snap-xxxxxxxx"  
    }  
}
```

To omit a mapping for a device, use the following mapping.

```
{  
    "DeviceName": "/dev/sdj",  
    "NoDevice": ""  
}
```

Alternatively, you can use the `-BlockDeviceMapping` parameter with the following commands (AWS Tools for Windows PowerShell):

- [New-EC2Image](#)
- [Register-EC2Image](#)

View the EBS volumes in an AMI block device mapping

You can easily enumerate the EBS volumes in the block device mapping for an AMI.

To view the EBS volumes for an AMI using the console

1. Open the Amazon EC2 console.
2. In the navigation pane, choose **AMIs**.
3. Choose **EBS images** from the **Filter** list to get a list of EBS-backed AMIs.
4. Select the desired AMI, and look at the **Details** tab. At a minimum, the following information is available for the root device:
 - **Root Device Type** (ebs)
 - **Root Device Name** (for example, /dev/sda1)
 - **Block Devices** (for example, /dev/sda1=snap-1234567890abcdef0:8:true)

If the AMI was created with additional EBS volumes using a block device mapping, the **Block Devices** field displays the mapping for those additional volumes as well. (This screen doesn't display instance store volumes.)

To view the EBS volumes for an AMI using the command line

Use the [describe-images](#) (AWS CLI) command or [Get-EC2Image](#) (AWS Tools for Windows PowerShell) command to enumerate the EBS volumes in the block device mapping for an AMI.

Instance block device mapping

By default, an instance that you launch includes any storage devices specified in the block device mapping of the AMI from which you launched the instance. You can specify changes to the block device mapping for an instance when you launch it, and these updates overwrite or merge with the block device mapping of the AMI.

Limitations

- For the root volume, you can only modify the following: volume size, volume type, and the **Delete on Termination** flag.
- When you modify an EBS volume, you can't decrease its size. Therefore, you must specify a snapshot whose size is equal to or greater than the size of the snapshot specified in the block device mapping of the AMI.

Contents

- [Update the block device mapping when launching an instance \(p. 1659\)](#)
- [Update the block device mapping of a running instance \(p. 1661\)](#)
- [View the EBS volumes in an instance block device mapping \(p. 1661\)](#)
- [View the instance block device mapping for instance store volumes \(p. 1662\)](#)

Update the block device mapping when launching an instance

You can add EBS volumes and instance store volumes to an instance when you launch it. Note that updating the block device mapping for an instance doesn't make a permanent change to the block device mapping of the AMI from which it was launched.

To add volumes to an instance using the console

1. Open the Amazon EC2 console.
2. From the dashboard, choose **Launch Instance**.
3. On the **Choose an Amazon Machine Image (AMI)** page, select the AMI to use and choose **Select**.
4. Follow the wizard to complete the **Choose an Instance Type** and **Configure Instance Details** pages.
5. On the **Add Storage** page, you can modify the root volume, EBS volumes, and instance store volumes as follows:
 - To change the size of the root volume, locate the **Root** volume under the **Type** column, and change its **Size** field.
 - To suppress an EBS volume specified by the block device mapping of the AMI used to launch the instance, locate the volume and click its **Delete** icon.
 - To add an EBS volume, choose **Add New Volume**, choose **EBS** from the **Type** list, and fill in the fields (**Device**, **Snapshot**, and so on).
 - To suppress an instance store volume specified by the block device mapping of the AMI used to launch the instance, locate the volume, and choose its **Delete** icon.
 - To add an instance store volume, choose **Add New Volume**, select **Instance Store** from the **Type** list, and select a device name from **Device**.
6. Complete the remaining wizard pages, and choose **Launch**.

To add volumes to an instance using the AWS CLI

Use the `run-instances` AWS CLI command with the `--block-device-mappings` option to specify a block device mapping for an instance at launch.

For example, suppose that an EBS-backed AMI specifies the following block device mapping:

- `/dev/sdb=ephemeral0`
- `/dev/sdh=snap-1234567890abcdef0`
- `/dev/sdj=:100`

To prevent `/dev/sdj` from attaching to an instance launched from this AMI, use the following mapping.

```
{  
    "DeviceName": "/dev/sdj",  
    "NoDevice": ""  
}
```

To increase the size of `/dev/sdh` to 300 GiB, specify the following mapping. Notice that you don't need to specify the snapshot ID for `/dev/sdh`, because specifying the device name is enough to identify the volume.

```
{  
    "DeviceName": "/dev/sdh",  
    "Ebs": {  
        "VolumeSize": 300  
    }  
}
```

To increase the size of the root volume at instance launch, first call `describe-images` with the ID of the AMI to verify the device name of the root volume. For example, `"RootDeviceName": "/dev/xvda"`. To override the size of the root volume, specify the device name of the root device used by the AMI and the new volume size.

```
{  
    "DeviceName": "/dev/xvda",  
    "Ebs": {  
        "VolumeSize": 100  
    }  
}
```

To attach an additional instance store volume, `/dev/sdc`, specify the following mapping. If the instance type doesn't support multiple instance store volumes, this mapping has no effect. If the instance supports NVMe instance store volumes, they are automatically enumerated and assigned an NVMe device name.

```
{  
    "DeviceName": "/dev/sdc",  
    "VirtualName": "ephemeral1"  
}
```

To add volumes to an instance using the AWS Tools for Windows PowerShell

Use the `-BlockDeviceMapping` parameter with the [New-EC2Instance](#) command (AWS Tools for Windows PowerShell).

Update the block device mapping of a running instance

You can use the [modify-instance-attribute](#) AWS CLI command to update the block device mapping of a running instance. You do not need to stop the instance before changing this attribute.

```
aws ec2 modify-instance-attribute --instance-id i-1a2b3c4d --block-device-mappings file://mapping.json
```

For example, to preserve the root volume at instance termination, specify the following in `mapping.json`.

```
[  
    {  
        "DeviceName": "/dev/sda1",  
        "Ebs": {  
            "DeleteOnTermination": false  
        }  
    }  
]
```

Alternatively, you can use the `-BlockDeviceMapping` parameter with the [Edit-EC2InstanceAttribute](#) command (AWS Tools for Windows PowerShell).

View the EBS volumes in an instance block device mapping

You can easily enumerate the EBS volumes mapped to an instance.

Note

For instances launched before the release of the 2009-10-31 API, AWS can't display the block device mapping. You must detach and reattach the volumes so that AWS can display the block device mapping.

To view the EBS volumes for an instance using the console

1. Open the Amazon EC2 console.

2. In the navigation pane, choose **Instances**.
3. In the search box, enter **Root device type**, and then choose **EBS**. This displays a list of EBS-backed instances.
4. Select the desired instance and look at the details displayed in the **Storage** tab. At a minimum, the following information is available for the root device:
 - **Root device type** (for example, **EBS**)
 - **Root device name** (for example, `/dev/xvda`)
 - **Block devices** (for example, `/dev/xvda`, `/dev/sdf`, and `/dev/sdj`)

If the instance was launched with additional EBS volumes using a block device mapping, they appear under **Block devices**. Any instance store volumes do not appear on this tab.

5. To display additional information about an EBS volume, choose its volume ID to go to the volume page. For more information, see [View information about an Amazon EBS volume \(p. 1386\)](#).

To view the EBS volumes for an instance using the command line

Use the [describe-instances](#) (AWS CLI) command or [Get-EC2Instance](#) (AWS Tools for Windows PowerShell) command to enumerate the EBS volumes in the block device mapping for an instance.

View the instance block device mapping for instance store volumes

When you view the block device mapping for your instance, you can see only the EBS volumes, not the instance store volumes. The method you use to view the instance store volumes for your instance depends on the volume type.

NVMe instance store volumes

You can use the NVMe command line package, [nvme-cli](#), to query the NVMe instance store volumes in the block device mapping. Download and install the package on your instance, and then run the following command.

```
[ec2-user ~]$ sudo nvme list
```

The following is example output for an instance. The text in the Model column indicates whether the volume is an EBS volume or an instance store volume. In this example, both `/dev/nvme1n1` and `/dev/nvme2n1` are instance store volumes.

Node	SN	Model	Namespace
<code>/dev/nvme0n1</code>	vol06afc3f8715b7a597	Amazon Elastic Block Store	1
<code>/dev/nvme1n1</code>	AWS2C1436F5159EB6614	Amazon EC2 NVMe Instance Storage	1
<code>/dev/nvme2n1</code>	AWSB1F4FFOC0A6C281EA	Amazon EC2 NVMe Instance Storage	1
...			

HDD or SSD instance store volumes

You can use instance metadata to query the HDD or SSD instance store volumes in the block device mapping. NVMe instance store volumes are not included.

The base URI for all requests for instance metadata is <http://169.254.169.254/latest/>. For more information, see [Instance metadata and user data \(p. 726\)](#).

First, connect to your running instance. From the instance, use this query to get its block device mapping.

IMDSv2

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" -v http://169.254.169.254/latest/meta-data/block-device-mapping/
```

IMDSv1

```
[ec2-user ~]$ curl http://169.254.169.254/latest/meta-data/block-device-mapping/
```

The response includes the names of the block devices for the instance. For example, the output for an instance store-backed m1.small instance looks like this.

```
ami
ephemeral0
root
swap
```

The `ami` device is the root device as seen by the instance. The instance store volumes are named `ephemeral[0-23]`. The `swap` device is for the page file. If you've also mapped EBS volumes, they appear as `ebs1`, `ebs2`, and so on.

To get details about an individual block device in the block device mapping, append its name to the previous query, as shown here.

IMDSv2

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" -v http://169.254.169.254/latest/meta-data/block-device-mapping/ephemeral0
```

IMDSv1

```
[ec2-user ~]$ curl http://169.254.169.254/latest/meta-data/block-device-mapping/
ephemeral0
```

The instance type determines the number of instance store volumes that are available to the instance. If the number of instance store volumes in a block device mapping exceeds the number of instance store volumes available to an instance, the additional volumes are ignored. To view the instance store volumes for your instance, run the `lblk` command. To learn how many instance store volumes are supported by each instance type, see [Instance store volumes \(p. 1621\)](#).

Resources and tags

Amazon EC2 provides different *resources* that you can create and use. Some of these resources include images, instances, volumes, and snapshots. When you create a resource, we assign the resource a unique resource ID.

Some resources can be tagged with values that you define, to help you organize and identify them.

The following topics describe resources and tags, and how you can work with them.

Contents

- [Recycle Bin \(p. 1664\)](#)
- [Resource locations \(p. 1683\)](#)
- [Resource IDs \(p. 1684\)](#)
- [List and filter your resources \(p. 1685\)](#)
- [Tag your Amazon EC2 resources \(p. 1692\)](#)
- [Amazon EC2 service quotas \(p. 1706\)](#)
- [Amazon EC2 usage reports \(p. 1708\)](#)

Recycle Bin

Recycle Bin is a data recovery feature that enables you to restore accidentally deleted Amazon EBS snapshots and EBS-backed AMIs. When using Recycle Bin, if your resources are deleted, they are retained in the Recycle Bin for a time period that you specify before being permanently deleted.

You can restore a resource from the Recycle Bin at any time before its retention period expires. After you restore a resource from the Recycle Bin, the resource is removed from the Recycle Bin and you can use it in the same way that you use any other resource of that type in your account. If the retention period expires and the resource is not restored, the resource is permanently deleted from the Recycle Bin and it is no longer available for recovery.

Using Recycle Bin helps to ensure business continuity by protecting your business-critical data against accidental deletion.

Topics

- [How does it work? \(p. 1664\)](#)
- [Supported resources \(p. 1665\)](#)
- [Considerations \(p. 1665\)](#)
- [Quotas \(p. 1666\)](#)
- [Related services \(p. 1667\)](#)
- [Pricing \(p. 1667\)](#)
- [Required IAM permissions \(p. 1667\)](#)

- [Work with resources in the Recycle Bin \(p. 1675\)](#)
- [Monitoring Recycle Bin using AWS CloudTrail \(p. 1675\)](#)

How does it work?

To enable and use Recycle Bin, you must create *retention rules* in the AWS Regions in which you want to protect your resources. Retention rules specify the following:

- The resource type that you want to protect.
- The resources that you want to retain in the Recycle Bin when they are deleted.
- The retention period for which to retain resources in the Recycle Bin before they are permanently deleted.

With Recycle Bin, you can create two types of retention rules:

- **Tag-level retention rules** — A tag-level retention rule uses resource tags to identify the resources that are to be retained in the Recycle Bin. For each retention rule, you specify one or more tag key and value pairs. Resources of the specified type that are tagged with at least one of the tag key and value pairs that are specified in the retention rule are automatically retained in the Recycle Bin upon deletion. Use this type of retention rule if you want to protect specific resources in your account based on their tags.
- **Region-level retention rules** — A Region-level retention rule does not have any resource tags specified. It applies to all of the resources of the specified type in the Region in which the rule is created, even if the resources are not tagged. Use this type of retention rule if you want to protect all resources of a specific type in a specific Region.

While a resource is in the Recycle Bin, you have the ability to restore it for use at any time.

The resource remains in the Recycle Bin until one of the following happens:

- You manually restore it for use. When you restore a resource from the Recycle Bin, the resource is removed from the Recycle Bin and it immediately becomes available for use. You can use restored resources in the same way as any other resource of that type in your account.
- The retention period expires. If the retention period expires, and the resource has not been restored from the Recycle Bin, the resource is permanently deleted from the Recycle Bin and it can no longer be viewed or restored.

Supported resources

Recycle Bin supports the following resource types:

- Amazon EBS snapshots
- Amazon EBS-backed Amazon Machine Images (AMIs)

Considerations

The following considerations apply when working with Recycle Bin and retention rules.

General considerations

- **Important**
When you create your first retention rule, it can take up to 30 minutes for the rule to become active and for it to start retaining resources. After you create the first retention rule, subsequent retention rules become active and start retaining resources almost immediately.
- If a resource matches more than one tag-level retention rule upon deletion, then the retention rule with the longest retention period takes precedence.

If a resource matches a Region-level rule and a tag-level rule, then the tag-level rule takes precedence.
- You can't manually delete a resource from the Recycle Bin. The resource will be automatically deleted when its retention period expires.

- While a resource is in the Recycle Bin, you can only view it, restore it, or modify its tags. To use the resource in any other way, you must first restore it.
- When a resource is sent to the Recycle Bin, the following system-generate tag is assigned to the resource:
 - Tag key — `aws:recycle-bin:resource-in-bin`
 - Tag value — `true`

You can't manually edit or delete this tag. When the resource is restored from the Recycle Bin, the tag is automatically removed.

Considerations for snapshots

- **Important**
If you have retention rules for AMIs and for their associated snapshots, make the retention period for the snapshots the same or longer than the retention period for the AMIs. This ensures that Recycle Bin does not delete the snapshots associated with an AMI before deleting the AMI itself, as this would make the AMI unrecoverable.
- If a snapshot is enabled for fast snapshot restore when it is deleted, fast snapshot restore is automatically disabled shortly after the snapshot is sent to the Recycle Bin.
 - If you restore the snapshot before fast snapshot restore is disabled for the snapshot, it remains enabled.
 - If you restore the snapshot, after fast snapshot restore has been disabled, it remains disabled. If needed, you must manually re-enable fast snapshot restore.
- If a snapshot is shared when it is deleted, it is automatically unshared when it is sent to the Recycle Bin. If you restore the snapshot, all of the previous sharing permissions are automatically restored.
- If a snapshot that was created by another AWS service, such as AWS Backup, is sent to the Recycle Bin and you later restore that snapshot from the Recycle Bin, it is no longer managed by the AWS service that created it. You must manually delete the snapshot if it is no longer needed.

Considerations for AMIs

- Only Amazon EBS-backed AMIs are supported.
- **Important**
If you have retention rules for AMIs and for their associated snapshots, make the retention period for the snapshots the same or longer than the retention period for the AMIs. This ensures that Recycle Bin does not delete the snapshots associated with an AMI before deleting the AMI itself, as this would make the AMI unrecoverable.
- If an AMI is shared when it is deleted, it is automatically unshared when it is sent to the Recycle Bin. If you restore the AMI, all of the previous sharing permissions are automatically restored.
- Before you can restore an AMI from the Recycle Bin, you must first restore all of its associated snapshots from the Recycle Bin and ensure that they are in the `available` state.
- If the snapshots that are associated with the AMI are deleted from the Recycle Bin, the AMI is no longer recoverable. The AMI will be deleted when the retention period expires.
- If an AMI that was created by another AWS service, such as AWS Backup, is sent to the Recycle Bin and you later restore that AMI from the Recycle Bin, it is no longer managed by the AWS service that created it. You must manually delete the AMI if it is no longer needed.

Quotas

The following quotas apply to Recycle Bin.

Quota	Default quota			
Retention rules per Region	250			
Tag key and value pairs per retention rule	50			

Related services

Recycle Bin works with the following services:

- **AWS CloudTrail** — Enables you to record events that occur in Recycle Bin. For more information, see [Monitoring Recycle Bin using AWS CloudTrail \(p. 1675\)](#).

Pricing

Resources in the Recycle Bin are billed at their standard rates. There are no additional charges for using Recycle Bin and retention rules. For more information, see [Amazon EBS pricing](#).

Note

Some resources might still appear in the Recycle Bin console or in the AWS CLI and API output for a short period after their retention periods have expired and they have been permanently deleted. You are not billed for these resources. Billing stops as soon as the retention period expires.

You can use the following AWS generated cost allocation tags for cost tracking and allocation purposes when using AWS Billing and Cost Management.

- Key: `aws:recycle-bin:resource-in-bin`
- Value: `true`

For more information, see [AWS-Generated Cost Allocation Tags](#) in the *AWS Billing and Cost Management User Guide*.

Required IAM permissions

By default, AWS Identity and Access Management (IAM) users don't have permission to work with Recycle Bin, retention rules, or with resources that are in the Recycle Bin. To allow IAM users to work with these resources, you must create IAM policies that grant permission to use specific resources and API actions. You then attach those policies to the IAM users or the groups that require those permissions.

Topics

- [Permissions for working with Recycle Bin and retention rules \(p. 1667\)](#)
- [Permissions for working with resources in the Recycle Bin \(p. 1668\)](#)

Permissions for working with Recycle Bin and retention rules

To work with Recycle Bin and retention rules, IAM users need the following permissions.

- `rbin:CreateRule`

- rbin:UpdateRule
- rbin:GetRule
- rbin>ListRules
- rbin>DeleteRule
- rbin:TagResource
- rbin:UntagResource
- rbin>ListTagsForResource

To use the Recycle Bin console, IAM users need the `tag:GetResources` permission.

The following is an example IAM policy. It includes the `tag:GetResources` permission for console users. If the permission is not needed, you can remove it from the policy.

```
{  
    "Version": "2012-10-17",  
    "Statement": [{  
        "Effect": "Allow",  
        "Action": [  
            "rbin>CreateRule",  
            "rbin:UpdateRule",  
            "rbin:GetRule",  
            "rbin>ListRules",  
            "rbin>DeleteRule",  
            "rbin:TagResource",  
            "rbin:UntagResource",  
            "rbin>ListTagsForResource",  
            "tag:GetResources"  
        ],  
        "Resource": "*"  
    }]  
}
```

Permissions for working with resources in the Recycle Bin

For more information about the IAM permissions needed to work with resources in the Recycle Bin, see the following:

- [Permissions for working with snapshots in the Recycle Bin \(p. 1445\)](#)
- [Permissions for working with AMIs in the Recycle Bin \(p. 200\)](#)

Work with retention rules

To enable and use Recycle Bin, you must create *retention rules* in the AWS Regions in which you want to protect your resources. Retention rules specify the following:

- The resource type that you want to protect.
- The resources that you want to retain in the Recycle Bin when they are deleted.
- The retention period for which to retain resources in the Recycle Bin before they are permanently deleted.

With Recycle Bin, you can create two types of retention rules:

- **Tag-level retention rules** — A tag-level retention rule uses resource tags to identify the resources that are to be retained in the Recycle Bin. For each retention rule, you specify one or more tag key

and value pairs. Resources of the specified type that are tagged with at least one of the tag key and value pairs that are specified in the retention rule are automatically retained in the Recycle Bin upon deletion. Use this type of retention rule if you want to protect specific resources in your account based on their tags.

- **Region-level retention rules** — A Region-level retention rule does not have any resource tags specified. It applies to all of the resources of the specified type in the Region in which the rule is created, even if the resources are not tagged. Use this type of retention rule if you want to protect all resources of a specific type in a specific Region.

After you create a retention rule, resources that match its criteria are automatically retained in the Recycle Bin for the specified retention period after they are deleted.

Topics

- [Create a retention rule \(p. 1669\)](#)
- [View Recycle Bin retention rules \(p. 1671\)](#)
- [Update retention rules \(p. 1671\)](#)
- [Tag retention rules \(p. 1672\)](#)
- [View retention rule tags \(p. 1673\)](#)
- [Remove tags from retention rules \(p. 1673\)](#)
- [Delete Recycle Bin retention rules \(p. 1674\)](#)

Create a retention rule

To create a retention rule, you must specify:

- An optional name for the retention rule. The name can be up to 255 characters long.
- An optional description for the rule. The description can be up to 255 characters long.
- The resource type that is to be protected by the retention rule.
- Resource tags that identify the resources that are to be retained in the Recycle Bin. You can specify up to 50 tags for each rule. However, you can add the same tag key and value pair to up to 5 retention rules only.
 - To create a tag-level retention rule, specify at least one tag key and value pair.
 - To create an Region-level retention rule, do not specify any tag key and value pairs.
- The period for which the resources are to be retained in the Recycle Bin after deletion. The period can be up to 1 year (365 days).
- Optional retention rule tags to help identify and organize your retention rules. You can assign up to 50 tags to each rule.

Retention rules function only in the Regions in which they are created. If you intend to use Recycle Bin in other Regions, you must create additional retention rules in those Regions.

You can create a Recycle Bin retention rule using one of the following methods.

Recycle Bin console

To create a retention rule

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation panel, choose **Retention rules**, and then choose **Create retention rule**.
3. In the **Rule details** section, do the following:
 - a. (*Optional*) For **Retention rule name**, enter a descriptive name for the retention rule.

- b. *(Optional)* For **Retention rule description**, enter a brief description for the retention rule.
4. In the **Rule settings** section, do the following:
 - a. For **Resource type**, select choose the type of resource for the retention rule to protect. The retention rule will retain only resources of this type in the Recycle Bin.
 - b. Do one of the following:
 - To create a Region-level retention rule that matches all deleted resources of the specified type in the Region, select **Apply to all resources**. The retention rule will retain all deleted resources of the specified in the Recycle Bin upon deletion, even if the resources do not have any tags.
 - To create a tag-level retention rule, for **Resource tags to match**, enter the tag key and value pairs to use to identify resource of the specified type that are to be retained in the Recycle Bin. Only resources of the specified type that have at least one of the specified tag key and value pairs will be retained by the retention rule.
 - c. For **Retention period**, enter the number of days for which the retention rule is to retain resources in the Recycle Bin.
5. *(Optional)* In the **Tags** section, do the following:
 - To tag the rule with custom tags, choose **Add tag** and then enter the tag key and value pair.
6. Choose **Create retention rule**.

AWS CLI

To create a retention rule

Use the [create-rule](#) AWS CLI command. For **--retention-period**, specify the number of days to retain deleted snapshots in the Recycle Bin. For **--resource-type**, specify **EBS_SNAPSHOT** for snapshots or **EC2_IMAGE** for AMIs. To create a tag-level retention rule, for **--resource-tags**, specify the tags to use to identify the snapshots that are to be retained. To create a Region-level retention rule, omit **--resource-tags**.

```
$ aws rbin create-rule \
--retention-period RetentionPeriodValue=number_of_days,RetentionPeriodUnit=DAYS \
--resource-type EBS_SNAPSHOT/EC2_IMAGE \
--description "rule_description" \
--resource-tags ResourceTagKey>tag_key,ResourceTagValue>tag_value
```

Example 1

The following example command creates a Region-level retention rule that retains all deleted snapshots for a period of 8 days.

```
$ aws rbin create-rule \
--retention-period RetentionPeriodValue=8,RetentionPeriodUnit=DAYS \
--resource-type EBS_SNAPSHOT \
--description "Match all snapshots"
```

Example 2

The following example command creates a tag-level rule that retains deleted snapshots that are tagged with **purpose=production** for a period of 14 days.

```
$ aws rbin create-rule \
--retention-period RetentionPeriodValue=14,RetentionPeriodUnit=DAYS \
--resource-type EBS_SNAPSHOT \
--description "Match snapshots with a specific tag" \
```

```
--resource-tags ResourceTagKey=purpose,ResourceTagValue=production
```

View Recycle Bin retention rules

You can view Recycle Bin retention rules using one of the following methods.

Recycle Bin console

To view retention rules

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation panel, choose **Retention rules**.
3. The grid lists all of the retention rules for the selected Region. To view more information about a specific retention rule, select it in the grid.

AWS CLI

To view all of your retention rules

Use the [list-rules](#) AWS CLI command, and for --resource-type, specify `EBS_SNAPSHOT` for snapshots or `EC2_IMAGE` for AMIs.

```
$ aws rbin list-rules --resource-type EBS_SNAPSHOT|EC2_IMAGE
```

Example

The following example command provides lists all retention rules that retain snapshots.

```
$ aws rbin list-rules --resource-type EBS_SNAPSHOT
```

To view information for a specific retention rule

Use the [get-rule](#) AWS CLI command.

```
$ aws rbin get-rule --identifier rule_ID
```

Example

The following example command provides information about retention rule `pxwIkFcvge4`.

```
$ aws rbin get-rule --identifier pxwIkFcvge4
```

Update retention rules

You can update a retention rule at any time after creation. You can modify all of a retention rule's parameters, including its description, resource type, resource tags, and retention period.

After you update a retention rule, the changes only apply to new resources that it retains. The changes do not affect resources that it previously sent to the Recycle Bin. For example, if you update a retention rule's retention period, only snapshots that are deleted after the update are retained for the new retention period. Snapshots that it sent to the Recycle Bin before the update are still retained for the previous (old) retention period.

You can update a retention rule using one of the following methods.

Recycle Bin console

To update a retention rule

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation panel, choose **Retention rules**.
3. In the grid, select the retention rule to update, and choose **Actions**, **Edit retention rule**.
4. In the **Rule details** section, update **Retention rule name** and **Retention rule description** as needed.
5. In the **Rule settings** section, update the **Resource type**, **Resource tags to match**, and **Retention period** as needed.
6. In the **Tags** section, add or remove retention rule tags as needed.
7. Choose **Save retention rule**.

AWS CLI

To update a retention rule

Use the `update-rule` AWS CLI command. For `--identifier`, specify the ID of the retention rule to update. For `--resource-types`, specify `EBS_SNAPSHOT` for snapshots or `EC2_IMAGE` for AMIs.

```
$ aws rbin update-rule \
--identifier rule_ID \
--retention-period RetentionPeriodValue=number_of_days,RetentionPeriodUnit=DAYs \
--resource-type EBS_SNAPSHOT/EC2_IMAGE \
--description "rule_description"
```

Example

The following example command updates retention rule `6lsJ2Fa9nh9` to retain all snapshots for 21 days and updates its description.

```
$ aws rbin update-rule \
--identifier 6lsJ2Fa9nh9 \
--retention-period RetentionPeriodValue=21,RetentionPeriodUnit=DAYs \
--resource-type EBS_SNAPSHOT \
--description "Retain for three weeks"
```

Tag retention rules

You can assign custom tags to your retention rules to categorize them in different ways, for example, by purpose, owner, or environment. This helps you to efficiently find a specific retention rule based on the custom tags that you assigned.

You can assign a tag to a retention rule using one of the following methods.

Recycle Bin console

To tag a retention rule

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation panel, choose **Retention rules**.
3. Select the retention rule to tag, choose the **Tags** tab, and then choose **Manage tags**.
4. Choose **Add tag**. For **Key**, enter the tag key. For **Value**, enter the tag value.
5. Choose **Save**.

AWS CLI

To tag a retention rule

Use the [tag-resource](#) AWS CLI command. For `--resource-arn`, specify the Amazon Resource Name (ARN) of the retention rule to tag, and for `--tags`, specify the tag key and value pair.

```
$ aws rbin tag-resource \
--resource-arn retention_rule_arn \
--tags key=tag_key,value=tag_value
```

Example

The following example command tags retention rule `arn:aws:rbin:us-east-1:123456789012:rule/nOoSBBtItF3` with tag `purpose=production`.

```
$ aws rbin tag-resource \
--resource-arn arn:aws:rbin:us-east-1:123456789012:rule/nOoSBBtItF3 \
--tags key=purpose,value=production
```

View retention rule tags

You can view the tags assigned to a retention rule using one of the following methods.

Recycle Bin console

To view tags for a retention rule

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation panel, choose **Retention rules**.
3. Select the retention rule for which to view the tags, and choose the **Tags** tab.

AWS CLI

To view the tags assigned to a retention rule

Use the [list-tags-for-resource](#) AWS CLI command. For `--resource-arn`, specify the ARN of the retention rule.

```
$ aws rbin list-tags-for-resource \
--resource-arn retention_rule_arn
```

Example

The following example command lists the tags for retention rule `arn:aws:rbin:us-east-1:123456789012:rule/nOoSBBtItF3`.

```
$ aws rbin list-tags-for-resource \
--resource-arn arn:aws:rbin:us-east-1:123456789012:rule/nOoSBBtItF3
```

Remove tags from retention rules

You can remove tags from a retention rule using one of the following methods.

Recycle Bin console

To remove a tag from a retention rule

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation panel, choose **Retention rules**.
3. Select the retention rule from which to remove the tag, choose the **Tags** tab, and then choose **Manage tags**.
4. Choose **Remove** next to the tag to remove.
5. Choose **Save**.

AWS CLI

To remove a tag from a retention rule

Use the [untag-resource](#) AWS CLI command. For `--resource-arn`, specify the ARN of the retention rule. For `--tagkeys`, specify the tags keys of the tags to remove.

```
$ aws rbin untag-resource \
--resource-arn retention_rule_arn \
--tagkeys tag_key
```

Example

The following example command removes tags that have a tag key of `purpose` from retention rule `arn:aws:rbin:us-east-1:123456789012:rule/nOoSBBtItF3`.

```
$ aws rbin untag-resource \
--resource-arn arn:aws:rbin:us-east-1:123456789012:rule/nOoSBBtItF3 \
--tagkeys purpose
```

Delete Recycle Bin retention rules

You can delete a retention rule at any time. When you delete a retention rule, it no longer retains new resources after they have been deleted. Resources that were sent to the Recycle Bin before the retention rule was deleted continue to be retained in the Recycle Bin according to the retention period defined in the retention rule. When the period expires, the resource is permanently deleted from the Recycle Bin.

You can delete a retention rule using one of the following methods.

Recycle Bin console

To delete a retention rule

1. Open the Recycle Bin console at <https://console.aws.amazon.com/rbin/home/>
2. In the navigation panel, choose **Retention rules**.
3. In the grid, select the retention rule to delete, and choose **Actions, Delete retention rule**.
4. When prompted, enter the confirmation message and choose **Delete retention rule**.

AWS CLI

To delete a retention rule

Use the [delete-rule](#) AWS CLI command. For `--identifier`, specify the ID of the retention rule to delete.

```
$ aws rbin delete-rule --identifier rule_ID
```

Example

The following example command deletes retention rule `61sJ2Fa9nh9`.

```
$ aws rbin delete-rule --identifier 61sJ2Fa9nh9
```

Work with resources in the Recycle Bin

Recycle Bin supports the following resource types:

- Amazon EBS snapshots
- Amazon EBS-backed Amazon Machine Images (AMIs)

Topics

- [Work with snapshots in the Recycle Bin \(p. 1675\)](#)
- [Work with AMIs in the Recycle Bin \(p. 1675\)](#)

This section includes links to the topics that explain how to work with the supported resource types.

Work with snapshots in the Recycle Bin

For more information about working with snapshots in the Recycle Bin, see [Recover snapshots from the Recycle Bin \(p. 1445\)](#).

Work with AMIs in the Recycle Bin

For more information about working with AMIs in the Recycle Bin, see [Recover AMIs from the Recycle Bin \(p. 200\)](#).

Monitoring Recycle Bin using AWS CloudTrail

The Recycle Bin service is integrated with AWS CloudTrail. CloudTrail is a service that provides a record of actions taken by a user, role, or an AWS service. CloudTrail captures all API calls performed in Recycle Bin as events. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon Simple Storage Service (Amazon S3) bucket. If you don't configure a trail, you can still view the most recent management events in the CloudTrail console in **Event history**. You can use the information collected by CloudTrail to determine the request that was made to Recycle Bin, the IP address from which the request was made, who made the request, when it was made, and additional details.

For more information about CloudTrail, see the [AWS CloudTrail User Guide](#).

Recycle Bin information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When supported event activity occurs in Recycle Bin, that activity is recorded in a CloudTrail event along with other AWS service events in **Event history**. You can view, search, and download recent events in your AWS account. For more information, see [Viewing Events with CloudTrail Event History](#).

For an ongoing record of events in your AWS account, including events for Recycle Bin, create a trail. A *trail* enables CloudTrail to deliver log files to an S3 bucket. By default, when you create a trail in the console, the trail applies to all AWS Regions. The trail logs events from all Regions in the AWS

partition and delivers the log files to the S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see [Overview for creating a trail](#) in the *AWS CloudTrail User Guide*.

Supported API actions

For Recycle Bin, you can use CloudTrail to log the following API actions as *management events*.

- CreateRule
- UpdateRule
- GetRules
- ListRule
- DeleteRule
- TagResource
- UntagResource
- ListTagsForResource

For more information about logging management events, see [Logging management events for trails](#) in the *CloudTrail User Guide*.

Identity information

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root or AWS Identity and Access Management (IAM) user credentials.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another AWS service.

For more information, see the [CloudTrail userIdentityElement](#).

Understand Recycle Bin log file entries

A trail is a configuration that enables delivery of events as log files to an S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. CloudTrail log files aren't an ordered stack trace of the public API calls, so they don't appear in any specific order.

The following are example CloudTrail log entries.

CreateRule

```
{

Resource locations

Amazon EC2 resources are specific to the AWS Region or Availability Zone in which they reside.

Resource	Type	Description
Amazon EC2 resource identifiers	Regional	Each resource identifier, such as an AMI ID, instance ID, EBS volume ID, or EBS snapshot ID, is tied to its Region and can be used only in the Region where you created the resource.
User-supplied resource names	Regional	Each resource name, such as a security group name or key pair name, is tied to its Region and can be used only in the Region where you created the resource. Although you can create resources with the same name in multiple Regions, they aren't related to each other.
AMIs	Regional	An AMI is tied to the Region where its files are located within Amazon S3. You can copy an AMI from one Region to another. For more information, see Copy an AMI (p. 180) .
EBS snapshots	Regional	An EBS snapshot is tied to its Region and can only be used to create volumes in the same Region. You can copy a snapshot from one Region to another. For more information, see Copy an Amazon EBS snapshot (p. 1413) .
EBS volumes	Availability Zone	An Amazon EBS volume is tied to its Availability Zone and can be attached only to instances in the same Availability Zone.
Elastic IP addresses	Regional	An Elastic IP address is tied to a Region and can be associated only with an instance in the same Region.

Resource	Type	Description
Instances	Availability Zone	An instance is tied to the Availability Zones in which you launched it. However, its instance ID is tied to the Region.
Key pairs	Global or Regional	<p>The key pairs that you create using Amazon EC2 are tied to the Region where you created them. You can create your own RSA key pair and upload it to the Region in which you want to use it; therefore, you can make your key pair globally available by uploading it to each Region.</p> <p>For more information, see Amazon EC2 key pairs and Linux instances (p. 1310).</p>
Security groups	Regional	A security group is tied to a Region and can be assigned only to instances in the same Region. You can't enable an instance to communicate with an instance outside its Region using security group rules. Traffic from an instance in another Region is seen as WAN bandwidth.

Resource IDs

When resources are created, we assign each resource a unique resource ID. A resource ID takes the form of a resource identifier (such as `snap` for a snapshot) followed by a hyphen and a unique combination of letters and numbers.

Each resource identifier, such as an AMI ID, instance ID, EBS volume ID, or EBS snapshot ID, is tied to its Region and can be used only in the Region where you created the resource.

You can use resource IDs to find your resources in the Amazon EC2 console. If you are using a command line tool or the Amazon EC2 API to work with Amazon EC2, resource IDs are required for certain commands. For example, if you are using the `stop-instances` AWS CLI command to stop an instance, you must specify the instance ID in the command.

Resource ID length

Prior to January 2016, the IDs assigned to newly created resources of certain resource types used 8 characters after the hyphen (for example, `i-1a2b3c4d`). From January 2016 to June 2018, we changed the IDs of these resource types to use 17 characters after the hyphen (for example, `i-1234567890abcdef0`). Depending on when your account was created, you might have resources of the following resource types with short IDs, though any new resources of these types receive the longer IDs:

- `bundle`
- `conversion-task`
- `customer-gateway`
- `dhcp-options`
- `elastic-ip-allocation`
- `elastic-ip-association`
- `export-task`
- `flow-log`

- [image](#)
- [import-task](#)

List and filter your resources

You can get a list of some types of resources using the Amazon EC2 console. You can get a list of each type of resource using its corresponding command or API action. If you have many resources, you can filter the results to include, or exclude, only the resources that match certain criteria.

Contents

- [List and filter resources using the console \(p. 1685\)](#)
- [List and filter using the CLI and API \(p. 1689\)](#)
- [List and filter resources across Regions using Amazon EC2 Global View \(p. 1691\)](#)

List and filter resources using the console

Contents

- [List resources using the console \(p. 1685\)](#)
- [Filter resources using the console \(p. 1686\)](#)

List resources using the console

You can view the most common Amazon EC2 resource types using the console. To view additional resources, use the command line interface or the API actions.

To list EC2 resources using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose the option that corresponds to the resource type. For example, to list your instances, choose **Instances**.

The page displays all resources of the selected resource type.

Filter resources using the console

To filter a list of resources

1. In the navigation pane, select a resource type (for example, **Instances**).
2. Choose the search field.
3. Choose the filter from the list.
4. Choose a filter value.
5. When you are finished, remove the filter.

The search and filter functionality differs slightly between the *old* and *new* Amazon EC2 console.

New console

The new console supports two types of filtering.

- *API filtering* happens on the server side. The filtering is applied on the API call, which reduces the number of resources returned by the server. It allows for quick filtering across large sets of resources, and it can reduce data transfer time and cost between the server and the browser.
- *Client filtering* happens on the client side. It enables you to filter down on data that is already available in the browser (in other words, data that has already been returned by the API). Client filtering works well in conjunction with an API filter to filter down to smaller data sets in the browser.

The new Amazon EC2 console supports the following types of searches:

Search by keyword

Searching by keyword is a free text search that lets you search for a value across all of your resources' attributes, without specifying an attribute to search.

Note

All keyword searches use *client filtering*.

To search by keyword, enter or paste what you're looking for in the search field, and then choose **Enter**. For example, searching for 123 matches all instances that have 123 in any of their attributes, such as an IP address, instance ID, VPC ID, or AMI ID. If your free text search returns unexpected matches, apply additional filters.

Search by attributes

Searching by an attribute lets you search a specific attribute across all of your resources.

Note

Attribute searches use either *API filtering* or *client filtering*, depending on the selected attribute. When performing an attribute search, the attributes are grouped accordingly.

For example, you can search the **Instance state** attribute for all of your instances to return only instances that are in the stopped state. To do this:

1. In the search field on the **Instances** screen, start entering `Instance state`. As you enter the characters, the two types of filters appear for **Instance state: API filters** and **Client filters**.
2. To search on the server side, choose **Instance state** under **API filters**. To search on the client side, choose **Instance state (client)** under **Client filters**.
A list of possible values for the selected attribute appears.
3. Choose **stopped** from the list.

You can use the following techniques to enhance or refine your searches:

Inverse search

Inverse searches let you search for resources that do **not** match a specified value. Inverse searches are performed by prefixing the search keyword with the exclamation mark (!) character.

Note

Inverse search is supported with keyword searches and attribute searches on *client filters* only. It is not supported with attribute searches on API filters.

For example, you can search the **Instance state** attribute for all of your instances to exclude all instances that are in the `terminated` state. To do this:

1. In the search field on the **Instances** screen, start entering `Instance state`. As you enter the characters, the two types of filters appear for **Instance state: API filters** and **Client filters**.
2. Choose **Instance state (client)**. Inverse search is only supported on *client filters*.

A list of possible values for the selected attribute appears.

3. Enter `!` (exclamation mark) to display the inverse filters.
4. Choose `!terminated` from the list.

To filter instances based on an instance state attribute, you can also use the search icons (

) in the **Instance state** column. The search icon with a plus sign (+) displays all the instances that *match* that attribute. The search icon with a minus sign (-) *excludes* all instances that match that attribute.

Here is another example of using the inverse search: To list all instances that are **not** assigned the security group named `launch-wizard-1`, search by the **Security group name** attribute, and for the keyword, enter `!launch-wizard-1`.

Partial search

With partial searches, you can search for partial string values. To perform a partial search, enter only a part of the keyword that you want to search for. For example, to search for all `t2.micro`, `t2.small`, and `t2.medium` instances, search by the **Instance Type** attribute, and for the keyword, enter `t2`.

Note

Partial search is supported with keyword searches and attribute searches on *client filters* only. It is not supported with attribute searches on API filters.

Regular expression search

To use regular expression searches, you must enable **Use regular expression matching** in the Preferences.

Regular expressions are useful when you need to match the values in a field with a specific pattern. For example, to search for a value that starts with `s`, search for `^s`. To search for a value that ends with `xyz`, search for `xyz$`. Or to search for a value that starts with a number that is followed by one or more characters, search for `[0-9]+.*`. Regular expression searches are not case-sensitive.

Note

Regular expression search is supported with keyword searches and attribute searches on client filters only. It is not supported with attribute searches on API filters.

Wildcard search

Use the * wildcard to match zero or more characters. Use the ? wildcard to match zero or one character. For example, if you have a data set with the following values: prod, prods, and production; "prod*" matches all values, whereas "prod?" matches only prod and prods. To use the literals values, escape them with a backslash (\). For example, "prod*" would match prod*.

Note

Wildcard search is supported with attribute searches on API filters only. It is not supported with keyword searches and attribute searches on client filters only.

Combining searches

In general, multiple filters with the same attribute are automatically joined with OR. For example, searching for `Instance State : Running` and `Instance State : Stopped` returns all instances that are either running OR stopped. To join search with AND, search across different attributes. For example, searching for `Instance State : Running` and `Instance Type : c4.large` returns only instances that are of type `c4.large` AND that are in the running state.

Old console

The old Amazon EC2 console supports the following types of searches:

Search by keyword

Searching by keyword is a free text search that lets you search for a value across all of your resources' attributes. To search by keyword, enter or paste what you're looking for in the search field, and then choose **Enter**. For example, searching for `123` matches all instances that have `123` in any of their attributes, such as an IP address, instance ID, VPC ID, or AMI ID. If your free text search returns unexpected matches, apply additional filters.

Search by attributes

Searching by an attribute lets you search a specific attribute across all of your resources. For example, you can search the **State** attribute for all of your instances to return only instances that are in the `stopped` state. To do this:

1. In the search field on the Instances screen, start entering `Instance State`. As you enter characters, a list of matching attributes appears.
2. Select **Instance State** from the list. A list of possible values for the selected attribute appears.
3. Select **Stopped** from the list.

You can use the following techniques to enhance or refine your searches:

Inverse search

Inverse searches let you search for resources that do **not** match a specified value. Inverse searches are performed by prefixing the search keyword with the exclamation mark (!) character. For example, to list all instances that are **not** terminated, search by the **Instance State** attribute, and for the keyword, enter `!Terminated`.

Partial search

With partial searches, you can search for partial string values. To perform a partial search, enter only a part of the keyword you want to search for. For example, to search for all `t2.micro`, `t2.small`, and `t2.medium` instances, search by the **Instance Type** attribute, and for the keyword, enter `t2`.

Regular expression search

Regular expressions are useful when you need to match the values in a field with a specific pattern. For example, to search for all instances that have an attribute value that starts with s, search for ^s. Or to search for all instances that have an attribute value that ends with xyz, search for xyz\$. Regular expression searches are not case-sensitive.

Combining searches

In general, multiple filters with the same attribute are automatically joined with OR. For example, searching for `Instance State : Running` and `Instance State : Stopped` returns all instances that are either running OR stopped. To join search with AND, search across different attributes. For example, searching for `Instance State : Running` and `Instance Type : c4.large` returns only instances that are of type `c4.large` AND that are in the stopped state.

List and filter using the CLI and API

Each resource type has a corresponding CLI command and API action that you use to list resources of that type. The resulting lists of resources can be long, so it can be faster and more useful to filter the results to include only the resources that match specific criteria.

Filtering considerations

- You can specify multiple filters and multiple filter values in a single request.
- You can use wildcards with the filter values. An asterisk (*) matches zero or more characters, and a question mark (?) matches zero or one character.
- Filter values are case sensitive.
- Your search can include the literal values of the wildcard characters; you just need to escape them with a backslash before the character. For example, a value of *amazon\?\\ searches for the literal string *amazon?\.

Supported filters

To see the supported filters for each Amazon EC2 resource, see the following documentation:

- AWS CLI: The `describe` commands in the [AWS CLI Command Reference-Amazon EC2](#).
- Tools for Windows PowerShell: The `Get` commands in the [AWS Tools for PowerShell Cmdlet Reference-Amazon EC2](#).
- Query API: The `Describe` API actions in the [Amazon EC2 API Reference](#).

Example Example: Specify a single filter

You can list your Amazon EC2 instances using [describe-instances](#). Without filters, the response contains information for all of your resources. You can use the following command to include only the running instances in your output.

```
aws ec2 describe-instances --filters Name=instance-state-name,Values=running
```

To list only the instance IDs for your running instances, add the `--query` parameter as follows.

```
aws ec2 describe-instances --filters Name=instance-state-name,Values=running --query "Reservations[*].Instances[*].InstanceId" --output text
```

The following is example output.

```
i-0ef1f57f78d4775a4  
i-0626d4edd54f1286d  
i-04a636d18e83cfacb
```

Example Example: Specify multiple filters or filter values

If you specify multiple filters or multiple filter values, the resource must match all filters to be included in the results.

You can use the following command to list all instances whose type is either `m5.large` or `m5d.large`.

```
aws ec2 describe-instances --filters Name=instance-type,Values=m5.large,m5d.large
```

You can use the following command to list all stopped instances whose type is `t2.micro`.

```
aws ec2 describe-instances --filters Name=instance-state-name,Values=stopped Name=instance-type,Values=t2.micro
```

Example Example: Use wildcards in a filter value

If you specify `database` as the filter value for the `description` filter when describing EBS snapshots using [describe-snapshots](#), the command returns only the snapshots whose description is "database".

```
aws ec2 describe-snapshots --filters Name=description,Values=database
```

The `*` wildcard matches zero or more characters. If you specify `*database*` as the filter value, the command returns only snapshots whose description includes the word `database`.

```
aws ec2 describe-snapshots --filters Name=description,Values=*database*
```

The `?` wildcard matches exactly 1 character. If you specify `database?` as the filter value, the command returns only snapshots whose description is "database" or "database" followed by one character.

```
aws ec2 describe-snapshots --filters Name=description,Values=database?
```

If you specify `database????`, the command returns only snapshots whose description is "database" followed by up to four characters. It excludes descriptions with "database" followed by five or more characters.

```
aws ec2 describe-snapshots --filters Name=description,Values=database????
```

Example Example: Filter based on date

With the AWS CLI, you can use JMESPath to filter results using expressions. For example, the following [describe-snapshots](#) command displays the IDs of all snapshots created by your AWS account (represented by `123456789012`) before the specified date (represented by `2020-03-31`). If you do not specify the owner, the results include all public snapshots.

```
aws ec2 describe-snapshots --filters Name=owner-id,Values=123456789012 --query "Snapshots[?(StartTime<='2020-03-31')].[SnapshotId]" --output text
```

The following command displays the IDs of all snapshots created in the specified date range.

```
aws ec2 describe-snapshots --filters Name=owner-id,Values=123456789012 --query "Snapshots[?(StartTime>='2019-01-01') && (StartTime<='2019-12-31')].[SnapshotId]" --output text
```

Filter based on tags

For examples of how to filter a list of resources according to their tags, see [Work with tags using the command line \(p. 1701\)](#).

List and filter resources across Regions using Amazon EC2 Global View

Amazon EC2 Global View enables you to view some of your Amazon EC2 and Amazon VPC resources across a single AWS Region, or across multiple Regions in a single console. Using Amazon EC2 Global View, you can view a summary of all of your VPCs, subnets, instances, security groups, and volumes across all of the Regions for which your AWS account is enabled. Amazon EC2 Global View also provides *global search* functionality that lets you search for specific resources or specific resource types across multiple Regions simultaneously.

Amazon EC2 Global View does not let you modify resources in any way.

Required permissions

An IAM user must have the following permissions to use Amazon EC2 Global View.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ec2:DescribeInstances",
        "ec2:DescribeVpcs",
        "ec2:DescribeRegions",
        "ec2:DescribeVolumes",
        "ec2:DescribeSubnets",
        "ec2:DescribeSecurityGroups"
      ],
      "Resource": "*"
    }
  ]
}
```

To use Amazon EC2 Global View

Open the Amazon EC2 Global View console at <https://console.aws.amazon.com/ec2globalview/home>.

The console consists of two tabs:

- **Region explorer**—This tab includes the following sections:
 - **Resource summary**—Provides a high-level overview of your resources across all Regions.

Enabled Regions indicates the number of Regions for which your AWS account is enabled. The remaining fields indicate the number of resources that you currently have in those Regions. Choose any of the links to view the resources of that type across all Regions. For example, if the link below the **Instances** label is **29 in 10 Regions**, it indicates that you currently have 29 instances across 10 Regions. Choose the link to view a list of all 29 instances.

- **Resource counts per Region**—Lists all of the AWS Regions (including those for which your account is not enabled) and provides totals for each resource type for each Region.

Choose a Region name to view all resources of all types for that specific Region. For example, choose **Africa (Cape Town) af-south-1** to view all VPCs, subnets, instances, security groups, and volumes in that Region. Alternatively, select a Region and choose **View resources for selected Region**.

Choose the value for a specific resource type in a specific Region to view only resources of that type in that Region. For example, choose the value for Instances for **Africa (Cape Town) af-south-1** to view only the instances in that Region.

- **Global search**—This tab enables you to search for specific resources or specific resource types across a single Region or across multiple Regions. It also enables you to view details for a specific resource.

To search for resources, enter the search criteria in the field preceding the grid. You can search by Region, by resource type, and by the tags assigned to resources.

To view the details for a specific resource, select it in the grid. You can also choose the resource ID of a resource to open it in its respective console. For example, choose an instance ID to open the instance in the Amazon EC2 console, or choose a subnet ID to open the subnet in the Amazon VPC console.

Tag your Amazon EC2 resources

To help you manage your instances, images, and other Amazon EC2 resources, you can assign your own metadata to each resource in the form of *tags*. Tags enable you to categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This is useful when you have many resources of the same type—you can quickly identify a specific resource based on the tags that you've assigned to it. This topic describes tags and shows you how to create them.

Warning

Tag keys and their values are returned by many different API calls. Denying access to `DescribeTags` doesn't automatically deny access to tags returned by other APIs. As a best practice, we recommend that you do not include sensitive data in your tags.

Contents

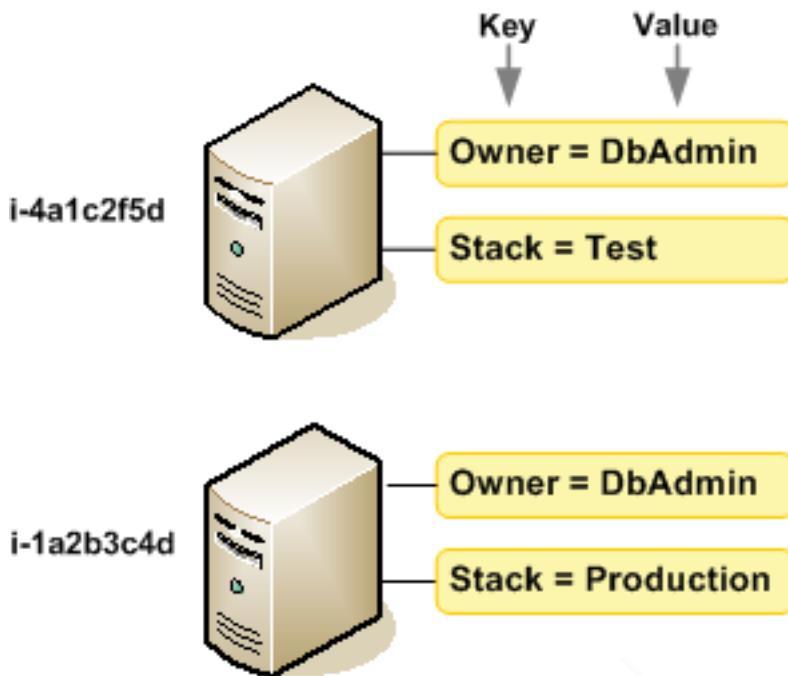

- [Tag basics \(p. 1692\)](#)
- [Tag your resources \(p. 1693\)](#)
- [Tag restrictions \(p. 1696\)](#)

- [Work with instance tags in instance metadata \(p. 1704\)](#)
- [Add tags to a resource using CloudFormation \(p. 1705\)](#)

Tag basics

A tag is a label that you assign to an AWS resource. Each tag consists of a *key* and an optional *value*, both of which you define.

Tags enable you to categorize your AWS resources in different ways, for example, by purpose, owner, or environment. For example, you could define a set of tags for your account's Amazon EC2 instances that helps you track each instance's owner and stack level.

The following diagram illustrates how tagging works. In this example, you've assigned two tags to each of your instances—one tag with the key `Owner` and another with the key `Stack`. Each tag also has an associated value.

We recommend that you devise a set of tag keys that meets your needs for each resource type. Using a consistent set of tag keys makes it easier for you to manage your resources. You can search and filter the resources based on the tags you add. For more information about how to implement an effective resource tagging strategy, see the AWS whitepaper [Tagging Best Practices](#).

Tags don't have any semantic meaning to Amazon EC2 and are interpreted strictly as a string of characters. Also, tags are not automatically assigned to your resources. You can edit tag keys and values, and you can remove tags from a resource at any time. You can set the value of a tag to an empty string, but you can't set the value of a tag to null. If you add a tag that has the same key as an existing tag on that resource, the new value overwrites the old value. If you delete a resource, any tags for the resource are also deleted.

Note

After you delete a resource, its tags might remain visible in the console, API, and CLI output for a short period. These tags will be gradually disassociated from the resource and be permanently deleted.

Tag your resources

You can tag most Amazon EC2 resources that already exist in your account. The following [table \(p. 1694\)](#) lists the resources that support tagging.

If you're using the Amazon EC2 console, you can apply tags to resources by using the **Tags** tab on the relevant resource screen, or you can use the **Tags** screen. Some resource screens enable you to specify tags for a resource when you create the resource; for example, a tag with a key of `Name` and a value that you specify. In most cases, the console applies the tags immediately after the resource is created (rather

than during resource creation). The console may organize resources according to the `Name` tag, but this tag doesn't have any semantic meaning to the Amazon EC2 service.

If you're using the Amazon EC2 API, the AWS CLI, or an AWS SDK, you can use the `CreateTags` EC2 API action to apply tags to existing resources. Additionally, some resource-creating actions enable you to specify tags for a resource when the resource is created. If tags cannot be applied during resource creation, we roll back the resource creation process. This ensures that resources are either created with tags or not created at all, and that no resources are left untagged at any time. By tagging resources at the time of creation, you can eliminate the need to run custom tagging scripts after resource creation. For more information about enabling users to tag resources on creation, see [Grant permission to tag resources during creation \(p. 1248\)](#).

The following table describes the Amazon EC2 resources that can be tagged, and the resources that can be tagged on creation using the Amazon EC2 API, the AWS CLI, or an AWS SDK.

Tagging support for Amazon EC2 resources

Resource	Supports tags	Supports tagging on creation
AFI	Yes	Yes
AMI	Yes	Yes
Bundle task	No	No
Capacity Reservation	Yes	Yes
Carrier gateway	Yes	Yes
Client VPN endpoint	Yes	Yes
Client VPN route	No	No
Customer gateway	Yes	Yes
Dedicated Host	Yes	Yes
Dedicated Host Reservation	Yes	Yes
DHCP options	Yes	Yes
EBS snapshot	Yes	Yes
EBS volume	Yes	Yes
EC2 Fleet	Yes	Yes
Egress-only internet gateway	Yes	Yes
Elastic IP address	Yes	Yes
Elastic Graphics accelerator	Yes	No
Instance	Yes	Yes
Instance event window	Yes	Yes
Instance store volume	N/A	N/A
Internet gateway	Yes	Yes
IP address pool (BYOIP)	Yes	Yes

Resource	Supports tags	Supports tagging on creation
Key pair	Yes	Yes
Launch template	Yes	Yes
Launch template version	No	No
Local gateway	Yes	No
Local gateway route table	Yes	No
Local gateway virtual interface	Yes	No
Local gateway virtual interface group	Yes	No
Local gateway route table VPC association	Yes	Yes
Local gateway route table virtual interface group association	Yes	No
NAT gateway	Yes	Yes
Network ACL	Yes	Yes
Network interface	Yes	Yes
Placement group	Yes	Yes
Prefix list	Yes	Yes
Reserved Instance	Yes	No
Reserved Instance listing	No	No
Route table	Yes	Yes
Spot Fleet request	Yes	Yes
Spot Instance request	Yes	Yes
Security group	Yes	Yes
Security group rule	Yes	No
Subnet	Yes	Yes
Traffic Mirror filter	Yes	Yes
Traffic Mirror session	Yes	Yes
Traffic Mirror target	Yes	Yes
Transit gateway	Yes	Yes
Transit gateway multicast domain	Yes	Yes
Transit gateway route table	Yes	Yes
Transit gateway VPC attachment	Yes	Yes

Resource	Supports tags	Supports tagging on creation
Virtual private gateway	Yes	Yes
VPC	Yes	Yes
VPC endpoint	Yes	Yes
VPC endpoint service	Yes	Yes
VPC endpoint service configuration	Yes	Yes
VPC flow log	Yes	Yes
VPC peering connection	Yes	Yes
VPN connection	Yes	Yes

You can tag instances, volumes, and network interfaces on creation using the Amazon EC2 Launch Instances wizard in the Amazon EC2 console. You can tag your EBS volumes on creation using the Volumes screen, or EBS snapshots using the Snapshots screen. Alternatively, use the resource-creating Amazon EC2 APIs (for example, [RunInstances](#)) to apply tags when creating your resource.

You can apply tag-based resource-level permissions in your IAM policies to the Amazon EC2 API actions that support tagging on creation to implement granular control over the users and groups that can tag resources on creation. Your resources are properly secured from creation—tags are applied immediately to your resources, therefore any tag-based resource-level permissions controlling the use of resources are immediately effective. Your resources can be tracked and reported on more accurately. You can enforce the use of tagging on new resources, and control which tag keys and values are set on your resources.

You can also apply resource-level permissions to the `CreateTags` and `DeleteTags` Amazon EC2 API actions in your IAM policies to control which tag keys and values are set on your existing resources. For more information, see [Example: Tag resources \(p. 1280\)](#).

For more information about tagging your resources for billing, see [Using cost allocation tags in the AWS Billing and Cost Management User Guide](#).

Tag restrictions

The following basic restrictions apply to tags:

- Maximum number of tags per resource – 50
- For each resource, each tag key must be unique, and each tag key can have only one value.
- Maximum key length – 128 Unicode characters in UTF-8
- Maximum value length – 256 Unicode characters in UTF-8
- Allowed characters
 - Although EC2 allows for any character in its tags, other services are more restrictive. The allowed characters across services are: letters, numbers, and spaces representable in UTF-8, and the following characters: + - = . _ : / @.
 - If you enable instance tags in instance metadata, instance tag keys can only use letters (a–z, A–Z), numbers (0–9), and the following characters: -_+=,.@:. Instance tag keys can't use spaces, /, or the reserved names ., . . . , or _index. For more information, see [Work with instance tags in instance metadata \(p. 1704\)](#).
- Tag keys and values are case-sensitive.

- The `aws:` prefix is reserved for AWS use. If a tag has a tag key with this prefix, then you can't edit or delete the tag's key or value. Tags with the `aws:` prefix do not count against your tags per resource limit.

You can't terminate, stop, or delete a resource based solely on its tags; you must specify the resource identifier. For example, to delete snapshots that you tagged with a tag key called `DeleteMe`, you must use the `DeleteSnapshots` action with the resource identifiers of the snapshots, such as `snap-1234567890abcdef0`.

When you tag public or shared resources, the tags you assign are available only to your AWS account; no other AWS account will have access to those tags. For tag-based access control to shared resources, each AWS account must assign its own set of tags to control access to the resource.

You can't tag all resources. For more information, see [Tagging support for Amazon EC2 resources \(p. 1694\)](#).

Tags and access management

If you're using AWS Identity and Access Management (IAM), you can control which users in your AWS account have permission to create, edit, or delete tags. For more information, see [Grant permission to tag resources during creation \(p. 1248\)](#).

You can also use resource tags to implement attribute-based control (ABAC). You can create IAM policies that allow operations based on the tags for the resource. For more information, see [Control access to EC2 resources using resource tags \(p. 1250\)](#).

Tag your resources for billing

You can use tags to organize your AWS bill to reflect your own cost structure. To do this, sign up to get your AWS account bill with tag key values included. For more information about setting up a cost allocation report with tags, see [Monthly cost allocation report](#) in the *AWS Billing and Cost Management User Guide*. To see the cost of your combined resources, you can organize your billing information based on resources that have the same tag key values. For example, you can tag several resources with a specific application name, and then organize your billing information to see the total cost of that application across several services. For more information, see [Using cost allocation tags](#) in the *AWS Billing and Cost Management User Guide*.

Note

If you've just enabled reporting, data for the current month is available for viewing after 24 hours.

Cost allocation tags can indicate which resources are contributing to costs, but deleting or deactivating resources doesn't always reduce costs. For example, snapshot data that is referenced by another snapshot is preserved, even if the snapshot that contains the original data is deleted. For more information, see [Amazon Elastic Block Store volumes and snapshots](#) in the *AWS Billing and Cost Management User Guide*.

Note

Elastic IP addresses that are tagged do not appear on your cost allocation report.

Work with tags using the console

Using the Amazon EC2 console, you can see which tags are in use across all of your Amazon EC2 resources in the same Region. You can view tags by resource and by resource type, and you can also view how many items of each resource type are associated with a specified tag. You can also use the Amazon EC2 console to apply or remove tags from one or more resources at a time.

For more information about using filters when listing your resources, see [List and filter your resources \(p. 1685\)](#).

For ease of use and best results, use Tag Editor in the AWS Management Console, which provides a central, unified way to create and manage your tags. For more information, see [Tag Editor](#) in *Getting Started with the AWS Management Console*.

Tasks

- [Display tags \(p. 1698\)](#)
- [Add and delete tags on an individual resource \(p. 1699\)](#)
- [Add and delete tags to a group of resources \(p. 1699\)](#)
- [Add a tag when you launch an instance \(p. 1700\)](#)
- [Filter a list of resources by tag \(p. 1700\)](#)

Display tags

You can display tags in two different ways in the Amazon EC2 console. You can display the tags for an individual resource or for all resources.

Display tags for individual resources

When you select a resource-specific page in the Amazon EC2 console, it displays a list of those resources. For example, if you select **Instances** from the navigation pane, the console displays your Amazon EC2 instances. When you select a resource from one of these lists (for example, an instance), if the resource supports tags, you can view and manage its tags. On most resource pages, you can view the tags by choosing the **Tags** tab.

You can add a column to the resource list that displays all values for tags with the same key. You can use this column sort and filter the resource list by the tag.

New console

- Choose the **Preferences** gear-shaped icon in the top right corner of the screen. In the **Preferences** dialog box, under **Tag columns**, select one or more tag keys, and then choose **Confirm**.

Old console

There are two ways to add a new column to the resource list to display your tags:

- On the **Tags** tab, select **Show Column**. A new column is added to the console.
- Choose the **Show/Hide Columns** gear-shaped icon, and in the **Show/Hide Columns** dialog box, select the tag key under **Your Tag Keys**.

Display tags for all resources

You can display tags across all resources by selecting **Tags** from the navigation pane in the Amazon EC2 console. The following image shows the **Tags** pane, which lists all tags in use by resource type.

Manage Tags						
Filter:		Search Keys	X	Search Values	X	1 to 7 of 7 Tags
	Tag Key	Tag Value	Total	Instances	AMIs	Volumes
Manage Tag	Name	DNS Server	1	1	0	0
Manage Tag	Owner	TeamB	2	0	0	2
Manage Tag	Owner	TeamA	2	0	0	2
Manage Tag	Purpose	Project2	1	0	0	1
Manage Tag	Purpose	Logs	1	0	0	1
Manage Tag	Purpose	Network Management	1	1	0	0
Manage Tag	Purpose	Project1	2	0	0	2

Add and delete tags on an individual resource

You can manage tags for an individual resource directly from the resource's page.

To add a tag to an individual resource

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, select the Region that meets your needs. This choice is important because some Amazon EC2 resources can be shared between Regions, while others can't. For more information, see [Resource locations \(p. 1683\)](#).
3. In the navigation pane, select a resource type (for example, [Instances](#)).
4. Select the resource from the resource list and choose the **Tags** tab.
5. Choose **Manage tags**, **Add tag**. Enter the key and value for the tag. When you are finished adding tags, choose **Save**.

To delete a tag from an individual resource

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, select the Region that meets your needs. This choice is important because some Amazon EC2 resources can be shared between Regions, while others can't. For more information, see [Resource locations \(p. 1683\)](#).
3. In the navigation pane, choose a resource type (for example, [Instances](#)).
4. Select the resource from the resource list and choose the **Tags** tab.
5. Choose **Manage tags**. For each tag, choose **Remove**. When you are finished removing tags, choose **Save**.

Add and delete tags to a group of resources

To add a tag to a group of resources

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, select the Region that meets your needs. This choice is important because some Amazon EC2 resources can be shared between Regions, while others can't. For more information, see [Resource locations \(p. 1683\)](#).

3. In the navigation pane, choose **Tags**.
4. At the top of the content pane, choose **Manage Tags**.
5. For **Filter**, select the type of resource (for example, instances).
6. In the resources list, select the check box next to each resource.
7. Under **Add Tag**, enter the tag key and value and choose **Add Tag**.

Note

If you add a new tag with the same tag key as an existing tag, the new tag overwrites the existing tag.

To remove a tag from a group of resources

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, select the Region that meets your needs. This choice is important because some Amazon EC2 resources can be shared between Regions, while others can't. For more information, see [Resource locations \(p. 1683\)](#).
3. In the navigation pane, choose **Tags, Manage Tags**.
4. To view the tags in use, select the **Show/Hide Columns** gear-shaped icon, and in the **Show/Hide Columns** dialog box, select the tag keys to view and choose **Close**.
5. For **Filter**, select the type of resource (for example, instances).
6. In the resource list, select the check box next to each resource.
7. Under **Remove Tag**, enter the tag key and choose **Remove Tag**.

Add a tag when you launch an instance

To add a tag using the Launch Wizard

1. From the navigation bar, select the Region for the instance. This choice is important because some Amazon EC2 resources can be shared between Regions, while others can't. Select the Region that meets your needs. For more information, see [Resource locations \(p. 1683\)](#).
2. Choose **Launch Instance**.
3. The **Choose an Amazon Machine Image (AMI)** page displays a list of basic configurations called Amazon Machine Images (AMIs). Select the AMI to use and choose **Select**. For more information, see [Find a Linux AMI \(p. 117\)](#).
4. On the **Configure Instance Details** page, configure the instance settings as necessary, and then choose **Next: Add Storage**.
5. On the **Add Storage** page, you can specify additional storage volumes for your instance. Choose **Next: Add Tags** when done.
6. On the **Add Tags** page, specify tags for the instance, the volumes, or both. Choose **Add another tag** to add more than one tag to your instance. Choose **Next: Configure Security Group** when you are done.
7. On the **Configure Security Group** page, you can choose from an existing security group that you own, or let the wizard create a new security group for you. Choose **Review and Launch** when you are done.
8. Review your settings. When you're satisfied with your selections, choose **Launch**. Select an existing key pair or create a new one, select the acknowledgment check box, and then choose **Launch Instances**.

Filter a list of resources by tag

You can filter your list of resources based on one or more tag keys and tag values.

To filter a list of resources by tag

1. In the navigation pane, select a resource type (for example, [Instances](#)).
2. Choose the search field.
3. Choose the tag key from in the list.
4. Choose the corresponding tag value from the list.
5. When you are finished, remove the filter.

For more information about filters, see [List and filter your resources \(p. 1685\)](#).

Work with tags using the command line

You can add tags to many EC2 resource when you create them, using the tag specifications parameter for the create command. You can view the tags for a resource using the describe command for the resource. You can also add, update, or delete tags for your existing resources using the following commands.

Task	AWS CLI	AWS Tools for Windows PowerShell
Add or overwrite one or more tags	create-tags	New-EC2Tag
Delete one or more tags	delete-tags	Remove-EC2Tag
Describe one or more tags	describe-tags	Get-EC2Tag

Tasks

- [Add tags on resource creation \(p. 1701\)](#)
- [Add tags to an existing resource \(p. 1702\)](#)
- [Describe tagged resources \(p. 1703\)](#)

Add tags on resource creation

The following examples demonstrate how to apply tags when you create resources.

The way you enter JSON-formatted parameters on the command line differs depending on your operating system. Linux, macOS, or Unix and Windows PowerShell use single quotes ('') to enclose the JSON data structure. Omit the single quotes when using the commands with the Windows command line. For more information, see [Specifying parameter values for the AWS CLI](#).

Example Example: Launch an instance and apply tags to the instance and volume

The following [run-instances](#) command launches an instance and applies a tag with the key **webserver** and the value **production** to the instance. The command also applies a tag with the key **cost-center** and the value **cc123** to any EBS volume that's created (in this case, the root volume).

```
aws ec2 run-instances \
--image-id ami-abc12345 \
--count 1 \
--instance-type t2.micro \
--key-name MyKeyPair \
--subnet-id subnet-6e7f829e \
```

```
--tag-specifications 'ResourceType=instance,Tags=[{Key=webserver,Value=production}]'  
'ResourceType=volume,Tags=[{Key=cost-center,Value=cc123}]'
```

You can apply the same tag keys and values to both instances and volumes during launch. The following command launches an instance and applies a tag with a key of **cost-center** and a value of **cc123** to both the instance and any EBS volume that's created.

```
aws ec2 run-instances \  
  --image-id ami-abc12345 \  
  --count 1 \  
  --instance-type t2.micro \  
  --key-name MyKeyPair \  
  --subnet-id subnet-6e7f829e \  
  --tag-specifications 'ResourceType=instance,Tags=[{Key=cost-center,Value=cc123}]'  
  'ResourceType=volume,Tags=[{Key=cost-center,Value=cc123}]'
```

Example Example: Create a volume and apply a tag

The following [create-volume](#) command creates a volume and applies two tags: **purpose=production** and **cost-center=cc123**.

```
aws ec2 create-volume \  
  --availability-zone us-east-1a \  
  --volume-type gp2 \  
  --size 80 \  
  --tag-specifications 'ResourceType=volume,Tags=[{Key=purpose,Value=production},  
  {Key=cost-center,Value=cc123}]'
```

Add tags to an existing resource

The following examples demonstrate how to add tags to an existing resource using the [create-tags](#) command.

Example Example: Add a tag to a resource

The following command adds the tag **Stack=production** to the specified image, or overwrites an existing tag for the AMI where the tag key is **Stack**. If the command succeeds, no output is returned.

```
aws ec2 create-tags \  
  --resources ami-78a54011 \  
  --tags Key=Stack,Value=production
```

Example Example: Add tags to multiple resources

This example adds (or overwrites) two tags for an AMI and an instance. One of the tags contains just a key (**webserver**), with no value (we set the value to an empty string). The other tag consists of a key (**stack**) and value (**Production**). If the command succeeds, no output is returned.

```
aws ec2 create-tags \  
  --resources ami-1a2b3c4d i-1234567890abcdef0 \  
  --tags Key=webserver,Value= Key=stack,Value=Production
```

Example Example: Add tags with special characters

This example adds the tag **[Group]=test** to an instance. The square brackets ([and]) are special characters, which must be escaped.

If you are using Linux or OS X, to escape the special characters, enclose the element with the special character with double quotes ("), and then enclose the entire key and value structure with single quotes (').

```
aws ec2 create-tags \
--resources i-1234567890abcdef0 \
--tags 'Key=[Group]',Value=test'
```

If you are using Windows, to escape the special characters, enclose the element that has special characters with double quotes ("), and then precede each double quote character with a backslash (\) as follows:

```
aws ec2 create-tags ^
--resources i-1234567890abcdef0 ^
--tags Key=\"[Group]\\",Value=test
```

If you are using Windows PowerShell, to escape the special characters, enclose the value that has special characters with double quotes ("), precede each double quote character with a backslash (\), and then enclose the entire key and value structure with single quotes (') as follows:

```
aws ec2 create-tags ^
--resources i-1234567890abcdef0 ^
--tags 'Key=\\"[Group]\\"",Value=test'
```

Describe tagged resources

The following examples show you how to use filters with the [describe-instances](#) to view instances with specific tags. All EC2 describe commands use this syntax to filter by tag across a single resource type. Alternatively, you can use the [describe-tags](#) command to filter by tag across EC2 resource types.

Example Example: Describe instances with the specified tag key

The following command describes the instances with a **Stack** tag, regardless of the value of the tag.

```
aws ec2 describe-instances \
--filters Name=tag-key,Values=Stack
```

Example Example: Describe instances with the specified tag

The following command describes the instances with the tag **Stack=production**.

```
aws ec2 describe-instances \
--filters Name=tag:Stack,Values=production
```

Example Example: Describe instances with the specified tag value

The following command describes the instances with a tag with the value **production**, regardless of the tag key.

```
aws ec2 describe-instances \
--filters Name=tag-value,Values=production
```

Example Example: Describe all EC2 resources with the specified tag

The following command describes all EC2 resources with the tag **Stack=Test**.

```
aws ec2 describe-tags \
--filters Name=key,Values=Stack Name=value,Values=Test
```

Work with instance tags in instance metadata

You can access an instance's tags from the instance metadata. By accessing tags from the instance metadata, you no longer need to use the `DescribeInstances` or `DescribeTags` API calls to retrieve tag information, which reduces your API transactions per second, and lets your tag retrievals scale with the number of instances that you control. Furthermore, local processes that are running on an instance can view the instance's tag information directly from the instance metadata.

By default, tags are not available from the instance metadata; you must explicitly allow access. You can allow access at instance launch, or after launch on a running or stopped instance. You can also allow access to tags by specifying this in a launch template. Instances that are launched by using the template allow access to tags in the instance metadata.

If you add or remove an instance tag, the instance metadata is updated while the instance is running for [instances built on the Nitro System \(p. 247\)](#), without needing to stop and then start the instance. For all other instances, to update the tags in the instance metadata, you must stop and then start the instance.

Topics

- [Allow access to tags in instance metadata \(p. 1704\)](#)
- [Turn off access to tags in instance metadata \(p. 1705\)](#)
- [Retrieve tags from instance metadata \(p. 1705\)](#)

Allow access to tags in instance metadata

By default, there is no access to instance tags in the instance metadata. For each instance, you must explicitly allow access by using one of the following methods.

To allow access to tags in instance metadata using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Instances**.
3. Select an instance, and then choose **Actions**, **Instance settings**, **Allow tags in instance metadata**.
4. To allow access to tags in instance metadata, select the **Allow** check box.
5. Choose **Save**.

To allow access to tags in instance metadata at launch using the AWS CLI

Use the `run-instances` command and set `InstanceMetadataTags` to `enabled`.

```
aws ec2 run-instances \
--image-id ami-0abcdef1234567890 \
--instance-type c3.large \
...
--metadata-options "InstanceMetadataTags=enabled"
```

To allow access to tags in instance metadata on a running or stopped instance using the AWS CLI

Use the `modify-instance-metadata-options` command and set `--instance-metadata-tags` to `enabled`.

```
aws ec2 modify-instance-metadata-options \
--instance-id i-123456789example \
--instance-metadata-tags enabled
```

Turn off access to tags in instance metadata

To turn off access to instance tags in the instance metadata, use one of the following methods. You don't need to turn off access to instance tags on instance metadata at launch because it's turned off by default.

To turn off access to tags in instance metadata using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Instances**.
3. Select an instance, and then choose **Actions**, **Instance settings**, **Allow tags in instance metadata**.
4. To turn off access to tags in instance metadata, clear the **Allow** check box.
5. Choose **Save**.

To turn off access to tags in instance metadata using the AWS CLI

Use the `modify-instance-metadata-options` command and set `--instance-metadata-tags` to `disabled`.

```
aws ec2 modify-instance-metadata-options \
--instance-id i-123456789example \
--instance-metadata-tags disabled
```

Retrieve tags from instance metadata

If instance tags are allowed in the instance metadata, the `tags/instance` category is accessible from the instance metadata. For examples on how to retrieve tags from the instance metadata, see [Get the instance tags for an instance \(p. 740\)](#).

Add tags to a resource using CloudFormation

With Amazon EC2 resource types, you specify tags using either a `Tags` or `TagSpecifications` property.

The following examples add the tag `Stack=Production` to `AWS::EC2::Instance` using its `Tags` property.

Example Example: Tags in YAML

```
Tags:
- Key: "Stack"
  Value: "Production"
```

Example Example: Tags in JSON

```
"Tags": [
{
  "Key": "Stack",
  "Value": "Production"
```

```
    }
]
```

The following examples add the tag **Stack=Production** to [AWS::EC2::LaunchTemplate](#) `LaunchTemplateData` using its `TagSpecifications` property.

Example Example: TagSpecifications in YAML

```
TagSpecifications:
- ResourceType: "instance"
  Tags:
  - Key: "Stack"
    Value: "Production"
```

Example Example: TagSpecifications in JSON

```
"TagSpecifications": [
  {
    "ResourceType": "instance",
    "Tags": [
      {
        "Key": "Stack",
        "Value": "Production"
      }
    ]
}
```

Amazon EC2 service quotas

Amazon EC2 provides different *resources* that you can use. These resources include images, instances, volumes, and snapshots. When you create your AWS account, we set default quotas (also referred to as limits) on these resources on a per-Region basis. For example, there is a maximum number of instances that you can launch in a Region. So if you were to launch an instance in the US West (Oregon) Region, for example, the request must not cause your usage to exceed your maximum number of instances in that Region.

The Amazon EC2 console provides limit information for the resources managed by the Amazon EC2 and Amazon VPC consoles. You can request an increase for many of these limits. Use the limit information that we provide to manage your AWS infrastructure. Plan to request any limit increases in advance of the time that you'll need them.

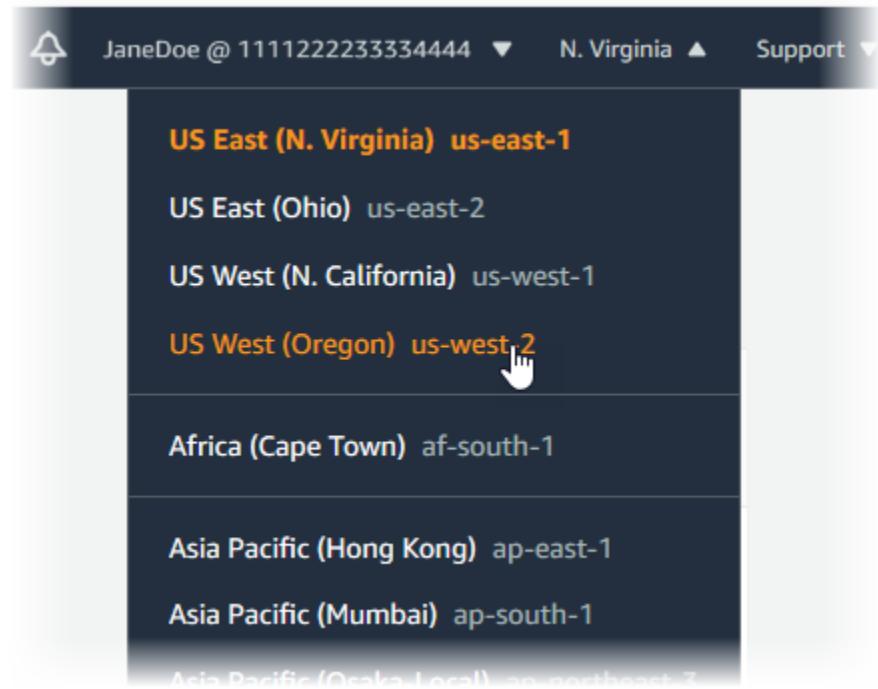

For more information, see [Amazon EC2 endpoints and quotas](#) in the *Amazon Web Services General Reference*. For information about Amazon EBS quotas, see [Amazon EBS quotas \(p. 1620\)](#).

View your current limits

Use the **Limits** page in the Amazon EC2 console to view the current limits for resources provided by Amazon EC2 and Amazon VPC, on a per-Region basis.

To view your current limits

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, select a Region.

3. From the navigation pane, choose **Limits**.
4. Locate the resource in the list. You can use the search fields to filter the list by resource name or resource group. The **Current limit** column displays the current maximum for the resource for your account.

Request an increase

Use the **Limits** page in the Amazon EC2 console to request an increase in your Amazon EC2 or Amazon VPC resources, on a per-Region basis.

Alternatively, request an increase using Service Quotas. For more information, see [Requesting a quota increase](#) in the *Service Quotas User Guide*.

To request an increase using the Amazon EC2 console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. From the navigation bar, select a Region.
3. From the navigation pane, choose **Limits**.
4. Select the resource in the list, and choose **Request limit increase**.
5. Complete the required fields on the limit increase form and choose **Submit**. We'll respond to you using the contact method that you specified.

Restriction on email sent using port 25

On all instances, Amazon EC2 restricts outbound traffic to public IP addresses over port 25 by default. You can request that this restriction be removed. For more information, see [How do I remove the restriction on port 25 from my EC2 instance?](#) in the AWS Knowledge Center.

Note

This restriction does not apply to outbound traffic sent over port 25 to:

- IP addresses in the primary CIDR block of the VPC in which the originating network interface exists.
- IP addresses in the CIDRs defined in [RFC 1918](#), [RFC 6598](#), and [RFC 4193](#).

Amazon EC2 usage reports

AWS provides a free reporting tool called AWS Cost Explorer that enables you to analyze the cost and usage of your EC2 instances and the usage of your Reserved Instances. You can view data up to the last 13 months, and forecast how much you are likely to spend for the next three months. You can use Cost Explorer to see patterns in how much you spend on AWS resources over time, identify areas that need further inquiry, and see trends that you can use to understand your costs. You also can specify time ranges for the data, and view time data by day or by month.

Here's an example of some of the questions that you can answer when using Cost Explorer:

- How much am I spending on instances of each instance type?
- How many instance hours are being used by a particular department?
- How is my instance usage distributed across Availability Zones?
- How is my instance usage distributed across AWS accounts?
- How well am I using my Reserved Instances?
- Are my Reserved Instances helping me save money?

For more information about working with reports in Cost Explorer, including saving reports, see [Analyzing your costs with Cost Explorer](#).

Troubleshoot EC2 instances

The following documentation can help you troubleshoot problems that you might have with your instance.

Contents

- [Troubleshoot instance launch issues \(p. 1709\)](#)
- [Troubleshoot connecting to your instance \(p. 1712\)](#)
- [Troubleshoot stopping your instance \(p. 1723\)](#)
- [Troubleshoot instance termination \(shutting down\) \(p. 1725\)](#)
- [Troubleshoot instances with failed status checks \(p. 1726\)](#)
- [Troubleshoot an unreachable instance \(p. 1747\)](#)
- [Boot from the wrong volume \(p. 1750\)](#)
- [Use EC2Rescue for Linux \(p. 1751\)](#)
- [EC2 Serial Console for Linux instances \(p. 1761\)](#)
- [Send a diagnostic interrupt \(for advanced users\) \(p. 1778\)](#)

For additional help with Windows instances, see [Troubleshoot Windows instances](#) in the *Amazon EC2 User Guide for Windows Instances*.

Troubleshoot instance launch issues

The following issues prevent you from launching an instance.

Launch Issues

- [Instance limit exceeded \(p. 1709\)](#)
- [Insufficient instance capacity \(p. 1710\)](#)
- [The requested configuration is currently not supported. Please check the documentation for supported configurations. \(p. 1710\)](#)
- [Instance terminates immediately \(p. 1711\)](#)

Instance limit exceeded

Description

You get the `InstanceLimitExceeded` error when you try to launch a new instance or restart a stopped instance.

Cause

If you get an `InstanceLimitExceeded` error when you try to launch a new instance or restart a stopped instance, you have reached the limit on the number of instances that you can launch in a Region. When you create your AWS account, we set default limits on the number of instances you can run on a per-Region basis.

Solution

You can request an instance limit increase on a per-region basis. For more information, see [Amazon EC2 service quotas \(p. 1706\)](#).

Insufficient instance capacity

Description

You get the `InsufficientInstanceCapacity` error when you try to launch a new instance or restart a stopped instance.

Cause

If you get this error when you try to launch an instance or restart a stopped instance, AWS does not currently have enough available On-Demand capacity to fulfill your request.

Solution

To resolve the issue, try the following:

- Wait a few minutes and then submit your request again; capacity can shift frequently.
- Submit a new request with a reduced number of instances. For example, if you're making a single request to launch 15 instances, try making 3 requests for 5 instances, or 15 requests for 1 instance instead.
- If you're launching an instance, submit a new request without specifying an Availability Zone.
- If you're launching an instance, submit a new request using a different instance type (which you can resize at a later stage). For more information, see [Change the instance type \(p. 382\)](#).
- If you are launching instances into a cluster placement group, you can get an insufficient capacity error. For more information, see [Placement group rules and limitations \(p. 1194\)](#).

The requested configuration is currently not supported. Please check the documentation for supported configurations.

Description

You get the `Unsupported` error when you try to launch a new instance because the instance configuration is not supported.

Cause

The error message provides additional details. For example, an instance type or instance purchasing option might not be supported in the specified Region or Availability Zone.

Solution

Try a different instance configuration. To search for an instance type that meets your requirements, see [Find an Amazon EC2 instance type \(p. 378\)](#).

Instance terminates immediately

Description

Your instance goes from the pending state to the terminated state.

Cause

The following are a few reasons why an instance might immediately terminate:

- You've exceeded your EBS volume limits. For more information, see [Instance volume limits \(p. 1644\)](#).
- An EBS snapshot is corrupted.
- The root EBS volume is encrypted and you do not have permissions to access the KMS key for decryption.
- A snapshot specified in the block device mapping for the AMI is encrypted and you do not have permissions to access the KMS key for decryption or you do not have access to the KMS key to encrypt the restored volumes.
- The instance store-backed AMI that you used to launch the instance is missing a required part (an image.part.xx file).

For more information, get the termination reason using one of the following methods.

To get the termination reason using the Amazon EC2 console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**, and select the instance.
3. On the first tab, find the reason next to **State transition reason**.

To get the termination reason using the AWS Command Line Interface

1. Use the [describe-instances](#) command and specify the instance ID.

```
aws ec2 describe-instances --instance-id instance_id
```

2. Review the JSON response returned by the command and note the values in the **StateReason** response element.

The following code block shows an example of a **StateReason** response element.

```
"StateReason": {  
    "Message": "Client.VolumeLimitExceeded: Volume limit exceeded",  
    "Code": "Server.InternalError"  
},
```

To get the termination reason using AWS CloudTrail

For more information, see [Viewing events with CloudTrail event history](#) in the *AWS CloudTrail User Guide*.

Solution

Depending on the termination reason, take one of the following actions:

- **Client.VolumeLimitExceeded: Volume limit exceeded** — Delete unused volumes. You can [submit a request](#) to increase your volume limit.
- **Client.InternalError: Client error on launch** — Ensure that you have the permissions required to access the AWS KMS keys used to decrypt and encrypt volumes. For more information, see [Using key policies in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

Troubleshoot connecting to your instance

The following information can help you troubleshoot issues with connecting to your instance. For additional help with Windows instances, see [Troubleshoot Windows instances](#) in the *Amazon EC2 User Guide for Windows Instances*.

Connection problems and errors

- [Common causes for connection issues \(p. 1712\)](#)
- [Error connecting to your instance: Connection timed out \(p. 1713\)](#)
- [Error: unable to load key ... Expecting: ANY PRIVATE KEY \(p. 1716\)](#)
- [Error: User key not recognized by server \(p. 1716\)](#)
- [Error: Permission denied or connection closed by \[instance\] port 22 \(p. 1718\)](#)
- [Error: Unprotected private key file \(p. 1719\)](#)
- [Error: Private key must begin with "-----BEGIN RSA PRIVATE KEY-----" and end with "-----END RSA PRIVATE KEY-----" \(p. 1720\)](#)
- [Error: Server refused our key or No supported authentication methods available \(p. 1721\)](#)
- [Cannot ping instance \(p. 1721\)](#)
- [Error: Server unexpectedly closed network connection \(p. 1721\)](#)
- [Error: Host key validation failed for EC2 Instance Connect \(p. 1722\)](#)

Common causes for connection issues

We recommend that you begin troubleshooting by checking some common causes for issues connecting to your instance.

Verify the user name for your instance

You can connect to your instance using the user name for your user account or the default user name for the AMI that you used to launch your instance.

- **Get the user name for your user account.**

For more information about how to create a user account, see [Manage user accounts on your Amazon Linux instance \(p. 675\)](#).

- **Get the default user name for the AMI that you used to launch your instance:**

- For Amazon Linux 2 or the Amazon Linux AMI, the user name is `ec2-user`.
- For a CentOS AMI, the user name is `centos` or `ec2-user`.
- For a Debian AMI, the user name is `admin`.
- For a Fedora AMI, the user name is `fedora` or `ec2-user`.
- For a RHEL AMI, the user name is `ec2-user` or `root`.
- For a SUSE AMI, the user name is `ec2-user` or `root`.
- For an Ubuntu AMI, the user name is `ubuntu`.
- For an Oracle AMI, the user name is `ec2-user`.

- For a Bitnami AMI, the user name is `bitnami`.
- Otherwise, check with the AMI provider.

Verify that your security group rules allow traffic

Make sure your security group rules allow inbound traffic from your public IPv4 address on the proper port. For steps to verify, see [Error connecting to your instance: Connection timed out \(p. 1713\)](#)

Verify that your instance is ready

After you launch an instance, it can take a few minutes for the instance to be ready so that you can connect to it. Check your instance to make sure it is running and has passed its status checks.

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**, and then select your instance.
3. Verify the following:
 - a. In the **Instance state** column, verify that your instance is in the `running` state.
 - b. In the **Status check** column, verify that your instance has passed the two status checks.

Verify the general prerequisites for connecting to your instance

For more information, see [General prerequisites for connecting to your instance \(p. 611\)](#).

Error connecting to your instance: Connection timed out

If you try to connect to your instance and get an error message `Network error: Connection timed out` or `Error connecting to [instance], reason: -> Connection timed out: connect`, try the following:

Check your security group rules.

You need a security group rule that allows inbound traffic from your public IPv4 address on the proper port.

New console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**, and then select your instance.
3. On the **Security** tab at the bottom of the console page, under **Inbound rules**, check the list of rules that are in effect for the selected instance.
 - For Linux instances: Verify that there is a rule that allows traffic from your computer to port 22 (SSH).
 - For Windows instances: Verify that there is a rule that allows traffic from your computer to port 3389 (RDP).
4. Each time you restart your instance, a new IP address (and host name) will be assigned. If your security group has a rule that allows inbound traffic from a single IP address, this address might not be static if your computer is on a corporate network or if you are connecting through an internet service provider (ISP). Instead, specify the range of IP addresses used by client computers. If your security group does not have a rule that allows inbound traffic as described in the previous step, add a rule to your security group. For more information, see [Authorize inbound traffic for your Linux instances \(p. 1307\)](#).

For more information about security group rules, see [Security group rules in the Amazon VPC User Guide](#).

Old console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**, and then select your instance.
3. In the **Description** tab at the bottom of the console page, next to **Security groups**, select **view inbound rules** to display the list of rules that are in effect for the selected instance.
4. For Linux instances: When you select **view inbound rules**, a window will appear that displays the port(s) to which traffic is allowed. Verify that there is a rule that allows traffic from your computer to port 22 (SSH).

For Windows instances: When you select **view inbound rules**, a window will appear that displays the port(s) to which traffic is allowed. Verify that there is a rule that allows traffic from your computer to port 3389 (RDP).

Each time you restart your instance, a new IP address (and host name) will be assigned. If your security group has a rule that allows inbound traffic from a single IP address, this address may not be static if your computer is on a corporate network or if you are connecting through an internet service provider (ISP). Instead, specify the range of IP addresses used by client computers. If your security group does not have a rule that allows inbound traffic as described in the previous step, add a rule to your security group. For more information, see [Authorize inbound traffic for your Linux instances \(p. 1307\)](#).

For more information about security group rules, see [Security group rules in the Amazon VPC User Guide](#).

Check the route table for the subnet.

You need a route that sends all traffic destined outside the VPC to the internet gateway for the VPC.

New console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**, and then select your instance.
3. On the **Networking** tab, make note of the values for **VPC ID** and **Subnet ID**.
4. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
5. In the navigation pane, choose **Internet Gateways**. Verify that there is an internet gateway attached to your VPC. Otherwise, choose **Create internet gateway**, enter a name for the internet gateway, and choose **Create internet gateway**. Then, for the internet gateway you created, choose **Actions**, **Attach to VPC**, select your VPC, and then choose **Attach internet gateway** to attach it to your VPC.
6. In the navigation pane, choose **Subnets**, and then select your subnet.
7. On the **Route table** tab, verify that there is a route with `0.0.0.0/0` as the destination and the internet gateway for your VPC as the target. If you're connecting to your instance using its IPv6 address, verify that there is a route for all IPv6 traffic (`::/0`) that points to the internet gateway. Otherwise, do the following:
 - a. Choose the ID of the route table (rtb-xxxxxxx) to navigate to the route table.
 - b. On the **Routes** tab, choose **Edit routes**. Choose **Add route**, use `0.0.0.0/0` as the destination and the internet gateway as the target. For IPv6, choose **Add route**, use `::/0` as the destination and the internet gateway as the target.

- c. Choose **Save routes**.

Old console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**, and then select your instance.
3. In the **Description** tab, write down the values of **VPC ID** and **Subnet ID**.
4. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
5. In the navigation pane, choose **Internet Gateways**. Verify that there is an internet gateway attached to your VPC. Otherwise, choose **Create Internet Gateway** to create an internet gateway. Select the internet gateway, and then choose **Attach to VPC** and follow the directions to attach it to your VPC.
6. In the navigation pane, choose **Subnets**, and then select your subnet.
7. On the **Route Table** tab, verify that there is a route with 0.0.0.0/0 as the destination and the internet gateway for your VPC as the target. If you're connecting to your instance using its IPv6 address, verify that there is a route for all IPv6 traffic (::/0) that points to the internet gateway. Otherwise, do the following:
 - a. Choose the ID of the route table (rtb-xxxxxxx) to navigate to the route table.
 - b. On the **Routes** tab, choose **Edit routes**. Choose **Add route**, use 0.0.0.0/0 as the destination and the internet gateway as the target. For IPv6, choose **Add route**, use ::/0 as the destination and the internet gateway as the target.
 - c. Choose **Save routes**.

Check the network access control list (ACL) for the subnet.

The network ACLs must allow inbound traffic from your local IP address on port 22 (for Linux instances) or port 3389 (for Windows instances). It must also allow outbound traffic to the ephemeral ports (1024-65535).

1. Open the Amazon VPC console at <https://console.aws.amazon.com/vpc/>.
2. In the navigation pane, choose **Subnets**.
3. Select your subnet.
4. On the **Network ACL** tab, for **Inbound rules**, verify that the rules allow inbound traffic from your computer on the required port. Otherwise, delete or modify the rule that is blocking the traffic.
5. For **Outbound rules**, verify that the rules allow outbound traffic to your computer on the ephemeral ports. Otherwise, delete or modify the rule that is blocking the traffic.

If your computer is on a corporate network

Ask your network administrator whether the internal firewall allows inbound and outbound traffic from your computer on port 22 (for Linux instances) or port 3389 (for Windows instances).

If you have a firewall on your computer, verify that it allows inbound and outbound traffic from your computer on port 22 (for Linux instances) or port 3389 (for Windows instances).

Check that your instance has a public IPv4 address.

If not, you can associate an Elastic IP address with your instance. For more information, see [Elastic IP addresses \(p. 1082\)](#).

Check the CPU load on your instance; the server may be overloaded.

AWS automatically provides data such as Amazon CloudWatch metrics and instance status, which you can use to see how much CPU load is on your instance and, if necessary, adjust how your loads are handled. For more information, see [Monitor your instances using CloudWatch \(p. 975\)](#).

- If your load is variable, you can automatically scale your instances up or down using [Auto Scaling](#) and [Elastic Load Balancing](#).
- If your load is steadily growing, you can move to a larger instance type. For more information, see [Change the instance type \(p. 382\)](#).

To connect to your instance using an IPv6 address, check the following:

- Your subnet must be associated with a route table that has a route for IPv6 traffic (`::/0`) to an internet gateway.
- Your security group rules must allow inbound traffic from your local IPv6 address on the proper port (22 for Linux and 3389 for Windows).
- Your network ACL rules must allow inbound and outbound IPv6 traffic.
- If you launched your instance from an older AMI, it might not be configured for DHCPv6 (IPv6 addresses are not automatically recognized on the network interface). For more information, see [Configure IPv6 on Your Instances](#) in the *Amazon VPC User Guide*.
- Your local computer must have an IPv6 address, and must be configured to use IPv6.

Error: unable to load key ... Expecting: ANY PRIVATE KEY

If you try to connect to your instance and get the error message, `unable to load key ... Expecting: ANY PRIVATE KEY`, the file in which the private key is stored is incorrectly configured. If the private key file ends in `.pem`, it might still be incorrectly configured. A possible cause for an incorrectly configured private key file is a missing certificate.

If the private key file is incorrectly configured, follow these steps to resolve the error

1. Create a new key pair. For more information, see [Create a key pair using Amazon EC2 \(p. 1311\)](#).
2. Add the new key pair to your instance. For more information, see [Connect to your Linux instance if you lose your private key \(p. 1321\)](#).
3. Connect to your instance using the new key pair.

Error: User key not recognized by server

If you use SSH to connect to your instance

- Use `ssh -vvv` to get triple verbose debugging information while connecting:

```
ssh -vvv -i path/my-key-pair.pem my-instance-user-
name@ec2-203-0-113-25.compute-1.amazonaws.com
```

The following sample output demonstrates what you might see if you were trying to connect to your instance with a key that was not recognized by the server:

```
open/ANT/myusername/.ssh/known_hosts).
debug2: bits set: 504/1024
debug1: ssh_rsa_verify: signature correct
```

```
debug2: kex_derive_keys
debug2: set_newkeys: mode 1
debug1: SSH2_MSG_NEWKEYS sent
debug1: expecting SSH2_MSG_NEWKEYS
debug2: set_newkeys: mode 0
debug1: SSH2_MSG_NEWKEYS received
debug1: Roaming not allowed by server
debug1: SSH2_MSG_SERVICE_REQUEST sent
debug2: service_accept: ssh-userauth
debug1: SSH2_MSG_SERVICE_ACCEPT received
debug2: key: bogusperm.pem ((nil))
debug1: Authentications that can continue: publickey
debug3: start over, passed a different list publickey

debug1: Authentications that can continue: publickey
debug2: we did not send a packet, disable method
debug1: No more authentication methods to try.
Permission denied (publickey).
```

If you use PuTTY to connect to your instance

- Verify that your private key (.pem) file has been converted to the format recognized by PuTTY (.ppk). For more information about converting your private key, see [Connect to your Linux instance from Windows using PuTTY \(p. 627\)](#).

Note

In PuTTYgen, load your private key file and select **Save Private Key** rather than **Generate**.

- Verify that you are connecting with the appropriate user name for your AMI. Enter the user name in the **Host name** box in the **PuTTY Configuration** window.
 - For Amazon Linux 2 or the Amazon Linux AMI, the user name is `ec2-user`.
 - For a CentOS AMI, the user name is `centos` or `ec2-user`.
 - For a Debian AMI, the user name is `admin`.
 - For a Fedora AMI, the user name is `fedora` or `ec2-user`.
 - For a RHEL AMI, the user name is `ec2-user` or `root`.
 - For a SUSE AMI, the user name is `ec2-user` or `root`.
 - For an Ubuntu AMI, the user name is `ubuntu`.
 - For an Oracle AMI, the user name is `ec2-user`.
 - For a Bitnami AMI, the user name is `bitnami`.
 - Otherwise, check with the AMI provider.
- Verify that you have an inbound security group rule to allow inbound traffic to the appropriate port. For more information, see [Authorizing Network Access to Your Instances \(p. 1307\)](#).

Error: Permission denied or connection closed by [instance] port 22

If you connect to your instance using SSH and get any of the following errors, Host key not found in [directory], Permission denied (publickey), Authentication failed, permission denied, or Connection closed by [instance] port 22, verify that you are connecting with the appropriate user name for your AMI and that you have specified the proper private key (.pem) file for your instance.

The appropriate user names are as follows:

- For Amazon Linux 2 or the Amazon Linux AMI, the user name is `ec2-user`.
- For a CentOS AMI, the user name is `centos` or `ec2-user`.
- For a Debian AMI, the user name is `admin`.
- For a Fedora AMI, the user name is `fedora` or `ec2-user`.
- For a RHEL AMI, the user name is `ec2-user` or `root`.
- For a SUSE AMI, the user name is `ec2-user` or `root`.
- For an Ubuntu AMI, the user name is `ubuntu`.
- For an Oracle AMI, the user name is `ec2-user`.
- For a Bitnami AMI, the user name is `bitnami`.
- Otherwise, check with the AMI provider.

For example, to use an SSH client to connect to an Amazon Linux instance, use the following command:

```
ssh -i /path/my-key-pair.pem my-instance-user-name@ec2-203-0-113-25.compute-1.amazonaws.com
```

Confirm that you are using the private key file that corresponds to the key pair that you selected when you launched the instance.

New console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and then select your instance.
3. On the **Details** tab, under **Instance details**, verify the value of **Key pair name**.
4. If you did not specify a key pair when you launched the instance, you can terminate the instance and launch a new instance, ensuring that you specify a key pair. If this is an instance that you have been using but you no longer have the .pem file for your key pair, you can replace the key pair with a new one. For more information, see [Connect to your Linux instance if you lose your private key \(p. 1321\)](#).

Old console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and then select your instance.
3. In the **Description** tab, verify the value of **Key pair name**.
4. If you did not specify a key pair when you launched the instance, you can terminate the instance and launch a new instance, ensuring that you specify a key pair. If this is an instance that you have been using but you no longer have the .pem file for your key pair, you can replace the key

pair with a new one. For more information, see [Connect to your Linux instance if you lose your private key \(p. 1321\)](#).

If you generated your own key pair, ensure that your key generator is set up to create RSA keys. DSA keys are not accepted.

If you get a `Permission denied (publickey)` error and none of the above applies (for example, you were able to connect previously), the permissions on the home directory of your instance may have been changed. Permissions for `/home/my-instance-user-name/.ssh/authorized_keys` must be limited to the owner only.

To verify the permissions on your instance

1. Stop your instance and detach the root volume. For more information, see [Stop and start your instance \(p. 637\)](#) and [Detach an Amazon EBS volume from a Linux instance \(p. 1400\)](#).
2. Launch a temporary instance in the same Availability Zone as your current instance (use a similar or the same AMI as you used for your current instance), and attach the root volume to the temporary instance. For more information, see [Attach an Amazon EBS volume to an instance \(p. 1375\)](#).
3. Connect to the temporary instance, create a mount point, and mount the volume that you attached. For more information, see [Make an Amazon EBS volume available for use on Linux \(p. 1382\)](#).
4. From the temporary instance, check the permissions of the `/home/my-instance-user-name/` directory of the attached volume. If necessary, adjust the permissions as follows:

```
[ec2-user ~]$ chmod 600 mount_point/home/my-instance-user-name/.ssh/authorized_keys
```

```
[ec2-user ~]$ chmod 700 mount_point/home/my-instance-user-name/.ssh
```

```
[ec2-user ~]$ chmod 700 mount_point/home/my-instance-user-name
```

5. Unmount the volume, detach it from the temporary instance, and re-attach it to the original instance. Ensure that you specify the correct device name for the root volume; for example, `/dev/xvda`.
6. Start your instance. If you no longer require the temporary instance, you can terminate it.

Error: Unprotected private key file

Your private key file must be protected from read and write operations from any other users. If your private key can be read or written to by anyone but you, then SSH ignores your key and you see the following warning message below.

```
@@@@@@@WARNING: UNPROTECTED PRIVATE KEY FILE!@@@@@@@  
@Permissions 0777 for '.ssh/my_private_key.pem' are too open.  
It is required that your private key files are NOT accessible by others.  
This private key will be ignored.  
bad permissions: ignore key: .ssh/my_private_key.pem  
Permission denied (publickey).
```

If you see a similar message when you try to log in to your instance, examine the first line of the error message to verify that you are using the correct public key for your instance. The above example uses the private key `.ssh/my_private_key.pem` with file permissions of 0777, which allow anyone to read or write to this file. This permission level is very insecure, and so SSH ignores this key.

Error: Private key must begin with "-----BEGIN RSA PRIVATE KEY-----" and end with "-----END RSA PRIVATE KEY-----"

If you are connecting from MacOS or Linux, run the following command to fix this error, substituting the path for your private key file.

```
[ec2-user ~]$ chmod 0400 .ssh/my_private_key.pem
```

If you are connecting from Windows, perform the following steps on your local computer.

1. Navigate to your .pem file.
2. Right-click on the .pem file and select **Properties**.
3. Choose the **Security** tab.
4. Select **Advanced**.
5. Verify that you are the owner of the file. If not, change the owner to your username.
6. Select **Disable inheritance** and **Remove all inherited permissions from this object**.
7. Select **Add, Select a principal**, enter your username, and select **OK**.
8. From the **Permission Entry** window, grant **Read** permissions and select **OK**.
9. Click **Apply** to ensure all settings are saved.
10. Select **OK** to close the **Advanced Security Settings** window.
11. Select **OK** to close the **Properties** window.
12. You should be able to connect to your Linux instance from Windows via SSH.

From a Windows command prompt, run the following commands.

1. From the command prompt, navigate to the file path location of your .pem file.
2. Run the following command to reset and remove explicit permissions:

```
icacls.exe $path /reset
```

3. Run the following command to grant Read permissions to the current user:

```
icacls.exe $path /GRANT:R "$(env:USERNAME):(R)"
```

4. Run the following command to disable inheritance and remove inherited permissions.

```
icacls.exe $path /inheritance:r
```

5. You should be able to connect to your Linux instance from Windows via SSH.

Error: Private key must begin with "-----BEGIN RSA PRIVATE KEY-----" and end with "-----END RSA PRIVATE KEY-----"

If you use a third-party tool, such as **ssh-keygen**, to create an RSA key pair, it generates the private key in the OpenSSH key format. When you connect to your instance, if you use the private key in the OpenSSH format to decrypt the password, you'll get the error **Private key must begin with "-----BEGIN RSA PRIVATE KEY-----" and end with "-----END RSA PRIVATE KEY-----".**

To resolve the error, the private key must be in the PEM format. Use the following command to create the private key in the PEM format:

```
ssh-keygen -m PEM
```

Error: Server refused our key or No supported authentication methods available

If you use PuTTY to connect to your instance and get either of the following errors, Error: Server refused our key or Error: No supported authentication methods available, verify that you are connecting with the appropriate user name for your AMI. Type the user name in **User name** in the **PuTTY Configuration** window.

The appropriate user names are as follows:

- For Amazon Linux 2 or the Amazon Linux AMI, the user name is `ec2-user`.
- For a CentOS AMI, the user name is `centos` or `ec2-user`.
- For a Debian AMI, the user name is `admin`.
- For a Fedora AMI, the user name is `fedora` or `ec2-user`.
- For a RHEL AMI, the user name is `ec2-user` or `root`.
- For a SUSE AMI, the user name is `ec2-user` or `root`.
- For an Ubuntu AMI, the user name is `ubuntu`.
- For an Oracle AMI, the user name is `ec2-user`.
- For a Bitnami AMI, the user name is `bitnami`.
- Otherwise, check with the AMI provider.

You should also verify that your private key (.pem) file has been correctly converted to the format recognized by PuTTY (.ppk). For more information about converting your private key, see [Connect to your Linux instance from Windows using PuTTY \(p. 627\)](#).

Cannot ping instance

The `ping` command is a type of ICMP traffic — if you are unable to ping your instance, ensure that your inbound security group rules allow ICMP traffic for the `Echo Request` message from all sources, or from the computer or instance from which you are issuing the command.

If you are unable to issue a `ping` command from your instance, ensure that your outbound security group rules allow ICMP traffic for the `Echo Request` message to all destinations, or to the host that you are attempting to ping.

`Ping` commands can also be blocked by a firewall or time out due to network latency or hardware issues. You should consult your local network or system administrator for help with further troubleshooting.

Error: Server unexpectedly closed network connection

If you are connecting to your instance with PuTTY and you receive the error "Server unexpectedly closed network connection," verify that you have enabled keepalives on the Connection page of the PuTTY Configuration to avoid being disconnected. Some servers disconnect clients when they do not receive any data within a specified period of time. Set the Seconds between keepalives to 59 seconds.

If you still experience issues after enabling keepalives, try to disable Nagle's algorithm on the Connection page of the PuTTY Configuration.

Error: Host key validation failed for EC2 Instance Connect

If you rotate your instance host keys, the new host keys are not automatically uploaded to the AWS trusted host keys database. This causes host key validation to fail when you try to connect to your instance using the EC2 Instance Connect browser-based client, and you're unable to connect to your instance.

To resolve the error, you must run the `eic_harvest_hostkeys` script on your instance, which uploads your new host key to EC2 Instance Connect. The script is located at `/opt/aws/bin/` on Amazon Linux 2 instances, and at `/usr/share/ec2-instance-connect/` on Ubuntu instances.

Amazon Linux 2

To resolve the host key validation failed error on an Amazon Linux 2 instance

1. Connect to your instance using SSH.

You can connect by using the EC2 Instance Connect CLI or by using the SSH key pair that was assigned to your instance when you launched it and the default user name of the AMI that you used to launch your instance. For Amazon Linux 2, the default user name is `ec2-user`.

For example, if your instance was launched using Amazon Linux 2, your instance's public DNS name is `ec2-a-b-c-d.us-west-2.compute.amazonaws.com`, and the key pair is `my_ec2_private_key.pem`, use the following command to SSH into your instance:

```
$ ssh -i my_ec2_private_key.pem ec2-user@ec2-a-b-c-d.us-west-2.compute.amazonaws.com
```

For more information about connecting to your instance, see [Connect to your Linux instance using SSH \(p. 614\)](#).

2. Navigate to the following folder.

```
[ec2-user ~]$ cd /opt/aws/bin/
```

3. Run the following command on your instance.

```
[ec2-user ~]$ ./eic_harvest_hostkeys
```

Note that a successful call results in no output.

You can now use the EC2 Instance Connect browser-based client to connect to your instance.

Ubuntu

To resolve the host key validation failed error on an Ubuntu instance

1. Connect to your instance using SSH.

You can connect by using the EC2 Instance Connect CLI or by using the SSH key pair that was assigned to your instance when you launched it and the default user name of the AMI that you used to launch your instance. For Ubuntu, the default user name is `ubuntu`.

For example, if your instance was launched using Ubuntu, your instance's public DNS name is `ec2-a-b-c-d.us-west-2.compute.amazonaws.com`, and the key pair is `my_ec2_private_key.pem`, use the following command to SSH into your instance:

```
$ ssh -i my_ec2_private_key.pem ubuntu@ec2-a-b-c-d.us-west-2.compute.amazonaws.com
```

For more information about connecting to your instance, see [Connect to your Linux instance using SSH \(p. 614\)](#).

2. Navigate to the following folder.

```
[ec2-user ~]$ cd /usr/share/ec2-instance-connect/
```

3. Run the following command on your instance.

```
[ec2-user ~]$ ./eic_harvest_hostkeys
```

Note that a successful call results in no output.

You can now use the EC2 Instance Connect browser-based client to connect to your instance.

Troubleshoot stopping your instance

If you have stopped your Amazon EBS-backed instance and it appears stuck in the `stopping` state, there may be an issue with the underlying host computer.

There is no cost for instance usage while an instance is in the `stopping` state or in any other state except `running`. You are only charged for instance usage when an instance is in the `running` state.

Force stop the instance

Force the instance to stop using either the console or the AWS CLI.

New console

To force stop the instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and select the stuck instance.
3. Choose **Instance state, Force stop instance, Stop**.

Old console

To force stop the instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and select the stuck instance.
3. Choose **Instance State, Stop, Yes, Forcefully Stop**.

AWS CLI

To force stop the instance using the AWS CLI

Use the [stop-instances](#) command and the `--force` option as follows:

```
aws ec2 stop-instances --instance-ids i-0123ab456c789d01e --force
```

If, after 10 minutes, the instance has not stopped, post a request for help in the [Amazon EC2 forum](#). To help expedite a resolution, include the instance ID, and describe the steps that you've already taken. Alternatively, if you have a support plan, create a technical support case in the [Support Center](#).

Create a replacement instance

To attempt to resolve the problem while you are waiting for assistance from the [Amazon EC2 forum](#) or the [Support Center](#), create a replacement instance. Create an AMI of the stuck instance, and launch a new instance using the new AMI.

New console

To create a replacement instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and select the stuck instance.
3. Choose **Actions, Image and templates, Create image**.
4. On the **Create image** page, do the following:
 - a. Enter a name and description for the AMI.
 - b. Choose **No reboot**.
 - c. Choose **Create image**.

For more information, see [Create a Linux AMI from an instance \(p. 146\)](#).

5. Launch a new instance from the AMI and verify that the new instance is working.
6. Select the stuck instance, and choose **Actions, Instance state, Terminate instance**. If the instance also gets stuck terminating, Amazon EC2 automatically forces it to terminate within a few hours.

Old console

To create a replacement instance using the console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances** and select the stuck instance.
3. Choose **Actions, Image, Create Image**.
4. In the **Create Image** dialog box, fill in the following fields, and then choose **Create Image**:
 - a. Specify a name and description for the AMI.
 - b. Choose **No reboot**.

For more information, see [Create a Linux AMI from an instance \(p. 146\)](#).

5. Launch a new instance from the AMI and verify that the new instance is working.
6. Select the stuck instance, and choose **Actions, Instance State, Terminate**. If the instance also gets stuck terminating, Amazon EC2 automatically forces it to terminate within a few hours.

AWS CLI

To create a replacement instance using the CLI

1. Create an AMI from the stuck instance using the [create-image](#) (AWS CLI) command and the --no-reboot option as follows:

```
aws ec2 create-image --instance-id i-0123ab456c789d01e --name "AMI" --  
description "AMI for replacement instance" --no-reboot
```

2. Launch a new instance from the AMI using the [run-instances](#) (AWS CLI) command as follows:

```
aws ec2 run-instances --image-id ami-1a2b3c4d --count 1 --instance-type c3.large --  
key-name MyKeyPair --security-groups MySecurityGroup
```

3. Verify that the new instance is working.
4. Terminate the stuck instance using the [terminate-instances](#) (AWS CLI) command as follows:

```
aws ec2 terminate-instances --instance-ids i-1234567890abcdef0
```

If you are unable to create an AMI from the instance as described in the previous procedure, you can set up a replacement instance as follows:

(Alternate) To create a replacement instance using the console

1. Select the instance and choose **Description, Block devices**. Select each volume and make note of its volume ID. Be sure to note which volume is the root volume.
2. In the navigation pane, choose **Volumes**. Select each volume for the instance, and choose **Actions, Create Snapshot**.
3. In the navigation pane, choose **Snapshots**. Select the snapshot that you just created, and choose **Actions, Create Volume**.
4. Launch an instance with the same operating system as the stuck instance. Note the volume ID and device name of its root volume.
5. In the navigation pane, choose **Instances**, select the instance that you just launched, and choose **Instance state, Stop instance**.
6. In the navigation pane, choose **Volumes**, select the root volume of the stopped instance, and choose **Actions, Detach Volume**.
7. Select the root volume that you created from the stuck instance, choose **Actions, Attach Volume**, and attach it to the new instance as its root volume (using the device name that you made note of). Attach any additional non-root volumes to the instance.
8. In the navigation pane, choose **Instances** and select the replacement instance. Choose **Instance state, Start instance**. Verify that the instance is working.
9. Select the stuck instance, choose **Instance state, Terminate instance**. If the instance also gets stuck terminating, Amazon EC2 automatically forces it to terminate within a few hours.

Troubleshoot instance termination (shutting down)

You are not billed for any instance usage while an instance is not in the `running` state. In other words, when you terminate an instance, you stop incurring charges for that instance as soon as its state changes to `shutting-down`.

Instance terminates immediately

Several issues can cause your instance to terminate immediately on start-up. See [Instance terminates immediately \(p. 1711\)](#) for more information.

Delayed instance termination

If your instance remains in the shutting-down state longer than a few minutes, it might be delayed due to shutdown scripts being run by the instance.

Another possible cause is a problem with the underlying host computer. If your instance remains in the shutting-down state for several hours, Amazon EC2 treats it as a stuck instance and forcibly terminates it.

If it appears that your instance is stuck terminating and it has been longer than several hours, post a request for help to the [Amazon EC2 forum](#). To help expedite a resolution, include the instance ID and describe the steps that you've already taken. Alternatively, if you have a support plan, create a technical support case in the [Support Center](#).

Terminated instance still displayed

After you terminate an instance, it remains visible for a short while before being deleted. The state shows as terminated. If the entry is not deleted after several hours, contact Support.

Instances automatically launched or terminated

Generally, the following behaviors mean that you've used Amazon EC2 Auto Scaling, EC2 Fleet, or Spot Fleet to scale your computing resources automatically based on criteria that you've defined:

- You terminate an instance and a new instance launches automatically.
- You launch an instance and one of your instances terminates automatically.
- You stop an instance and it terminates and a new instance launches automatically.

To stop automatic scaling, see the [Amazon EC2 Auto Scaling User Guide](#), [EC2 Fleet \(p. 778\)](#), or [Create a Spot Fleet request \(p. 872\)](#).

Troubleshoot instances with failed status checks

The following information can help you troubleshoot issues if your instance fails a status check. First determine whether your applications are exhibiting any problems. If you verify that the instance is not running your applications as expected, review the status check information and the system logs.

For examples of problems that can cause status checks to fail, see [Status checks for your instances \(p. 945\)](#).

Contents

- [Review status check information \(p. 1727\)](#)

- [fsck died with exit status... \(Missing device\) \(p. 1742\)](#)
- [GRUB prompt \(grubdom>\) \(p. 1743\)](#)
- [Bringing up interface eth0: Device eth0 has different MAC address than expected, ignoring. \(Hard-coded MAC address\) \(p. 1745\)](#)
- [Unable to load SELinux Policy. Machine is in enforcing mode. Halting now. \(SELinux misconfiguration\) \(p. 1746\)](#)
- [XENBUS: Timeout connecting to devices \(Xenbus timeout\) \(p. 1747\)](#)

Review status check information

To investigate impaired instances using the Amazon EC2 console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**, and then select your instance.
3. In the details pane, choose **Status Checks** to see the individual results for all **System Status Checks** and **Instance Status Checks**.

If a system status check has failed, you can try one of the following options:

- Create an instance recovery alarm. For more information, see [Create alarms that stop, terminate, reboot, or recover an instance \(p. 999\)](#).
- If you changed the instance type to an instance built on the [Nitro System \(p. 247\)](#), status checks fail if you migrated from an instance that does not have the required ENA and NVMe drivers. For more information, see [Compatibility for changing the instance type \(p. 387\)](#).
- For an instance using an Amazon EBS-backed AMI, stop and restart the instance.
- For an instance using an instance-store backed AMI, terminate the instance and launch a replacement.
- Wait for Amazon EC2 to resolve the issue.
- Post your issue to the [Amazon EC2 forum](#).
- If your instance is in an Auto Scaling group, the Amazon EC2 Auto Scaling service automatically launches a replacement instance. For more information, see [Health Checks for Auto Scaling Instances](#) in the [Amazon EC2 Auto Scaling User Guide](#).
- Retrieve the system log and look for errors.

Retrieve the system logs

If an instance status check fails, you can reboot the instance and retrieve the system logs. The logs may reveal an error that can help you troubleshoot the issue. Rebooting clears unnecessary information from the logs.

To reboot an instance and retrieve the system log

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**, and select your instance.
3. Choose **Instance state, Reboot instance**. It might take a few minutes for your instance to reboot.
4. Verify that the problem still exists; in some cases, rebooting may resolve the problem.
5. When the instance is in the `running` state, choose **Actions, Monitor and troubleshoot, Get system log**.
6. Review the log that appears on the screen, and use the list of known system log error statements below to troubleshoot your issue.
7. If your experience differs from our check results, or if you are having an issue with your instance that our checks did not detect, choose **Submit feedback** on the **Status Checks** tab to help us improve our detection tests.
8. If your issue is not resolved, you can post your issue to the [Amazon EC2 forum](#).

Troubleshoot system log errors for Linux-based instances

For Linux-based instances that have failed an instance status check, such as the instance reachability check, verify that you followed the steps above to retrieve the system log. The following list contains some common system log errors and suggested actions you can take to resolve the issue for each error.

Memory Errors

- [Out of memory: kill process \(p. 1729\)](#)
- [ERROR: mmu_update failed \(Memory management update failed\) \(p. 1730\)](#)

Device Errors

- [I/O error \(block device failure\) \(p. 1730\)](#)
- [I/O ERROR: neither local nor remote disk \(Broken distributed block device\) \(p. 1731\)](#)

Kernel Errors

- [request_module: runaway loop modprobe \(Looping legacy kernel modprobe on older Linux versions\) \(p. 1732\)](#)
- ["FATAL: kernel too old" and "fsck: No such file or directory while trying to open /dev" \(Kernel and AMI mismatch\) \(p. 1733\)](#)
- ["FATAL: Could not load /lib/modules" or "BusyBox" \(Missing kernel modules\) \(p. 1734\)](#)
- [ERROR Invalid kernel \(EC2 incompatible kernel\) \(p. 1735\)](#)

File System Errors

- [fsck: No such file or directory while trying to open... \(File system not found\) \(p. 1736\)](#)
- [General error mounting filesystems \(failed mount\) \(p. 1737\)](#)
- [VFS: Unable to mount root fs on unknown-block \(Root filesystem mismatch\) \(p. 1739\)](#)
- [Error: Unable to determine major/minor number of root device... \(Root file system/device mismatch\) \(p. 1740\)](#)
- [XENBUS: Device with no driver... \(p. 1741\)](#)
- [... days without being checked, check forced \(File system check required\) \(p. 1742\)](#)
- [fsck died with exit status... \(Missing device\) \(p. 1742\)](#)

Operating System Errors

- [GRUB prompt \(grubdom>\) \(p. 1743\)](#)
- [Bringing up interface eth0: Device eth0 has different MAC address than expected, ignoring. \(Hard-coded MAC address\) \(p. 1745\)](#)
- [Unable to load SELinux Policy. Machine is in enforcing mode. Halting now. \(SELinux misconfiguration\) \(p. 1746\)](#)
- [XENBUS: Timeout connecting to devices \(Xenbus timeout\) \(p. 1747\)](#)

Out of memory: kill process

An out-of-memory error is indicated by a system log entry similar to the one shown below.

```
[115879.769795] Out of memory: kill process 20273 (httpd) score 1285879
or a child
[115879.769795] Killed process 1917 (php-cgi) vsz:467184kB, anon-
rss:101196kB, file-rss:204kB
```

Potential cause

Exhausted memory

Suggested actions

For this instance type	Do this
Amazon EBS-backed	<p>Do one of the following:</p> <ul style="list-style-type: none">• Stop the instance, and modify the instance to use a different instance type, and start the instance again. For example, a larger or a memory-optimized instance type.• Reboot the instance to return it to a non-impaired status. The problem will probably occur again unless you change the instance type.
Instance store-backed	<p>Do one of the following:</p> <ul style="list-style-type: none">• Terminate the instance and launch a new instance, specifying a different instance type. For example, a larger or a memory-optimized instance type.

For this instance type	Do this
	<ul style="list-style-type: none">Reboot the instance to return it to an unimpaired status. The problem will probably occur again unless you change the instance type.

ERROR: mmu_update failed (Memory management update failed)

Memory management update failures are indicated by a system log entry similar to the following:

```
...
Press `ESC' to enter the menu... 0  [H[J  Booting 'Amazon Linux 2011.09
(2.6.35.14-95.38.amzn1.i686)'

```

Potential causes

Instance type	Potential cause
Amazon EBS-backed	A failed Amazon EBS volume
Instance store-backed	A failed physical drive

Suggested actions

For this instance type	Do this
Amazon EBS-backed	<p>Use the following procedure:</p> <ol style="list-style-type: none">1. Stop the instance.2. Detach the volume.3. Attempt to recover the volume. <p>Note It's good practice to snapshot your Amazon EBS volumes often. This dramatically decreases the risk of data loss as a result of failure.</p> <ol style="list-style-type: none">4. Re-attach the volume to the instance.5. Start the instance.
Instance store-backed	<p>Terminate the instance and launch a new instance.</p> <p>Note Data cannot be recovered. Recover from backups.</p> <p>Note It's a good practice to use either Amazon S3 or Amazon EBS for backups. Instance store volumes are directly tied to single host and single disk failures.</p>

I/O ERROR: neither local nor remote disk (Broken distributed block device)

An input/output error on the device is indicated by a system log entry similar to the following example:

```
...  
block drbd1: Local IO failed in request_timer_fn. Detaching...  
Aborting journal on device drbd1-8.
```

```
block drbd1: IO ERROR: neither local nor remote disk

Buffer I/O error on device drbd1, logical block 557056

lost page write due to I/O error on drbd1

JBD2: I/O error detected when updating journal superblock for drbd1-8.
```

Potential causes

Instance type	Potential cause
Amazon EBS-backed	A failed Amazon EBS volume
Instance store-backed	A failed physical drive

Suggested action

Terminate the instance and launch a new instance.

For an Amazon EBS-backed instance you can recover data from a recent snapshot by creating an image from it. Any data added after the snapshot cannot be recovered.

request_module: runaway loop modprobe (Looping legacy kernel modprobe on older Linux versions)

This condition is indicated by a system log similar to the one shown below. Using an unstable or old Linux kernel (for example, 2.6.16-xenU) can cause an interminable loop condition at startup.

```
Linux version 2.6.16-xenU (builder@xenbat.amazonsa) (gcc version 4.0.1
20050727 (Red Hat 4.0.1-5)) #1 SMP Mon May 28 03:41:49 SAST 2007

BIOS-provided physical RAM map:

xen: 0000000000000000 - 0000000026700000 (usable)

0MB HIGHMEM available.
...

request_module: runaway loop modprobe binfmt-464c
```

Suggested actions

For this instance type	Do this
Amazon EBS-backed	Use a newer kernel, either GRUB-based or static, using one of the following options:

For this instance type	Do this
	Option 1: Terminate the instance and launch a new instance, specifying the <code>-kernel</code> and <code>-ramdisk</code> parameters. Option 2: 1. Stop the instance. 2. Modify the kernel and ramdisk attributes to use a newer kernel. 3. Start the instance.
Instance store-backed	Terminate the instance and launch a new instance, specifying the <code>-kernel</code> and <code>-ramdisk</code> parameters.

"FATAL: kernel too old" and "fsck: No such file or directory while trying to open /dev" (Kernel and AMI mismatch)

This condition is indicated by a system log similar to the one shown below.

```

Linux version 2.6.16.33-xenU (root@dom0-0-50-45-1-a4-ee.z-2.aes0.internal)
(gcc version 4.1.1 20070105 (Red Hat 4.1.1-52)) #2 SMP Wed Aug 15 17:27:36 SAST 2007
...
FATAL: kernel too old
Kernel panic - not syncing: Attempted to kill init!

```

Potential causes

Incompatible kernel and userland

Suggested actions

For this instance type	Do this
Amazon EBS-backed	Use the following procedure: 1. Stop the instance. 2. Modify the configuration to use a newer kernel. 3. Start the instance.
Instance store-backed	Use the following procedure: 1. Create an AMI that uses a newer kernel. 2. Terminate the instance. 3. Start a new instance from the AMI you created.

"FATAL: Could not load /lib/modules" or "BusyBox" (Missing kernel modules)

This condition is indicated by a system log similar to the one shown below.

```
[    0.370415] Freeing unused kernel memory: 1716k freed
Loading, please wait...
WARNING: Couldn't open directory /lib/modules/2.6.34-4-virtual: No such file or directory
FATAL: Could not open /lib/modules/2.6.34-4-virtual/modules.dep.temp for writing: No such
file or directory
FATAL: Could not load /lib/modules/2.6.34-4-virtual/modules.dep: No such file or directory
Couldn't get a file descriptor referring to the console
Begin: Loading essential drivers... ...
FATAL: Could not load /lib/modules/2.6.34-4-virtual/modules.dep: No such file or directory
FATAL: Could not load /lib/modules/2.6.34-4-virtual/modules.dep: No such file or directory
Done.
Begin: Running /scripts/init-premount ...
Done.
Begin: Mounting root file system... ...
Begin: Running /scripts/local-top ...
Done.
Begin: Waiting for root file system... ...
Done.
Gave up waiting for root device. Common problems:
- Boot args (cat /proc/cmdline)
- Check rootdelay= (did the system wait long enough?)
- Check root= (did the system wait for the right device?)
- Missing modules (cat /proc/modules; ls /dev)
FATAL: Could not load /lib/modules/2.6.34-4-virtual/modules.dep: No such file or directory
FATAL: Could not load /lib/modules/2.6.34-4-virtual/modules.dep: No such file or directory
ALERT! /dev/sda1 does not exist. Dropping to a shell!

BusyBox v1.13.3 (Ubuntu 1:1.13.3-1ubuntu5) built-in shell (ash)
Enter 'help' for a list of built-in commands.

(initramfs)
```

Potential causes

One or more of the following conditions can cause this problem:

- Missing ramdisk
- Missing correct modules from ramdisk
- Amazon EBS root volume not correctly attached as /dev/sda1

Suggested actions

For this instance type	Do this
Amazon EBS-backed	<p>Use the following procedure:</p> <ol style="list-style-type: none">1. Select corrected ramdisk for the Amazon EBS volume.2. Stop the instance.3. Detach the volume and repair it.

For this instance type	Do this
	4. Attach the volume to the instance. 5. Start the instance. 6. Modify the AMI to use the corrected ramdisk.
Instance store-backed	Use the following procedure: 1. Terminate the instance and launch a new instance with the correct ramdisk. 2. Create a new AMI with the correct ramdisk.

ERROR Invalid kernel (EC2 incompatible kernel)

This condition is indicated by a system log similar to the one shown below.

```

...
root (hd0)

Filesystem type is ext2fs, using whole disk

kernel /vmlinuz root=/dev/sda1 ro

initrd /initrd.img

ERROR Invalid kernel: elf_xen_note_check: ERROR: Will only load images
built for the generic loader or Linux images
xc_dom_parse_image returned -1

Error 9: Unknown boot failure

Booting 'Fallback'

root (hd0)

Filesystem type is ext2fs, using whole disk

kernel /vmlinuz.old root=/dev/sda1 ro

Error 15: File not found

```

Potential causes

One or both of the following conditions can cause this problem:

- Supplied kernel is not supported by GRUB
- Fallback kernel does not exist

Suggested actions

For this instance type	Do this
Amazon EBS-backed	Use the following procedure: 1. Stop the instance.

For this instance type	Do this
	2. Replace with working kernel. 3. Install a fallback kernel. 4. Modify the AMI by correcting the kernel.
Instance store-backed	Use the following procedure: <ol style="list-style-type: none"> 1. Terminate the instance and launch a new instance with the correct kernel. 2. Create an AMI with the correct kernel. 3. (Optional) Seek technical assistance for data recovery using AWS Support.

fsck: No such file or directory while trying to open... (File system not found)

This condition is indicated by a system log similar to the one shown below.

```

Welcome to Fedora
Press 'I' to enter interactive startup.
Setting clock : Wed Oct 26 05:52:05 EDT 2011 [ OK ]

Starting udev: [ OK ]

Setting hostname localhost: [ OK ]

No devices found
Setting up Logical Volume Management: File descriptor 7 left open
  No volume groups found
[ OK ]

Checking filesystems
Checking all file systems.
[/sbin/fsck.ext3 (1) -- /] fsck.ext3 -a /dev/sda1
/dev/sda1: clean, 82081/1310720 files, 2141116/2621440 blocks
[/sbin/fsck.ext3 (1) -- /mnt/dbbackups] fsck.ext3 -a /dev/sdh
fsck.ext3: No such file or directory while trying to open /dev/sdh

/dev/sdh:
The superblock could not be read or does not describe a correct ext2
filesystem. If the device is valid and it really contains an ext2
filesystem (and not swap or ufs or something else), then the superblock
is corrupt, and you might try running e2fsck with an alternate superblock:
  e2fsck -b 8193 <device>

[FAILED]

*** An error occurred during the file system check.
*** Dropping you to a shell; the system will reboot
*** when you leave the shell.
Give root password for maintenance
(or type Control-D to continue):

```

Potential causes

- A bug exists in ramdisk filesystem definitions /etc/fstab

- Misconfigured filesystem definitions in /etc/fstab
- Missing/failed drive

Suggested actions

For this instance type	Do this
Amazon EBS-backed	<p>Use the following procedure:</p> <ol style="list-style-type: none">1. Stop the instance, detach the root volume, repair/modify /etc/fstab the volume, attach the volume to the instance, and start the instance.2. Fix ramdisk to include modified /etc/fstab (if applicable).3. Modify the AMI to use a newer ramdisk. <p>The sixth field in the fstab defines availability requirements of the mount – a nonzero value implies that an fsck will be done on that volume and <i>must</i> succeed. Using this field can be problematic in Amazon EC2 because a failure typically results in an interactive console prompt that is not currently available in Amazon EC2. Use care with this feature and read the Linux man page for fstab.</p>
Instance store-backed	<p>Use the following procedure:</p> <ol style="list-style-type: none">1. Terminate the instance and launch a new instance.2. Detach any errant Amazon EBS volumes and the reboot instance.3. (Optional) Seek technical assistance for data recovery using AWS Support.

General error mounting filesystems (failed mount)

This condition is indicated by a system log similar to the one shown below.

```
>Loading xenblk.ko module
xen-vbd: registered block device major 8

>Loading ehci-hcd.ko module
>Loading ohci-hcd.ko module
>Loading uhci-hcd.ko module

General error mounting filesystems.  
A maintenance shell will now be started.  
CONTROL-D will terminate this shell and re-try.  
Press enter for maintenance  
(or type Control-D to continue):
```

Potential causes

Instance type	Potential cause
Amazon EBS-backed	<ul style="list-style-type: none">Detached or failed Amazon EBS volume.Corrupted filesystem.Mismatched ramdisk and AMI combination (such as Debian ramdisk with a SUSE AMI).
Instance store-backed	<ul style="list-style-type: none">A failed drive.A corrupted file system.A mismatched ramdisk and combination (for example, a Debian ramdisk with a SUSE AMI).

Suggested actions

For this instance type	Do this
Amazon EBS-backed	<p>Use the following procedure:</p> <ol style="list-style-type: none">Stop the instance.Detach the root volume.Attach the root volume to a known working instance.Run filesystem check (fsck -a /dev/...).Fix any errors.Detach the volume from the known working instance.Attach the volume to the stopped instance.Start the instance.Recheck the instance status.

For this instance type	Do this
Instance store-backed	<p>Try one of the following:</p> <ul style="list-style-type: none"> • Start a new instance. • (Optional) Seek technical assistance for data recovery using AWS Support.

VFS: Unable to mount root fs on unknown-block (Root filesystem mismatch)

This condition is indicated by a system log similar to the one shown below.

```

Linux version 2.6.16-xenU (builder@xenbat.amazonsa) (gcc version 4.0.1
20050727 (Red Hat 4.0.1-5)) #1 SMP Mon May 28 03:41:49 SAST 2007
...
Kernel command line: root=/dev/sda1 ro 4
...
Registering block device major 8
...
Kernel panic - not syncing: VFS: Unable to mount root fs on unknown-block(8,1)

```

Potential causes

Instance type	Potential cause
Amazon EBS-backed	<ul style="list-style-type: none"> • Device not attached correctly. • Root device not attached at correct device point. • Filesystem not in expected format. • Use of legacy kernel (such as 2.6.16-XenU). • A recent kernel update on your instance (faulty update, or an update bug)
Instance store-backed	Hardware device failure.

Suggested actions

For this instance type	Do this
Amazon EBS-backed	<p>Do one of the following:</p> <ul style="list-style-type: none"> • Stop and then restart the instance. • Modify root volume to attach at the correct device point, possibly /dev/sda1 instead of /dev/sda. • Stop and modify to use modern kernel. • Refer to the documentation for your Linux distribution to check for known update bugs. Change or reinstall the kernel.

For this instance type	Do this
Instance store-backed	Terminate the instance and launch a new instance using a modern kernel.

Error: Unable to determine major/minor number of root device... (Root file system/device mismatch)

This condition is indicated by a system log similar to the one shown below.

```

...
XENBUS: Device with no driver: device/vif/0
XENBUS: Device with no driver: device/vbd/2048
drivers/rtc/hctosys.c: unable to open rtc device (rtc0)

You are being dropped to a recovery shell
  Type 'exit' to try and continue booting
sh: can't access tty; job control turned off
[ramfs /]#

```

Potential causes

- Missing or incorrectly configured virtual block device driver
- Device enumeration clash (sda versus xvda or sda instead of sda1)
- Incorrect choice of instance kernel

Suggested actions

For this instance type	Do this
Amazon EBS-backed	Use the following procedure: <ol style="list-style-type: none"> 1. Stop the instance. 2. Detach the volume. 3. Fix the device mapping problem. 4. Start the instance. 5. Modify the AMI to address device mapping issues.
Instance store-backed	Use the following procedure: <ol style="list-style-type: none"> 1. Create a new AMI with the appropriate fix (map block device correctly).

For this instance type	Do this
	2. Terminate the instance and launch a new instance from the AMI you created.

XENBUS: Device with no driver...

This condition is indicated by a system log similar to the one shown below.

```
XENBUS: Device with no driver: device/vbd/2048
drivers/rtc/hctosys.c: unable to open rtc device (rtc0)
Initializing network drop monitor service
Freeing unused kernel memory: 508k freed
::: Starting udevd...
done.
::: Running Hook [udev]
::: Triggering uevents...<30>udevd[65]: starting version 173
done.
Waiting 10 seconds for device /dev/xvda1 ...
Root device '/dev/xvda1' doesn't exist. Attempting to create it.
ERROR: Unable to determine major/minor number of root device '/dev/xvda1'.
You are being dropped to a recovery shell
    Type 'exit' to try and continue booting
sh: can't access tty; job control turned off
[ramfs/]#
```

Potential causes

- Missing or incorrectly configured virtual block device driver
- Device enumeration clash (sda versus xvda)
- Incorrect choice of instance kernel

Suggested actions

For this instance type	Do this
Amazon EBS-backed	<p>Use the following procedure:</p> <ol style="list-style-type: none">1. Stop the instance.2. Detach the volume.3. Fix the device mapping problem.4. Start the instance.5. Modify the AMI to address device mapping issues.
Instance store-backed	<p>Use the following procedure:</p> <ol style="list-style-type: none">1. Create an AMI with the appropriate fix (map block device correctly).2. Terminate the instance and launch a new instance using the AMI you created.

... days without being checked, check forced (File system check required)

This condition is indicated by a system log similar to the one shown below.

```
...
Checking filesystems
Checking all file systems.
[/sbin/fsck.ext3 (1) -- /] fsck.ext3 -a /dev/sda1
/dev/sda1 has gone 361 days without being checked, check forced
```

Potential causes

Filesystem check time passed; a filesystem check is being forced.

Suggested actions

- Wait until the filesystem check completes. A filesystem check can take a long time depending on the size of the root filesystem.
- Modify your filesystems to remove the filesystem check (fsck) enforcement using tune2fs or tools appropriate for your filesystem.

fsck died with exit status... (Missing device)

This condition is indicated by a system log similar to the one shown below.

```
Cleaning up ifupdown....
Loading kernel modules...done.
...
Activating lvm and md swap...done.
Checking file systems...fsck from util-linux-ng 2.16.2
/sbin/fsck.xfs: /dev/sdh does not exist
fsck died with exit status 8
[31mfailed (code 8).[39;49m
```

Potential causes

- Ramdisk looking for missing drive
- Filesystem consistency check forced
- Drive failed or detached

Suggested actions

For this instance type	Do this
Amazon EBS-backed	<p>Try one or more of the following to resolve the issue:</p> <ul style="list-style-type: none">• Stop the instance, attach the volume to an existing running instance.

For this instance type	Do this
	<ul style="list-style-type: none"> Manually run consistency checks. Fix ramdisk to include relevant utilities. Modify filesystem tuning parameters to remove consistency requirements (not recommended).
Instance store-backed	<p>Try one or more of the following to resolve the issue:</p> <ul style="list-style-type: none"> Rebundle ramdisk with correct tooling. Modify file system tuning parameters to remove consistency requirements (not recommended). Terminate the instance and launch a new instance. (Optional) Seek technical assistance for data recovery using AWS Support.

GRUB prompt (grubdom>)

This condition is indicated by a system log similar to the one shown below.

```
GNU GRUB  version 0.97  (629760K lower / 0K upper memory)

[ Minimal BASH-like line editing is supported.  For
the first word, TAB lists possible command
completions. Anywhere else TAB lists the possible
completions of a device/filename. ]

grubdom>
```

Potential causes

Instance type	Potential causes
Amazon EBS-backed	<ul style="list-style-type: none"> Missing GRUB configuration file. Incorrect GRUB image used, expecting GRUB configuration file at a different location. Unsupported filesystem used to store your GRUB configuration file (for example, converting your root file system to a type that is not supported by an earlier version of GRUB).
Instance store-backed	<ul style="list-style-type: none"> Missing GRUB configuration file. Incorrect GRUB image used, expecting GRUB configuration file at a different location. Unsupported filesystem used to store your GRUB configuration file (for example, converting your root file system to a type that is not supported by an earlier version of GRUB).

Suggested actions

For this instance type	Do this
Amazon EBS-backed	<p>Option 1: Modify the AMI and relaunch the instance:</p> <ol style="list-style-type: none">1. Modify the source AMI to create a GRUB configuration file at the standard location (/boot/grub/menu.lst).2. Verify that your version of GRUB supports the underlying file system type and upgrade GRUB if necessary.3. Pick the appropriate GRUB image, (hd0-1st drive or hd00 – 1st drive, 1st partition).4. Terminate the instance and launch a new one using the AMI that you created. <p>Option 2: Fix the existing instance:</p> <ol style="list-style-type: none">1. Stop the instance.2. Detach the root filesystem.3. Attach the root filesystem to a known working instance.4. Mount filesystem.5. Create a GRUB configuration file.6. Verify that your version of GRUB supports the underlying file system type and upgrade GRUB if necessary.7. Detach filesystem.8. Attach to the original instance.9. Modify kernel attribute to use the appropriate GRUB image (1st disk or 1st partition on 1st disk).10. Start the instance.
Instance store-backed	<p>Option 1: Modify the AMI and relaunch the instance:</p> <ol style="list-style-type: none">1. Create the new AMI with a GRUB configuration file at the standard location (/boot/grub/menu.lst).2. Pick the appropriate GRUB image, (hd0-1st drive or hd00 – 1st drive, 1st partition).3. Verify that your version of GRUB supports the underlying file system type and upgrade GRUB if necessary.4. Terminate the instance and launch a new instance using the AMI you created. <p>Option 2: Terminate the instance and launch a new instance, specifying the correct kernel.</p>

For this instance type	Do this
	<p>Note To recover data from the existing instance, contact AWS Support.</p>

Bringing up interface eth0: Device eth0 has different MAC address than expected, ignoring. (Hard-coded MAC address)

This condition is indicated by a system log similar to the one shown below.

```
...  
Bringing up loopback interface: [ OK ]  
Bringing up interface eth0: Device eth0 has different MAC address than expected, ignoring.  
[FAILED]  
Starting auditd: [ OK ]
```

Potential causes

There is a hardcoded interface MAC in the AMI configuration

Suggested actions

For this instance type	Do this
Amazon EBS-backed	<p>Do one of the following:</p> <ul style="list-style-type: none">• Modify the AMI to remove the hardcoding and relaunch the instance.• Modify the instance to remove the hardcoded MAC address. <p>OR</p> <p>Use the following procedure:</p> <ol style="list-style-type: none">1. Stop the instance.2. Detach the root volume.3. Attach the volume to another instance and modify the volume to remove the hardcoded MAC address.4. Attach the volume to the original instance.5. Start the instance.
Instance store-backed	<p>Do one of the following:</p> <ul style="list-style-type: none">• Modify the instance to remove the hardcoded MAC address.

	<ul style="list-style-type: none">Terminate the instance and launch a new instance.

Unable to load SELinux Policy. Machine is in enforcing mode. Halting now. (SELinux misconfiguration)

This condition is indicated by a system log similar to the one shown below.

```
audit(1313445102.626:2): enforcing=1 old_enforcing=0 auid=4294967295
Unable to load SELinux Policy. Machine is in enforcing mode. Halting now.
Kernel panic - not syncing: Attempted to kill init!
```

Potential causes

SELinux has been enabled in error:

- Supplied kernel is not supported by GRUB
- Fallback kernel does not exist

Suggested actions

For this instance type	Do this
Amazon EBS-backed	<p>Use the following procedure:</p> <ol style="list-style-type: none">Stop the failed instance.Detach the failed instance's root volume.Attach the root volume to another running Linux instance (later referred to as a recovery instance).Connect to the recovery instance and mount the failed instance's root volume.Disable SELinux on the mounted root volume. This process varies across Linux distributions; for more information, consult your OS-specific documentation. <p>Note On some systems, you disable SELinux by setting <code>SELINUX=disabled</code> in the <code>/mount_point/etc/sysconfig/selinux</code> file, where <code>mount_point</code> is the location that you mounted the volume on your recovery instance.</p> <ol style="list-style-type: none">Unmount and detach the root volume from the recovery instance and reattach it to the original instance.

For this instance type	Do this
	7. Start the instance.
Instance store-backed	<p>Use the following procedure:</p> <ol style="list-style-type: none">1. Terminate the instance and launch a new instance.2. (Optional) Seek technical assistance for data recovery using AWS Support.

XENBUS: Timeout connecting to devices (Xenbus timeout)

This condition is indicated by a system log similar to the one shown below.

```
Linux version 2.6.16-xenU (builder@xenbat.amazonsa) (gcc version 4.0.1
20050727 (Red Hat 4.0.1-5)) #1 SMP Mon May 28 03:41:49 SAST 2007
...
XENBUS: Timeout connecting to devices!
...
Kernel panic - not syncing: No init found. Try passing init= option to kernel.
```

Potential causes

- The block device is not connected to the instance
- This instance is using an old instance kernel

Suggested actions

For this instance type	Do this
Amazon EBS-backed	<p>Do one of the following:</p> <ul style="list-style-type: none">• Modify the AMI and instance to use a modern kernel and relaunch the instance.• Reboot the instance.
Instance store-backed	<p>Do one of the following:</p> <ul style="list-style-type: none">• Terminate the instance.• Modify the AMI to use a modern kernel, and launch a new instance using this AMI.

Troubleshoot an unreachable instance

You can use the following methods to troubleshoot an unreachable Linux instance. For information about troubleshooting an unreachable Windows instance, see [Troubleshoot an unreachable instance](#).

Contents

- [Instance reboot \(p. 1748\)](#)
- [Instance console output \(p. 1748\)](#)
- [Capture a screenshot of an unreachable instance \(p. 1749\)](#)
- [Instance recovery when a host computer fails \(p. 1750\)](#)

Instance reboot

The ability to reboot instances that are otherwise unreachable is valuable for both troubleshooting and general instance management.

Just as you can reset a computer by pressing the reset button, you can reset EC2 instances using the Amazon EC2 console, CLI, or API. For more information, see [Reboot your instance \(p. 657\)](#)

Warning

For Windows instances, this operation performs a hard reboot that might result in data corruption.

Instance console output

Console output is a valuable tool for problem diagnosis. It is especially useful for troubleshooting kernel problems and service configuration issues that could cause an instance to terminate or become unreachable before its SSH daemon can be started.

For Linux/Unix, the instance console output displays the exact console output that would normally be displayed on a physical monitor attached to a computer. The console output returns buffered information that was posted shortly after an instance transition state (start, stop, reboot, and terminate). The posted output is not continuously updated; only when it is likely to be of the most value.

For Windows instances, the instance console output includes the last three system event log errors.

You can optionally retrieve the latest serial console output at any time during the instance lifecycle. This option is only supported on [Instances built on the Nitro System \(p. 247\)](#). It is not supported through the Amazon EC2 console.

Note

Only the most recent 64 KB of posted output is stored, which is available for at least 1 hour after the last posting.

Only the instance owner can access the console output. You can retrieve the console output for your instances using the console or the command line.

Use one of the following methods to get console output.

New console

To get console output

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Instances**, and select the instance.
3. Choose **Actions, Monitor and troubleshoot, Get system log**.

Old console

To get console output

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Instances**, and select the instance.

3. Choose **Actions, Instance Settings, Get System Log**.

Command line

To get console output

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [get-console-output \(AWS CLI\)](#)
- [Get-EC2ConsoleOutput \(AWS Tools for Windows PowerShell\)](#)

For more information about common system log errors, see [Troubleshoot system log errors for Linux-based instances \(p. 1728\)](#).

Capture a screenshot of an unreachable instance

If you are unable to reach your instance via SSH or RDP, you can capture a screenshot of your instance and view it as an image. The image can provide visibility as to the status of the instance, and allows for quicker troubleshooting. You can generate screenshots while the instance is running or after it has crashed. There is no data transfer cost for this screenshot. The image is generated in JPG format and is no larger than 100 kb. This feature is not supported when the instance is using an NVIDIA GRID driver, is on bare metal instances (instances of type *.meta1), or is powered by Arm-based Graviton or Graviton 2 processors. This feature is available in the following Regions:

- US East (N. Virginia) Region
- US East (Ohio) Region
- US West (Oregon) Region
- US West (N. California) Region
- Europe (Ireland) Region
- Europe (Frankfurt) Region
- Asia Pacific (Tokyo) Region
- Asia Pacific (Seoul) Region
- Asia Pacific (Singapore) Region
- Asia Pacific (Sydney) Region
- South America (São Paulo) Region
- Asia Pacific (Mumbai) Region
- Canada (Central) Region
- Europe (London) Region
- Europe (Paris) Region

To access the instance console

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the left navigation pane, choose **Instances**.
3. Select the instance to capture.
4. Choose **Actions, Monitor and troubleshoot**.
5. Choose **Get instance screenshot**.

Right-click the image to download and save it.

To capture a screenshot using the command line

You can use one of the following commands. The returned content is base64-encoded. For more information about these command line interfaces, see [Access Amazon EC2 \(p. 3\)](#).

- [get-console-screenshot](#) (AWS CLI)
- [GetConsoleScreenshot](#) (Amazon EC2 Query API)

Instance recovery when a host computer fails

If there is an unrecoverable issue with the hardware of an underlying host computer, AWS may schedule an instance stop event. You are notified of such an event ahead of time by email.

To recover an Amazon EBS-backed instance running on a host computer that failed

1. Back up any important data on your instance store volumes to Amazon EBS or Amazon S3.
2. Stop the instance.
3. Start the instance.
4. Restore any important data.

For more information, see [Stop and start your instance \(p. 637\)](#).

To recover an instance store-backed instance running on a host computer that failed

1. Create an AMI from the instance.
2. Upload the image to Amazon S3.
3. Back up important data to Amazon EBS or Amazon S3.
4. Terminate the instance.
5. Launch a new instance from the AMI.
6. Restore any important data to the new instance.

For more information, see [Create an instance store-backed Linux AMI \(p. 149\)](#).

Boot from the wrong volume

In some situations, you may find that a volume other than the volume attached to /dev/xvda or /dev/sda has become the root volume of your instance. This can happen when you have attached the root volume of another instance, or a volume created from the snapshot of a root volume, to an instance with an existing root volume.

This is due to how the initial ramdisk in Linux works. It chooses the volume defined as / in the /etc/fstab, and in some distributions, this is determined by the label attached to the volume partition. Specifically, you find that your /etc/fstab looks something like the following:

```
LABEL=/ / ext4 defaults,noatime 1 1
tmpfs /dev/shm tmpfs defaults 0 0
devpts /dev/pts devpts gid=5,mode=620 0 0
sysfs /sys sysfs defaults 0 0
proc /proc proc defaults 0 0
```

If you check the label of both volumes, you see that they both contain the / label:

```
[ec2-user ~]$ sudo e2label /dev/xvda1
/
[ec2-user ~]$ sudo e2label /dev/xvdf1
/
```

In this example, you could end up having `/dev/xvdf1` become the root device that your instance boots to after the initial ramdisk runs, instead of the `/dev/xvda1` volume from which you had intended to boot. To solve this, use the same **e2label** command to change the label of the attached volume that you do not want to boot from.

In some cases, specifying a UUID in `/etc/fstab` can resolve this. However, if both volumes come from the same snapshot, or the secondary is created from a snapshot of the primary volume, they share a UUID.

```
[ec2-user ~]$ sudo blkid
/dev/xvda1: LABEL="/" UUID=73947a77-ddbe-4dc7-bd8f-3fe0bc840778 TYPE="ext4"
PARTLABEL="Linux" PARTUUID=d55925ee-72c8-41e7-b514-7084e28f7334
/dev/xvdf1: LABEL="old/" UUID=73947a77-ddbe-4dc7-bd8f-3fe0bc840778 TYPE="ext4"
PARTLABEL="Linux" PARTUUID=d55925ee-72c8-41e7-b514-7084e28f7334
```

To change the label of an attached ext4 volume

1. Use the **e2label** command to change the label of the volume to something other than `/`.

```
[ec2-user ~]$ sudo e2label /dev/xvdf1 old/
```

2. Verify that the volume has the new label.

```
[ec2-user ~]$ sudo e2label /dev/xvdf1
old/
```

To change the label of an attached xfs volume

- Use the **xfs_admin** command to change the label of the volume to something other than `/`.

```
[ec2-user ~]$ sudo xfs_admin -L old/ /dev/xvdf1
writing all SBs
new label = "old/"
```

After changing the volume label as shown, you should be able to reboot the instance and have the proper volume selected by the initial ramdisk when the instance boots.

Important

If you intend to detach the volume with the new label and return it to another instance to use as the root volume, you must perform the above procedure again and change the volume label back to its original value. Otherwise, the other instance does not boot because the ramdisk is unable to find the volume with the label `/`.

Use EC2Rescue for Linux

EC2Rescue for Linux is an easy-to-use, open-source tool that can be run on an Amazon EC2 Linux instance to diagnose and troubleshoot common issues using its library of over 100 modules. A few generalized use cases for EC2Rescue for Linux include gathering syslog and package manager logs,

collecting resource utilization data, and diagnosing/remediating known problematic kernel parameters and common OpenSSH issues.

The [AWSSupport-TroubleshootSSH](#) runbook installs EC2Rescue for Linux and then uses the tool to check or attempt to fix common issues that prevent a remote connection to a Linux machine via SSH. For more information, and to run this automation, see [AWS Support-TroubleshootSSH](#).

If you are using a Windows instance, see [EC2Rescue for Windows Server](#).

Contents

- [Install EC2Rescue for Linux \(p. 1752\)](#)
- [Work with EC2Rescue for Linux \(p. 1755\)](#)
- [Develop EC2Rescue modules \(p. 1757\)](#)

Install EC2Rescue for Linux

The EC2Rescue for Linux tool can be installed on an Amazon EC2 Linux instance that meets the following prerequisites.

Prerequisites

- Supported operating systems:
 - Amazon Linux 2
 - Amazon Linux 2016.09+
 - SUSE Linux Enterprise Server 12+
 - RHEL 7+
 - Ubuntu 16.04+
- Software requirements:
 - Python 2.7.9+ or 3.2+

The [AWSSupport-TroubleshootSSH](#) runbook installs EC2Rescue for Linux and then uses the tool to check or attempt to fix common issues that prevent a remote connection to a Linux machine via SSH. For more information, and to run this automation, see [AWS Support-TroubleshootSSH](#).

If your system has the required Python version, you can install the standard build. Otherwise, you can install the bundled build, which includes a minimal copy of Python.

To install the standard build

1. From a working Linux instance, download the [EC2Rescue for Linux](#) tool:

```
curl -O https://s3.amazonaws.com/ec2rescuelinux/ec2rl.tgz
```

2. (Optional) Before proceeding, you can optionally verify the signature of the EC2Rescue for Linux installation file. For more information, see [\(Optional\) Verify the signature of EC2Rescue for Linux \(p. 1753\)](#).

3. Download the sha256 hash file:

```
curl -O https://s3.amazonaws.com/ec2rescuelinux/ec2rl.tgz.sha256
```

4. Verify the integrity of the tarball:

```
sha256sum -c ec2rl.tgz.sha256
```

5. Unpack the tarball:

```
tar -xzvf ec2rl.tgz
```

6. Verify the installation by listing out the help file:

```
cd ec2rl-<version_number>
./ec2rl help
```

To install the bundled build

For a link to the download and a list of limitations, see [EC2Rescue for Linux](#) on github.

(Optional) Verify the signature of EC2Rescue for Linux

The following is the recommended process of verifying the validity of the EC2Rescue for Linux package for Linux-based operating systems.

When you download an application from the internet, we recommend that you authenticate the identity of the software publisher and check that the application has not been altered or corrupted after it was published. This protects you from installing a version of the application that contains a virus or other malicious code.

If, after running the steps in this topic, you determine that the software for EC2Rescue for Linux is altered or corrupted, do not run the installation file. Instead, contact Amazon Web Services.

EC2Rescue for Linux files for Linux-based operating systems are signed using GnuPG, an open-source implementation of the Pretty Good Privacy (OpenPGP) standard for secure digital signatures. GnuPG (also known as GPG) provides authentication and integrity checking through a digital signature. AWS publishes a public key and signatures that you can use to verify the downloaded EC2Rescue for Linux package. For more information about PGP and GnuPG (GPG), see <http://www.gnupg.org>.

The first step is to establish trust with the software publisher. Download the public key of the software publisher, check that the owner of the public key is who they claim to be, and then add the public key to your keyring. Your keyring is a collection of known public keys. After you establish the authenticity of the public key, you can use it to verify the signature of the application.

Tasks

- [Install the GPG tools \(p. 1753\)](#)
- [Authenticate and import the public key \(p. 1754\)](#)
- [Verify the signature of the package \(p. 1754\)](#)

Install the GPG tools

If your operating system is Linux or Unix, the GPG tools may already be installed. To test whether the tools are installed on your system, enter `gpg2` at a command prompt. If the GPG tools are installed, you see a GPG command prompt. If the GPG tools are not installed, you see an error stating that the command cannot be found. You can install the GnuPG package from a repository.

To install GPG tools on Debian-based Linux

- From a terminal, run the following command:

```
apt-get install gnupg2
```

To install GPG tools on Red Hat-based Linux

- From a terminal, run the following command:

```
yum install gnupg2
```

Authenticate and import the public key

The next step in the process is to authenticate the EC2Rescue for Linux public key and add it as a trusted key in your GPG keyring.

To authenticate and import the EC2Rescue for Linux public key

- At a command prompt, use the following command to obtain a copy of our public GPG build key:

```
curl -O https://s3.amazonaws.com/ec2rescuelinux/ec2rl.key
```

- At a command prompt in the directory where you saved ec2rl.key, use the following command to import the EC2Rescue for Linux public key into your keyring:

```
gpg2 --import ec2rl.key
```

The command returns results similar to the following:

```
gpg: /home/ec2-user/.gnupg/trustdb.gpg: trustdb created
gpg: key 2FAE2A1C: public key "ec2autodiag@amazon.com <EC2 Rescue for Linux>" imported
gpg: Total number processed: 1
gpg:                      imported: 1  (RSA: 1)
```

Verify the signature of the package

After you've installed the GPG tools, authenticated and imported the EC2Rescue for Linux public key, and verified that the EC2Rescue for Linux public key is trusted, you are ready to verify the signature of the EC2Rescue for Linux installation script.

To verify the EC2Rescue for Linux installation script signature

- At a command prompt, run the following command to download the signature file for the installation script:

```
curl -O https://s3.amazonaws.com/ec2rescuelinux/ec2rl.tgz.sig
```

- Verify the signature by running the following command at a command prompt in the directory where you saved ec2rl.tgz.sig and the EC2Rescue for Linux installation file. Both files must be present.

```
gpg2 --verify ./ec2rl.tgz.sig
```

The output should look something like the following:

```
gpg: Signature made Thu 12 Jul 2018 01:57:51 AM UTC using RSA key ID 6991ED45
gpg: Good signature from "ec2autodiag@amazon.com <EC2 Rescue for Linux>"
gpg: WARNING: This key is not certified with a trusted signature!
gpg:                 There is no indication that the signature belongs to the owner.
Primary key fingerprint: E528 BCC9 0DBF 5AFA 0F6C C36A F780 4843 2FAE 2A1C
Subkey fingerprint: 966B 0D27 85E9 AEEC 1146 7A9D 8851 1153 6991 ED45
```

If the output contains the phrase `Good signature from "ec2autodiag@amazon.com <EC2 Rescue for Linux>"`, it means that the signature has successfully been verified, and you can proceed to run the EC2Rescue for Linux installation script.

If the output includes the phrase `BAD signature`, check whether you performed the procedure correctly. If you continue to get this response, contact Amazon Web Services and do not run the installation file that you downloaded previously.

The following are details about the warnings that you might see:

- **WARNING: This key is not certified with a trusted signature! There is no indication that the signature belongs to the owner.** This refers to your personal level of trust in your belief that you possess an authentic public key for EC2Rescue for Linux. In an ideal world, you would visit an Amazon Web Services office and receive the key in person. However, more often you download it from a website. In this case, the website is an Amazon Web Services website.
- **gpg2: no ultimately trusted keys found.** This means that the specific key is not "ultimately trusted" by you (or by other people whom you trust).

For more information, see <http://www.gnupg.org>.

Work with EC2Rescue for Linux

The following are common tasks you can perform to get started using this tool.

Tasks

- [Run EC2Rescue for Linux \(p. 1755\)](#)
- [Upload the results \(p. 1756\)](#)
- [Create backups \(p. 1756\)](#)
- [Get help \(p. 1757\)](#)

Run EC2Rescue for Linux

You can run EC2Rescue for Linux as shown in the following examples.

Example Example: Run all modules

To run all modules, run EC2Rescue for Linux with no options:

```
./ec2rl run
```

Some modules require root access. If you are not a root user, use `sudo` to run these modules as follows:

```
sudo ./ec2rl run
```

Example Example: Run a specific module

To run only specific modules, use the **--only-modules** parameter:

```
./ec2rl run --only-modules=module_name --arguments
```

For example, this command runs the **dig** module to query the `amazon.com` domain:

```
./ec2rl run --only-modules=dig --domain=amazon.com
```

Example Example: View the results

You can view the results in `/var/tmp/ec2rl`:

```
cat /var/tmp/ec2rl/logfile_location
```

For example, view the log file for the **dig** module:

```
cat /var/tmp/ec2rl/2017-05-11T15_39_21.893145/mod_out/run/dig.log
```

Upload the results

If AWS Support has requested the results or to share the results from an S3 bucket, upload them using the EC2Rescue for Linux CLI tool. The output of the EC2Rescue for Linux commands should provide the commands that you need to use.

Example Example: Upload results to AWS Support

```
./ec2rl upload --upload-directory=/var/tmp/ec2rl/2017-05-11T15_39_21.893145 --support-url="URLProvidedByAWSupport"
```

Example Example: Upload results to an S3 bucket

```
./ec2rl upload --upload-directory=/var/tmp/ec2rl/2017-05-11T15_39_21.893145 --presigned-url="YourPresignedS3URL"
```

For more information about generating pre-signed URLs for Amazon S3, see [Uploading Objects Using Pre-Signed URLs](#).

Create backups

Create a backup for your instance, one or more volumes, or a specific device ID using the following commands.

Example Example: Back up an instance using an Amazon Machine Image (AMI)

```
./ec2rl run --backup=ami
```

Example Example: Back up all volumes associated with the instance

```
./ec2rl run --backup=allvolumes
```

Example Example: Back up a specific volume

```
./ec2rl run --backup=volumeID
```

Get help

EC2Rescue for Linux includes a help file that gives you information and syntax for each available command.

Example Example: Display the general help

```
./ec2rl help
```

Example Example: List the available modules

```
./ec2rl list
```

Example Example: Display the help for a specific module

```
./ec2rl help module_name
```

For example, use the following command to show the help file for the **dig** module:

```
./ec2rl help dig
```

Develop EC2Rescue modules

Modules are written in YAML, a data serialization standard. A module's YAML file consists of a single document, representing the module and its attributes.

Add module attributes

The following table lists the available module attributes.

Attribute	Description
name	The name of the module. The name should be less than or equal to 18 characters in length.
version	The version number of the module.
title	A short, descriptive title for the module. This value should be less than or equal to 50 characters in length.
helptext	<p>The extended description of the module. Each line should be less than or equal to 75 characters in length. If the module consumes arguments, required or optional, include them in the helptext value.</p> <p>For example:</p> <pre>helptext: !!str </pre>

Attribute	Description
	<p>Collect output from ps for system analysis Consumes --times= for number of times to repeat Consumes --period= for time period between repetition</p>
placement	<p>The stage in which the module should be run. Supported values:</p> <ul style="list-style-type: none"> • prediagnostic • run • postdiagnostic
language	<p>The language that the module code is written in. Supported values:</p> <ul style="list-style-type: none"> • bash • python <p>Note Python code must be compatible with both Python 2.7.9+ and Python 3.2+.</p>
remediation	<p>Indicates whether the module supports remediation. Supported values are True or False.</p> <p>The module defaults to False if this is absent, making it an optional attribute for those modules that do not support remediation.</p>
content	The entirety of the script code.
constraint	The name of the object containing the constraint values.
domain	<p>A descriptor of how the module is grouped or classified. The set of included modules uses the following domains:</p> <ul style="list-style-type: none"> • application • net • os • performance
class	<p>A descriptor of the type of task performed by the module. The set of included modules uses the following classes:</p> <ul style="list-style-type: none"> • collect (collects output from programs) • diagnose (pass/fail based on a set of criteria) • gather (copies files and writes to specific file)

Attribute	Description
distro	The list of Linux distributions that this module supports. The set of included modules uses the following distributions: <ul style="list-style-type: none"> • alami (Amazon Linux) • rhel • ubuntu • suse
required	The required arguments that the module is consuming from the CLI options.
optional	The optional arguments that the module can use.
software	The software executables used in the module. This attribute is intended to specify software that is not installed by default. The EC2Rescue for Linux logic ensures that these programs are present and executable before running the module.
package	The source software package for an executable. This attribute is intended to provide extended details on the package with the software, including a URL for downloading or getting further information.
sudo	Indicates whether root access is required to run the module. You do not need to implement sudo checks in the module script. If the value is true, then the EC2Rescue for Linux logic only runs the module when the executing user has root access.
perfimpact	Indicates whether the module can have significant performance impact upon the environment in which it is run. If the value is true and the --perfimpact=true argument is not present, then the module is skipped.
parallelexclusive	Specifies a program that requires mutual exclusivity. For example, all modules specifying "bpf" run in a serial manner.

Add environment variables

The following table lists the available environment variables.

Environment Variable	Description
EC2RL_CALLPATH	The path to <code>ec2rl.py</code> . This path can be used to locate the <code>lib</code> directory and use vendored Python modules.
EC2RL_WORKDIR	The main <code>tmp</code> directory for the diagnostic tool.

Environment Variable	Description
	Default value: /var/tmp/ec2rl.
EC2RL_RUNDIR	The directory where all output is stored. Default value: /var/tmp/ec2rl/ <date×tamp>.
EC2RL_GATHEREDDIR	The root directory for placing gathered module data. Default value: /var/tmp/ec2rl/ <date×tamp>/mod_out/gathered/.
EC2RL_NET_DRIVER	The driver in use for the first, alphabetically ordered, non-virtual network interface on the instance. Examples: <ul style="list-style-type: none"> • xen_netfront • ixgbefv • ena
EC2RL_SUDO	True if EC2Rescue for Linux is running as root; otherwise, false.
EC2RL_VIRT_TYPE	The virtualization type as provided by the instance metadata. Examples: <ul style="list-style-type: none"> • default-hvm • default-paravirtual
EC2RL_INTERFACES	An enumerated list of interfaces on the system. The value is a string containing names, such as eth0, eth1, etc. This is generated via the functions.bash and is only available for modules that have sourced it.

Use YAML syntax

The following should be noted when constructing your module YAML files:

- The triple hyphen (---) denotes the explicit start of a document.
- The !ec2rlcore.module.Module tag tells the YAML parser which constructor to call when creating the object from the data stream. You can find the constructor inside the module.py file.
- The !!str tag tells the YAML parser to not attempt to determine the type of data, and instead interpret the content as a string literal.
- The pipe character (|) tells the YAML parser that the value is a literal-style scalar. In this case, the parser includes all whitespace. This is important for modules because indentation and newline characters are kept.
- The YAML standard indent is two spaces, which can be seen in the following examples. Ensure that you maintain standard indentation (for example, four spaces for Python) for your script and then indent the entire content two spaces inside the module file.

Example modules

Example one (mod.d/ps.yaml):

```
--- !ec2rlcore.module.Module
# Module document. Translates directly into an almost-complete Module object
name: !!str ps
path: !!str
version: !!str 1.0
title: !!str Collect output from ps for system analysis
helpText: !!str |
    Collect output from ps for system analysis
    Requires --times= for number of times to repeat
    Requires --period= for time period between repetition
placement: !!str run
package:
    - !!str
language: !!str bash
content: !!str |
    #!/bin/bash
    error_trap()
    {
        printf "%0.s=" {1..80}
        echo -e "\nERROR: \"$BASH_COMMAND\" exited with an error on line ${BASH_LINENO[0]}"
        exit 0
    }
    trap error_trap ERR

    # read-in shared function
    source functions.bash
    echo "I will collect ps output from this $EC2RL_DISTRO box for $times times every $period
seconds."
    for i in $(seq 1 $times); do
        ps auxww
        sleep $period
    done
constraint:
    requires_ec2: !!str False
    domain: !!str performance
    class: !!str collect
    distro: !!str alami ubuntu rhel suse
    required: !!str period times
    optional: !!str
    software: !!str
    sudo: !!str False
    perfImpact: !!str False
    parallelExclusive: !!str
```

EC2 Serial Console for Linux instances

With the EC2 serial console, you have access to your Amazon EC2 instance's serial port, which you can use to troubleshoot boot, network configuration, and other issues. The serial console does not require your instance to have any networking capabilities. With the serial console, you can enter commands to an instance as if your keyboard and monitor are directly attached to the instance's serial port. The serial console session lasts during instance reboot and stop. During reboot, you can view all of the boot messages from the start.

Access to the serial console is not available by default. Your organization must grant account access to the serial console and configure IAM policies to grant your users access to the serial console. Serial

console access can be controlled at a granular level by using instance IDs, resource tags, and other IAM levers. For more information, see [Configure access to the EC2 Serial Console \(p. 1762\)](#).

The serial console can be accessed by using the EC2 console or the AWS CLI.

The serial console is available at no additional cost.

If you are using a Windows instance, see [EC2 Serial Console for Windows instances in the Amazon EC2 User Guide for Windows Instances](#).

Topics

- [Configure access to the EC2 Serial Console \(p. 1762\)](#)
- [Connect to the EC2 Serial Console \(p. 1767\)](#)
- [Terminate an EC2 Serial Console session \(p. 1772\)](#)
- [Troubleshoot your Linux instance using the EC2 Serial Console \(p. 1772\)](#)

Configure access to the EC2 Serial Console

To configure access to the serial console, you must grant serial console access at the account level and then configure IAM policies to grant access to your IAM users. You must also configure a password-based user on every instance so that your users can use the serial console for troubleshooting.

Topics

- [Levels of access to the EC2 Serial Console \(p. 1762\)](#)
- [Manage account access to the EC2 Serial Console \(p. 1763\)](#)
- [Configure IAM policies for EC2 Serial Console access \(p. 1765\)](#)
- [Set an OS user password \(p. 1766\)](#)

Levels of access to the EC2 Serial Console

By default, there is no access to the serial console at the account level. You need to explicitly grant access to the serial console at the account level. For more information, see [Manage account access to the EC2 Serial Console \(p. 1763\)](#).

You can use a service control policy (SCP) to allow access to the serial console within your organization. You can then have granular access control at the IAM user level by using an IAM policy to control access. By using a combination of SCP and IAM policies, you have different levels of access control to the serial console.

Organization level

You can use a service control policy (SCP) to allow access to the serial console for member accounts within your organization. For more information about SCPs, see [Service control policies in the AWS Organizations User Guide](#).

Instance level

You can configure the serial console access policies by using IAM PrincipalTag and ResourceTag constructions and by specifying instances by their ID. For more information, see [Configure IAM policies for EC2 Serial Console access \(p. 1765\)](#).

IAM user level

You can configure access at the user level by configuring an IAM policy to allow or deny a specified user the permission to push the SSH public key to the serial console service of a particular instance. For more information, see [Configure IAM policies for EC2 Serial Console access \(p. 1765\)](#).

OS level

You can set a user password at the guest OS level. This provides access to the serial console for some use cases. However, to monitor the logs, you don't need a password-based user. For more information, see [Set an OS user password \(p. 1766\)](#).

Manage account access to the EC2 Serial Console

By default, there is no access to the serial console at the account level. You need to explicitly grant access to the serial console at the account level.

Topics

- [Grant permission to IAM users to manage account access \(p. 1763\)](#)
- [View account access status to the serial console \(p. 1763\)](#)
- [Grant account access to the serial console \(p. 1764\)](#)
- [Deny account access to the serial console \(p. 1764\)](#)

Grant permission to IAM users to manage account access

To allow your IAM users to manage account access to the EC2 serial console, you need to grant them the required IAM permissions.

The following policy grants permissions to view the account status, and to allow and prevent account access to the EC2 serial console.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:GetSerialConsoleAccessStatus",  
                "ec2:EnableSerialConsoleAccess",  
                "ec2:DisableSerialConsoleAccess"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

For more information, see [Creating IAM policies](#) in the *IAM User Guide*.

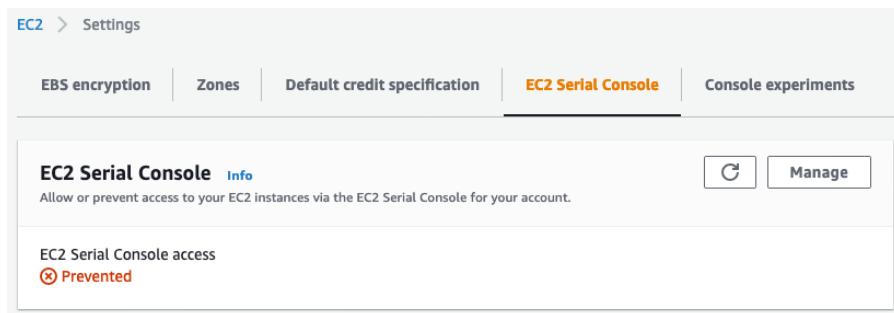

View account access status to the serial console

To view account access status to the serial console (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. On the left navigation pane, choose **EC2 Dashboard**.
3. From **Account attributes**, choose **EC2 Serial Console**.

The **EC2 Serial Console access** field indicates whether account access is **Allowed** or **Prevented**.

The following screenshot shows that the account is prevented from using the EC2 serial console.

To view account access status to the serial console (AWS CLI)

Use the [get-serial-console-access-status](#) command to view account access status to the serial console.

```
aws ec2 get-serial-console-access-status --region us-east-1
```

In the following output, `true` indicates that the account is allowed access to the serial console.

```
{  
    "SerialConsoleAccessEnabled": true  
}
```

Grant account access to the serial console

To grant account access to the serial console (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. On the left navigation pane, choose **EC2 Dashboard**.
3. From **Account attributes**, choose **EC2 Serial Console**.
4. Choose **Manage**.
5. To allow access to the EC2 serial console of all instances in the account, select the **Allow** check box.
6. Choose **Update**.

To grant account access to the serial console (AWS CLI)

Use the [enable-serial-console-access](#) command to allow account access to the serial console.

```
aws ec2 enable-serial-console-access --region us-east-1
```

In the following output, `true` indicates that the account is allowed access to the serial console.

```
{  
    "SerialConsoleAccessEnabled": true  
}
```

Deny account access to the serial console

To deny account access to the serial console (console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. On the left navigation pane, choose **EC2 Dashboard**.

3. From **Account attributes**, choose **EC2 Serial Console**.
4. Choose **Manage**.
5. To prevent access to the EC2 serial console of all instances in the account, clear the **Allow** check box.
6. Choose **Update**.

To deny account access to the serial console (AWS CLI)

Use the [disable-serial-console-access](#) command to prevent account access to the serial console.

```
aws ec2 disable-serial-console-access --region us-east-1
```

In the following output, `false` indicates that the account is denied access to the serial console.

```
{  
    "SerialConsoleAccessEnabled": false  
}
```

Configure IAM policies for EC2 Serial Console access

By default, your IAM users do not have access to the serial console. Your organization must configure IAM policies to grant your IAM users the required access. For more information, see [Creating IAM policies](#) in the *IAM User Guide*.

For serial console access, create a JSON policy document that includes the `ec2-instance-connect:SendSerialConsoleSSH PublicKey` action. This action grants an IAM user permission to push the public key to the serial console service, which starts a serial console session. We recommend restricting access to specific EC2 instances. Otherwise, all IAM users with this permission can connect to the serial console of all EC2 instances.

Example IAM policies

- [Explicitly allow access to the serial console \(p. 1765\)](#)
- [Explicitly deny access to the serial console \(p. 1766\)](#)
- [Use resource tags to control access to the serial console \(p. 1766\)](#)

Explicitly allow access to the serial console

By default, no one has access to the serial console. To grant access to the serial console, you need to configure a policy to explicitly allow access. We recommend configuring a policy that restricts access to specific instances.

The following policy allows access to the serial console of a specific instance, identified by its instance ID.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "AllowSerialConsoleAccess",  
            "Effect": "Allow",  
            "Action": [  
                "ec2-instance-connect:SendSerialConsoleSSH PublicKey"  
            ],  
            "Resource": "arn:aws:ec2:region:account-id:instance/i-0598c7d356eba48d7"  
        }  
    ]  
}
```

Explicitly deny access to the serial console

The following IAM policy allows access to the serial console of all instances, denoted by the * (asterisk), and explicitly denies access to the serial console of a specific instance, identified by its ID.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "AllowSerialConsoleAccess",  
            "Effect": "Allow",  
            "Action": [  
                "ec2-instance-connect:SendSerialConsoleSSHPublicKey"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Sid": "DenySerialConsoleAccess",  
            "Effect": "Deny",  
            "Action": [  
                "ec2-instance-connect:SendSerialConsoleSSHPublicKey"  
            ],  
            "Resource": "arn:aws:ec2:region:account-id:instance/i-0598c7d356eba48d7"  
        }  
    ]  
}
```

Use resource tags to control access to the serial console

You can use resource tags to control access to the serial console of an instance.

Attribute-based access control is an authorization strategy that defines permissions based on tags that can be attached to users and AWS resources. For example, the following policy allows an IAM user to initiate a serial console connection for an instance only if that instance's resource tag and the principal's tag have the same `SerialConsole` value for the tag key.

For more information about using tags to control access to your AWS resources, see [Controlling access to AWS resources](#) in the *IAM User Guide*.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "AllowTagBasedSerialConsoleAccess",  
            "Effect": "Allow",  
            "Action": [  
                "ec2-instance-connect:SendSerialConsoleSSHPublicKey"  
            ],  
            "Resource": "*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:ResourceTag/SerialConsoleSerialConsole}"  
                }  
            }  
        }  
    ]  
}
```

Set an OS user password

You can connect to the serial console without a password. However, to *use* the serial console for troubleshooting an instance, the instance must have a password-based OS user.

You can set the password for any OS user, including the root user. Note that the root user can modify all files, while each OS user might have limited permissions.

You must set a user password for every instance for which you will use the serial console. This is a one-time requirement for each instance.

Note

The following instructions are applicable only if you launched your instance using an AWS-provided AMI because, by default, AWS-provided AMIs are not configured with a password-based user. If you launched your instance using an AMI that already has the root user password configured, you can skip these instructions.

To set an OS user password

1. [Connect \(p. 611\)](#) to your instance. You can use any method for connecting to your instance, except the EC2 Serial Console connection method.
2. To set the password for a user, use the **passwd** command. In the following example, the user is **root**.

```
[ec2-user ~]$ sudo passwd root
```

The following is example output.

```
Changing password for user root.  
New password:
```

3. At the **New password** prompt, enter the new password.
4. At the prompt, re-enter the password.

Connect to the EC2 Serial Console

You can connect to the serial console of your EC2 instance by using the Amazon EC2 console or via SSH. After connecting to the serial console, you can use it for troubleshooting boot, network configuration, and other issues. For more information about troubleshooting, see [Troubleshoot your Linux instance using the EC2 Serial Console \(p. 1772\)](#).

Topics

- [Considerations \(p. 1767\)](#)
- [Prerequisites \(p. 1768\)](#)
- [Connect to the EC2 Serial Console \(p. 1768\)](#)
- [EC2 Serial Console fingerprints \(p. 1770\)](#)

Considerations

- Only one active serial console connection is supported per instance.
- The serial console connection typically lasts for one hour unless you terminate it. However, during system maintenance, Amazon EC2 will terminate the serial console session.
- It takes 30 seconds to tear down a session after you've disconnected from the serial console in order to allow a new session.
- Supported serial console port for Linux: **ttyS0**
- When you connect to the serial console, you might observe a slight drop in your instance's throughput.

Prerequisites

- Supported in all AWS Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Osaka), China (Beijing), China (Ningxia), Europe (Milan), and Middle East (Bahrain).
- Not supported in Local Zones, Wavelength Zones, or AWS Outposts.
- Supported for all virtualized instances built on the [Nitro System \(p. 247\)](#).
- Not supported on bare metal instances.
- Configure access to the EC2 Serial Console, as follows:
 - [Manage account access to the EC2 Serial Console \(p. 1763\)](#).
 - [Configure IAM policies for EC2 Serial Console access \(p. 1765\)](#). All IAM users who will use the serial console must have the required permissions.
 - [Set an OS user password \(p. 1766\)](#).
- To connect to the serial console [using the browser-based client \(p. 1768\)](#), your browser must support WebSocket. If your browser does not support WebSocket, connect to the serial console [using your own key and an SSH client \(p. 1769\)](#)
- The instance must be in the `running` state. If the instance is in the `pending`, `stopping`, `stopped`, `shutting-down`, or `terminated` state, you can't connect to the serial console. For more information about the instance states, see [Instance lifecycle \(p. 574\)](#).
- If the instance uses Amazon EC2 Systems Manager, then SSM Agent version 3.0.854.0 or later must be installed on the instance. For information about SSM Agent, see [Working with SSM Agent](#) in the [AWS Systems Manager User Guide](#).

You do not need an `sshd` server installed or running on your instance.

Connect to the EC2 Serial Console

Connection options

- [Connect using the browser-based client \(p. 1768\)](#)
- [Connect using your own key and SSH client \(p. 1769\)](#)

Connect using the browser-based client

You can connect to your EC2 instance's serial console by using the browser-based client. You do this by selecting the instance in the Amazon EC2 console and choosing to connect to the serial console. The browser-based client handles the permissions and provides a successful connection.

EC2 serial console works from most browsers, and supports keyboard and mouse input.

To connect to your instance's serial port using the browser-based client (Amazon EC2 console)

1. Open the Amazon EC2 console at <https://console.aws.amazon.com/ec2/>.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, EC2 Serial Console, Connect**.

Alternatively, select the instance and choose **Connect, EC2 Serial Console, Connect**.

An in-browser terminal window opens.

4. Press **Enter**. If a login prompt returns, you are connected to the serial console.

If the screen remains black, you can use the following information to help resolve issues with connecting to the serial console:

- **Check that you have configured access to the serial console.** For more information, see [Configure access to the EC2 Serial Console \(p. 1762\)](#).
- **Use SysRq to connect to the serial console.** SysRq does not require that you connect via the browser-based client. For more information, see [Troubleshoot your Linux instance using SysRq \(p. 1776\)](#).
- **Restart getty.** If you have SSH access to your instance, then connect to your instance using SSH, and restart getty using the following command.

```
[ec2-user ~]$ sudo systemctl restart serial-getty@ttyS0
```

- **Reboot your instance.** You can reboot your instance by using SysRq, the EC2 console, or the AWS CLI. For more information, see [Troubleshoot your Linux instance using SysRq \(p. 1776\)](#) or [Reboot your instance \(p. 657\)](#).
5. At the login prompt, enter the user name of the password-based user that you [set up previously \(p. 1766\)](#), and then press **Enter**.
 6. At the Password prompt, enter the password, and then press **Enter**.

You are now logged onto the instance and can use the serial console for troubleshooting.

Connect using your own key and SSH client

You can use your own SSH key and connect to your instance from the SSH client of your choice while using the serial console API. This enables you to benefit from the serial console capability to push a public key to the instance.

To connect to an instance's serial console using SSH

1. Push your SSH public key to the instance to start a serial console session

Use the [send-serial-console-ssh-public-key](#) command to push your SSH public key to the instance. This starts a serial console session.

If a serial console session has already been started for this instance, the command fails because you can only have one session open at a time. It takes 30 seconds to tear down a session after you've disconnected from the serial console in order to allow a new session.

```
$ aws ec2-instance-connect send-serial-console-ssh-public-key \
  --instance-id i-001234a4bf70dec41EXAMPLE \
  --serial-port 0 \
  --ssh-public-key file://my_key.pub \
  --region us-east-1
```

2. Connect to the serial console using your private key

Use the **ssh** command to connect to the serial console before the public key is removed from the serial console service. You have 60 seconds before it is removed.

Use the private key that corresponds to the public key.

The user name format is `instance-id.port0`, which comprises the instance ID and port 0. In the following example, the user name is `i-001234a4bf70dec41EXAMPLE.port0`.

For all supported AWS Regions, except AWS GovCloud (US) Regions:

The format of the public DNS name of the serial console service is `serial-console.ec2-instance-connect.region.aws`. In the following example, the serial console service is in the `us-east-1` Region.

```
$ ssh -i my_key i-001234a4bf70dec41EXAMPLE.port0@serial-console.ec2-instance-connect.us-east-1.aws
```

For AWS GovCloud (US) Regions only:

The format of the public DNS name of the serial console service in the AWS GovCloud (US) Regions is `serial-console.ec2-instance-connect.GovCloud-region.amazonaws.com`. In the following example, the serial console service is in the `us-gov-east-1` Region.

```
$ ssh -i my_key i-001234a4bf70dec41EXAMPLE.port0@serial-console.ec2-instance-connect.us-gov-east-1.amazonaws.com
```

3. (Optional) Verify the fingerprint

When you connect for the first time to the serial console, you are prompted to verify the fingerprint. You can compare the serial console fingerprint with the fingerprint that's displayed for verification. If these fingerprints don't match, someone might be attempting a "man-in-the-middle" attack. If they match, you can confidently connect to the serial console.

The following fingerprint is for the serial console service in the us-east-1 Region. For the fingerprints for each Region, see [EC2 Serial Console fingerprints \(p. 1770\)](#).

```
SHA256:dXwn5ma/xadVMeBZGERu5l2gx+yI5LDiJaLUCz0FMmw
```

Note

The fingerprint only appears the first time you connect to the serial console.

4. Press `Enter`. If a prompt returns, you are connected to the serial console.

If the screen remains black, you can use the following information to help resolve issues with connecting to the serial console:

- **Check that you have configured access to the serial console.** For more information, see [Configure access to the EC2 Serial Console \(p. 1762\)](#).
- **Use SysRq to connect to the serial console.** SysRq does not require that you connect via SSH. For more information, see [Troubleshoot your Linux instance using SysRq \(p. 1776\)](#).
- **Restart getty.** If you have SSH access to your instance, then connect to your instance using SSH, and restart getty using the following command.

```
[ec2-user ~]$ sudo systemctl restart serial-getty@ttyS0
```

- **Reboot your instance.** You can reboot your instance by using SysRq, the EC2 console, or the AWS CLI. For more information, see [Troubleshoot your Linux instance using SysRq \(p. 1776\)](#) or [Reboot your instance \(p. 657\)](#).

5. At the login prompt, enter the user name of the password-based user that you [set up previously \(p. 1766\)](#), and then press `Enter`.
6. At the Password prompt, enter the password, and then press `Enter`.

You are now logged onto the instance and can use the serial console for troubleshooting.

EC2 Serial Console fingerprints

The EC2 Serial Console fingerprint is unique for each AWS Region.

Terminate an EC2 Serial Console session

The way to terminate a serial console session depends on the client.

Browser-based client

To terminate the serial console session, close the serial console in-browser terminal window.

Standard OpenSSH client

To terminate the serial console session, use the following command to close the SSH connection. This command must be run immediately following a new line.

```
$ ~.
```

Note

The command that you use for closing an SSH connection might be different depending on the SSH client that you're using.

Troubleshoot your Linux instance using the EC2 Serial Console

By using EC2 Serial Console, you can troubleshoot boot, network configuration, and other issues by connecting to your instance's serial port.

Topics

- [Troubleshoot your Linux instance using GRUB \(p. 1772\)](#)
- [Troubleshoot your Linux instance using SysRq \(p. 1776\)](#)

For information about troubleshooting your Windows instance, see [Troubleshoot your Windows instance using the EC2 Serial Console](#) in the *Amazon EC2 User Guide for Windows Instances*.

Troubleshoot your Linux instance using GRUB

GNU GRUB (short for GNU GRand Unified Bootloader, commonly referred to as GRUB) is the default boot loader for most Linux operating systems. From the GRUB menu, you can select which kernel to boot into, or modify menu entries to change how the kernel will boot. This can be useful when troubleshooting a failing instance.

The GRUB menu is displayed during the boot process. The menu is not accessible via normal SSH, but you can access it via the EC2 Serial Console.

Topics

- [Prerequisites \(p. 1773\)](#)
- [Configure GRUB \(p. 1773\)](#)
- [Use GRUB \(p. 1775\)](#)

Prerequisites

Before you can configure and use GRUB, you must grant access to the serial console. For more information, see [Configure access to the EC2 Serial Console \(p. 1762\)](#).

Configure GRUB

Before you can use GRUB via the serial console, you must configure your instance to use GRUB via the serial console.

To configure GRUB, choose one of the following procedures based on the AMI that was used to launch the instance.

Amazon Linux 2

To configure GRUB on an Amazon Linux 2 instance

1. [Connect \(p. 611\)](#) to your instance.
2. Add or change the following options in `/etc/default/grub`:
 - Set `GRUB_TIMEOUT=1`.
 - Add `GRUB_TERMINAL="console serial"`.
 - Add `GRUB_SERIAL_COMMAND="serial --speed=115200"`.

The following is an example of `/etc/default/grub`. You might need to change the configuration based on your system setup.

```
GRUB_CMDLINE_LINUX_DEFAULT="console=tty0 console=ttyS0,115200n8 net.ifnames=0
biosdevname=0 nvme_core.io_timeout=4294967295 rd.emergency=poweroff rd.shell=0"
GRUB_TIMEOUT=1
GRUB_DISABLE_RECOVERY="true"
GRUB_TERMINAL="console serial"
GRUB_SERIAL_COMMAND="serial --speed=115200"
```

3. Apply the updated configuration by running the following command.

```
[ec2-user ~]$ sudo grub2-mkconfig -o /boot/grub2/grub.cfg
```

Ubuntu

To configure GRUB on an Ubuntu instance

1. [Connect \(p. 611\)](#) to your instance.
2. Add or change the following options in `/etc/default/grub.d/50-cloudimg-settings.cfg`:
 - Set `GRUB_TIMEOUT=1`.

- Add GRUB_TIMEOUT_STYLE=menu.
- Add GRUB_TERMINAL="console serial".
- Remove GRUB_HIDDEN_TIMEOUT.
- Add GRUB_SERIAL_COMMAND="serial --speed=115200".

The following is an example of /etc/default/grub.d/50-cloudimg-settings.cfg. You might need to change the configuration based on your system setup.

```
# Cloud Image specific Grub settings for Generic Cloud Images
# CLOUD_IMG: This file was created/modified by the Cloud Image build process

# Set the recordfail timeout
GRUB_RECORDFAIL_TIMEOUT=0

# Do not wait on grub prompt
GRUB_TIMEOUT=1
GRUB_TIMEOUT_STYLE=menu

# Set the default commandline
GRUB_CMDLINE_LINUX_DEFAULT="console=tty1 console=ttyS0
    nvme_core.io_timeout=4294967295"

# Set the grub console type
GRUB_TERMINAL="console serial"
GRUB_SERIAL_COMMAND="serial --speed 115200"
```

3. Apply the updated configuration by running the following command.

```
[ec2-user ~]$ sudo update-grub
```

RHEL

To configure GRUB on a RHEL instance

1. [Connect \(p. 611\)](#) to your instance.
2. Add or change the following options in /etc/default/grub:
 - Remove GRUB_TERMINAL_OUTPUT.
 - Add GRUB_TERMINAL="console serial".
 - Add GRUB_SERIAL_COMMAND="serial --speed=115200".

The following is an example of /etc/default/grub. You might need to change the configuration based on your system setup.

```
GRUB_TIMEOUT=1
GRUB_DISTRIBUTOR="$(sed 's, release .*$,,g' /etc/system-release)"
GRUB_DEFAULT=saved
GRUB_DISABLE_SUBMENU=true
GRUB_CMDLINE_LINUX="console=ttyS0,115200n8 console=tty0 net.ifnames=0
    rd.blacklist=nouveau nvme_core.io_timeout=4294967295 crashkernel=auto"
GRUB_DISABLE_RECOVERY="true"
GRUB_ENABLE_BLSCFG=true
GRUB_TERMINAL="console serial"
GRUB_SERIAL_COMMAND="serial --speed=115200"
```

3. Apply the updated configuration by running the following command.

```
[ec2-user ~]$ sudo grub2-mkconfig -o /boot/grub2/grub.cfg
```

CentOS

For instances that are launched using a CentOS AMI, GRUB is configured for the serial console by default.

The following is an example of `/etc/default/grub`. Your configuration might be different based on your system setup.

```
GRUB_TIMEOUT=1
GRUB_DISTRIBUTOR="$(sed 's, release .*$,,g' /etc/system-release)"
GRUB_DEFAULT=saved
GRUB_DISABLE_SUBMENU=true
GRUB_TERMINAL="serial console"
GRUB_SERIAL_COMMAND="serial --speed=115200"
GRUB_CMDLINE_LINUX="console=tty0 crashkernel=auto console=ttyS0,115200"
GRUB_DISABLE_RECOVERY="true"
```

Use GRUB

After GRUB is configured, connect to the serial console and reboot the instance with the `reboot` command. During reboot, you see the GRUB menu. Press any key when the GRUB menu appears to stop the boot process, allowing you to interact with the GRUB menu.

Topics

- [Single user mode \(p. 1775\)](#)
- [Emergency mode \(p. 1776\)](#)

Single user mode

Single user mode will boot the kernel at a lower runlevel. For example, it might mount the filesystem but not activate the network, giving you the opportunity to perform the maintenance necessary to fix the instance.

To boot into single user mode

1. [Connect \(p. 1768\)](#) to the instance's serial console.
2. Reboot the instance using the following command.

```
[ec2-user ~]$ sudo reboot
```

3. During reboot, when the GRUB menu appears, press any key to stop the boot process.
4. In the GRUB menu, use the arrow keys to select the kernel to boot into, and press `e` on your keyboard.
5. Use the arrow keys to locate your cursor on the line containing the kernel. The line begins with either `linux` or `linux16` depending on the AMI that was used to launch the instance. For Ubuntu, two lines begin with `linux`, which must both be modified in the next step.
6. At the end of the line, add the word `single`.

The following is an example for Amazon Linux 2.

```
linux /boot/vmlinuz-4.14.193-149.317.amzn2.aarch64 root=UUID=d33f9c9a-\\
```

```
dadd-4499-938d-ebbf42c3e499 ro console=tty0 console=ttyS0,115200n8 net.ifname\  
s=0 biosdevname=0 nvme_core.io_timeout=4294967295 rd.emergency=poweroff rd.she\  
l1l=0 single
```

7. Press **Ctrl+X** to boot into single user mode.
8. At the **Login** prompt, enter the user name of the password-based user that you [set up previously \(p. 1766\)](#), and then press **Enter**.
9. At the **Password** prompt, enter the password, and then press **Enter**.

Emergency mode

Emergency mode is similar to single user mode except that the kernel runs at the lowest runlevel possible.

To boot into emergency mode, follow the steps in [Single user mode \(p. 1775\)](#) in the preceding section, but at step 6 add the word `emergency` instead of `single`.

Troubleshoot your Linux instance using SysRq

The System Request (SysRq) key, which is sometimes referred to as "magic SysRq", can be used to directly send the kernel a command, outside of a shell, and the kernel will respond, regardless of what the kernel is doing. For example, if the instance has stopped responding, you can use the SysRq key to tell the kernel to crash or reboot. For more information, see [Magic SysRq key](#) in Wikipedia.

Topics

- [Prerequisites \(p. 1776\)](#)
- [Configure SysRq \(p. 1776\)](#)
- [Use SysRq \(p. 1777\)](#)

Prerequisites

Before you can configure and use SysRq, you must grant access to the serial console. For more information, see [Configure access to the EC2 Serial Console \(p. 1762\)](#).

Configure SysRq

To configure SysRq, you enable the SysRq commands for the current boot cycle. To make the configuration persistent, you can also enable the SysRq commands for subsequent boots.

To enable all SysRq commands for the current boot cycle

1. [Connect \(p. 611\)](#) to your instance.
2. Run the following command.

```
[ec2-user ~]$ sudo sysctl -w kernel.sysrq=1
```

Note

This setting will clear on the next reboot.

To enable all SysRq commands for subsequent boots

1. Create the file `/etc/sysctl.d/99-sysrq.conf` and open it in your favorite editor.

```
[ec2-user ~]$ sudo vi /etc/sysctl.d/99-sysrq.conf
```

2. Add the following line.

```
kernel.sysrq=1
```

3. Reboot the instance to apply the changes.

```
[ec2-user ~]$ sudo reboot
```

4. At the login prompt, enter the user name of the password-based user that you [set up previously \(p. 1766\)](#), and then press **Enter**.
5. At the **Password** prompt, enter the password, and then press **Enter**.

Use SysRq

You can use SysRq commands in the EC2 Serial Console browser-based client or in an SSH client. The command to send a break request is different for each client.

To use SysRq, choose one of the following procedures based on the client that you are using.

Browser-based client

To use SysRq in the serial console browser-based client

1. [Connect \(p. 1768\)](#) to the instance's serial console.
2. To send a break request, press **CTRL+0** (zero). If your keyboard supports it, you can also send a break request using the Pause or Break key.

```
[ec2-user ~]$ CTRL+0
```

3. To issue a SysRq command, press the key on your keyboard that corresponds to the required command. For example, to display a list of SysRq commands, press **h**.

```
[ec2-user ~]$ h
```

The **h** command outputs something similar to the following.

```
[ 1169.389495] sysrq: HELP : loglevel(0-9) reboot(b) crash(c) terminate-all-tasks(e) memory-full-oom-kill(f) kill-all-tasks(i) thaw/filesystems(j) sak(k) show-backtrace-all-active-cpus(l) show-memory-usage(m) nice-all-RT-tasks(n) poweroff(o) show-registers(p) show-all-timers(q) unwind(r) sync(s) show-task-states(t) umount(u) show-blocked-tasks(w) dump-ftrace-buffer(z)
```

SSH client

To use SysRq in an SSH client

1. [Connect \(p. 1768\)](#) to the instance's serial console.
2. To send a break request, press **~B** (tilde, followed by uppercase **B**).

```
[ec2-user ~]$ ~B
```

3. To issue a SysRq command, press the key on your keyboard that corresponds to the required command. For example, to display a list of SysRq commands, press h.

```
[ec2-user ~]$ h
```

The h command outputs something similar to the following.

```
[ 1169.389495] sysrq: HELP : loglevel(0-9) reboot(b) crash(c) terminate-all-tasks(e) memory-full-oom-kill(f) kill-all-tasks(i) thaw/filesystems(j) sak(k) show-backtrace-all-active-cpus(l) show-memory-usage(m) nice-all-RT-tasks(n) poweroff(o) show-registers(p) show-all-timers(q) unwind(r) sync(s) show-task-states(t) umount(u) show-blocked-tasks(w) dump-ftrace-buffer(z)
```

Note

The command that you use for sending a break request might be different depending on the SSH client that you're using.

Send a diagnostic interrupt (for advanced users)

Warning

Diagnostic interrupts are intended for use by advanced users. Incorrect usage could negatively impact your instance. Sending a diagnostic interrupt to an instance could trigger an instance to crash and reboot, which could lead to the loss of data.

You can send a diagnostic interrupt to an unreachable or unresponsive Linux instance to manually trigger a *kernel panic*.

Linux operating systems typically crash and reboot when a kernel panic occurs. The specific behavior of the operating system depends on its configuration. A kernel panic can also be used to cause the instance's operating system kernel to perform tasks, such as generating a crash dump file. You can then use the information in the crash dump file to conduct root cause analysis and debug the instance.

The crash dump data is generated locally by the operating system on the instance itself.

Before sending a diagnostic interrupt to your instance, we recommend that you consult the documentation for your operating system and then make the necessary configuration changes.

Contents

- [Supported instance types \(p. 1778\)](#)
- [Prerequisites \(p. 1778\)](#)
- [Send a diagnostic interrupt \(p. 1781\)](#)

Supported instance types

Diagnostic interrupt is supported on all Nitro-based instance types, except A1. For more information, see [Instances built on the Nitro System \(p. 247\)](#).

Prerequisites

Before using a diagnostic interrupt, you must configure your instance's operating system. This ensures that it performs the actions that you need when a kernel panic occurs.

To configure Amazon Linux 2 to generate a crash dump when a kernel panic occurs

1. Connect to your instance.
2. Install **kexec** and **kdump**.

```
[ec2-user ~]$ sudo yum install kexec-tools -y
```

3. Configure the kernel to reserve an appropriate amount of memory for the secondary kernel. The amount of memory to reserve depends on the total available memory of your instance. Open the `/etc/default/grub` file using your preferred text editor, locate the line that starts with `GRUB_CMDLINE_LINUX_DEFAULT`, and then add the `crashkernel` parameter in the following format: `crashkernel=memory_to_reserve`. For example, to reserve 160MB, modify the `grub` file as follows:

```
GRUB_CMDLINE_LINUX_DEFAULT="crashkernel=160M console=tty0 console=ttyS0,115200n8
net.ifnames=0 biosdevname=0 nvme_core.io_timeout=4294967295 rd.emergency=poweroff
rd.shell=0"
GRUB_TIMEOUT=0
GRUB_DISABLE_RECOVERY="true"
```

4. Save the changes and close the `grub` file.
5. Rebuild the GRUB2 configuration file.

```
[ec2-user ~]$ sudo grub2-mkconfig -o /boot/grub2/grub.cfg
```

6. On instances based on Intel and AMD processors, the `send-diagnostic-interrupt` command sends an *unknown non-maskable interrupt* (NMI) to the instance. You must configure the kernel to crash when it receives the unknown NMI. Open the `/etc/sysctl.conf` file using your preferred text editor and add the following.

```
kernel.unknown_nmi_panic=1
```

7. Reboot and reconnect to your instance.
8. Verify that the kernel has been booted with the correct `crashkernel` parameter.

```
$ grep crashkernel /proc/cmdline
```

The following example output indicates successful configuration.

```
BOOT_IMAGE=/boot/vmlinuz-4.14.128-112.105.amzn2.x86_64 root=UUID=a1e1011e-
e38f-408e-878b-fed395b47ad6 ro crashkernel=160M console=tty0 console=ttyS0,115200n8
net.ifnames=0 biosdevname=0 nvme_core.io_timeout=4294967295 rd.emergency=poweroff
rd.shell=0
```

9. Verify that the **kdump** service is running.

```
[ec2-user ~]$ systemctl status kdump.service
```

The following example output shows the result if the **kdump** service is running.

```
kdump.service - Crash recovery kernel arming
   Loaded: loaded (/usr/lib/systemd/system/kdump.service; enabled; vendor preset:
             enabled)
     Active: active (exited) since Fri 2019-05-24 23:29:13 UTC; 22s ago
       Process: 2503 ExecStart=/usr/bin/kdumpctl start (code=exited, status=0/SUCCESS)
      Main PID: 2503 (code=exited, status=0/SUCCESS)
```

Note

By default, the crash dump file is saved to `/var/crash/`. To change the location, modify the `/etc/kdump.conf` file using your preferred text editor.

To configure Amazon Linux to generate a crash dump when a kernel panic occurs

1. Connect to your instance.
2. Install **kexec** and **kdump**.

```
[ec2-user ~]$ sudo yum install kexec-tools -y
```

3. Configure the kernel to reserve an appropriate amount of memory for the secondary kernel. The amount of memory to reserve depends on the total available memory of your instance.

```
$ sudo grubby --args="crashkernel=memory_to_reserve" --update-kernel=ALL
```

For example, to reserve 160MB for the crash kernel, use the following command.

```
$ sudo grubby --args="crashkernel=160M" --update-kernel=ALL
```

4. On instances based on Intel and AMD processors, the `send-diagnostic-interrupt` command sends an *unknown non-maskable interrupt* (NMI) to the instance. You must configure the kernel to crash when it receives the unknown NMI. Open the `/etc/sysctl.conf` file using your preferred text editor and add the following.

```
kernel.unknown_nmi_panic=1
```

5. Reboot and reconnect to your instance.
6. Verify that the kernel has been booted with the correct `crashkernel` parameter.

```
$ grep crashkernel /proc/cmdline
```

The following example output indicates successful configuration.

```
root=LABEL=/ console=tty1 console=ttyS0 selinux=0 nvme_core.io_timeout=4294967295  
LANG=en_US.UTF-8 KEYTABLE=us crashkernel=160M
```

7. Verify that the **kdump** service is running.

```
[ec2-user ~]$ sudo service kdump status
```

If the service is running, the command returns the `Kdump is operational` response.

Note

By default, the crash dump file is saved to `/var/crash/`. To change the location, modify the `/etc/kdump.conf` file using your preferred text editor.

To configure SUSE Linux Enterprise, Ubuntu, or Red Hat Enterprise Linux

See the following websites:

- [SUSE Linux Enterprise](#)
- [Ubuntu](#)
- [Red Hat Enterprise Linux \(RHEL\)](#)

Note

On instances based on Intel and AMD processors, the `send-diagnostic-interrupt` command sends an *unknown non-maskable interrupt* (NMI) to the instance. You must configure the kernel to crash when it receives the unknown NMI. Add the following to your configuration file.

```
kernel.unknown_nmi_panic=1
```

Send a diagnostic interrupt

After you have completed the necessary configuration changes, you can send a diagnostic interrupt to your instance using the AWS CLI or Amazon EC2 API.

To send a diagnostic interrupt to your instance (AWS CLI)

Use the [send-diagnostic-interrupt](#) command and specify the instance ID.

```
aws ec2 send-diagnostic-interrupt --instance-id i-1234567890abcdef0
```

Document history

The following table describes important additions to the Amazon EC2 documentation starting in 2019. We also update the documentation frequently to address the feedback that you send us.

update-history-change	update-history-description	update-history-date
C6a instances (p. 1782)	New compute optimized instances featuring 3rd generation AMD EPYC processors (Milan).	February 14, 2022
Recycle Bin for AMIs	Recycle Bin enables you to restore accidentally deleted AMIs.	February 3, 2022
X2iezn instances (p. 1782)	New memory optimized instances featuring Intel Xeon Platinum processors (Cascade Lake).	January 26, 2022
ED25519 keys	ED25519 keys are now supported for EC2 Instance Connect and EC2 Serial Console.	January 20, 2022
New Local Zones added	Add Local Zones in Atlanta, Phoenix, and Seattle.	January 11, 2022
Additional RHEL platforms for Capacity Reservations	Additional Red Hat Enterprise Linux platforms for On-Demand Capacity Reservations.	January 11, 2022
Hpc6a instances (p. 1782)	New compute optimized instances featuring AMD EPYC processors.	January 10, 2022
Instance tags in instance metadata	You can access an instance's tags from the instance metadata.	January 6, 2022
Capacity Reservations in cluster placement groups	You can create Capacity Reservations in cluster placement groups.	January 6, 2022
Im4gn and Is4gen instances (p. 1782)	New storage optimized instances.	November 30, 2021
Recycle Bin for Amazon EBS snapshots	Recycle Bin for Amazon EBS snapshots is a snapshot recovery feature that enables you to restore accidentally deleted snapshots.	November 29, 2021
M6a instances (p. 1782)	New general purpose instances powered by AMD 3rd Generation EPYC processors.	November 29, 2021

G5g instances (p. 1782)	New accelerated computing instances featuring AWS Graviton2 processors based on 64-bit Arm architecture.	November 29, 2021
Amazon EBS Snapshots Archive	Amazon EBS Snapshots Archive is a new storage tier that you can use for low-cost, long-term storage of your rarely-accessed snapshots.	November 29, 2021
R6i instances (p. 1782)	New memory optimized instances.	November 22, 2021
G5 instances (p. 1782)	New accelerated computing instances featuring up to 8 NVIDIA A10G GPUs and second generation AMD EPY processors.	November 11, 2021
Spot Fleet launch-before-terminate	Spot Fleet can terminate the Spot Instances that receive a rebalance notification after new replacement Spot Instances are launched.	November 4, 2021
EC2 Fleet launch-before-terminate	EC2 Fleet can terminate the Spot Instances that receive a rebalance notification after new replacement Spot Instances are launched.	November 4, 2021
Compare timestamps	You can determine the true time of an event by comparing the timestamp of your Amazon EC2 Linux instance with ClockBound.	November 2, 2021
Share AMIs with organizations and OUs	You can now share AMIs with the following AWS resources: organizations and organizational units (OUs).	October 29, 2021
C6i instances (p. 1782)	New compute optimized instances featuring Intel Xeon Scalable processors (Ice Lake).	October 28, 2021
Spot placement score	Get a recommendation for an AWS Region or Availability Zone based on your Spot capacity requirements.	October 27, 2021
Attribute-based instance type selection for Spot Fleet	Specify the attributes that an instance must have, and Amazon EC2 will identify all the instance types with those attributes.	October 27, 2021
Attribute-based instance type selection for EC2 Fleet	Specify the attributes that an instance must have, and Amazon EC2 will identify all the instance types with those attributes.	October 27, 2021

New Local Zones added	Add Local Zones in Las Vegas, New York City, and Portland.	October 26, 2021
DL1 instances (p. 1782)	New accelerated computing instances featuring Habana Gaudi accelerators and Intel Xeon Platinum processors (Cascade Lake).	October 26, 2021
On-Demand Capacity Reservation Fleet	You can use a Capacity Reservation Fleet to launch a group, or fleet, of Capacity Reservations.	October 5, 2021
Hibernation support for Ubuntu 20.04 LTS - Focal	Hibernate your newly-launched instances that were launched from the Ubuntu 20.04 LTS - Focal AMI.	October 4, 2021
EC2 Fleet and targeted On-Demand Capacity Reservations	EC2 Fleet can launch On-Demand Instances into targeted Capacity Reservations.	September 22, 2021
T3 instances on Dedicated Hosts	Support for T3 instances on Amazon EC2 Dedicated Host.	September 14, 2021
VT1 instances (p. 1782)	New accelerated computing instances that use Xilinx Alveo U30 media accelerators and are designed for live video transcoding workloads.	September 13, 2021
Hibernation support for RHEL, Fedora, and CentOS	Hibernate your newly-launched instances that were launched from RHEL, Fedora, and CentOS AMIs.	September 9, 2021
New Local Zones added	Add Local Zones in Chicago, Minneapolis, and Kansas City.	September 8, 2021
Amazon EC2 Global View	Amazon EC2 Global View enables you to view VPCs, subnets, instances, security groups, and volumes across multiple AWS Regions in a single console.	September 1, 2021
AMI deprecation support for Amazon Data Lifecycle Manager	Amazon Data Lifecycle Manager EBS-backed AMI policies can deprecate AMIs. The <code>AWSDataLifecycleManagerServiceRoleForAMIManagement</code> AWS managed policy has been updated to support this feature.	August 23, 2021
Hibernation support for C5d, M5d, and R5d	Hibernate your newly-launched instances running on C5d, M5d, and R5d instance types.	August 19, 2021

Amazon EC2 key pairs	Amazon EC2 now supports ED25519 keys on Linux and Mac instances.	August 17, 2021
M6i instances (p. 1782)	New general purpose instances featuring third generation Intel Xeon Scalable processors (Ice Lake).	August 16, 2021
CloudWatch metrics for Amazon Data Lifecycle Manager	You can monitor your Amazon Data Lifecycle Manager policies using Amazon CloudWatch.	July 28, 2021
New Local Zone added	Add Local Zone in Denver.	July 27, 2021
CloudTrail data events for EBS direct APIs	The ListSnapshotBlocks, ListChangedBlocks, GetSnapshotBlock, and PutSnapshotBlock APIs can be logged data events in CloudTrail.	July 27, 2021
Prefixes for network interfaces	You can assign a private IPv4 or IPv6 CIDR range, either automatically or manually, to your network interfaces.	July 22, 2021
io2 Block Express volumes	io2 Block Express volumes are now generally available in all Regions and Availability Zones that support R5b instances.	July 19, 2021
Event windows	You can define custom, weekly-recurring event windows for scheduled events that reboot, stop, or terminate your Amazon EC2 instances.	July 15, 2021
Resource IDs and tagging support for security group rules (p. 1782)	You can refer to security group rules by resource ID. You can also add tags to your security group rules.	July 7, 2021
New Local Zones added	Add Local Zones in Dallas and Philadelphia.	July 7, 2021
Deprecate an AMI	You can now specify when an AMI is deprecated.	June 11, 2021
Windows per-second billing (p. 1782)	Amazon EC2 charges for Windows- and SQL Server-based usage by the second, with a one-minute minimum charge.	June 10, 2021
Capacity Reservations on AWS Outposts	You can now use Capacity Reservations on AWS Outposts.	May 24, 2021
Capacity Reservation sharing	You can now share Capacity Reservations created in Local Zones and Wavelength Zones.	May 24, 2021

High memory virtualized instances (p. 1782)	Virtualized high memory instances purpose-built to run large in-memory databases. The new types are u-6tb1.56xlarge, u-6tb1.112xlarge, u-9tb1.112xlarge, and u-12tb1.112xlarge.	May 11, 2021
Root volume replacement	You can now use root volume replacement tasks to replace the root EBS volume for running instances.	April 22, 2021
Store and restore an AMI using S3	Store EBS-backed AMIs in S3 and restore them from S3 to enable cross-partition copying of AMIs.	April 6, 2021
EC2 Serial Console	Troubleshoot boot and network connectivity issues by establishing a connection to the serial port of an instance.	March 30, 2021
Boot modes	Amazon EC2 now supports UEFI boot on selected AMD- and Intel-based EC2 instances.	March 22, 2021
X2gd instances (p. 1782)	New memory optimized instances featuring an AWS Graviton2 processor based on 64-bit Arm architecture.	March 16, 2021
Amazon EBS local snapshots on Outposts	You can now use Amazon EBS local snapshots on Outposts to store snapshots of volumes on an Outpost locally in Amazon S3 on the Outpost itself.	February 4, 2021
Create a reverse DNS record	You can now set up reverse DNS lookup for your Elastic IP addresses.	February 3, 2021
Multi-Attach support for io2 volumes	You can now enable Provisioned IOPS SSD (io2) volumes for Amazon EBS Multi-Attach.	December 18, 2020
C6gn instances (p. 1782)	New compute optimized instances featuring an AWS Graviton2 processor based on 64-bit Arm architecture. These instances can utilize up to 100 Gbps of network bandwidth.	December 18, 2020
Amazon Data Lifecycle Manager	Use Amazon Data Lifecycle Manager to automate the process of sharing snapshots and copying them across AWS accounts.	December 17, 2020

G4ad instances (p. 1782)	New instances powered by AMD Radeon Pro V520 GPUs and AMD 2nd Generation EPYC processors.	December 9, 2020
Tag AMIs and snapshots on AMI creation	When you create an AMI, you can tag the AMI and the snapshots with the same tags, or you can tag them with different tags.	December 4, 2020
io2 Block Express preview	You can opt in to the io2 Block Express volumes preview. io2 Block Express volumes provide sub-millisecond latency, and support higher IOPS, higher throughput, and larger capacity than io2 volumes.	December 1, 2020
gp3 volumes (p. 1782)	A new Amazon EBS General Purpose SSD volume type. You can specify provisioned IOPS and throughput when you create or modify the volume.	December 1, 2020
D3, D3en, M5zn, and R5b instances (p. 1782)	New instance types built on the Nitro System.	December 1, 2020
Throughput Optimized HDD and Cold HDD volume sizes	Throughput Optimized HDD (st1) and Cold HDD (sc1) volumes can range in size from 125 GiB to 16 TiB.	November 30, 2020
Mac1 instances	New instances built on Apple Mac mini computers that support running macOS workloads on Amazon EC2.	November 30, 2020
Use Amazon EventBridge to monitor Spot Fleet events	Create EventBridge rules that trigger programmatic actions in response to Spot Fleet state changes and errors.	November 20, 2020
Use Amazon EventBridge to monitor EC2 Fleet events	Create EventBridge rules that trigger programmatic actions in response to EC2 Fleet state changes and errors.	November 20, 2020
Delete instant fleets	Delete an EC2 Fleet of type instant and terminate all the instances in the fleet in a single API call.	November 18, 2020
Hibernation support for T3 and T3a	Hibernate your newly-launched instances running on T3 and T3a instance types.	November 17, 2020

Amazon EFS Quick Create	You can create and mount an Amazon Elastic File System (Amazon EFS) file system to an instance at launch using Amazon EFS Quick Create.	November 9, 2020
Amazon Data Lifecycle Manager	You can use Amazon Data Lifecycle Manager to automate the creation, retention, and deletion of EBS-backed AMIs.	November 9, 2020
Instance metadata category: events/recommendations/rebalance	The approximate time, in UTC, when the EC2 instance rebalance recommendation notification is emitted for the instance.	November 4, 2020
EC2 instance rebalance recommendation	A signal that notifies you when a Spot Instance is at elevated risk of interruption.	November 4, 2020
Capacity Reservations in Wavelength Zones	Capacity Reservations can now be created and used in Wavelength Zones.	November 4, 2020
Capacity Rebalancing	Configure Spot Fleet or EC2 Fleet to launch a replacement Spot Instance when Amazon EC2 emits a rebalance recommendation.	November 4, 2020
P4d instances (p. 1782)	New accelerated computing instances that provide a high-performance platform for machine learning and HPC workloads.	November 2, 2020
Hibernation support for I3, M5ad, and R5ad	Hibernate your newly-launched instances running on I3, M5ad, and R5ad instance types.	October 21, 2020
Spot Instance vCPU limits	Spot Instance limits are now managed in terms of the number of vCPUs that your running Spot Instances are either using or will use pending the fulfillment of open requests.	October 1, 2020
Capacity Reservations in Local Zones	Capacity Reservations can now be created and used in Local Zones.	September 30, 2020
Amazon Data Lifecycle Manager	Amazon Data Lifecycle Manager policies can be configured with up to four schedules.	September 17, 2020

T4g instances (p. 1782)	New general purpose instances powered by AWS Graviton2 processors, which are based on 64-bit Arm Neoverse cores and custom silicon designed by AWS for optimized performance and cost.	September 14, 2020
Hibernation support for M5a and R5a	Hibernate your newly-launched instances running on M5a and R5a instance types.	August 28, 2020
Provisioned IOPS SSD (io2) volumes for Amazon EBS	Provisioned IOPS SSD (io2) volumes are designed to provide 99.999 percent volume durability with an AFR no higher than 0.001 percent.	August 24, 2020
Instance metadata provides instance location and placement information	New instance metadata fields under the placement category: Region, placement group name, partition number, host ID, and Availability Zone ID.	August 24, 2020
C5ad instances (p. 1782)	New compute optimized instances featuring second-generation AMD EPYC processors.	August 13, 2020
Wavelength Zones	A Wavelength Zone is an isolated zone in the carrier location where the Wavelength infrastructure is deployed.	August 6, 2020
Capacity Reservation groups	You can use AWS Resource Groups to create logical collections of Capacity Reservations, and then target instance launches into those groups.	July 29, 2020
C6gd, M6gd, and R6gd instances (p. 1782)	New general purpose instances powered by AWS Graviton2 processors, which are based on 64-bit Arm Neoverse cores and custom silicon designed by AWS for optimized performance and cost.	July 27, 2020
Fast snapshot restore	You can enable fast snapshot restore for snapshots that are shared with you.	July 21, 2020

C6g and R6g instances (p. 1782)	New general purpose instances powered by AWS Graviton2 processors, which are based on 64-bit Arm Neoverse cores and custom silicon designed by AWS for optimized performance and cost.	June 10, 2020
Bare metal instances for G4dn (p. 1782)	New instances that provide your applications with direct access to the physical resources of the host server.	June 5, 2020
C5a instances (p. 1782)	New compute optimized instances featuring second-generation AMD EPYC processors.	June 4, 2020
Bring your own IPv6 addresses	You can bring part or all of your IPv6 address range from your on-premises network to your AWS account.	May 21, 2020
M6g instances (p. 1782)	New general purpose instances powered by AWS Graviton2 processors, which are based on 64-bit Arm Neoverse cores and custom silicon designed by AWS for optimized performance and cost.	May 11, 2020
Launch instances using a Systems Manager parameter	You can specify a AWS Systems Manager parameter instead of an AMI when you launch an instance.	May 5, 2020
Customize scheduled event notifications	You can customize scheduled event notifications to include tags in the email notification.	May 4, 2020
Amazon Linux 2 Kernel Live Patching	Kernel Live Patching for Amazon Linux 2 enables you to apply security vulnerability and critical bug patches to a running Linux kernel, without reboots or disruptions to running applications.	April 28, 2020
Amazon EBS Multi-Attach	You can now attach a single Provisioned IOPS SSD (io1) volume to up to 16 Nitro-based instances that are in the same Availability Zone.	February 14, 2020
Stop and start a Spot Instance	Stop your Spot Instances backed by Amazon EBS and start them at will, instead of relying on the stop interruption behavior.	January 13, 2020

Resource tagging (p. 1782)	You can tag egress-only internet gateways, local gateways, local gateway route tables, local gateway virtual interfaces, local gateway virtual interface groups, local gateway route table VPC associations, and local gateway route table virtual interface group associations.	January 10, 2020
Connect to your instance using Session Manager	You can start a Session Manager session with an instance from the Amazon EC2 console.	December 18, 2019
Inf1 instances (p. 1782)	New instances featuring AWS Inferentia, a machine learning inference chip designed to deliver high performance at a low cost.	December 3, 2019
Dedicated Hosts and host resource groups	Dedicated Hosts can now be used with host resource groups.	December 2, 2019
Dedicated Host sharing	You can now share your Dedicated Hosts across AWS accounts.	December 2, 2019
Default credit specification at the account level	You can set the default credit specification per burstable performance instance family at the account level per AWS Region.	November 25, 2019
Instance type discovery	You can find an instance type that meets your needs.	November 22, 2019
Dedicated Hosts (p. 1782)	You can now configure a Dedicated Host to support multiple instance types in an instance family.	November 21, 2019
Amazon EBS fast snapshot restores	You can enable fast snapshot restores on an EBS snapshot to ensure that EBS volumes created from the snapshot are fully-initialized at creation and instantly deliver all of their provisioned performance.	November 20, 2019
Instance Metadata Service Version 2	You can use Instance Metadata Service Version 2, which is a session-oriented method for requesting instance metadata.	November 19, 2019
Elastic Fabric Adapter (p. 1782)	Elastic Fabric Adapters can now be used with Intel MPI 2019 Update 6.	November 15, 2019

Queued purchases of Reserved Instances	You can queue the purchase of a Reserved Instance up to three years in advance.	October 4, 2019
G4dn instances (p. 1782)	New instances featuring NVIDIA Tesla GPUs.	September 19, 2019
Diagnostic interrupt	You can send a diagnostic interrupt to an unreachable or unresponsive instance to trigger a kernel panic.	August 14, 2019
Capacity optimized allocation strategy	Using EC2 Fleet or Spot Fleet, you can launch Spot Instances from Spot pools with optimal capacity for the number of instances that are launching.	August 12, 2019
On-Demand Capacity Reservation sharing	You can now share your Capacity Reservations across AWS accounts.	July 29, 2019
Elastic Fabric Adapter (p. 1782)	EFA now supports Open MPI 3.1.4 and Intel MPI 2019 Update 4.	July 26, 2019
Resource tagging (p. 1782)	Launch templates on creation.	July 24, 2019
EC2 Instance Connect	EC2 Instance Connect is a simple and secure way to connect to your instances using Secure Shell (SSH).	June 27, 2019
Host recovery	Automatically restart your instances on a new host in the event of an unexpected hardware failure on a Dedicated Host.	June 5, 2019
Amazon EBS multi-volume snapshots	You can take exact point-in-time, data coordinated, and crash-consistent snapshots across multiple EBS volumes attached to an EC2 instance.	May 29, 2019
Resource tagging (p. 1782)	You can tag Dedicated Host Reservations.	May 27, 2019
Amazon EBS encryption by default	After you enable encryption by default in a Region, all new EBS volumes you create in the Region are encrypted using the default KMS key for EBS encryption.	May 23, 2019
Resource tagging (p. 1782)	You can tag VPC endpoints, endpoint services, and endpoint service configurations.	May 13, 2019

Windows to Linux Replatforming Assistant for Microsoft SQL Server Databases	Move existing Microsoft SQL Server workloads from a Windows to a Linux operating system.	May 8, 2019
I3en instances (p. 1782)	New I3en instances can utilize up to 100 Gbps of network bandwidth.	May 8, 2019
Elastic Fabric Adapter	You can attach an Elastic Fabric Adapter to your instances to accelerate High Performance Computing (HPC) applications.	April 29, 2019
T3a instances (p. 1782)	New instances featuring AMD EPYC processors.	April 24, 2019
M5ad and R5ad instances (p. 1782)	New instances featuring AMD EPYC processors.	March 27, 2019
Resource tagging (p. 1782)	You can assign custom tags to your Dedicated Host Reservations to categorize them in different ways.	March 14, 2019
Bare metal instances for M5, M5d, R5, R5d, and z1d (p. 1782)	New instances that provide your applications with direct access to the physical resources of the host server.	February 13, 2019

History for previous years

The following table describes important additions to the Amazon EC2 documentation in 2018 and earlier years.

Feature	API version	Description	Release date
Partition placement groups	2016-11-15	Partition placement groups spread instances across logical partitions, ensuring that instances in one partition do not share underlying hardware with instances in other partitions. For more information, see Partition placement groups (p. 1192) .	20 December 2018
p3dn.24xlarge instances	2016-11-15	New p3dn.24xlarge instances provide 100 Gbps of network bandwidth.	7 December 2018
Hibernate EC2 Linux instances	2016-11-15	You can hibernate a Linux instance if it's enabled for hibernation and it meets the hibernation prerequisites. For more information, see Hibernate your On-Demand Linux instance (p. 640) .	28 November 2018
Amazon Elastic Inference Accelerators	2016-11-15	You can attach an Amazon EI accelerator to your instances to add GPU-powered acceleration to reduce the cost of running deep learning	28 November 2018

Feature	API version	Description	Release date
		inference. For more information, see Amazon Elastic Inference (p. 776) .	
Instances featuring 100 Gbps of network bandwidth	2016-11-15	New C5n instances can utilize up to 100 Gbps of network bandwidth.	26 November 2018
Instances featuring Arm-based Processors	2016-11-15	New A1 instances deliver significant cost savings and are ideally suited for scale-out and Arm-based workloads.	26 November 2018
Spot console recommends a fleet of instances	2016-11-15	The Spot console recommends a fleet of instances based on Spot best practice (instance diversification) to meet the minimum hardware specifications (vCPUs, memory, and storage) for your application need. For more information, see Create a Spot Fleet request (p. 872) .	20 November 2018
New EC2 Fleet request type: instant	2016-11-15	EC2 Fleet now supports a new request type, instant, that you can use to synchronously provision capacity across instance types and purchase models. The instant request returns the launched instances in the API response, and takes no further action, enabling you to control if and when instances are launched. For more information, see EC2 Fleet request types (p. 780) .	14 November 2018
Instances featuring AMD EPYC processors	2016-11-15	New general purpose (M5a) and memory optimized instances (R5a) offer lower-priced options for microservices, small to medium databases, virtual desktops, development and test environments, business applications, and more.	6 November 2018
Spot savings information	2016-11-15	You can view the savings made from using Spot Instances for a single Spot Fleet or for all Spot Instances. For more information, see Savings from purchasing Spot Instances (p. 447) .	5 November 2018
Console support for optimizing CPU options	2016-11-15	When you launch an instance, you can optimize the CPU options to suit specific workloads or business needs using the Amazon EC2 console. For more information, see Optimize CPU options (p. 691) .	31 October 2018
Console support for creating a launch template from an instance	2016-11-15	You can create a launch template using an instance as the basis for a new launch template using the Amazon EC2 console. For more information, see Create a launch template (p. 596) .	30 October 2018

Feature	API version	Description	Release date
On-Demand Capacity Reservations	2016-11-15	You can reserve capacity for your Amazon EC2 instances in a specific Availability Zone for any duration. This allows you to create and manage capacity reservations independently from the billing discounts offered by Reserved Instances (RI). For more information, see On-Demand Capacity Reservations (p. 538) .	25 October 2018
Bring Your Own IP Addresses (BYOIP)	2016-11-15	You can bring part or all of your public IPv4 address range from your on-premises network to your AWS account. After you bring the address range to AWS, it appears in your account as an address pool. You can create an Elastic IP address from your address pool and use it with your AWS resources. For more information, see Bring your own IP addresses (BYOIP) in Amazon EC2 (p. 1058) .	23 October 2018
g3s.xlarge instances	2016-11-15	Expands the range of the accelerated-computing G3 instance family with the introduction of g3s.xlarge instances.	11 October 2018
Dedicated Host tag on create and console support	2016-11-15	You can tag your Dedicated Hosts on creation, and you can manage your Dedicated Host tags using the Amazon EC2 console. For more information, see Allocate Dedicated Hosts (p. 504) .	08 October 2018
High memory instances	2016-11-15	These instances are purpose-built to run large in-memory databases. They offer bare metal performance with direct access to host hardware. For more information, see Memory optimized instances (p. 319) .	27 September 2018
f1.4xlarge instances	2016-11-15	Expands the range of the accelerated-computing F1 instance family with the introduction of f1.4xlarge instances.	25 September 2018
Console support for scheduled scaling for Spot Fleet	2016-11-15	Increase or decrease the current capacity of the fleet based on the date and time. For more information, see Scale Spot Fleet using scheduled scaling (p. 891) .	20 September 2018
T3 instances	2016-11-15	T3 instances are burstable general-purpose instance type that provide a baseline level of CPU performance with the ability to burst CPU usage at any time for as long as required. For more information, see Burstable performance instances (p. 266) .	21 August 2018
Allocation strategies for EC2 Fleets	2016-11-15	You can specify whether On-Demand capacity is fulfilled by price (lowest price first) or priority (highest priority first). You can specify the number of Spot pools across which to allocate your target Spot capacity. For more information, see Allocation strategies for Spot Instances (p. 799) .	26 July 2018

Feature	API version	Description	Release date
Allocation strategies for Spot Fleets	2016-11-15	You can specify whether On-Demand capacity is fulfilled by price (lowest price first) or priority (highest priority first). You can specify the number of Spot pools across which to allocate your target Spot capacity. For more information, see Allocation strategy for Spot Instances (p. 840) .	26 July 2018
R5 and R5d instances	2016-11-15	R5 and R5d instances are ideally suited for high-performance databases, distributed in-memory caches, and in-memory analytics. R5d instances come with NVMe instance store volumes. For more information, see Memory optimized instances (p. 319) .	25 July 2018
z1d instances	2016-11-15	These instances are designed for applications that require high per-core performance with a large amount of memory, such as electronic design automation (EDA) and relational databases. These instances come with NVME instance store volumes. For more information, see Memory optimized instances (p. 319) .	25 July 2018
Automate snapshot lifecycle	2016-11-15	You can use Amazon Data Lifecycle Manager to automate creation and deletion of snapshots for your EBS volumes. For more information, see Amazon Data Lifecycle Manager (p. 1485) .	12 July 2018
Launch template CPU options	2016-11-15	When you create a launch template using the command line tools, you can optimize the CPU options to suit specific workloads or business needs. For more information, see Create a launch template (p. 596) .	11 July 2018
Tag Dedicated Hosts	2016-11-15	You can tag your Dedicated Hosts. For more information, see Tag Dedicated Hosts (p. 515) .	3 July 2018
i3.metal instances	2016-11-15	i3.metal instances provide your applications with direct access to the physical resources of the host server, such as processors and memory. For more information, see Storage optimized instances (p. 335) .	17 May 2018
Get latest console output	2016-11-15	You can retrieve the latest console output for some instance types when you use the get-console-output AWS CLI command.	9 May 2018
Optimize CPU options	2016-11-15	When you launch an instance, you can optimize the CPU options to suit specific workloads or business needs. For more information, see Optimize CPU options (p. 691) .	8 May 2018

Feature	API version	Description	Release date
EC2 Fleet	2016-11-15	You can use EC2 Fleet to launch a group of instances across different EC2 instance types and Availability Zones, and across On-Demand Instance, Reserved Instance, and Spot Instance purchasing models. For more information, see EC2 Fleet (p. 778) .	2 May 2018
On-Demand Instances in Spot Fleets	2016-11-15	You can include a request for On-Demand capacity in your Spot Fleet request to ensure that you always have instance capacity. For more information, see Spot Fleet (p. 839) .	2 May 2018
Tag EBS snapshots on creation	2016-11-15	You can apply tags to snapshots during creation. For more information, see Create Amazon EBS snapshots (p. 1407) .	2 April 2018
Change placement groups	2016-11-15	You can move an instance in or out of a placement group, or change its placement group. For more information, see Change the placement group for an instance (p. 1202) .	1 March 2018
Longer resource IDs	2016-11-15	You can enable the longer ID format for more resource types. For more information, see Resource IDs (p. 1684) .	9 February 2018
Network performance improvements	2016-11-15	Instances outside of a cluster placement group can now benefit from increased bandwidth when sending or receiving network traffic between other instances or Amazon S3. For more information, see Networking and storage features (p. 248) .	24 January 2018
Tag Elastic IP addresses	2016-11-15	You can tag your Elastic IP addresses. For more information, see Tag an Elastic IP address (p. 1085) .	21 December 2017
Amazon Linux 2	2016-11-15	Amazon Linux 2 is a new version of Amazon Linux. It provides a high performance, stable, and secure foundation for your applications. For more information, see Amazon Linux (p. 211) .	13 December 2017
Amazon Time Sync Service	2016-11-15	You can use the Amazon Time Sync Service to keep accurate time on your instance. For more information, see Set the time for your Linux instance (p. 685) .	29 November 2017
T2 Unlimited	2016-11-15	T2 Unlimited instances can burst above the baseline for as long as required. For more information, see Burstable performance instances (p. 266) .	29 November 2017
Launch templates	2016-11-15	A launch template can contain all or some of the parameters to launch an instance, so that you don't have to specify them every time you launch an instance. For more information, see Launch an instance from a launch template (p. 594) .	29 November 2017

Feature	API version	Description	Release date
Spread placement	2016-11-15	Spread placement groups are recommended for applications that have a small number of critical instances that should be kept separate from each other. For more information, see Spread placement groups (p. 1193) .	29 November 2017
H1 instances	2016-11-15	H1 instances are designed for high-performance big data workloads. For more information, see Storage optimized instances (p. 335) .	28 November 2017
M5 instances	2016-11-15	M5 instances are general purpose compute instances. They provide a balance of compute, memory, storage, and network resources.	28 November 2017
Spot Instance hibernation	2016-11-15	The Spot service can hibernate Spot Instances in the event of an interruption. For more information, see Hibernate interrupted Spot Instances (p. 477) .	28 November 2017
Spot Fleet target tracking	2016-11-15	You can set up target tracking scaling policies for your Spot Fleet. For more information, see Scale Spot Fleet using a target tracking policy (p. 888) .	17 November 2017
Spot Fleet integrates with Elastic Load Balancing	2016-11-15	You can attach one or more load balancers to a Spot Fleet.	10 November 2017
X1e instances	2016-11-15	X1e instances are ideally suited for high-performance databases, in-memory databases, and other memory-intensive enterprise applications. For more information, see Memory optimized instances (p. 319) .	28 November 2017
C5 instances	2016-11-15	C5 instances are designed for compute-heavy applications. For more information, see Compute optimized instances (p. 308) .	6 November 2017
Merge and split Convertible Reserved Instances	2016-11-15	You can exchange (merge) two or more Convertible Reserved Instances for a new Convertible Reserved Instance. You can also use the modification process to split a Convertible Reserved Instance into smaller reservations. For more information, see Exchange Convertible Reserved Instances (p. 433) .	6 November 2017
P3 instances	2016-11-15	P3 instances are compute-optimized GPU instances. For more information, see Linux accelerated computing instances (p. 345) .	25 October 2017
Modify VPC tenancy	2016-11-15	You can change the instance tenancy attribute of a VPC from dedicated to default. For more information, see Change the tenancy of a VPC (p. 537) .	16 October 2017
Per second billing	2016-11-15	Amazon EC2 charges for Linux-based usage by the second, with a one-minute minimum charge.	2 October 2017

Feature	API version	Description	Release date
Stop on interruption	2016-11-15	You can specify whether Amazon EC2 should stop or terminate Spot Instances when they are interrupted. For more information, see Interruption behavior (p. 476) .	18 September 2017
Tag NAT gateways	2016-11-15	You can tag your NAT gateway. For more information, see Tag your resources (p. 1693) .	7 September 2017
Security group rule descriptions	2016-11-15	You can add descriptions to your security group rules. For more information, see Security group rules (p. 1326) .	31 August 2017
Recover Elastic IP addresses	2016-11-15	If you release an Elastic IP address for use in a VPC, you might be able to recover it. For more information, see Recover an Elastic IP address (p. 1089) .	11 August 2017
Tag Spot Fleet instances	2016-11-15	You can configure your Spot Fleet to automatically tag the instances that it launches.	24 July 2017
G3 instances	2016-11-15	G3 instances provide a cost-effective, high-performance platform for graphics applications using DirectX or OpenGL. G3 instances also provide NVIDIA GRID Virtual Workstation features, supporting 4 monitors with resolutions up to 4096x2160. For more information, see Linux accelerated computing instances (p. 345) .	13 July 2017
F1 instances	2016-11-15	F1 instances are accelerated computing instances. For more information, see Linux accelerated computing instances (p. 345) .	19 April 2017
Tag resources during creation	2016-11-15	You can apply tags to instances and volumes during creation. For more information, see Tag your resources (p. 1693) . In addition, you can use tag-based resource-level permissions to control the tags that are applied. For more information see, Grant permission to tag resources during creation (p. 1248) .	28 March 2017
I3 instances	2016-11-15	I3 instances are storage optimized instances. For more information, see Storage optimized instances (p. 335) .	23 February 2017
Perform modifications on attached EBS volumes	2016-11-15	With most EBS volumes attached to most EC2 instances, you can modify volume size, type, and IOPS without detaching the volume or stopping the instance. For more information, see Amazon EBS Elastic Volumes (p. 1529) .	13 February 2017
Attach an IAM role	2016-11-15	You can attach, detach, or replace an IAM role for an existing instance. For more information, see IAM roles for Amazon EC2 (p. 1297) .	9 February 2017

Feature	API version	Description	Release date
Dedicated Spot Instances	2016-11-15	You can run Spot Instances on single-tenant hardware in a virtual private cloud (VPC). For more information, see Specify a tenancy for your Spot Instances (p. 450) .	19 January 2017
IPv6 support	2016-11-15	You can associate an IPv6 CIDR with your VPC and subnets, and assign IPv6 addresses to instances in your VPC. For more information, see Amazon EC2 instance IP addressing (p. 1037) .	1 December 2016
R4 instances	2016-09-15	R4 instances are memory optimized instances. R4 instances are well-suited for memory-intensive, latency-sensitive workloads such as business intelligence (BI), data mining and analysis, in-memory databases, distributed web scale in-memory caching, and applications performance real-time processing of unstructured big data. For more information, see Memory optimized instances (p. 319)	30 November 2016
New t2.xlarge and t2.2xlarge instance types	2016-09-15	T2 instances are designed to provide moderate base performance and the capability to burst to significantly higher performance as required by your workload. They are intended for applications that need responsiveness, high performance for limited periods of time, and a low cost. For more information, see Burstable performance instances (p. 266) .	30 November 2016
P2 instances	2016-09-15	P2 instances use NVIDIA Tesla K80 GPUs and are designed for general purpose GPU computing using the CUDA or OpenCL programming models. For more information, see Linux accelerated computing instances (p. 345) .	29 September 2016
m4.16xlarge instances	2016-04-01	Expands the range of the general-purpose M4 family with the introduction of m4.16xlarge instances, with 64 vCPUs and 256 GiB of RAM.	6 September 2016
Automatic scaling for Spot Fleet		You can now set up scaling policies for your Spot Fleet. For more information, see Automatic scaling for Spot Fleet (p. 886) .	1 September 2016
Elastic Network Adapter (ENA)	2016-04-01	You can now use ENA for enhanced networking. For more information, see Enhanced networking support (p. 1124) .	28 June 2016
Enhanced support for viewing and modifying longer IDs	2016-04-01	You can now view and modify longer ID settings for other IAM users, IAM roles, or the root user. For more information, see Resource IDs (p. 1684) .	23 June 2016
Copy encrypted Amazon EBS snapshots between AWS accounts	2016-04-01	You can now copy encrypted EBS snapshots between AWS accounts. For more information, see Copy an Amazon EBS snapshot (p. 1413) .	21 June 2016

Feature	API version	Description	Release date
Capture a screenshot of an instance console	2015-10-01	You can now obtain additional information when debugging instances that are unreachable. For more information, see Capture a screenshot of an unreachable instance (p. 1749) .	24 May 2016
X1 instances	2015-10-01	Memory-optimized instances designed for running in-memory databases, big data processing engines, and high performance computing (HPC) applications. For more information, see Memory optimized instances (p. 319) .	18 May 2016
Two new EBS volume types	2015-10-01	You can now create Throughput Optimized HDD (st1) and Cold HDD (sc1) volumes. For more information, see Amazon EBS volume types (p. 1352) .	19 April 2016
Added new NetworkPacketsIn and NetworkPacketsOut metrics for Amazon EC2		Added new NetworkPacketsIn and NetworkPacketsOut metrics for Amazon EC2. For more information, see Instance metrics (p. 978) .	23 March 2016
CloudWatch metrics for Spot Fleet		You can now get CloudWatch metrics for your Spot Fleet. For more information, see CloudWatch metrics for Spot Fleet (p. 884) .	21 March 2016
Scheduled Instances	2015-10-01	Scheduled Reserved Instances (Scheduled Instances) enable you to purchase capacity reservations that recur on a daily, weekly, or monthly basis, with a specified start time and duration. For more information, see Scheduled Reserved Instances (p. 438) .	13 January 2016
Longer resource IDs	2015-10-01	We're gradually introducing longer length IDs for some Amazon EC2 and Amazon EBS resource types. During the opt-in period, you can enable the longer ID format for supported resource types. For more information, see Resource IDs (p. 1684) .	13 January 2016
ClassicLink DNS support	2015-10-01	You can enable ClassicLink DNS support for your VPC so that DNS hostnames that are addressed between linked EC2-Classic instances and instances in the VPC resolve to private IP addresses and not public IP addresses. For more information, see Enable ClassicLink DNS support (p. 1220) .	11 January 2016

Feature	API version	Description	Release date
New t2.nano instance type	2015-10-01	T2 instances are designed to provide moderate base performance and the capability to burst to significantly higher performance as required by your workload. They are intended for applications that need responsiveness, high performance for limited periods of time, and a low cost. For more information, see Burstable performance instances (p. 266) .	15 December 2015
Dedicated hosts	2015-10-01	An Amazon EC2 Dedicated host is a physical server with instance capacity dedicated for your use. For more information, see Dedicated Hosts (p. 498) .	23 November 2015
Spot Instance duration	2015-10-01	You can now specify a duration for your Spot Instances. For more information, see Define a duration for your Spot Instances (p. 450) .	6 October 2015
Spot Fleet modify request	2015-10-01	You can now modify the target capacity of your Spot Fleet request. For more information, see Modify a Spot Fleet request (p. 882) .	29 September 2015
Spot Fleet diversified allocation strategy	2015-04-15	You can now allocate Spot Instances in multiple Spot pools using a single Spot Fleet request. For more information, see Allocation strategy for Spot Instances (p. 840) .	15 September 2015
Spot Fleet instance weighting	2015-04-15	You can now define the capacity units that each instance type contributes to your application's performance, and adjust the amount you are willing to pay for Spot Instances for each Spot pool accordingly. For more information, see Spot Fleet instance weighting (p. 864) .	31 August 2015
New reboot alarm action and new IAM role for use with alarm actions		Added the reboot alarm action and new IAM role for use with alarm actions. For more information, see Create alarms that stop, terminate, reboot, or recover an instance (p. 999) .	23 July 2015
New t2.large instance type		T2 instances are designed to provide moderate base performance and the capability to burst to significantly higher performance as required by your workload. They are intended for applications that need responsiveness, high performance for limited periods of time, and a low cost. For more information, see Burstable performance instances (p. 266) .	16 June 2015
M4 instances		General-purpose instances that provide a balance of compute, memory, and network resources. M4 instances are powered by a custom Intel 2.4 GHz Intel® Xeon® E5 2676v3 (Haswell) processor with AVX2.	11 June 2015

Feature	API version	Description	Release date
Spot Fleets	2015-04-15	You can manage a collection, or fleet, of Spot Instances instead of managing separate Spot Instance requests. For more information, see Spot Fleet (p. 839) .	18 May 2015
Migrate Elastic IP addresses to EC2-Classic	2015-04-15	You can migrate an Elastic IP address that you've allocated for use in EC2-Classic to be used in a VPC. For more information, see the section called "Elastic IP addresses" (p. 1227) .	15 May 2015
Importing VMs with multiple disks as AMIs	2015-03-01	The VM Import process now supports importing VMs with multiple disks as AMIs. For more information, see Importing a VM as an Image Using VM Import/Export in the <i>VM Import/Export User Guide</i> .	23 April 2015
New g2.8xlarge instance type		The new g2.8xlarge instance is backed by four high-performance NVIDIA GPUs, making it well suited for GPU compute workloads including large scale rendering, transcoding, machine learning, and other server-side workloads that require massive parallel processing power.	7 April 2015
D2 instances		<p>Dense-storage instances that are optimized for applications requiring sequential access to large amount of data on direct attached instance storage. D2 instances are designed to offer best price/performance in the dense-storage family. Powered by 2.4 GHz Intel® Xeon® E5 2676v3 (Haswell) processors, D2 instances improve on HS1 instances by providing additional compute power, more memory, and Enhanced Networking. In addition, D2 instances are available in four instance sizes with 6TB, 12TB, 24TB, and 48TB storage options.</p> <p>For more information, see Storage optimized instances (p. 335).</p>	24 March 2015
Automatic recovery for EC2 instances		<p>You can create an Amazon CloudWatch alarm that monitors an Amazon EC2 instance and automatically recovers the instance if it becomes impaired due to an underlying hardware failure or a problem that requires AWS involvement to repair. A recovered instance is identical to the original instance, including the instance ID, IP addresses, and all instance metadata.</p> <p>For more information, see Recover your instance (p. 667).</p>	12 January 2015

Feature	API version	Description	Release date
C4 instances		<p>Next-generation compute-optimized instances that provide very high CPU performance at an economical price. C4 instances are based on custom 2.9 GHz Intel® Xeon® E5-2666 v3 (Haswell) processors. With additional Turbo boost, the processor clock speed in C4 instances can reach as high as 3.5Ghz with 1 or 2 core turbo. Expanding on the capabilities of C3 compute-optimized instances, C4 instances offer customers the highest processor performance among EC2 instances. These instances are ideally suited for high-traffic web applications, ad serving, batch processing, video encoding, distributed analytics, high-energy physics, genome analysis, and computational fluid dynamics.</p> <p>For more information, see Compute optimized instances (p. 308).</p>	11 January 2015
ClassicLink	2014-10-01	<p>ClassicLink enables you to link your EC2-Classic instance to a VPC in your account. You can associate VPC security groups with the EC2-Classic instance, enabling communication between your EC2-Classic instance and instances in your VPC using private IP addresses. For more information, see ClassicLink (p. 1214).</p>	7 January 2015
Spot Instance termination notices		<p>The best way to protect against Spot Instance interruption is to architect your application to be fault tolerant. In addition, you can take advantage of Spot Instance termination notices, which provide a two-minute warning before Amazon EC2 must terminate your Spot Instance.</p> <p>For more information, see Spot Instance interruption notices (p. 481).</p>	5 January 2015
DescribeVolumes pagination support	2014-09-01	<p>The <code>DescribeVolumes</code> API call now supports the pagination of results with the <code>MaxResults</code> and <code>NextToken</code> parameters. For more information, see DescribeVolumes in the <i>Amazon EC2 API Reference</i>.</p>	23 October 2014
T2 instances	2014-06-15	<p>T2 instances are designed to provide moderate base performance and the capability to burst to significantly higher performance as required by your workload. They are intended for applications that need responsiveness, high performance for limited periods of time, and a low cost. For more information, see Burstable performance instances (p. 266).</p>	30 June 2014

Feature	API version	Description	Release date
New EC2 Service Limits page		Use the EC2 Service Limits page in the Amazon EC2 console to view the current limits for resources provided by Amazon EC2 and Amazon VPC, on a per-region basis.	19 June 2014
Amazon EBS General Purpose SSD Volumes	2014-05-01	General Purpose SSD volumes offer cost-effective storage that is ideal for a broad range of workloads. These volumes deliver single-digit millisecond latencies, the ability to burst to 3,000 IOPS for extended periods of time, and a base performance of 3 IOPS/GiB. General Purpose SSD volumes can range in size from 1 GiB to 1 TiB. For more information, see General Purpose SSD volumes (gp2) (p. 1355) .	16 June 2014
Amazon EBS encryption	2014-05-01	Amazon EBS encryption offers seamless encryption of EBS data volumes and snapshots, eliminating the need to build and maintain a secure key management infrastructure. EBS encryption enables data at rest security by encrypting your data using AWS managed keys. The encryption occurs on the servers that host EC2 instances, providing encryption of data as it moves between EC2 instances and EBS storage. For more information, see Amazon EBS encryption (p. 1542) .	21 May 2014
R3 instances	2014-02-01	Memory-optimized instances with the best price point per GiB of RAM and high performance. These instances are ideally suited for relational and NoSQL databases, in-memory analytics solutions, scientific computing, and other memory-intensive applications that can benefit from the high memory per vCPU, high compute performance, and enhanced networking capabilities of R3 instances. For more information about the hardware specifications for each Amazon EC2 instance type, see Amazon EC2 Instance Types .	9 April 2014
New Amazon Linux AMI release		Amazon Linux AMI 2014.03 is released.	27 March 2014
Amazon EC2 Usage Reports		Amazon EC2 Usage Reports is a set of reports that shows cost and usage data of your usage of EC2. For more information, see Amazon EC2 usage reports (p. 1708) .	28 January 2014
Additional M3 instances	2013-10-15	The M3 instance sizes <code>m3.medium</code> and <code>m3.large</code> are now supported. For more information about the hardware specifications for each Amazon EC2 instance type, see Amazon EC2 Instance Types .	20 January 2014

Feature	API version	Description	Release date
I2 instances	2013-10-15	These instances provide very high IOPS and support TRIM on Linux instances for better successive SSD write performance. I2 instances also support enhanced networking that delivers improved inter-instance latencies, lower network jitter, and significantly higher packet per second (PPS) performance. For more information, see Storage optimized instances (p. 335) .	19 December 2013
Updated M3 instances	2013-10-15	The M3 instance sizes, m3.xlarge and m3.2xlarge now support instance store with SSD volumes.	19 December 2013
Importing Linux virtual machines	2013-10-15	The VM Import process now supports the importation of Linux instances. For more information, see the VM Import/Export User Guide .	16 December 2013
Resource-level permissions for RunInstances	2013-10-15	You can now create policies in AWS Identity and Access Management to control resource-level permissions for the Amazon EC2 RunInstances API action. For more information and example policies, see Identity and access management for Amazon EC2 (p. 1240) .	20 November 2013
C3 instances	2013-10-15	Compute-optimized instances that provide very high CPU performance at an economical price. C3 instances also support enhanced networking that delivers improved inter-instance latencies, lower network jitter, and significantly higher packet per second (PPS) performance. These instances are ideally suited for high-traffic web applications, ad serving, batch processing, video encoding, distributed analytics, high-energy physics, genome analysis, and computational fluid dynamics. For more information about the hardware specifications for each Amazon EC2 instance type, see Amazon EC2 Instance Types .	14 November 2013
Launching an instance from the AWS Marketplace		You can now launch an instance from the AWS Marketplace using the Amazon EC2 launch wizard. For more information, see Launch an AWS Marketplace instance (p. 610) .	11 November 2013
G2 instances	2013-10-01	These instances are ideally suited for video creation services, 3D visualizations, streaming graphics-intensive applications, and other server-side workloads requiring massive parallel processing power. For more information, see Linux accelerated computing instances (p. 345) .	4 November 2013

Feature	API version	Description	Release date
New launch wizard		There is a new and redesigned EC2 launch wizard. For more information, see Launch an instance using the Launch Instance Wizard (p. 580) .	10 October 2013
Modifying Instance Types of Amazon EC2 Reserved Instances	2013-10-01	You can now modify the instance type of Linux Reserved Instances within the same family (for example, M1, M2, M3, C1). For more information, see Modify Reserved Instances (p. 426) .	09 October 2013
New Amazon Linux AMI release		Amazon Linux AMI 2013.09 is released.	30 September 2013
Modifying Amazon EC2 Reserved Instances	2013-08-15	You can now modify Reserved Instances in a Region. For more information, see Modify Reserved Instances (p. 426) .	11 September 2013
Assigning a public IP address	2013-07-15	You can now assign a public IP address when you launch an instance in a VPC. For more information, see Assign a public IPv4 address during instance launch (p. 1042) .	20 August 2013
Granting resource-level permissions	2013-06-15	Amazon EC2 supports new Amazon Resource Names (ARNs) and condition keys. For more information, see IAM policies for Amazon EC2 (p. 1242) .	8 July 2013
Incremental Snapshot Copies	2013-02-01	You can now perform incremental snapshot copies. For more information, see Copy an Amazon EBS snapshot (p. 1413) .	11 June 2013
New Tags page		There is a new Tags page in the Amazon EC2 console. For more information, see Tag your Amazon EC2 resources (p. 1692) .	04 April 2013
New Amazon Linux AMI release		Amazon Linux AMI 2013.03 is released.	27 March 2013
Additional EBS-optimized instance types	2013-02-01	The following instance types can now be launched as EBS-optimized instances: c1.xlarge, m2.2xlarge, m3.xlarge, and m3.2xlarge. For more information, see Amazon EBS-optimized instances (p. 1562) .	19 March 2013
Copy an AMI from one Region to another	2013-02-01	You can copy an AMI from one Region to another, enabling you to launch consistent instances in more than one AWS Region quickly and easily. For more information, see Copy an AMI (p. 180) .	11 March 2013

Feature	API version	Description	Release date
Launch instances into a default VPC	2013-02-01	Your AWS account is capable of launching instances into either EC2-Classic or a VPC, or only into a VPC, on a region-by-region basis. If you can launch instances only into a VPC, we create a default VPC for you. When you launch an instance, we launch it into your default VPC, unless you create a nondefault VPC and specify it when you launch the instance.	11 March 2013
High-memory cluster (cr1.8xlarge) instance type	2012-12-01	Have large amounts of memory coupled with high CPU and network performance. These instances are well suited for in-memory analytics, graph analysis, and scientific computing applications.	21 January 2013
High storage (hs1.8xlarge) instance type	2012-12-01	High storage instances provide very high storage density and high sequential read and write performance per instance. They are well-suited for data warehousing, Hadoop/MapReduce, and parallel file systems.	20 December 2012
EBS snapshot copy	2012-12-01	You can use snapshot copies to create backups of data, to create new Amazon EBS volumes, or to create Amazon Machine Images (AMIs). For more information, see Copy an Amazon EBS snapshot (p. 1413) .	17 December 2012
Updated EBS metrics and status checks for Provisioned IOPS SSD volumes	2012-10-01	Updated the EBS metrics to include two new metrics for Provisioned IOPS SSD volumes. For more information, see Amazon CloudWatch metrics for Amazon EBS (p. 1603) . Also added new status checks for Provisioned IOPS SSD volumes. For more information, see EBS volume status checks (p. 1392) .	20 November 2012
Linux Kernels		Updated AKI IDs; reorganized distribution kernels; updated PVOps section.	13 November 2012
M3 instances	2012-10-01	There are new M3 extra-large and M3 double-extra-large instance types. For more information about the hardware specifications for each Amazon EC2 instance type, see Amazon EC2 Instance Types .	31 October 2012
Spot Instance request status	2012-10-01	Spot Instance request status makes it easy to determine the state of your Spot requests.	14 October 2012
New Amazon Linux AMI release		Amazon Linux AMI 2012.09 is released.	11 October 2012

Feature	API version	Description	Release date
Amazon EC2 Reserved Instance Marketplace	2012-08-15	The Reserved Instance Marketplace matches sellers who have Amazon EC2 Reserved Instances that they no longer need with buyers who are looking to purchase additional capacity. Reserved Instances bought and sold through the Reserved Instance Marketplace work like any other Reserved Instances, except that they can have less than a full standard term remaining and can be sold at different prices.	11 September 2012
Provisioned IOPS SSD for Amazon EBS	2012-07-20	Provisioned IOPS SSD volumes deliver predictable, high performance for I/O intensive workloads, such as database applications, that rely on consistent and fast response times. For more information, see Amazon EBS volume types (p. 1352) .	31 July 2012
High I/O instances for Amazon EC2	2012-06-15	High I/O instances provides very high, low latency, disk I/O performance using SSD-based local instance storage.	18 July 2012
IAM roles on Amazon EC2 instances	2012-06-01	IAM roles for Amazon EC2 provide: <ul style="list-style-type: none"> • AWS access keys for applications running on Amazon EC2 instances. • Automatic rotation of the AWS access keys on the Amazon EC2 instance. • Granular permissions for applications running on Amazon EC2 instances that make requests to your AWS services. 	11 June 2012
Spot Instance features that make it easier to get started and handle the potential of interruption.		You can now manage your Spot Instances as follows: <ul style="list-style-type: none"> • Specify the amount you are willing to pay for Spot Instances using Auto Scaling launch configurations, and set up a schedule for specifying the amount you are willing to pay for Spot Instances. For more information, see Launching Spot Instances in Your Auto Scaling Group in the <i>Amazon EC2 Auto Scaling User Guide</i>. • Get notifications when instances are launched or terminated. • Use AWS CloudFormation templates to launch Spot Instances in a stack with AWS resources. 	7 June 2012
EC2 instance export and timestamps for status checks for Amazon EC2	2012-05-01	Added support for timestamps on instance status and system status to indicate the date and time that a status check failed.	25 May 2012

Feature	API version	Description	Release date
EC2 instance export, and timestamps in instance and system status checks for Amazon VPC	2012-05-01	Added support for EC2 instance export to Citrix Xen, Microsoft Hyper-V, and VMware vSphere. Added support for timestamps in instance and system status checks.	25 May 2012
Cluster Compute Eight Extra Large instances	2012-04-01	Added support for cc2.8xlarge instances in a VPC.	26 April 2012
AWS Marketplace AMIs	2012-04-01	Added support for AWS Marketplace AMIs.	19 April 2012
New Linux AMI release		Amazon Linux AMI 2012.03 is released.	28 March 2012
New AKI version		We've released AKI version 1.03 and AKIs for the AWS GovCloud (US) region.	28 March 2012
Medium instances, support for 64-bit on all AMIs, and a Java-based SSH Client	2011-12-15	Added support for a new instance type and 64-bit information. Added procedures for using the Java-based SSH client to connect to Linux instances.	7 March 2012
Reserved Instance pricing tiers	2011-12-15	Added a new section discussing how to take advantage of the discount pricing that is built into the Reserved Instance pricing tiers.	5 March 2012
Elastic Network Interfaces (ENIs) for EC2 instances in Amazon Virtual Private Cloud	2011-12-01	Added new section about elastic network interfaces (ENIs) for EC2 instances in a VPC. For more information, see Elastic network interfaces (p. 1091) .	21 December 2011
New GRU Region and AKIs		Added information about the release of new AKIs for the SA-East-1 Region. This release deprecates the AKI version 1.01. AKI version 1.02 will continue to be backward compatible.	14 December 2011
New offering types for Amazon EC2 Reserved Instances	2011-11-01	You can choose from a variety of Reserved Instance offerings that address your projected use of the instance.	01 December 2011
Amazon EC2 instance status	2011-11-01	You can view additional details about the status of your instances, including scheduled events planned by AWS that might have an impact on your instances. These operational activities include instance reboots required to apply software updates or security patches, or instance retirements required where there are hardware issues. For more information, see Monitor the status of your instances (p. 945) .	16 November 2011
Amazon EC2 Cluster Compute Instance Type		Added support for Cluster Compute Eight Extra Large (cc2.8xlarge) to Amazon EC2.	14 November 2011

Feature	API version	Description	Release date
New PDX Region and AKIs		Added information about the release of new AKIs for the new US-West 2 Region.	8 November 2011
Spot Instances in Amazon VPC	2011-07-15	Added information about the support for Spot Instances in Amazon VPC. With this update, users can launch Spot Instances in a virtual private cloud (VPC). By launching Spot Instances in a VPC, users of Spot Instances can enjoy the benefits of Amazon VPC.	11 October 2011
New Linux AMI release		Added information about the release of Amazon Linux AMI 2011.09. This update removes the beta tag from the Amazon Linux AMI, supports the ability to lock the repositories to a specific version, and provides for notification when updates are available to installed packages including security updates.	26 September 2011
Simplified VM import process for users of the CLI tools	2011-07-15	The VM Import process is simplified with the enhanced functionality of <code>ImportInstance</code> and <code>ImportVolume</code> , which now will perform the upload of the images into Amazon EC2 after creating the import task. In addition, with the introduction of <code>ResumeImport</code> , users can restart an incomplete upload at the point the task stopped.	15 September 2011
Support for importing in VHD file format		VM Import can now import virtual machine image files in VHD format. The VHD file format is compatible with the Citrix Xen and Microsoft Hyper-V virtualization platforms. With this release, VM Import now supports RAW, VHD and VMDK (VMware ESX-compatible) image formats. For more information, see the VM Import/Export User Guide .	24 August 2011
Update to the Amazon EC2 VM Import Connector for VMware vCenter		Added information about the 1.1 version of the Amazon EC2 VM Import Connector for VMware vCenter virtual appliance (Connector). This update includes proxy support for Internet access, better error handling, improved task progress bar accuracy, and several bug fixes.	27 June 2011
Enabling Linux AMI to run user-provided kernels		Added information about the AKI version change from 1.01 to 1.02. This version updates the PVGRUB to address launch failures associated with t1.micro Linux instances. For more information, see User provided kernels (p. 229) .	20 June 2011

Feature	API version	Description	Release date
Spot Instances Availability Zone pricing changes	2011-05-15	Added information about the Spot Instances Availability Zone pricing feature. In this release, we've added new Availability Zone pricing options as part of the information returned when you query for Spot Instance requests and Spot price history. These additions make it easier to determine the price required to launch a Spot Instance into a particular Availability Zone.	26 May 2011
AWS Identity and Access Management		Added information about AWS Identity and Access Management (IAM), which enables users to specify which Amazon EC2 actions a user can use with Amazon EC2 resources in general. For more information, see Identity and access management for Amazon EC2 (p. 1240) .	26 April 2011
Enabling Linux AMI to run user-provided kernels		Added information about enabling a Linux AMI to use PVGRUB Amazon Kernel Image (AKI) to run a user-provided kernel. For more information, see User provided kernels (p. 229) .	26 April 2011
Dedicated instances		Launched within your Amazon Virtual Private Cloud (Amazon VPC), Dedicated Instances are instances that are physically isolated at the host hardware level. Dedicated Instances let you take advantage of Amazon VPC and the AWS cloud, with benefits including on-demand elastic provisioning and pay only for what you use, while isolating your Amazon EC2 compute instances at the hardware level. For more information, see Dedicated Instances (p. 531) .	27 March 2011
Reserved Instances updates to the AWS Management Console		Updates to the AWS Management Console make it easier for users to view their Reserved Instances and purchase additional Reserved Instances, including Dedicated Reserved Instances. For more information, see Reserved Instances (p. 396) .	27 March 2011
New Amazon Linux reference AMI		The new Amazon Linux reference AMI replaces the CentOS reference AMI. Removed information about the CentOS reference AMI, including the section named Correcting Clock Drift for Cluster Instances on CentOS 5.4 AMI.	15 March 2011
Metadata information	2011-01-01	Added information about metadata to reflect changes in the 2011-01-01 release. For more information, see Instance metadata and user data (p. 726) and Instance metadata categories (p. 744) .	11 March 2011

Feature	API version	Description	Release date
Amazon EC2 VM Import Connector for VMware vCenter		Added information about the Amazon EC2 VM Import Connector for VMware vCenter virtual appliance (Connector). The Connector is a plug-in for VMware vCenter that integrates with VMware vSphere Client and provides a graphical user interface that you can use to import your VMware virtual machines to Amazon EC2.	3 March 2011
Force volume detachment		You can now use the AWS Management Console to force the detachment of an Amazon EBS volume from an instance. For more information, see Detach an Amazon EBS volume from a Linux instance (p. 1400) .	23 February 2011
Instance termination protection		You can now use the AWS Management Console to prevent an instance from being terminated. For more information, see Enable termination protection (p. 663) .	23 February 2011
Correcting Clock Drift for Cluster Instances on CentOS 5.4 AMI		Added information about how to correct clock drift for cluster instances running on Amazon's CentOS 5.4 AMI.	25 January 2011
VM Import	2010-11-15	Added information about VM Import, which allows you to import a virtual machine or volume into Amazon EC2. For more information, see the VM Import/Export User Guide .	15 December 2010
Basic monitoring for instances	2010-08-31	Added information about basic monitoring for EC2 instances.	12 December 2010
Filters and Tags	2010-08-31	Added information about listing, filtering, and tagging resources. For more information, see List and filter your resources (p. 1685) and Tag your Amazon EC2 resources (p. 1692) .	19 September 2010
Idempotent Instance Launch	2010-08-31	Added information about ensuring idempotency when running instances. For more information, see Ensure idempotency in the Amazon EC2 API Reference .	19 September 2010
Micro instances	2010-06-15	Amazon EC2 offers the t1.micro instance type for certain types of applications. For more information, see Burstable performance instances (p. 266) .	8 September 2010
AWS Identity and Access Management for Amazon EC2		Amazon EC2 now integrates with AWS Identity and Access Management (IAM). For more information, see Identity and access management for Amazon EC2 (p. 1240) .	2 September 2010

Feature	API version	Description	Release date
Cluster instances	2010-06-15	Amazon EC2 offers cluster compute instances for high-performance computing (HPC) applications. For more information about the hardware specifications for each Amazon EC2 instance type, see Amazon EC2 Instance Types .	12 July 2010
Amazon VPC IP Address Designation	2010-06-15	Amazon VPC users can now specify the IP address to assign an instance launched in a VPC.	12 July 2010
Amazon CloudWatch monitoring for Amazon EBS Volumes		Amazon CloudWatch monitoring is now automatically available for Amazon EBS volumes. For more information, see Amazon CloudWatch metrics for Amazon EBS (p. 1603) .	14 June 2010
High-memory extra large instances	2009-11-30	Amazon EC2 now supports a High-Memory Extra Large (m2.xlarge) instance type. For more information about the hardware specifications for each Amazon EC2 instance type, see Amazon EC2 Instance Types .	22 February 2010
